GAS TO HALLEY.

J. Hudson, Printer, Castle Street, London.

THE
LONDON ENCYCLOPÆDIA,
OR
UNIVERSAL DICTIONARY
OF
SCIENCE, ART, LITERATURE, AND PRACTICAL MECHANICS,
COMPRISING A
POPULAR VIEW OF THE PRESENT STATE OF KNOWLEDGE.
ILLUSTRATED BY
NUMEROUS ENGRAVINGS, A GENERAL ATLAS,
AND APPROPRIATE DIAGRAMS.

Sic oportet ad librum, presertim miscellanei generis, legendum accedere lectorem, ut solet ad convivium conviva civilis. Convivator annuitur omnibus satisfacere; et tamen si quid apponitur, quod hujus aut illius palato non respondeat, et hic et ille urbane dissimulant, et alia fercula probant, ne quid contristent convivatorem.

Erasmus

A reader should sit down to a book, especially of the miscellaneous kind, as a well-behaved visitor does to a banquet. The master of the feast exerts himself to satisfy his guests; but if, after all his care and pains, something should appear on the table that does not suit this or that person's taste, they politely pass it over without notice, and commend other dishes, that they may not distress a kind host.

Translation.

BY THE ORIGINAL EDITOR OF THE ENCYCLOPÆDIA METROPOLITANA,
ASSISTED BY EMINENT PROFESSIONAL AND OTHER GENTLEMEN.

GAS. Goth. and Swed. *gasa*, to ferment, a term first commonly used by Van Helmont for fluids of an aëriform character.

GAS. The various gaseous bodies have been enumerated, and their properties explained, in that department of chemistry, to which they peculiarly belong; and we now propose to direct the attention of our readers to one of the most important practical applications of gaseous chemistry, in the illumination of buildings, and even large cities, by carbureted hydrogen gas.

The producing from coal an aëriform fluid, which could be distributed at pleasure in every direction, for the purpose of economical illumination, has justly been ranked amongst the greatest benefits which the science and enterprise of this country have conferred on mankind.

That coal evolves a permanently elastic and inflammable aëriform fluid, seems first to have been experimentally ascertained by the Rev. Dr. Clayton, and a brief account of his discovery is published in the Philosophical Transactions for the year 1739. The following is an extract from his paper:—‘I got some coal, and distilled it in a retort in an open fire. At first there came over only phlegm, afterwards a black oil, and then likewise a spirit arose, which I could no ways condense; but it forced my lute or broke my glasses. Once when it had forced my lute, coming close thereto, in order to try to repair it, I observed that the spirit which issued from it caught fire at the flame of the candle, and continued burning with violence, as it issued out in a stream, which I blew out and lighted again alternately for several times. I then had a mind to try if I could save any of this spirit, in order to which, I took a turbinated receiver, and putting a candle to the pipe of the receiver, whilst the spirit arose, I observed that it caught flame, and continued burning at the end of the pipe, though you could not discern what fed the flame. I then blew it out, and lighted it again several times; after which I fixed a bladder, squeezed and void of air, to the pipe of the receiver. The oil and phlegm descended into the receiver, but the spirit, still ascending, blew up the bladder. I then filled a good many bladders therewith, and might have filled an inconceivable number more, for the spirit continued to rise for several hours, and filled the bladders almost as fast as a man could have blown them with his mouth; and yet the quantity of coals distilled was inconsiderable.

‘I kept this spirit in the bladders a considerable time, and endeavoured several ways to condense it, but in vain. And when I had a mind to divert strangers or friends, I have frequently taken one of these bladders, and pricking a hole therein with a pin, and compressing

gently the bladder near the flame of a candle till it once took fire, it would then continue flaming till all the spirit was compressed out of the bladder, which was the more surprising; because no one could discern any difference in the appearance between these bladders, and those which are filled with common air.

‘But then I found that this spirit must be kept in good thick bladders, as in those of an ox, or the like; for if I filled calves’ bladders therewith, it would lose its inflammability in twenty-four hours, though the bladders became not relaxed at all.’

But the application of the gas thus generated to the purposes of economical illumination is of much more recent date, and the merit of introducing it is principally due to Mr. Murdoch, whose observations upon the subject are published in the Philosophical Transactions for 1808. He first tried it in Cornwall, in the year 1792; and afterwards, in 1798, established an apparatus upon a more extended scale at Boulton and Watt’s foundry at Birmingham; and it was there that the first public display of gas lights was made in 1802, upon the occasion of the rejoicings for peace. These, however, were but imperfect trials, when compared with that made in 1805 at Messrs. Phillips and Lee’s cotton mills at Manchester; and upon the results of which, all subsequent procedures, with regard to gas lighting, may be said to be founded. The whole cotton mill, and many adjacent buildings, were illuminated with coal gas, to the exclusion of lamps, candles, and other sources of artificial light. Nearly 1000 burners of different forms were employed; and the light produced was estimated equal to that of 2500 well managed candles of six to the pound.

The most important and curious part of Mr. Murdoch’s statement relates to the cost of the two modes of lighting (namely, by gas and candles) per annum. The cost of the coal, used to furnish the gas, amounting annually to 110 tons, was £125. Forty tons of coals to heat the retort £20, and the interest of capital sunk, with due allowance for accidents and repairs, £550. From the joint amount of these items must be deducted the value of seventy tons of coke, at 1s. 4d. per cwt., amounting to £93, which reduces the total annual expense to £602; while that of candles to give the same light would amount to £2000.

Such was the flattering result of the first trial of gas illumination upon a tolerably extensive scale. In regard to its efficacy, we are informed by Mr. Murdoch, that the peculiar softness and clearness of the light, with its almost unvarying intensity, brought it into great favor with the work people; and its being free from the incon-

Fig. 1

Fig. 2

Fig. 4

Fig. 5

Fig. 6

venience of sparks, and the frequent necessity of snuffing, are circumstances of material importance, as tending to diminish the hazard from fire, to which cotton mills are so much exposed.

When Mr. Lee was examined by Mr. Brougham, in 1809, before a committee of the house of commons, against the Gas-light and Coke Company's bill, his evidence was then equally favorable. He said, it gave no disagreeable smell; and when questioned as to the goodness and purity of the light, 'I burn it,' said he, 'every night in my own house, instead of thirty pairs of candles.' He further added, that he found it perfectly wholesome, and that it was never complained of either in his own dwelling-house, or in the mill.

The president and council of the Royal Society proved the high opinion which they entertained of the value and importance of Mr. Murdoch's communication, on the employment of the gas from coal for the purpose of illumination, by adjudging to him count Rumford's gold and silver medals.

We are indebted to Dr. Henry, of Manchester, for some valuable researches concerning the composition of the æriform products of several varieties of coal. He has pointed out the various composition of the gas at different periods of the distillation, and has shown the important influence of the circumstances under which the coal is distilled, upon the proportion of gas yielded, and its fitness for the purposes of illumination. This fact attracted the notice of Mr. Clegg, the engineer of the Gas-light Company, who has founded upon it several ingenious improvements in the construction of the retorts employed at the Westminster gas works. Coal in large heaps, and gradually heated, affords less gas, and more water and tar, than when it is extended over a considerable surface, and suddenly brought to a red heat. It is also very advantageous to dry the coal before its introduction into the retort.

In a small gas apparatus, erected in the laboratory of the Royal Institution, it was found that 4 lbs. of good Newcastle coal, introduced into the retort previously heated red in a shallow iron pan, may be made to afford a produce of from twenty to twenty-six cubic feet of gas, consisting of

- 8 Olefiant gas.
- 72 Carbureted hydrogen.
- 13 Carbonic oxide and hydrogen.
- 4 Carbonic acid.
- 3 Sulphureted hydrogen.

100

The carbonic acid and sulphureted hydrogen are separated by the lime in the purifiers.

The same quantity of coal introduced into the cold retort, and gradually heated, afforded only twenty-two cubic feet of gas, consisting of

- 5 Olefiant gas.
- 70 Carbureted hydrogen.
- 18 Carbonic oxide and hydrogen.
- 6 Carbonic acid.
- 1 Sulphureted hydrogen.

100

The specific gravity of the former gas, that of air being = 1000, was = 560, and of the latter = 555: the fitness of gases for the purposes of illuminating is, generally speaking, directly as their specific gravity.

These experiments lead to the conclusion, that a chaldron of good Wallsend Newcastle coals would afford from 17,000 to 20,000 cubical feet of gas, but the process of distillation, as now carried on in the large establishments for lighting the metropolis, seldom affords a larger average produce than 12,000 cubical feet. There can, however, be little doubt that, by improvements in the construction and management of the retorts, the highest of the above averages might be procured; and calculating upon this produce of gas, and upon the other substances yielded by the operation, we obtain a curious and striking result.

The average value in London of a chaldron of the best Newcastle coals is £3. The value of the products of its distillation is as follows:—

	£.	s.	d.
1½ chaldron of coke, at 31s.	1	18	9
12 gallons of tar, at 10d.	0	10	0
18 gallons of ammoniacal liquor, at 6d.	0	9	0
20,000 cubic feet of gas, at 15s. per 1000 cubic feet	15	0	0
	<hr/>		
	£17	17	9

From the value of products must, of course, be deducted, the value of the common coal employed in the furnaces for heating the retorts, amounting to about five chaldrons for every five-and-twenty chaldrons submitted to distillation, and the expense incurred by wear and tear, with the wages of the laborers, and lastly, the interest upon capital. Mr. Murdoch's estimate, already quoted, will be found pretty accurate upon these heads.

The tar is frequently employed for the production of gas, either by mixing it with small coal in the retorts, or by passing it through a red hot tube. Every pound yields between seventeen and eighteen cubic feet, containing from fifteen to twenty per cent. of olefiant gas. When, therefore, it has been cleansed by lime, it burns with a very brilliant flame, and is a most improving addition to the common gas. Wigan and Cannel coal yield the best and largest proportion of gas for the purposes of illumination, but it is seldom it can be employed on account of its high price.

The burners, or tubes whence the gas issues for combustion, may be infinitely and tastefully varied. The varieties commonly employed are the bat's-wing burner, and the Argand burner. The former consists of a brass tube having a slit at its extremity about a quarter of an inch long and one-fortieth of an inch wide. The latter is composed of two concentric brass tubes, about two inches long, closed at bottom by a ring of brass, and at the top by one of steel, perforated with sixteen or eighteen holes, of one-thirtieth of an inch in diameter. The gas enters the cavity between the tubes, and issues from the circular row of apertures, where it is inflamed, and hav-

ing a due supply of air, within and without, burns very beautifully when a proper glass is placed over the burner. These burners, when very carefully regulated, consume about three cubical feet of gas per hour, and give light equal to that of six wax candles; but it is requisite, on account of carelessness and mismanagement, to allow four cubical feet to each burner per hour. The bat's wing burner should not consume more than three cubic feet per hour.

Besides the different varieties of coal, some of which, as has been hinted, are much preferable to others, and coal tar, a useful gas may be procured from a variety of other substances; and in the laboratory of the Royal Institution, the retort is often fed with waste paper, saw-dust, pieces of wood, &c., and the gas is consumed for a variety of purposes where oil was formerly employed.

The following are the results of some experiments upon these subjects, compared with the produce from coal.

1. The retort was charged with four pounds of coal. The quantity of gas amounted, after having passed the purifiers, to twenty cubic feet. The coke remaining in the retort weighed 2 lb. 8·7 ozs.

The heating power of the gas flame was compared with that of a wax candle, by ascertaining the time required by each to raise two ounces of water, in a thin copper vessel, from 55° to 212° . The flames were made as similar in dimensions as possible, and so placed that their joints just touched the bottom of the vessel. The heating power of the candle being assumed as $\equiv 1$, that of the coal gas flame was $\equiv 1\cdot5$.

2. Four pounds of the dried wood of the common willow yielded sixteen cubical feet of gas, and fourteen ounces of charcoal remained in the retort. The gas burned with a very pale blue flame, and was unfit for the purpose of illumination, and contained no olefant gas.

3. Four pounds of the wood of the mountain ash afforded fifteen cubical feet and a half of gas, and thirteen ounces and a half of charcoal. The flame was very pale and blue.

4. Four pounds of white birch wood gave fourteen cubical feet of gas, and twelve ounces of charcoal. The flame similar to 2 and 3.

5. Four pounds of hazel wood yielded thirteen cubical feet and a half of gas, and twelve ounces and a half of charcoal. Its heating power was $\equiv 1\cdot2$. It burned with a better flame than 2, 3, and 4, but the intensity was not sufficient for any useful purpose of illumination.

6. Four pounds of writing paper gave eighteen cubical feet of gas, and the remaining charcoal, which beautifully retained the form and texture of the paper, weighed eleven ounces and a half. The heating power of the gas was $\equiv 1\cdot6$. It burned with a flame nearly approaching in illuminating power to that of coal gas.

These experiments, along with others which it is thought unnecessary to notice, prove that the gas from woods is not fit for the purposes of illumination, although, as evolved during the production of charcoal, it may conveniently be consumed in the laboratory as a source of heat.

We may now describe the retort oven for ge-

nerating gas on a large scale. Fig. 1, plate I. GAS LIGHT, exhibits a longitudinal section, and fig. 1. shows the front elevation of the oven, built about ten feet above the ground, upon piers or arches, which saves brick-work, and allows a stage or platform to be erected in front of the fire places of the ovens. Between the back part of the ovens and the wall of the building in which they are erected is left an empty space of a few inches to prevent the heat of the oven being communicated to the wall.

The whole interior of the oven, as well as the horizontal flue which passes underneath the crown of it, near the upper tier of retorts, is lined with fire-bricks. The uppermost part or crown of the arch is constructed of large fire-bricks, of such a shape as will allow to flatten the upper part of the arch as much as possible, in order to contract the space between the two upper retorts and the crown of the arch of the oven.

R, R, fig. 2 and 3, are cylindrical retorts, placed horizontally in the oven, the lower series are either supported by a large fire-brick, placed edgewise underneath the retort, or by means of a stout wrought iron pillar, as shown in the design. The two upper retorts are supported by wrought iron straps, T, T, T. The straps pass through the brick-work of the upper part of the oven, as shown in the designs, and they are secured with screws and nuts to an iron bearing bar, the extremities of which are supported by the outer walls of the oven. Each retort is furnished at the extremity opposite to the mouth-piece with a short projecting piece or tail let into the brick-work of the oven.

M, fig. 4, shows the mouth-piece of the retort with its cross bar and hand screw; and fig. 5 shows the mouth-piece drawn to a larger scale. E is the hand-screw, with its cross or bearing bar D, which passes through the projecting arms C, C. The lid of the mouth-piece has a conical edge, so that it fits close when put into its place by means of the hand-screw E.

F, fig. 6, is the fire-place, with the ash-pit E of the oven. The door of the ash-pit is provided with three slits covered within by a register slide, to regulate the admission of air as occasion may require. The fire passes freely and uniformly round all the retorts, and the whole cavity of the oven acquires an equable temperature, which it retains, if the workman takes care to admit as little air as possible through the register door of the ash-pit, when the upper part of the arch, or crown of the oven has acquired a bright cherry red heat. The liquid substances, namely the tar and ammoniacal fluid, collect in the hydraulic main H, which is furnished with a perpendicular diaphragm or partition plate to cause a certain quantity of the liquid deposited in it to accumulate to a certain height, and thus to seal the perpendicular pipe P. The liquid cannot flow out of the horizontal pipe H, till it rises to the level of the diaphragm.

K, fig. 7, is the discharging pipe, connected with the upper part of the horizontal main H: it serves to convey away the gaseous and liquid products from the hydraulic main H. By means of this pipe the tar and ammoniacal fluids are conveyed into any convenient reservoir, called

the tar cistern, which is perfectly air-tight, and from this vessel the liquid may be drawn off by means of a pipe or stop-cock. The extremity of the pipe which communicates with the liquid is bent downwards, so that no air can enter the vessel.

It is essential that the condensation of the vaporous fluids should be fully completed before they reach the tar vessel. To effect this, there is usually allowed a considerable distance to intervene between the discharging pipe, K, and the reservoir destined to receive the condensable products; or the pipe is made to pass through a vessel containing water, called the condenser, which acts in a similar manner as the refrigeratory of a common still. It is obvious that it is immaterial how the condensation of the vaporous fluid is effected; it is essential, however, that the condensation should be complete before the liquid tar and ammoniacal fluid reach the reservoir destined to receive these products. The gaseous fluid, which accompanies the condensable products, is then made to pass into the lime machine, in order to be deprived, by means of quicklime and water, of the portion of sulphureted hydrogen and carbonic acid gas which was combined with the gas. And, when this has been accomplished, the purified gas is conveyed into the gas-holder, where it is stored up for use. In some establishments, the hydraulic main is furnished with two discharging pipes; the one carries away the condensable fluid, into which the perpendicular pipes, P, fig. 8, dip, whilst the other serves to convey away the gaseous fluids to a condenser, in order to deposit the vaporous portion of condensable liquid it may contain, and from thence the gas passes into the purifying apparatus, or lime machine. X, fig. 9, is a small screw plug, which, when opened, restores the equilibrium of the air within and without the retort previous to the lid being taken off, to prevent the loud report which otherwise happens when the lid or cover of the retort is suddenly removed. To avoid these explosive reports, which had become a nuisance to the neighbourhood of gas works, the practice of gradually withdrawing the lid of the retort, and, at the same time, presenting a lighted torch, has been adopted at some works, which fully remedies the evil.

The quantity of gas to be obtained from coal varies according to the coal employed and the manner in which it is treated: the quality also depends on the mode of applying the heat. Taking it for granted that the most advantageous method of decomposing it is followed, the quantity from the different kinds of coal varies. In stating the proportions, therefore, we can come only at an average conclusion.

Mr. Peckston, in his work on Coal-gas, states, that a chaldron of Newcastle Wall's End coal will yield 10,000 feet, supposing it decomposed under the most advantageous circumstances; 2 cwt. will, therefore, yield about 750 feet. At Edinburgh, 2 cwt. of Parrot-coal yield, on an average, 860 feet of gas. According to Mr. Neilson, engineer, Glasgow, 2 cwt. of Lesmahago coal will produce 1008 cubic feet of gas, allowing four and a half each pound. Mr. Russell, of London, has

stated the quantity from Newcastle coal to be the same, four feet and a half per pound. Mr. Dewy, in a paper in the *Annals of Philosophy*, asserts, that at Liverpool, Mr. King considers it good economy to procure 70.0 feet from a ton of Wigan Orral coal, making it only 700 feet from 2 cwt., a very little more than three feet per pound. He has stated also, that, at Glasgow, 1200 feet are procured from 2 cwt. of cannel-coal, which is considerably above that mentioned by Mr. Neilson. From these various statements, the general conclusion has been drawn, that 2 cwt. of good coal ought to yield about 1000 feet of gas.

With respect to the quantity to be obtained from oil, this must, of course, also depend on the nature of the oil, and the manner of decomposing it. Mr. Ricardo mentions, that, from repeated trials in various oil-gas establishments, it has been ascertained that one gallon produces 100 cubic feet. From the experiments of Mr. Brande, and Mr. Faraday, it appears that the same quantity affords from 100 to 110 feet. In some instances it has been known to amount to about 120; but in these cases, it was not good, the additional quantity having been derived from substances put into the retort. At Leith, a gallon of whale oil affords from ninety-eight to 108 cubic feet; and the same quantity of palm-oil, from ninety-seven to 114. It may be considered a fair estimate to obtain 100 feet from each gallon, presuming, of course, that the oil is decomposed under the most favorable circumstances, so as to get a gas possessing the greatest illuminating power; for on this every thing depends. From experiments performed on a small scale, and from trials made at Leith, Dr. Fyfe found, that if the oil be allowed to flow into a retort brought just to a red heat, there is comparatively little gas, but a great deal of volatile oil. When the retort is brought to an intense heat, lamp-black is formed in considerable quantity; so that, in both of these ways, there is a great loss. When the retort is at a full red heat, the oil seems to undergo decomposition most easily, and to give off the largest proportion of good gas.

In conducting the decomposition of coal, the evolution of the gas is far from being, with regard to quantity, uniform, during different periods of the distillatory process. The formation of the gas is more rapid in the beginning of the process, and gradually slackens as the operation proceeds. The gas also differs in its chemical constitution, at different periods of the process; although, in the case of large supplies, this difference is of little consequence after the gas is purified in the usual manner. The former consideration, however, has given rise to various modes of operating, of which it will be proper to take some notice.

It must be obvious that, in proportion as the mass of coal in the retort becomes carbonised or converted into coke, the exterior surface becomes a gradually increasing obstacle to the action of the heat upon the interior or central part of the coal remaining to be decomposed. The heat required on that account must be more intense, and kept up to purpose; and the extrication of gas becomes slower and slower, as the operation proceeds. The loss occasioned by this

rapid diminution of the means employed, is serious in every point of view, in regard both to the quantity of fuel used and time wasted, but it is unavoidable in the operation of decomposing coal in masses or layers from five to ten inches in thickness, and must be a great drawback on the value of the gas-light discovery. The loss of fuel, it is obvious, must be just in proportion to the quantity of carbonised matter, or coke, which is kept hot to no purpose, awaiting the decomposition of that portion of coal which it is the very means of protecting from becoming undecomposed.

A striking exemplification of this statement will be seen in the following table, exhibiting the result of the progressive produce of coal gas, obtainable, in a given time, by means of cylindrical and parallelopiped retorts.

Experiment with one Cylindrical Retort, containing two bushels of coal.

Hours of the distillatory process.	Quantity of gas produced.
First hour . . .	115 cubic feet.
Second hour . . .	81
Third hour . . .	78
Fourth hour . . .	70
Fifth hour . . .	66
Sixth hour . . .	55
Seventh hour . . .	49
Eighth hour . . .	42
	<hr/>
	555

The quantity of gas is at the rate of 10,000 cubic feet to the chaldron (27 cwt.) of coal.

Experiment with eighteen Cylindrical Retorts, containing one chaldron of coal.

Hours of the distillatory process.	Quantity of gas produced.
First hour . . .	2000 cubic feet.
Second hour . . .	1488
Third hour . . .	1400
Fourth hour . . .	1301
Fifth hour . . .	1208
Sixth hour . . .	1000
Seventh hour . . .	897
Eighth hour . . .	691
	<hr/>
	9985

This experiment was made with retorts set on the flue plan.

The coal employed was (Bewick and Craister's Wall's End) Newcastle coal.

Experiment with thirty-six Parallelopipedal Retorts, each containing two bushels of coal.

Hours of the distillatory process.	Quantity of gas produced.
First hour . . .	4-058
Second hour . . .	3-028
Third hour . . .	2-871
Fourth hour . . .	2-526
Fifth hour . . .	2-380
Sixth hour . . .	1-971
Seventh hour . . .	1-754
Eighth hour . . .	1-450
	<hr/>
	20-038

The same heat, as we have seen from the first table, which is necessary during the hour of

operation, for the evolution of 115 cubic feet of gas, is required in the eighth hour for the production of no more than forty-two cubic feet, being a decrease in effect of nearly two-thirds.

When larger retorts are employed for decomposing coal, in masses from five to ten inches in thickness, the loss of heat is in a much greater ratio.

In the hope of remedying, in some measure, the evils thus distinctly ascertained to arise from the undue thickness of the masses of coal subjected to the distillatory process, there have not been wanting manufacturers who have had recourse to experiments on a large scale, to ascertain with certainty whether they might not be gainers by suffering the distillatory process, when the retorts are charged with two bushels of coal, to proceed only for the space of six hours, instead of eight. But the result of these experiments has shown satisfactorily, that it is more profitable to keep up the distillatory process for a period of eight hours, with the retorts fully charged, than to abridge the operation by terminating it at the end of six hours. Others, again, have imagined, that it would be more economical to decompose a less quantity of coal at once, or to decrease the thickness of the stratum of coal in the cylindrical or in any of the before-named retorts; but then, again, serious difficulties occur in the practice. The more frequent charging of the retorts and luting on the covers, which such a mode of operating requires, occasions a prodigious waste of fuel, time, and labor. A greater number of retorts, and more workmen, must likewise be employed, in order to produce the requisite quantity of gas daily, which the manufacturer is called upon to supply; more space of ground is required, and more dead capital must be sunk in the establishment. The more frequent and sudden alterations of temperature which the retorts necessarily suffer, by the more frequent introduction of cold coal, renders them extremely liable to become injured; and it is almost impossible to maintain a number of retorts, thus worked, at a uniform temperature.

One of the best purposes to which the tar produced in the distillation of coal can be applied, is to the production of gas, which yields in the proportion of about eighteen cubic feet from each pound, and of an excellent quality for illumination. The following is an account of Mr. Clegg's apparatus for its decomposition, and which appears to answer better than any yet devised:—

A, plate I., fig. 10, is a tar cistern. B, a cock by which it is drawn off. As a sufficiently small stream of tar is apt to stop, by its stiffness, a larger quantity than is wanted is allowed to run into E, upon the edge of the dividing plate C, adjusted by the screw D: the excess runs off by a waste pipe into any proper vessel, while a due portion trickles through E into F, and runs down G, G, into H, where, when the tar has reached the level I, it is conducted into the retort K, L, M, the return of gas being prevented by the immersion of the end of the tube G, G, into the tar in the vessel H. The retort, resembling a bent pipe or syphon, is so inserted in a proper flue, that the ends K, M, provided with lids or

mouth-pieces N, O, may be easy of access, and one above another: the lower branch L, M, may be placed almost horizontally, and the upper should form with it an angle of about ten degrees. The retort being made red hot, the tar will be decomposed, and the gas, and some other products, will flow from the end M, by the pipe P, into the vessel Q, in which is a partition plate R, fig. 11, extending about half way down, and allowing the heavy products to accumulate for a convenient time before they can interfere with the passage of the gas, which passes to the purifiers, as usual, by the pipe S, S, fig. 12, is a moveable lid for cleansing the vessel. It is not thought necessary particularly to describe the construction of the furnace, which may be varied according as circumstances require.

We may now describe the *gas-metre* erected by Mr. Accum at the works in the royal mint. It consists of a hollow wheel or cylinder, made of thin iron plate; revolving upon an horizontal axis, in the manner of a grind-stone; this wheel is enclosed in a cast iron air-tight cask containing water.

The cylinder, or wheel, is composed of two circular channels, 1 and 2, fig. 1 plate II. concentric to each other. The larger or outer channel, 1, is divided into three equal compartments, by partition plates, marked *a*, as shown in the design. The compartments are provided with hydraulic ducts or valves, made at the upper part of every partition plate *a*, *a*, *a*, and by means of them a communication is formed between the larger concentric channel, 1, and the outer case in which the wheel revolves. Similar valves are also placed at the foot of each partition plate, they are seen near the letters *a*, *a*, *a*, and by this means a communication is established, between each compartment or chamber of the larger concentric channel, 1, and the smaller interior circle, 2, of the wheel.

On inspecting the design, it will be seen that the valves are situated in opposite directions to each other; hence there can be no communication either between the inner smaller concentric channel 2, and the larger compartment of the wheel 1, nor between the latter compartment, and the exterior case, in which the wheel revolves, except through the valves *a*, *a*, *a*, which form the communicating ducts. It will be seen also, that these valves are carried from one chamber of the machine into another, but in opposite directions; the entry into one chamber being in the opposite direction to the hydraulic duct, placed in the other chamber. From these particulars the action of the machine will be obvious.

Let us suppose that the outer case, in which the wheel revolves, be filled with water to about an inch above the axis of the wheel, and that gas is conveyed into the interior small channel, by a pipe, passing along the axis, so as to allow the wheel to turn freely round, and that the pipe is turned up at right angles in the inner chamber, and projects a little way above the surface of the water, as shown in the design. The gas then must enter into the interior chamber of the wheel above the surface of the water, and must press against the adjacent partition; it will therefore cause the wheel to turn round, and, in consequence of this motion, the next par-

tion plate will press the gas against the surface of the water, and cause it to pass through the hydraulic opening, in an equal quantity to that which is introduced into the exterior chamber. This alternate filling, and discharging, of the contents of each chamber, will take place once during every revolution of the wheel, and hence the number of times each particular chamber has been filled and emptied of gas may be known. In fact this machine performs the office of three revolving gas-holders, fixed on an horizontal axis, and moving in a cistern, which is the outer case of the machine. One gas-holder, or one compartment of the machine, is always in the act of becoming filled with gas, another is emptying its contents into the outer case, from which it passes into the reservoir, where it is to be stored up, or to the lamps, where it is to be burned, and the third compartment is stationary, or in an equilibrium. The wheel in any situation will therefore always have one of its receiving, and one of its discharging valves open, and consequently it will revolve.

Now to ascertain the quantity of gas discharged by one revolution of the wheel, we need only to know the capacity of the chambers, and add them together. Let us for example suppose, that each chamber contains 576 cubic inches, then one revolution of the wheel discharges a cubic foot of gas. To register the total number of revolutions which the wheel makes in a certain time, a train of wheel-work is connected with the axis of the metre; it consists of a pinion impelling a common train of wheel-work, composed of any number of wheels. The pinion on the axis of one wheel, acts into the circumference of the next wheel, and, the circumference of the wheel being as ten to one, it is obvious while the metre makes 1,000,000 revolutions, if the series consist of six wheels, the last wheel of the series will only have made one revolution. Each axis of the wheels is provided with a finger and dial-plate, divided into ten parts; therefore any number of revolutions may be read off at any time by inspection betwixt 10,000,000 and one. The velocity with which the metre acts, is of course in proportion to the quantity of gas passing through it. Thus suppose there is a burner or gas-lamp connected with the machine, of one foot capacity, lighted, which consumes four cubic feet of gas in an hour, the gas metre performs four revolutions per hour, and so on for every number of burners or lamps, not exceeding the number which the machine is calculated to supply.

The gas-holder, of the original construction, consists of two principal parts; first, of a cistern or reservoir of water, usually constructed of masonry, or of cast-iron plates, bolted and screwed together; and secondly, of an air-tight vessel which is closed at top and open at bottom, inverted with its open end downwards into the cistern of water. This vessel is always made of sheet-iron plates riveted together air-tight, and was suspended by a chain or chains, passing over wheels, supported by a frame work. If the common air be allowed to escape from the inner vessel, when its open end is under the edge of the water in the outer cistern, it will freely descend, and water will occupy the place of the

air; but if the avenue of the escape be stopped, and air be made to pass through the water, the suspended inverted vessel will rise to make room for the air. And, again, if the suspended vessel be counterpoised by a weight, so as to allow it to be a little heavier than the quantity of water which it displaces, it will descend, if the entering gas be withdrawn through an outlet made in the vessel to permit the gas to escape. But if the outlet be stopped, and air again be admitted under the vessel, it will rise again. The apparatus, therefore, is not only a reservoir for storing up the gas introduced into it, but serves to expel the gas which it contains, when required, into the pipes and mains connected with this machine. According to this construction of the apparatus, the interior inverted vessel forms strictly what is termed the gas-holder. It is suspended as already stated in the outer cistern, by a chain or chains, passing over pulleys, supported by blocks and frame work, and to the chain there is affixed a counterpoise balance, of such a relative weight as to allow the gas-holder a slow descent into the water, in order to propel the gas into the mains or vessel destined to receive it, with a very small and uniform weight.

It will be obvious that, when a gas-holder of this construction becomes immersed in the water, it loses as much of its weight as is equal to the bulk of water which it displaces; and hence to render its descent uniform, and to preserve the gas within of an invariable density, at any degree of immersion, a greater counterpoise is required as the gas-holder rises out of the water. Among various methods which have been adopted to attain this object, the ends of the chains by which the gas-holder is suspended, have been fastened in separate grooves, in the edge of a large wheel or pulley, of such a diameter, that the gas-holder rises to its full height before the wheel makes one revolution. In another groove, in the edge of the same wheel, was fixed the end of another chain, to which a balance weight was suspended. This weight was made nearly equal to the weight of the gas-holder. To equalise the density of the gas within the gas-holder, at any degree of immersion of the vessel, the weight chain was made to pass over a wheel, furnished with a spiral groove, so as to make the radii of the wheel change reciprocally with the relative weight of the gas-holder, and consequently to render the pressure of the gas-holder constant and uniform.

Another and more elegant method of obtaining a uniform elasticity of the gas within the gas-holder, and which has been more generally adopted, consists in passing the chain or chains by which the gas-holder is suspended over a pulley or wheels, and making the weight of that portion of the chain which is equal to the depth of the gas-holder, or that part of it which becomes immersed in the water, equal to one-half of the weight of the specific gravity of the gas-holder. It is obvious that, before the purified gas can be admitted into the gas-holder, the vessel must be allowed to descend to the bottom of the exterior cistern, in order to get rid of the common air which it contains. This may be effected rapidly by opening the man-hole at the

top of the gas-holder, to cause the vessei to descend completely into the outer cistern filled with water. The man-hole is then screwed up again air-tight, and the machine is ready to receive the gas. It is obvious that the operation of opening the man-hole, for letting out the common air, requires only to be done once prior to the commencing of the working of the apparatus.

The collapsing gas-holder was contrived by Mr. Clegg, and certainly, of all the contrivances which have been invented for collecting and storing up large quantities of gas, this machine must be pronounced to be by far the most simple, economical, and efficient. The striking advantage of the revolving gas-holder is, that it enables the dimensions of the tank to be very much diminished, where the nature of the ground will not permit of a cistern of great depth being sunk, except at an extraordinary expense; but the still superior feature of the collapsing gas holder which we now come to describe, is, that it may be constructed of any required capacity, and adapted to a tank or cistern of such diminished depth, as scarcely to deserve that name. It requires a sheet of water no more than eighteen inches in height, so that it may be constructed in or upon ground of all descriptions, not only with every possible facility, but at an immense saving of expense.

Fig. 2, plate II. Gas Light, exhibits a perspective view of this gas-holder. It is composed of two quadrangular side plates joined to two end plates meeting together at top in a ridge like the roof of a house. The side and end plates are united together by air-tight hinges, and the joints are covered with leather, to allow the side plates to fold together, and to open in the manner of a portfolio. The bottom edges of the gas-holder are immersed in a shallow cistern of water, to confine the gas. By the opening out or closing up of the sides and ends of the gas-holder, its internal capacity is enlarged or diminished, and this variation of capacity is effected without a deep tank of water to immerse the whole gas holder in, as required in the ordinary construction of rising and falling gas-holders. The collapsing gas-holder requires therefore only a very shallow trough of water to immerse the bottom edges of the gas-holder to prevent the escape of the gas introduced into it. The lower edges of the thin gas holder, which dip in water, are made to move in an horizontal plane or nearly so, when they are opened, so that they dip very little deeper in the water when shut or folded together, than when opened out.

For this purpose the top or ridge joints, which unite the two sides of the gas-holder, are slightly raised up when the sides close or approach together, or slightly depressed when the sides open out or recede from each other. To guide the whole gas-holder in this movement two perpendicular rods rise from the bottom of the shallow tank which pass through sockets in the ridge joints at the upper part of the gas-holder. These sockets are secured by collars of leather round the shafts or rods, to prevent the escape of the gas, and they are braced by chains proceeding from their upper extremities and fastened at the ground on each side of the tank

The weight of the gas-holder is balanced by levers bent in the form of the letter L, and placed in the inside of the gas-holder. These levers move on centre-pins fixed at the bottom of the shallow trough, which pass through the angles of the L levers. The perpendicular arms of the levers are jointed at their upper extremities to the sides of the gas-holder, nearly in the middle. At the ends of the horizontal arms of the L levers, are weights to counterbalance the weights of the gas-holder, and both sides of the gas holder are provided with these kinds of levers, which, at the same time that they balance its weight, cause the ridge joint of the machine to rise and fall, as before described, so that the under edges of the gas-holder, which are immersed in the water to confine the gas, must move in an horizontal plane instead of describing an arc of a circle as they would do if the ridge joint was a fixed centre of motion. When the gas-holder is closed, the perpendicular arms of the levers stand nearly in a perpendicular position; but when the gas-holder is opened out, the levers become inclined. And as they move upon a fixed fulcrum at their lower extremities, and are jointed to the sides of the gas-holder at their upper extremities, they allow the whole of the gas-holder to descend gradually upon the guide rods nearly in the same degree as the lower edges would rise up if the ridge joint was stable, and if the sides described an arc of a circle. It is obvious, however, that the latter movement is not very essential, but it is convenient and necessary to make a very inconsiderable depth of water, in the trough or tank, serve the purpose intended. It may be also observed, that the sides of the collapsing gas-holder may be made to unfold or open on a fixed ridge point as a centre of motion; but it will then require a considerable depth of water in the tank to keep the lower edges of the sides and ends of the machine always beneath the surface of the water, because the sides of the gas-holder then describe an arc of a circle when they are open.

Mr. Malam has contrived an instrument which serves to exhibit upon a dial-plate the quantity of gas which passes through a tube in its progress to the burners. It is represented in fig. 3 plate II., where *a* is the pipe through which the gas passes that is to be measured; *b* an air-tight vessel, like bellows, with the upper flap rising or falling upon a joint or hinge, and constructed of leather or cloth, protected against the chemical action of the gas. From this vessel the gas escapes through the aperture *c*, into the outer case *d d*, and hence through the exit-pipe *e*, to the burners. The aperture *c*, is partially enclosed by the flat plate *f* suspended or swinging upon the rod *g*, and accommodating itself to the descent of the flap. When equal quantities of gas pass along in the direction *a, f, b, c, d, e*, in equal spaces of time, which is generally the case, the quantity of gas will be indicated by the clock movement shown in the upper part of the figure, provided the clock always stops with the supply of gas, and goes again when the supply commences; for effecting which, there is a particular contrivance, which shall be afterwards described. The clock movement in the cylindrical box *l*,

supported and fixed upon legs *m m*, gives motion, to an axle carrying a small eccentric wheel, or crank *n*, in order to raise the lever *o*, which has its fulcrum on the axle of the wheel *q*, and rests upon the periphery of the eccentric wheel. The lever being thus raised, a small spring catch *p*, attached to it, takes into the teeth of the wheel *q*, and, when the lever again descends, the catch drives the wheel round a short way. Another spring *r* holds the wheel as the lever again rises; and, in this manner, by many revolutions of the eccentric wheel *n*, raising and lowering the lever *o*, the wheel *q* is driven entirely round. A pinion upon the axle of *q* works in the wheel *s*, which carries the index round a dial-plate, and thus registers the quantity of gas which has passed uniformly through the aperture *c*. Should the pressure of the gas, however, not be uniform, the flap of the vessel *b* will be raised or depressed accordingly, as indicated by the dotted line. When this happens, the connecting rods *h, i, k*, will raise or depress the lever *o*, so as to make it move through a greater or less arch, and consequently drive forward a greater or less number of the teeth of the wheel *q*. Upon the arm *k* is a stop *t*, which, when the flap of *b* descends and contracts the passage of the gas, will, by the connecting arms, *h, i, k*, be raised so high as to prevent the lever from being acted upon by the eccentric wheel during a part of its revolution; consequently, the arch described by the lever *o* will be smaller, and the progress of *q* and *s* diminished: but when the flap of the vessel *b* is raised, and enlarges the passage for the gas, then the stop *t* will be brought sufficiently low to enable the lever *o* to be acted upon by the periphery of the eccentric wheel during the whole revolution: in consequence of which, the arch described by the lever *o* will be greater, and the progress of the wheels *q* and *s* increased. A nut *v*, having a right and left screw, is employed to adjust the length of the rod *k*. For the purpose of stopping the clock movement, when the supply of gas is stopped, a paul lever *u* rises with the rod *k*, for the purpose of locking the eccentric wheel. In order to stop the passage of gas when the clock movement requires winding up, a pinion upon the axis of the fusee works in the dotted toothed arch *w, w*. The operation of winding up, carries the rack back; but, as the movement goes down, the rack advances, by which a tooth *x*, upon its axle, presses upon the short end of the lever *y*, which it raises, and causes to lift the rod *k*: at the same time making the rod *h* press down the flap of *b*, in order to bring the aperture *c* in contact with the plate *f*, and thus obstruct completely the passage of the gas.

Messrs. J. and P. Taylor are the first persons who have resorted to oil as a substance from which gas for illumination could be easily and cheaply prepared; and, in the construction of a convenient apparatus for the decomposition of this body, they have fully shown its numerous advantages over coal, while they have afforded the means of producing the most pure and brilliant flame from the inferior and cheap oils, which could not be used in lamps. The apparatus for the purpose is much smaller, much

simpler, and yet equally effectual, with the best coal-gas apparatus. The retort is a bent cast-iron tube, which is heated red by a small convenient furnace, and into which oil is allowed to drop by a very ingenious apparatus; the oil is immediately volatilised, and the vapor in traversing the tube becomes perfectly decomposed. A mixture of inflammable gases, which contains a great portion of olefiant gas, passes off; it is washed by being passed through a vessel of water (which dissolves a little sebacic acid, and which seldom requires changing), and is then conducted into the gasometer.

The facility and cleanliness with which gas is prepared from oil, in the above manner, may be conceived from the description of the process. A small furnace is lighted, and a sufficient quantity of the commonest oil is put into a small iron vessel, a cock is turned, and the gas after passing through water in the washing vessel goes into the gasometer. The operation may be stopped by shutting off the oil, or, to a certain extent, hastened by letting it on more freely; the small quantity of charcoal deposited in the retort is drawn out by a small rake, and the water of the washer is very rarely changed.

The gas prepared from oil is very superior in quality to that from coal; it cannot possibly contain sulphureted hydrogen, or any extraneous substance; it gives a much brighter and denser flame; and it is also more effectual, viz. a smaller quantity will supply the burner with fuel. These peculiarities are occasioned, in the first place, by the absence of sulphur from oil, and then by the gas containing more carbon in solution. As the proportion of light given out by the flame of a gaseous compound of carbon and hydrogen is, in common circumstances, in proportion to the quantity of carbon present, it is evident that the gas which contains a greater proportion of olefiant gas, or supercarburated hydrogen than coal gas, will yield a better and brighter light on combustion. It is necessary, in consequence of the abundance of charcoal in solution, to supply the gas when burning with plenty of atmospheric air; for as there is more combustible matter in a certain volume of it than in an equal volume of coal gas, it of necessity, must have more oxygen for its consumption. The consequence is, that less gas must be burnt in a flame of equal size, which will still possess superior brilliancy; that less is necessary for the same purpose of illumination; and that less heat will be occasioned. From five and a half to six cubical feet of coal gas are required to supply an Argand burner for an hour; two cubical feet to two and a half of that from oil, are abundantly sufficient for the same purpose. One important advantage gained by the circumstance, that so small a quantity of this gas is necessary for burners, is, that the gasometer required may be small in proportion. The gasometer is the most bulky part of a gas apparatus, and that least capable of concentration; and wherever it is placed, it occupies room to the exclusion of every thing else. Some very ingenious attempts have been made to diminish its size and weight, as in the double gasometer, and others, but without remarkable success. Here, however, where the

room required to contain the gas is directly diminished, the object is so far obtained; and when that takes place to one-half, or even one-third, it is of very great importance. It in a great number of cases brings the size of the apparatus within what can be allowed in private houses; and, in consequence of the rapidity with which the retort can be worked, the gasometer may again be reduced to a still smaller size. Another advantage gained by the small quantity of gas required for a flame is the proportionate diminution of heat arising from the lights. The quantities of heat and light produced by the combustion of inflammable gases are by no means in the same constant relation to each other: one frequently increases, whilst the other diminishes, and this is eminently the case when coal gas and oil gas are burned against each other. The quantity of heat liberated is, speaking generally, as the quantity of gas consumed, and this is greatest with the coal gas; but the quantity of light is nearly as the quantity of carbon that is well burnt in the flame; and this is greatest in the oil gas.

The very compact state in which the apparatus necessary for the decomposition of oil can be placed, the slight degree of attention required, its certainty of action, its cleanliness, and the numerous applications of which it admits, in the use of its furnace for other convenient or economical purposes, render it not only unobjectionable, but useful in manufactories and establishments; and these favorable circumstances are accompanied, not by an inferiority in the flame, or increased expense, but by an improved state of the first, and saving in the latter.

Messrs. Taylors have shown great ingenuity in the construction of their whole apparatus, but the washer and gasometer deserve particular notice for their remarkable simplicity also. In the washer, two planes are fixed in a box or cistern, in a direction not quite horizontal, but inclined a little in opposite directions; the planes are traversed nearly across by slips of wood or metal, fixed in an inclined position on the under surface, and which alternately touch one side of the cistern, leaving the other open and free. These planes being immersed in water, the gas is thrown in under the lowest ridge; and, by its ascending power, is made to traverse backward and forward along the ridges fixed on the planes, until it escapes at the highest part of the uppermost ridge. Thus, with a pressure of five or six inches of water only, it is made to pass through a distance of fourteen or sixteen feet under the surface of the fluid, and become well washed. The smaller gasometers are made of thin plate iron, and, being placed in a frame of light iron work, look more like ornamental stoves than the bulky appendages to gas apparatus, which they supply. The larger ones are made very light, and, when in pieces, very portable, by being constructed of a frame of wood work, in the edges of which are deep narrow grooves; plates of iron fit into these grooves, which, being caulked in and painted over, make a light and tight apparatus. These are easily put together in any place; and may therefore be introduced into a small apartment, or other confined space,

where a gasometer already made up would not enter.

The general advantages of oil-gas, when contrasted with coal-gas, are as follows:—The material from which it is produced, containing no sulphur, or other matter, by which the gas is contaminated, there are no objections to its use, on account of the suffocating smell, in close rooms. It does no sort of injury to furniture, books, plate, pictures, paint, &c. All the costly and offensive operation of purifying the gas by lime, &c., is totally avoided when it is obtained from oil. Nothing is contained in oil-gas which can possibly injure the metal of which the conveyance pipes are made. The oil-gas, containing no unmixed hydrogen, which occasions the great heat of coal-gas, there is no greater heat in proportion from the flame of oil-gas than from burning oil in lamps, wax-candles, &c.

The apparatus for the production of oil-gas is much less expensive than that necessary to make coal-gas; it occupies much less space; it requires much less labor and skill to manage it; it is not so liable to wear and tear, and not so costly to repair as a coal-gas apparatus; there are no offensive products to remove; and, on its present improved construction, it may be introduced into any dwelling-house without nuisance. The economy of light from oil-gas may be judged of from the following data:—One gallon of common whale-oil will produce about ninety cubic feet of gas, and an Argand burner will require a cubic foot and a half per hour to maintain a perfect light; consequently, a gallon of oil, made into gas, will afford such a light for sixty hours, and the expense, at a moderate price of oil, will be, allowing for coals, labor, &c., not more for one burner than three farthings per hour.

Such a burner will be equal in intensity of light to two Argand oil-lamps, or to ten mould candles. The expense of Argand oil-lamps is usually admitted to be about $1\frac{1}{2}d.$ per hour each. Supposing ten mould candles to be burning, at four to the lb., will be $2\frac{1}{2}$ lbs., costing 2s. 11d., one-tenth part will be consumed in each hour, and the cost of the light is then $3\frac{1}{2}d.$ per hour. If wax-candles be employed, the expense of a quantity of light equal to a gas-burner, for one hour, by the same mode of reckoning allowing a candle to burn ten hours, and taking the price of wax-candles at 4s. 6d. per lb., will cost about 14d.

The account will, therefore, stand thus:—

	d.
Argand burner, oil-gas, per hour	$\frac{3}{4}$
Argand lamps, spermaceti oil . . . 3	3
Mould-candles 3 $\frac{1}{2}$	3 $\frac{1}{2}$
Wax-candles 14	14

In many cases it may be desirable to use a much smaller quantity of light, than such a burner, as the one above calculated upon, might produce; and, instead of the light of ten candles, that of one or more may be given, by using burners of a different description; and the expenditure of gas and the cost will be reduced in proportion.

The oil-gas has a material advantage over coal-gas, from its peculiar richness in olefiant

gas, which renders so small a volume necessary that one cubic foot of oil-gas will be found to go as far as four of coal-gas. This circumstance is of great importance, as it reduces in the same proportion the size of the gasometers which are necessary to contain it; this is not only a great saving of expense in the construction, but is a material convenience where room is limited.

The calculations on the cost of light from oil-gas are taken on the usual price of good whale-oil; but, it is to be observed, that cheaper oils will answer the purpose nearly as well, and many of these are often to be procured; and the whole expense may be materially lessened by their use.

In the course of their first experiments, Messrs. John and Philip Taylor were surprised to find that the apparatus they employed gradually lost its power of decomposing oil, and generating gas. On investigation, they discovered that the metallic retorts, which had originally decomposed oil and produced gas in abundance, ceased in a very great degree to possess this power, although no visible change had taken place in them. The most perfect cleaning of the interior of the retort did not restore the effect, and some alteration appears to be produced on the iron by the action of the oil, at a high temperature.

Fortunately the experiments on this subject led to a most favorable result, for it was found that, by introducing fragments of brick into the retort, a great increase of the decomposing power was obtained, and the apparatus has been much improved by a circumstance, which, at one time, appeared to threaten its success. A small portion of the oil introduced into the retort, still passed off undecomposed; and, being changed into a volatile oil, it carried with it a great portion of caloric, which rendered the construction of the apparatus more difficult than was at first anticipated; but, by the present arrangement of its parts, this difficulty is fully provided for, and the volatilised oil is made to return into the oil-receiver, whence it again passes into the retort; so that a total conversion of the whole into gas is accomplished without trouble, or the escape of any unpleasant smell.

The only residuum in the retort is a small quantity of carbon, and the only products besides the gas are a minute quantity of sebacic and acetic acids, and a portion of water, all which are easily separated by passing the gas through a vessel containing water.

The superiority of the light from oil-gas over other artificial lights, is fully shown by its rendering the delicate shades of yellow and green nearly as distinct as when viewed by solar light.

Mr. De Ville of the Strand, who has made many important experiments and observations on gas illumination, with a view of applying it to light-houses, is inclined to estimate the average produce in gas of a gallon of oil, at eighty cubical feet. A single jet burner, giving the light of two candles and a half, consumes half a cubical foot of gas per hour. A double jet consumes three quarters of a foot to give twice the above light, and a treble jet requires one foot. The light of an Argand burner of coal-gas, com-

pared with one of spermaceti oil, may be estimated as $2\frac{1}{2}$ to 1; and of oil gas to coal gas, as 9 to 5.

A curious fact respecting Argand's burners for gas, is, that those with few holes consume a comparatively larger quantity of gas than those having a greater number:—thus,

A burner with 15 holes consumes	$2\frac{1}{2}$	} cubic feet per hour.
Ditto . . . 12 ditto . . .	$2\frac{1}{4}$	
Ditto . . . 10 ditto . . .	$2\frac{1}{2}$	ditto.

The holes being of the same dimensions in each burner.

Various statements have been given of the illuminating power of oil and coal-gas; nor is this to be wondered at, when we consider that the quality of the gases depends so much on the mode of preparation, and take into account also the defective modes usually adopted for determining the intensity of the light afforded by their combustion. Mr. Ricardo, in his early papers on this subject, has given a very flattering account of oil gas. He states, that an Argand burner, giving a light equal to six candles, six to a pound, consumed one cubic foot per hour; and, as Mr. Accum mentions, that an Argand of coal-gas, giving a light equal to three candles, eight to the pound, consumes two feet in the same time, he has inferred, supposing the candles of the same size, the illuminating power as 4 to 1; but, taking the average of a number of experiments, he has fixed their comparative power of giving light as $3\frac{1}{2}$ to 1.

In these trials, however, the gases were not brought into comparison with each other by burning them together, and the data on which he proceeds seem to be very fallacious, as it is not stated whether the candles were of the same kind in both experiments. Messrs. Taylor and Martineau have, however, come to nearly the same conclusion, that the illuminating power is as $3\frac{1}{2}$ to 1, a conclusion drawn from the experiments of Mr. Brande and Mr. Faraday. A gentleman connected with the Liverpool Gas Company, in the answers to the queries put to him by the committee of the Dundee Company, replies, that the relative quantity of gas requisite to supply the same light, is as 14 oil-gas to 51 coal-gas, making their power of affording light rather more than $3\frac{1}{2}$ to 1. Though the above statements place the illuminating power of oil-gas so high, a very different account is given by others. According to Mr. Neilson, Glasgow, it is not to be rated at above 2, or at all events beyond $2\frac{1}{4}$, to the other as 1; and the same conclusion is drawn from a series of experiments made at Bristol, by Messrs. Herapath and Rootsey, on whose results, Mr. Peckstone has remarked, that every reliance may be placed, as they could not be actuated by party-feeling, but solely by a desire to ascertain the truth. These statements, so very discordant, must arise either from the defective mode of ascertaining the intensity of the light, or from the variable quality of the gas, both of which have had their effect.

The mode usually followed for ascertaining the illuminating power, viz. of producing the

same intensity of shadow, and marking the quantity of the gas consumed in a given time is liable to many objections. It is extremely difficult, for instance, to judge with precision of the depth of shadows; besides, unless each gas is burned under circumstances favorable for producing the greatest light, the conclusion with respect to their power of illumination is not correct. Some of the experiments in which the oil-gas is stated as $3\frac{1}{2}$ to 1, it has been said, were conducted by using burners of equal dimensions for both: now, it is well known that the former requires a smaller one than the latter, otherwise the intensity of the light is not in proportion to the gas consumed, part of it probably escaping combustion. The remark, with respect to the variable quality of the gas, is also of equal force. In a paper published by Mr. Dewey, in the *Annals of Philosophy*, some experiments on the illuminating power of the gases are stated, with a view of 'setting the matter at rest.' This we conceive they have done, as far as can be expected; but we suspect the conclusion to be drawn from them, is very different from that at which Mr. Dewey arrives. The gases were taken from main-pipes running parallel to each other, the coal-gas from the Imperial Gas Works, the other from that at Bow. Being burned so as to afford the same intensity of light, the quantities were found by accurate metres to be (taking the mean of seven trials) as 4850 to 1368, very nearly $3\frac{1}{2}$ to 1. It has been supposed by some, that the specific gravity of coal-gas is a good test of its purity, the lighter it is, the greater being its power of illumination. The experiments of Dr. Henry, and others, however, disprove this; indeed, after the gases are properly purified, the heavier they are, so much the more will be the light afforded by their combustion. The gas used by Mr. Dewey was of specific gravity .406, now this was less than pure carbureted hydrogen, which is .555. In a note to the same paper, the editor remarks, that the results of Mr. Dewey coincide with those obtained by him and Mr. Faraday. The coal-gas they subjected to trial was, in one instance, of specific gravity .429, in another, .406. The oil-gas was .965 and .939, and their illuminating power to the former was as $3\frac{1}{2}$ to 1. As the coal-gas in all of these experiments was of inferior specific gravity to carbureted hydrogen, we may reasonably infer, that they contained a considerable proportion of pure hydrogen, which, it is well known, affords a very feeble light. Dr. Henry has found the gas to vary in specific gravity from .345 to .650, its illuminating power increasing as it approached the maximum. The specific gravity of the coal-gas of Edinburgh, which is allowed by all to be of very superior quality, has been found to be so high as .680. The oil-gas used by Mr. Dewey was .939. Dr. Henry mentions, that in some of his experiments it was .906. Dr. Fyfe found that from the small apparatus of Mr. Milne (Taylor and Martineau's), to be .940, and which is generally allowed to be very fine, so that we take it for granted, that that of Mr. Dewey was of good quality. If then, in these trials, a good oil-gas, pitched against a very inferior coal-gas, is only as $3\frac{1}{2}$ to 1, the illuminat

ing power of the former must be much reduced when brought in competition with the latter when of equally good quality; consequently, it must be far short of that stated by Mr. Dewey.

Dr. Henry, in his paper on the nature of the gases produced by the decomposition of coal and oil, proposes to ascertain their illuminating power by finding the quantity of oxygen necessary for their combustion; for, according to him, the more a gas will consume, the more light it will afford. He has found, that oil and coal gas, produced under different circumstances, take different quantities of oxygen.

	Specific gravity.	Oxygen.
100 volumes of coal-gas of	345	took of 78
Ditto	500	— 166
Ditto	620	— 194
Ditto	630	— 196
Ditto	650	— 217
100 volumes of oil-gas of	464	— 116
Ditto	590	— 178
Ditto	758	— 220
Ditto	906	— 260

From the above tables it would, of course, be inferred, that the illuminating power of oil-gas, No. 4, is the greatest; that of coal-gas, No. 1, the least, these being to each other as 260 to 78; that is, as $3\frac{1}{4}$ to 1. From this, then, it appears, that the best oil-gas is to the worst coal-gas as $3\frac{1}{4}$ to 1; of course a very different conclusion with respect to their illuminating power would be drawn, were we to take an average from the above tables, by which we should diminish the light given out by the former, and increase that from the latter.

The gaseous matter, given off from coal and oil, now known by the name of coal and oil gas, contains nearly the same ingredients, but in different proportions. Dr. Henry has shown, that they are mixtures of hydrogen, carbonic oxide, carbureted hydrogen, and olefiant gas, with occasionally a little nitrogen; and, in addition to these, coal-gas, before it is subjected to the process of purification, always contains ammonia, carbonic acid, and sulphureted hydrogen; but from which it is, or at least ought to be, freed before it is sent into the gas-holder; so that both gases, when exposed for sale, contain the same ingredients, but in different proportions. There is also given off, during the decomposition of coal and oil, an essential oil, which seems to be held in solution, in a state of vapor, in the gas, and which is the cause of the smell, and, as some suppose, adds to the illuminating power.

Dr. Henry, in his paper in the *Annals of Philosophy* for September 1821, has given the component parts of different samples of gas. The coal-gas was prepared from Wigan Canal, at the manufactory of Messrs. Phillips and Lee, and collected from an opening in a pipe between the retort and the tar-pit, generally about half an hour after the commencement of the distillation, except in the instance of the gas No. 4, which was taken five hours, and, No. 5, ten hours from that period; the carbonic acid and sulphureted hydrogen being removed by washing it with solution of potassa.

Gas.	Spec. Grav.	Gas Condensable by Chlorine.
No. 1	650	13 per cent.
2	620	12
3	630	12
4	500	7
5	345	0

After the condensable gas was removed, there remained,

Gas.	Azote.	Carb. Hyd.	Carb. Ox.	Hydrog.	Total.
No. 1	1.5	94.5	4	0	100
2	6	82	2	10	100
3	2	66	14	18	100
4	5	60	12	23	100
5	10	20	10	60	100

In the following table, the oil-gas of the first three experiments was procured from whale-oil, previously boiled, to free it from water, the heat of the retort being in each succeeding experiment reduced till it was just sufficient to decompose it. The fourth gas was from a London work.

Gas.	Sp. Gr.	Lost by Chlorine.
No. 1	464	6 per cent.
2	590	19
3	758	22.5
4	906	38

After this there remained a gas composed of,

Gas.	Azote.	Carb. Hyd.	Carb. Ox.	Hydrog.	Total.
No. 1	7	30	15	48	100
2	5	40	15	40	100
3	5	65	20	10	100
4	5	75	15	5	100

The gas condensed by chlorine is supposed to be partly olefiant, and partly a volatile oil. That not condensed, the above tables show to vary in its composition. In the best specimen of oil-gas, the carbonic oxide is in larger proportion than in the best kinds of coal-gas; and the carbureted hydrogen is most abundant in the latter. The hydrogen in both appears to increase as the temperature at which they are formed becomes higher, and is always greatest in the last proportions.

It has been proposed in Holland to substitute turf for coal, or oil, as a material from which to obtain a gas for illumination. The experiments that have been made promise much success; and the apparatus required may be of far simpler

construction than those used in the distillation of coal. The products do not require that careful and elaborate process of purification which is necessary for the gas from coal. It is said also that the light is better. The light may be better than that from coal-gas badly made, or carelessly used; but it is not likely that, with equal precautions, the first should surpass, or even equal the latter. With reference to the arrangement of the pipes, by which gas is distributed for the purpose of illuminating cities, it may be proper to state that all gas mains laid in public streets should be placed at least eighteen inches below the surface of the ground, to secure them from being disturbed by carriages, or interfering with the paving of the street; they should be placed perfectly firm, so that they may not easily give way. The course of the pipes should be rectilinear, with a dip of about one inch in every ten feet distance.

In all wide streets, where the number of houses on both sides of the streets, to be supplied with gas, is numerous, it is more economical to employ a separate gas main for each side of the street, than to make use of one larger main for both sides; because smaller mains may then be employed, and the collateral branch pipes leading into the houses are shorter; these circumstances amply compensate for the additional main. All branch pipes proceeding from a main should have a dip of about one inch in ten feet, towards the main from which they proceed, so that any fluid that may happen to collect in these pipes must run into the mains. All small wrought-iron branch pipes proceeding from the mains into the houses, or places to be lighted with gas, should be covered with a thick coat of coal tar, before they are laid down into the ground; this may easily be done by heating the pipe, and laying on the boiled tar with a brush.

Every separate length of branch pipe should be tried by condensing the gas in the pipe under water, in order to be certain that it is sound. The junctures of these pipes should be made by dipping the male screw of the pipe into a mixture of white lead and linseed oil, before they are screwed together.

Notwithstanding the usual care which can be taken in proving pipes, before the gas is admitted into them, a slight leakage may be sometimes subsequently detected.

Therefore, before the gas is suffered to enter the mains, they should be again proved, in order to be certain that all the junctures are air-tight. The most convenient manner of proving the mains when laid, is by means of a small portable gas-holder filled with common air, and connected, by means of a small pipe, with the system of the mains, to be tried. This gas-holder should be made to act with a pressure at least four times greater than the pressure which the pipes will have to sustain by the gas they are to convey. If the mains are air-tight, the gas-holder will remain stationary; but, if they are not sound, the gas-holder will descend in proportion to the leak of the mains; the quantity of gas lost may be thus ascertained.

In order to guard against the danger of water entering from the external surface into the pipes,

a reservoir should always be placed at the lowest point, where two or more descending mains meet and form an angle, so as to receive the water that may happen to collect at this angular point, an accumulation of which would cut off the communication between the two pipes: this reservoir is usually called a syphon. It ought to be at least twice the diameter of the bore of the mains, between which it is interposed, and four times that diameter in depth. These reservoirs afford the best indication to show the sound or leaky state of the system of the mains. In all instances, where the pipes are perfectly sound, observation has shown, that half a mile of gas-mains, three inches in the bore, does not deposit more than a quart of water in a year; on the other hand, if the mains are leaky, the water of the reservoir requires to be pumped out, sometimes as frequently as every fortnight; and, during wet weather, much oftener. The loss of gas by such leakage is much greater than is generally imagined. Instances might be mentioned where, in order to keep the common air out of a system of faulty pipes, a constant influx of gas, which a pipe two inches in diameter can supply, has been found necessary, and this, of course, is just so much gas lost to the economy of the establishment.

With regard to the diameter of the mains, no general rule can be given. It must vary according to the number of branch-pipes and lamps which the main has to supply within a given distance,—the angular direction of the mains,—the pressure of the gas-holder,—and, above all, with the relative altitude of the place where the gas-holder is situated, and the place at which the gas is to be supplied, or where the lamps are placed. Indeed, this is one of the most important considerations with regard to the economical distribution of gas-mains; and, by attending to this circumstance, a prodigious saving may be effected.

In order that the pipes for conveying the gas from the mains, and distributing it through the houses or other buildings to be lighted with gas, may, in the first place, not be unnecessarily large, or too small, the following rule may serve as a guide to workmen:—

One gas-lamp, consuming four cubic feet of gas in an hour, if situated twenty feet distance from the main which supplies the gas, requires a tube not less than a quarter of an inch in the bore.

Two lamps, thirty feet distance from the main, require a tube three-eighths of an inch in the bore.

Three lamps, thirty feet distance from the main, require a tube three-eighths of an inch in the bore.

Four lamps, forty feet distance from the main, require a tube half an inch in the bore.

Six lamps, fifty feet distance from the main, require a tube five-eighths of an inch in the bore.

Ten lamps, 100 feet distance from the main, require a tube three-quarters of an inch in the bore.

Fifteen lamps, 130 feet distance from the main, require a tube one inch in the bore.

Twenty lamps, 150 feet distance from the main, require a tube $1\frac{1}{4}$ inch in the bore.

Twenty-five lamps, 180 feet distance from the main, require a tube $1\frac{1}{2}$ of an inch in the bore.

Thirty lamps, 200 feet distance from the main, require a tube $1\frac{3}{4}$ inch in the bore.

Thirty-five lamps, 250 feet distance from the main, require a tube of $1\frac{3}{4}$ of an inch in the bore.

All copper pipes employed to convey gas through the interior of houses, should be of the following weight, with regard to a given length of the pipe:—

BORE OF THE PIPE.		WEIGHT PER FOOT.	
Parts of an Inch.		Ounces.	
$\frac{1}{2}$	3	
$\frac{3}{8}$	5	
$\frac{1}{4}$	6	
$\frac{3}{16}$	8	
$\frac{1}{8}$	10	

Mr. Phipson, of Birmingham, in order to obviate the effects produced by the action of gases on copper or brass pipes, through which they pass, has adopted the plan of lining them with lead. A tube is formed of rolled copper, by drawing it through a plate, and the edges are soldered together, so as to form a safe joint, the superfluous solder is dressed off, and the tube again drawn; a piece of lead-pipe is then drawn through a plate on a mandrill, of the diameter of the tube required, and placed within the copper pipe; then, by passing through it a conical mandrill attached to a rod, the lead-pipe is forced against the inner surface of the copper tube, so as to leave them in perfect contact; or, sometimes a lead-pipe is prepared on a mandrill, of the diameter of the tube required, and a copper-pipe, already soldered, drawn over it; they are then passed both together on a mandrill through a draw-plate, so as to bring the two into complete contact. The lead-pipe is proof against the action of gas, and the copper-pipe, at the same time that it supports and defends it, makes a better appearance.

Four gasometers of 25,000 feet each have been erected on a new principle at Ashton-under-Lyne Gas-Works, and in practice it is found to answer very well; there are four iron pillars at the four points of each gasometer, with an endless chain fixed and made tight round the pillars and gasometer; the latter is attached on one side of the pillars only, by which means it rises and falls as other gasometers. On this principle they are not acted on by the wind, though exposed; and another great advantage is, they are much cheaper than those erected on the old principle.

The great improvements which have taken place, both in the manufacture of gas, and in the methods of applying it for the purposes of illumination, render it extremely probable that it will be much more extensively employed in lighting up private houses. Many persons object to introduce the gas directly into their apartments; and it has accordingly been proposed to bring the gas to the windows, to allow it to burn on the outside, and thus to illuminate the room without any of the annoyances which arise, both

from the smell of the gas, and from the heat generated during its combustion.

In order to do this to the greatest advantage, the gas-pipe should be brought to the sill of the window, and should then have a gas-tight joint by means of which it can be placed either vertically, when it is to be used, or horizontally, when the apparatus is to be removed altogether, or put aside during the day in a press or recess made in the wall to receive it. The lamp which is to protect the gas from wind and rain, should have fronts of glass either hemispherical or semicylindrical, so that no opaque line or bar may interfere with or break the cone of rays which enters the window. The back part of the lamp must be a reflector, of such a surface that it will throw into the apartment all the rays that would otherwise not enter. The direct and reflected light which thus enter apartments, might be rendered uniform, by means of an ornamental blind of the finest muslin (varnished or not as may be found most advantageous); and, if the blind has a landscape upon it, the most luminous portion, or that nearest the gas flame, might be made to have the appearance of the sun in the heavens. In newly built houses, recesses might be constructed, in such a way that the lamp and gas-tube might turn round a joint, and be entirely concealed from view in the day-time.

The advantages of such a method of illumination are great and obvious. Instead of being annoyed by the constant entrance of servants to trim the lamp;—instead of having the furniture destroyed by the spilling of oil, and by the carbonaceous matter necessarily produced either by oil or wax burning within an apartment;—instead of having the temperature of over-heated rooms increased by the heat of the lights;—instead of having the eye injured by the irritation which arises from brilliant flame;—and instead of having the apartment illuminated by a light constantly varying in intensity, we shall avoid all these evils, and have our houses lighted in the very same manner as they are by the light of day. The disadvantages which attend this method are very few. They are prevented from excluding the cold air of winter by shutters and curtains; but in many cases this is an advantage, and, when it is not desirable, the heat on the outside of each window will diminish the currents of cold air which might otherwise be admitted. A greater quantity of light will no doubt be necessary to produce the same degree of illumination; but the cheapness of gas renders such an objection of no weight.

The application of inflammable gas to the purposes of illumination, has hitherto been almost wholly confined to the lighting of large cities, extensive manufactories, and public institutions. The ingenious apparatus invented by J. and P. Taylor, for obtaining gas from oil, has enabled gentlemen of fortune to light their houses with gas at a moderate expense, and without being annoyed by any of the disagreeable products which arise from the distillation of coal. But, notwithstanding this valuable improvement, gas-light has never been rendered generally portable, and the great body of private individuals, and all the lower classes of society, are unable to

derive any advantage from the extraordinary cheapness of this beautiful light.

In order to remove these limitations to the use of gas lights, and to render them available in nearly every case where lamps or candles can be used, Mr. Gordon conceived the idea of condensing a great quantity of gas into a small space, and set himself to construct a lamp in which this condensed gas could be burned with the same facility and security as an ordinary lamp. The body or reservoir of the lamp is commonly made of copper, about one-twentieth of an inch thick, in the form of a sphere or a cylinder with hemispherical ends. This reservoir may be put into a different apartment from that which is to be illuminated, or may be concealed under the table, or, when it is required to be ornamental, it may be put into a statue, or the pedestal of a statue, or may be suspended.

In order to regulate the escape of the condensed gas, Mr. Gordon has employed two different contrivances, which are extremely ingenious. The first of these is a stop-cock, constructed in the following manner :—After the cock has been drilled through, in the usual manner, the circular hole in the key is contracted at one side, by soldering into it two pieces of brass, which join at one side of the hole, and are about one-twentieth of an inch distant at the other side, forming an acute angular aperture. By this means the issue of gas can be regulated to the smallest possible stream, by bringing the acute angle of the opening in the key to communicate with the circular opening in the cock; and, as the expansibility diminishes as the gas is consumed, the aperture can be increased in the same proportion. But to secure the above object more completely, and to prevent the possibility of turning the cock suddenly, so as to admit too great a discharge of gas, a ratchet wheel is fixed in the end of the key of the cock, in which an endless screw works. By turning this screw with the nut, the flame may be enlarged or diminished to any extent, however highly condensed the gas may be.

The second contrivance which Mr. Gordon employs to produce the same effect, is a conical leather-valve, similar to that in the reservoir of an air-gun, placed in the opening of the reservoir of the lamp, where it screws on to the condensing pump. When the reservoir has been charged with gas, and removed from the pump, a brass instrument is screwed in above the valve. Through this piece of brass there passes a finger-screw, the point of which, when made to press on the valve, forces it back, and allows the gas to issue in any quantity that may be required. A bridge of brass, consisting of a hollow tube, in the form of a Gothic arch, passes over the head of this regulating screw, for the purpose of giving freedom to the fingers in turning the screw to regulate the flame, and to conduct the gas to the burner, which, in a standing lamp, is screwed on at the centre of the arch.

By either of these contrivances, the latter of which Mr. Gordon prefers from the simplicity of its construction, the command of the flame is so complete, that it may be reduced to an almost imperceptible quantity.

The forcing-pump by which Mr. Gordon con-

denses the gas is nearly the same as that of the common condensing syringe, having a solid piston worked by a lever, with shears and a guide to produce a vertical motion. As a considerable degree of heat is created during the condensation of the gas, the pump must be kept cool by surrounding it with a case filled with water, and changing the water as soon as it becomes heated.

When it is required to fill a great number of lamps with condensed gas, Mr. Gordon employs the steam engine to work the forcing pump, and the gas should be condensed into a large reservoir, from which the lamps of numerous individuals may be filled at once with the condensed gas. A mercurial gauge, similar to that used for ascertaining the force of condensed air, must be fixed to the large reservoir, for the purpose of enabling any person to see the degree of condensation to which the gas has been brought.

Although, at the first erection of gas works, the public feeling was strongly against them, on account of their supposed danger and offensive nature, this prejudice has gradually worn off. Though the danger of having large collections of gas has been rated at an enormous extent by Sir William Congreve, only one instance of the explosion of a gas-holder has happened; and this occurred in the first filling of one at Manchester, through ignorance, and the carelessness of the workmen. The atmospheric air, not having been extracted, was of course allowed to mix with the coal-gas; and one of the men, wishing to ascertain if the gas-holder was tight, applied a candle to a part, from which gas, mixed with atmospheric air, was issuing, which caused it to explode, and tear the gas-holder in pieces.

A few accidents have occurred, from the escape of gas from the pipes, but these have, in general, been produced by the carelessness of the workmen, and were of a trifling nature; for when the gas does escape, it is only when it gets into some confined place, as a vault, or a common sewer, that it can, on the approach of flame, do any mischief. Shops and apartments of a dwelling house are not close enough to keep the gas confined; but allowing them to be so, the quantity emitted is too trifling, compared to that of the air. Coal gas is most explosive when mixed with about five of air. In a room, then, of twelve feet each way, one burner, consuming five cubic feet per hour, would be sufficient to light it, but, in this apartment, there are 1728 feet, so that, to get an explosive mixture, and allowing there is no loss of gas, the burner must be left open upwards of fifty hours, or at least two days and nights, which is not likely to happen. When more lights are used, the apartments are of course larger, so that the same time would still be required. In those cases, also, in which the burners are left open, the odor of the gas gives warning of its escape; so that one of its properties, considered offensive, actually proves a valuable safe-guard.

GASCOIGNE (George), an English poet of some fame in the reign of queen Elizabeth. He was born in Essex, of an ancient family, and educated at Oxford and Cambridge. Thence he removed to Gray's Inn, but, having a genius too volatile for the law, he travelled, and for some

time served in the army in the Low Countries. He afterwards went to France, where he became enamoured of a Scottish lady, and married her. At length he returned to England, and settled once more in Gray's Inn, where he wrote most of his poems. The latter part of his life he spent in his native village of Walthamstow, where he died in 1578. His plays, first printed separately, were afterwards reprinted with other poems, in 2 vols. 4to. in 1577 and 1587.

GASCOIGNE (Sir William), chief justice of the king's bench under Henry IV., a celebrated judge, who, being insulted, it is said, on the bench by the then prince of Wales, afterwards Henry V., with great coolness and intrepidity committed him to prison. It is not well authenticated that the prince struck Sir William, as represented by Shakspeare; but all authors agree that he interrupted the course of justice to screen a lewd servant. Sir William died in 1413. Several of his remarks and decisions are referred to in the law books.

GASCONADE, *n. s. & v. n.* From the Gascons, a people remarkable for boasting. A boast or bravado: to brag, or swagger.

Was it a *gasconade* to please me, that you said your fortune was increased to one hundred a-year since I left you?
Swift.

GASCONADE, a river of North America, having a southern course into the Missouri, about 100 miles above its confluence with the Mississippi. It can be ascended from its mouth by boats about 100 miles, and is 157 yards wide and twenty feet deep where it enters the Missouri. On its banks are a number of salt-petre caves.

GASCONY, a ci-devant province of France, bounded by Guienne on the north, by Languedoc on the east, by the Pyrenees on the south, and by the Bay of Biscay on the west. It had its name from the Gascons, its ancient inhabitants. After these were subdued by the Franks, they had for some time dukes of their own, who were subject to the duke of Aquitaine; but both were at last dispossessed by the kings of France. It produces corn, wine, fruit, tobacco, hemp, brandy, prunes, &c.; and abundance of fine timber in the department of the Landes. Gascony is watered by the Garonne and Adour, besides smaller streams, and becomes hilly towards the south, the mountains containing mines and warm springs. Bourdeaux and Bayonne are the principal harbours, and the former is one of the best trading ports in France. The principal articles of export are wine, brandy, and vinegar; fruit, wool, linseed, pitch, cork, and wood: marble, iron, and coloring earths of all kinds, are also sent from the neighbourhood of the Pyrenees. Since the revolution Gascony forms the departments of the Upper Pyrenees, the Gers, the Landes, and part of those of the Lower Pyrenees, the Upper Garonne, and the Lot and Garonne. It is ascertained to have a territorial extent of 11,000 square miles.

GASH, *v. a. & n. s.* Fr. *hacher*; to cut; Belg. *gihash*. To make a wide and open wound; the wound so made.

He glancing on his helmet, made a large
And open *gash* therein; were not his targe,

That broke the violence of his intent,
The weary soul from thence it would discharge.

Spenser.

A perilous *gash*, a very limb lopt off.

Shakspeare.

Hamilton drove Newton almost to the end of the lists: But Newton on a sudden gave him such a *gash* on the leg, that therewith he fell to the ground.

Hayward.

Where the Englishmen at arms had been defeated, many of their horses were found grievously *gashed* or gored to death.

Id.

But the ethereal substance closed,
Not long divisible; and from the *gash*

A stream of nectareous humour issuing flowed.

Milton.

Streaming with blood, all over *gashed* with wounds,
He reeled, he groaned, and at the altar fell.

Philips.

See me *gashed* with knives,
Or seared with burning steel.

Rowe's Royal Conv.

I was fond of back-sword and cudgel play, and I now bear in my body many a black and blue *gash* and scar.

Arbutnot.

GAS'KINS. See GALLIGASKINS.

GASP, *n. s. & v. n.* Goth. *geisfd*; Dan. *gispe*, to sob; or probably from Sax. *geapan*, to yawn. To open the mouth wide for inspiration whether convulsively or not; to breathe with difficulty; to desire anxiously; but this use is hardly to be justified, as not being analogous to nature.

His fortunes all lie speechless, and his name
Is at last *gasp*. *Shakspeare. Cymbeline.*

Ah, Warwick, Montague hath breathed his last;

And to the latest *gasp* cried out for Warwick.

Shakspeare.

The rich countrymen in Austria were faint and *gasping* for breath.

Brown's Travels.

The sick for air before the portal *gasp*.

Dryden.

They raised a feeble cry with trembling notes;
But the weak voice deceived their *gasping* throats.

Id.

The *gasping* head flies off; a purple flood
Flows from the trunk. *Dryden's Æneid.*

The ladies *gasped*, and scarcely could respire;
The breath they drew no longer air, but fire. *Dryden.*

A scantling of wit lay *gasping* for life, and groaning
beneath a heap of rubbish. *Id.*

I lay me down to *gasp* my latest breath;
The wolves will get a breakfast by my death. *Id.*
He staggers round, his eyeballs roll in death,
And with short sobs he *gasps* away his breath.

Id. Æneid.

Pale and faint,
He *gasps* for breath; and, as his life flows from him,
Demands to see his friends. *Addison's Cato.*

If in the dreadful hour of death,

If at the latest *gasp* of breath,

When the cold damp bedews your brow,

You hope for mercy, shew it now. *Addison.*

The Castilian and his wife had the comfort to be under the same master, who, seeing how dearly they loved one another, and *gasped* after their liberty, demanded a most exorbitant price for their ransom.

Id. Spectator.

He now with pleasure views his *gasping* prize,
Gnash his sharp teeth and roll his blood-shot eyes.

Gay.

Parting day
Dies like the Dolphin, whom each pang imbues
With a new colour as it *gasps* away.

Byron. Child Harold.

GASPAR STRAIT AND ISLAND, a passage and island in the Eastern seas, between the east coast of the island of Banca, and the west coast of the island of Billiton. The island is high and conspicuous, about five miles long; and the strait, about fourteen leagues broad, is divided into two arms, and connects the China and Java seas.

GASPE, a district and county of Lower Canada, North America, on the south side of the St. Lawrence, which lies between 64° and 66° $30'$ W. long., and between 47° $20'$ and 49° $10'$ N. lat. It is bounded on the west by the district of Quebec, on the east and north-east by the river and gulf of St. Lawrence, and on the south by the province of New Brunswick and the bay of Chaleurs. It sends one member to the provincial parliament; and is divided into two parts by a ridge of mountains, which run north-east. The tract on the northern declivity of these mountains to the St. Lawrence is rough and barren; being almost covered with impenetrable forests. The south-east side of the ridge is also uneven and rugged in many parts. In 1808 the population amounted to 3200, and between 300 and 400 fishermen. New Carlisle is the principal town.

GASPE, a bay of the above district, in the gulf of St. Lawrence, between Cape Gaspe and Whale Head. It runs about sixteen miles into the land, and is about five miles broad. Two other inlets, called the north-west and south-west arms, penetrate from the end of it a considerable way into the interior, and receive the waters of numerous streams from the mountains. This bay is deep and well sheltered; capable of affording protection to a large number of ships. The shores are lofty.

GASPE is also the name of a cape on the coast of Canada, in the gulf of St. Lawrence. Long. 64° $10'$ W., lat 48° $35'$ N.

GASSENDI (Peter), a celebrated philosopher of France, was born at Chantersier in Provence, in 1592. His parents sent him to school at Digne, where he soon made such extraordinary progress in learning, that some persons, who had seen specimens of his genius, removed him to Aix, to study philosophy under Fesay, a learned minor friar. He was afterwards invited to be professor of rhetoric at Digne, before he was quite sixteen years of age; and he had been engaged in that office but three years when, Fesay dying, he was made professor in his room at Aix. There he composed his *Paradoxical Exercitations*; which coming to the hands of Nicholas Peiresc, Gassendi was first made canon of the church of Digne and D. D., and then obtained the rectorship of the church. Gassendi's fondness for astronomy increased with his years; and, his reputation daily increasing, he was, in 1645, appointed royal professor of mathematics at Paris. This institution being chiefly designed for astronomy, he read lectures on that science to crowded audiences. He, however, did not hold this place long; for a dangerous cough, and inflammation of the lungs, obliged him, in 1647, to return to Digne for the benefit of his native air. Gassendi combated the metaphysics of Descartes; and divided with that great man the philosophers of his time, almost all of whom were Car-

tesians or Gassendians. He left nine volumes of his philosophical works. 1. Three on Epicurus's Philosophy, and six which contained his own. 2. *Astronomical Works*. 3. *The Lives of Nicholas de Peiresc, Epicurus, Copernicus, Tycho Brahe, Puerbachius, and Regiomontanus*. 4. *Epistles, and other treatises*. All his works were collected together, and printed at Lyons, in 1653, in 6 vols. folio. He died at Paris, in 1655, aged sixty-three.

GASSICOURT (Charles Louis Cadet de) a modern French philosopher, and advocate, who had the singular good fortune to survive the whole of the revolution, was the son of an apothecary of Paris. M. Gassicourt first attracted notice by a pamphlet, published in 1797, on the *Theory of Elections*. Then followed other essays on political and miscellaneous subjects, among which was one *On the Private Life of Mirabeau*; *St. Geran, a Critique on the New Modes of Thinking, Writing, and Speaking*, introduced into France by the *Changes of the Times*; and others on the *Influence of the Masonic Societies in the Process of the Revolution*; and the *Four Ages of the National Guard*. About the same period appeared a volume of *Travels in Normandy*, and a *Dramatic Sketch*, portraying the principal characters who flourished under Louis XIV. and his successor, entitled *The Supper of Moliere*. On the death of his father, himself a man of scientific pursuits and the personal friend of Buffon, Lalande, and Condorcet, he seems to have diverted his attention from politics to the study of chemistry and physics. He edited his father's treatise on *Domestic Pharmacy*, and a *Formulary* on the same subject; and gave the world a *New Dictionary of Chemistry*, afterwards introduced into the Polytechnic school. This book appeared first in 1803. He followed the French army into Austria in 1809, and subsequently wrote an account of the Campaign, during which he invented a military instrument called *les baquettes*. The modern plan for the organisation of the French board of health owes its origin to him, and he had not only the satisfaction of seeing it eagerly adopted, but that of obtaining the appointment of Reporting Secretary. In this capacity he continued till his death, which took place at Paris in the summer of 1823. Besides the productions enumerated, Gassicourt was the author of a series of epistles on London and the English Nation; and a treatise on the application of the Physical Science to Military Purposes. He was also a material contributor to a variety of useful and scientific publications; and assisted in founding the Lyceum, afterwards the Athenæum, at Paris.

GAST, Sax. *gæst*. Vide *aghest*. To terrify.

When he saw my best alarmed spirits
Bold in the quarrel's right, roused to the encounter,
Or whether *gasted* by the noise I made,
I'll suddenly he fled.

Shakspeare. King Lear.

GASTEROSTEUS, the stickleback, in ichthyology, a genus of fishes belonging to the order of thoracici. There are three rays in the membrane of the gills: the body is carinated; and there are some distinct prickles before the back fin. There are thirteen species, distinguished by the number of prickles on the back. One of these,

G. aculeatus, stickleback, banstiele, or sharp-ling, is common in many of the British rivers. In the fens of Lincolnshire, and some rivers that proceed from them, they are found in prodigious quantities. At Spalding, once in seven or eight years, amazing shoals appear in the Welland, and come up the river in form of a vast column. They are supposed to be the multitudes that have been washed out of the fens by the floods of several years, and collected in some deep place, till, overcharged with numbers, they are periodically obliged to attempt a change of place. The quantity is so great that they are used to manure the land, and trials have been made to get oil from them. An idea may be conceived of this vast shoal, by being told that a man, having been employed by a farmer to take them, once obtained for a considerable time 4s. a day, by selling them for a halfpenny per bushel. This species is seldom two inches long: it has three sharp spines upon the back, that can be raised or depressed at pleasure. The color of the back and sides is an olive green; the belly white; but in some the lower jaws and belly are of a bright crimson.

GASTRELL (Francis), bishop of Chester, was born in 1662, appointed preacher to the society of Lincoln's Inn in 1694, and made bishop of Chester in 1714. He preached a course of sermons for Boyle's lectures; engaged in the Trinitarian controversy with Mr. Collins and Dr. Clarke; and published two popular pieces entitled *Christian Institutes*, and *A Moral Proof of a Future State*. He also vindicated the rights of the university of Oxford against the archbishop of Canterbury, in the appointment of the warden of Manchester College; and opposed the violent proceedings against bishop Atterbury in the house of lords, though he disliked the bishop's principles. He died in 1725.

GASTRIC, *adj.* } The root of all these
GASTROGRAPHIA, *n. s.* } words is the Gr. γαστήρ,
GASTROTOMY, *n. s.* } the belly. It is used
GASTROSTOMY, *n. s.* } in composition with
 παττω, to sow up; τέμνω, to cut, and νομος, a law or rule, and in these cases refers to sewing wounds, making incisions, or laying down laws in reference to the stomach or belly.

The *gastric* juice of an owl, falcon, or kite, will not touch grain. *Paley's Theology.*

GASTRIC JUICE, a thin pellucid liquor, which distils from certain glands in the stomach, for the dilution, &c., of the food.

It is soluble in water, has a slight saline taste, and is quite limpid. Its peculiar property is that of dissolving the food in the stomach into a milky liquid called chyle. After death this solvent power even acts upon the stomach itself. By evaporation it is reduced to a dry mass, which gives out in destructive distillation ammonia and empyreumatic oil, leaving carbonaceous matter, which contains muriate of soda and other neutral salts.

GASTROMANCY, **GASTROMANTIA**, from γαστήρ, the belly, and μαντεία, divination, a kind of divination practised among the ancients, by means of words coming, or seeming to come, out of the belly. There is another kind of *gastromancy*, which is performed by means of glasses,

or other round transparent vessels, within which certain figures appear by magic art. It is thus called, because the figure appears as in the belly of the vessels.

GASTUNI, a town of Greece, in the Morea, over against the island of Zante. It has a castle on the Ighaceo, and contains 3000 inhabitants, who cultivate the vine, cotton, and silk, with great industry. The environs are very fertile. About six miles to the east are found the ruins of the ancient Elis. Twelve miles east of Chianzenza.

GAT, the preterite of *get*.

Moses *gat* him up into the mount.

Ex. xxiv. 13.

GAT, **EAST**, a channel W. N. W. of the island of Walcheren, Netherlands, between the Caloot Sand and the Querns Flat. It has from four to five fathoms water.

GATA, **CAPE**, a promontory on the coast of Granada, Spain, forming the eastern limit of the bay of Almeria, and consisting of a mass of rocks, twenty-four miles in circuit, and thirteen in breadth. In the centre of this promontory there are four hills, called the Sacristan, the Two Friars, the Captain, and the White Mountain; and, about fifty paces from the beach, a rocky mass 200 feet high, crystallised in pieces that have four or five plates chased one within another. They are of the color of ashes, from eight to fourteen inches long, with a large grain that takes a good polish. The other side of the promontory, is called El Puerto de la Plata. Long 2° 22' W., lat. 36° 43' N.

GATAKER (Thomas), a learned critic and divine, born in London, in 1574. He studied at St. John's College, Cambridge, and was afterwards chosen preacher at Lincoln's Inn; which he quitted, in 1611, for the rectory of Rotherhithe. In 1620 he made a tour through the Low Countries; and, in 1624, published in London a work, entitled *Transubstantiation declared by the confession of the Popish Writers to have no necessary foundation in God's Word*. He wrote also a defence of this discourse. In 1642 he was appointed one of the assembly of divines, and was engaged with them in writing annotations upon the Bible. He died in July, 1654, in the eightieth year of his age. He published also, 1. *A Dissertation upon the Style of the New Testament*. 2. *De Nomine Tetragrammata*. 3. *De Diphthongis, sive Bivocalibus*. 4. *An Edition and Translation of Marcus Antoninus's Meditations*. 5. *A Collection of Sermons, in folio; and many other works.*

GATE, *n. s.* } Gate and way; Sax. *geat*.

GATEWAY, *n. s.* } A frame of timber or other material upon hinges giving access to a city, castle, dwelling or field: also an avenue or opening itself.

That other *gate* was kept by Shame,
 Whiche opened, as it was couthe
 Towards the parté of the southe.

Chaucer. Romaunt of the Rose.

She then the cities sought from *gate* to *gate*,
 And everie one did aske, did he him see.

Spenser. Faerie Queene.

Auria had done nothing but wisely and politically,
 in settling the Venetians together by the ears with the
 Turks, and opening a *gate* for a long war. *Kneller.*

Knowest thou the way to Dover ?

—Both stile and *gate*, horseway, and footpath.

Shakspeare.

Open the *gate* of mercy, gracious God !

My soul flies through these wounds to seek thee. *Id.*

Gateways between inclosures are so miry, that they cannot cart between one field and another.

Mortimer's Husbandry.

He feeds yon almshouse, neat but void of state,

Where age and want sit smiling at the *gate*. *Pope.*

GATES, in agriculture, are the convenient moveable parts of fences, generally formed of timber or iron, which are designed to give the freest inlet or outlet to enclosures, and at the same time to keep in cattle and admit of being securely closed

The great object is generally said to be to combine strength with lightness in their construction. The common sort are constructed of timber, and, whatever kind may be used, it is essential that it be well seasoned, as without attention in this respect they are soon warped in their structure by the heat of the sun : they should also be well and correctly put together. Oak is undoubtedly the best sort of wood for the purpose, where durability is the object ; though some of the lighter kind of woods, as deal, willow, &c., will often last a great length of time, and from their lightness they are not so apt to destroy themselves. The lighter gates are made towards the head or opening part, the better, provided they be sufficiently strong for the purpose they are to serve ; and, on this account, the top bars may in many cases, as where horses are to be kept, be left considerably stronger than the others. If this be not done, they are liable to be broken by the animals rubbing their necks upon them, except where they are made very high. Gates are generally made eight and a half or nine feet in width, and from five to six feet in height ; the bars being three or four feet broad, and five or six in number. To prevent small animals getting through, a smaller bar is sometimes introduced between the two lowermost ones. At the ordinary prices of wrought iron and oak, the former will be found of doubtful economy, and cast iron gates are too heavy, and too liable to be broken, for agricultural purposes, but they are frequently used for ornamental gates, to divide pastures.

The posts to which gates are attached should, in all convenient cases, says Mr. Loudon, be formed of stone ; as this material, when hewn and properly constructed, will last for ages. When formed of wood, oak or larch are the best sorts. The latter, where suitable, should be used without removing the bark, which has been found to add greatly to their durability. In some places it is customary to plant trees for gate-posts, and, after they have attained a certain size and thickness, to cut them over about ten feet above the surface : where the trees thrive, they form the most durable of all gate-posts ; in many instances, however, they misgive, and much trouble is necessary to repair the defect. Where the posts are made of dead timber, they should always be strong, and the wood well prepared ; that part which is let into the earth should also be defended, by dipping it in coarse oil, or giving it a coat of pyroligneous liquor ;

and all that is above ground exposed to the action of the weather should be well covered with one or two good coats of oil-paint. The expense of this preparation is but trifling, while the benefit is very great.

According to Parker, the substance of a gate-post should be from eight to ten inches square, or, for very heavy gates, a foot square would not be too large. If made of still larger size it is better. And he says, that the steadiness of a gate-post depends, in a great measure, upon the depth to which it is set in the ground, which ought to be nearly equal to the height of it. Five or six feet is, in general, fully sufficient. But the posts may be kept in their places by a strong frame-work placed under the ground, extending between the posts.

The common slip-bar gate is, perhaps, the most durable of any, especially where the gate-posts are of stone, with proper openings for the reception of the bars. The only objection is the trouble of opening and shutting this gate ; which, when servants or others are passing through it in a hurry, occasions its being frequently left open. In other respects it is preferable to every other description of gate, says the above writer, both in the original cost and greater durability. It is to be noticed, however, that upon the verge of a farm or estate, especially where it is bounded by a high road, the slip-bar gate will not answer, as it does not admit of being locked, or secured in the same way as other gates. But the chained slip-bar gate, though more expensive, is not liable to this objection. Here the bars are connected by a chain down the middle of the gate, and therefore, if one bar is padlocked to the post, none of them can be moved till that one is unlocked.

Parker's compensation-hinge for gates is much in use, and forms an excellent corrective to their falling ; all that is necessary when the gate sinks at the head is to screw it up by the nut *n*, till it regains its original position.

A gate should have one fall to the hanging post to make it catch, and another to a point at a right angle with the gateway, so as to keep it open. To effect this, having set the post perpendicular, let a plumb-line be drawn upon it: on this line, at a proper height, place the hook, so that it may project three inches and a half from the face of the post; and at a convenient distance below this place the lower hook an inch and a half to one side of the perpendicular line, and projecting two inches from the face of the post; then place the top loop, or eye, two inches from the face of the hanging stile, and the bottom loop three inches and a half. A gate thus hung will have a tendency to shut in every position; because if the weight of the gate be represented by a diagonal line from the heel to the head, this, by the resolution of forces, is resolvable into other two lines, one perpendicular, and the other horizontal; the former representing that part of the weight which presses in a perpendicular position, and the latter that part of the weight which presses in a horizontal direction, and gives the gate a tendency to shut.

The fastenings of gates, it is observed by Parker, are as various as the blacksmiths who construct them the subject occupied his attention in connexion with the hanging of gates, and he has introduced various improvements. One of the most secure is a spring latch *a*, opened by a lever *b*, which works in a groove of the upper bar of the gate, and therefore cannot be rubbed open by cattle; while, by means of a knob at the end of the lever, and rising up against the top of the upright bar *c*, so that cattle cannot touch it, it is very easily opened by persons on horseback with or without a stick or whip.

A cheap, simple, and effective spring-latch consists of a bolt which is loose, and plays freely in two mortised openings in the upright bars, and is kept in place by a spring. The gate may be shut from either side, when the bar, striking against the projection on the falling post is pushed back, till, arriving at the mortise, the spring forces it in, and the gate is shut securely. Such a gate is easily opened by a rider. This is a good latch for the common field-gates of a farm.

Double, or folding gates, are sometimes considered to be much more durable than those of the swing kind; because the bars, being only half the length, render the joints of the gate not so liable to be broken, or the hinges to be so much strained. On the other hand, such gates require more opening and shutting, and the latter operation is troublesome to perform, when both halves have fallen at all from the perpendicular. These gates are not, therefore, in such general use in agriculture, as the swing kind; but are common only as gates to parks, &c.

Clarke's window-sash gate is the last invention we shall notice. It is suspended by two weights, and opens and shuts exactly on the principle of a window-sash. The weights may be of stone or cast iron; the pulleys are of iron, and nine inches diameter. It was applied in the first instance to a cattle-court; but has since been erected in different situations. Its advantages the inventor states to be the following:—It is easy to open *b*, or shut *a*; remains in whatever situation it is placed; is not liable to be beaten to pieces by the action of the wind; shuts always perfectly close, whatever be the height of the straw or dung in the court or gateway; a cart may be driven quite close on either side before opening; is perfectly out of the way when fully open, and not liable to shut on what is passing; the gate bottom not liable to decay by being immersed in the dung, as is commonly the case with cattle court-gates; not liable to go out of order; may be erected in a hollow place, where a swinging-gate could not open either outwardly or inwardly; and is likely to be more durable than ordinary gates. See diagram.

GATES, in a military sense, are made of strong planks, with iron bars, to oppose an enemy. They are generally made in the middle of the curtain, whence they are seen and defended by the two flanks of the bastions. They should be covered with a good ravelin, that they may not be seen or enfiladed by the enemy. These gates, belonging to a fortified place, are passages through the rampart, which may be shut and opened by means of doors and a portcullis. They are either private or public.

Private Gates are those passages by which

the troops can go out of the town unseen by the enemy, when they pass to and from the relief of the duty in the outworks, or on any other occasion which is to be concealed from the besiegers.

Public Gates are those passages, through the middle of such curtains, to which the great roads of public ways lead. The dimensions of these are usually about thirteen or fourteen feet high, and nine or ten feet wide, continued through the rampart, with proper recesses for foot passengers to stand in, out of the way of wheel carriages.

GATESHEAD, a town of Durham, separated from Newcastle, by the Tyne; over which there is a fine stone bridge, which formerly had an iron gate in the middle, with the arms of Durham on one side, and those of Newcastle on the other; being the boundary between the bishopric and Northumberland. It is a borough by prescription, but not privileged to send members to parliament. Here are considerable manufactories of cast and wrought iron, whiting, &c. The church is a fine building, with a very high tower; and in the church-yard are several ancient monuments. There are few traces left of its ancient monastery, except a stone gateway, of rather a modern erection. The house covered two acres and a half of land. Here is a free school for grammar, arithmetic, and navigation. Gateshead Fell, a bleak and elevated ridge, extending southward from the town, is famous for its grindstone quarries, whence the Newcastle stones are exported to all parts of the world. The view of Newcastle and the Tyne from the hill on the north of the Hexham road is uncommonly grand. Gateshead is thirteen miles north-east of Durham.

GATEVEIN, *n. s.* Gate and vein. The vein otherwise called *vena porta*.

Being a king that loved wealth, he could not endure to have trade sick, nor any obstruction to continue in the *gatevein* which disperseth that blood.

Bacon's Henry VII.

GATH, or **GETH**, in ancient geography, a city of the Philistines, and one of their five satrapies. It is famous for having given birth to Goliath. David made a conquest of it, and it continued subject to his successors, till the declension of the kingdom of Judah. Rehoboam rebuilt and fortified it; king Uzziah retook it, and Hezekiah once more reduced it under his subjection. Some authors, among whom is F. Calmet, have committed an egregious mistake in making Gath the most southern, and Ekron the most northern, of the Philistine cities; as if these had been the two boundaries of their dominions, whereas they are not above five miles asunder; and Gaza is the last of the five satrapies south. Josephus expresses himself plainly enough, when he says, that Hezekiah took all the Philistine cities from Gaza to Gath; there being many more cities of that name, which signifies in the Hebrew a wine-press. Several more of the name of Geth or Gath are mentioned in Eusebius and St. Jerome, whose situation, according to them, plainly shows them to have been different places from this, and from each other; besides those which had an adjunct to distinguish them. This city recovered its liberty and lustre in the time of the prophets Amos and Micah, but was afterwards demolished by Hazael, king of Syria; since which it became of but little consideration till the time of the crusades, when Fulk king of Jerusalem built a castle on its ruins. It was thirty-two miles west of Jerusalem.

GATHERER, *v. a., v. n., & n. s.* } Saxon,
GATHERER, *n. s.* } *gaderan*.
GATHERING, *n. s.* } According
to some authors contracted from get here; but the Belgic has *gaderen*, *gader*; Teut. *gaderen*; and the Scotch, *gader*, of the same signification; and more probably compounded as the Goth. *gadra*, of *gacidra*, go and with. To collect, and form

into a whole, as an act of necessity or convenience; and, according to this definition, applicable to objects and subjects, as thus separately illustrated: persons who are thus occupied.

Gather stones—and they took stones and made an heap. *Genesis.*

The seventh year we shall not sow, nor *gather* in our increase. *Lev. xxv. 20.*

Let every one lay by him in store, that there be no *gathering* when I come. *1 Cor. xvi. 2.*

The luckless lucky maid
A long time with that savage people staid,
To *gather* breath in many miseries. *Spenser.*

It soones he 'gan to *gather* up around
His weapons, which lay scattered all abroad,
And as it fell his steed he ready found,
On whom remounting, fiercely forth he rode
Like sparkes of fire that from the anvile glode.

Spenser's Faerie Queene.

That which, out of the law of reason or of God,
men probably *gathering* to be expedient, they make it law. *Hooke.*

His opinions

Have satisfied the king for his divorce,
Gathered from all the famous colleges. *Shakspeare*

The reason that I *gather* he is mad,
Is a mad tale he told to day at dinner,
Of his own door being shut against his entrance.

Id.

All the way we went there were *gathered* some people on both sides, standing in a row. *Bacon.*

Their snow-ball did not *gather* as it went; for the people came in to them. *Id. Henry VII.*

I will spend this preface about those from whom I have *gathered* my knowledge; for I am but a *gatherer* and disposer of other men's stuff. *Wotton.*

Nor in that land

Do poisonous herbs deceive the *gatherer's* hand.

May's Virgil.

And if the night

Have *gathered* aught of evil, or concealed,
Disperse it, as now light dispels the dark. *Milton.*

Returned

By night, and listening where the hapless pair
Sat in their sad discourse, and various plaint,
Thence *gathered* his own doom. *Milton's Paradise Lost.*
Mademoiselle de Scudery, who is as old as Sibyl,
is translating Chaucer into French: from which I
gather that he has formerly been translated into the
old Provencal. *Dryden.*

When the rival winds their quarrel try,
South, East, and West, on airy coursers born,
The whirlwind *gathers*, and the woods are torn. *Id.*

He *gathers* ground upon her in the chace;
Now breathes upon her hair with nearer pace. *Id.*

What have I done?

To see my youth, my beauty, and my love
No sooner gained, but slighted and betrayed;
And like a rose just *gathered* from the stalk,
But only smelt, and cheaply thrown aside,
To wither on the ground! *Id. Spanish Fryar.*

To pay the creditor, that lent him his rent, he must
gather up money by degrees. *Locke.*

Think on the storm that *gathers* o'er your head,
And threatens every hour to burst upon it. *Addison.*

Immortal Tully shone,

The Roman rostra decked the consul's throne;
Gathering his flowing robe he seemed to stand,
In act to speak, and graceful stretched his hand.

Pope.

And *gathering* loiterers on the land discern,
Her boat descending from the latticed stern.

Byron. Corsair.

GATINOIS, or **GASTINOIS**, a ci-devant province of France, forty-five miles long and thirty

broad. In the eleventh century it had counts of its own, but was afterwards joined to Anjou. It was next divided into Gatinois, Orléanois, and François; and now forms part of the departments of the Seine and Marne, Seine and Oise, and Loiret. This district has been long celebrated for its saffron.

GATTEN-TREE, *n. s.* A species of Cornelian cherry.

GATTON, a small borough of Surrey, nineteen miles from London, on the side of a hill on the road to Ryegate. It is supposed to have been known to the Romans, from their coins and other antiquities found here. It is a borough by prescription; and has sent members to parliament ever since the 29th of Henry VI. It was formerly a large town. The members are returned by its constable, who is annually chosen at the lord of the manor's court.

GAUBIL (Anthony), a French author, born at Caillae in 1708. He was sent a missionary to China, and acted as interpreter at the court of Peking. He published a history of Jengis Khan, and a translation of the Chou King. He died in 1759.

GAUBIUS (Hieronymus David), a celebrated physician of Holland. He studied under the illustrious Boerhaave; and became so much his favorite, that he resigned the chemical chair in his favor. He taught at Leyden with great applause for forty years. His reputation was extended all over Europe by several valuable publications, particularly by his *Institutiones Pathologiæ Medicinalis*, and his *Adversaria*, which contributed not a little to the improvement of medicine. He died at Leyden, Nov. 20th, aged seventy-six.

GAUDE, *n. s. & v. a.* } Lat. *gaudere*, to be
GAT'DERY, *n. s.* } glad.—Minsheu. Ex-
GAT'DILY, *adv.* } pressive of what gives
GAT'DY, *adj. & n. s.* } pleasure; whether to
GAT'DINESS, *n. s.* } the eye, as splendid
colors; to the taste, as a luxurious feast; or to
the heart, as good news, &c.: of the pleasure it-
self, or the agents and mode of its communica-
tion.

By this *gaude*, have I wonnen, yere hy yere
An hundred mark, sin I was Pardonere.

Chaucer. *The Pardoner's Tale.*

Of smale corall, aboute hire arm, she bare
A pair of bedes *gauded* all with grene.

Id. *Prologue to Canterbury Tales.*

He stole the' impression of her fantasy,
With bracelets of thy hair, rings, *gaudes*, conceits,
Knacks, trifles, nosegays, sweetmeats. *Shakspeare.*

The sun is in the heaven, and the proud day,
Attended with the pleasures of the world,
Is all too wanton, and too full of *gaudes*,
To give me audience. *Id. King Lear.*

My love to Hermaia
Is melted as the snow; seems to me now
As the remembrance of an idle *gaude*,
Which in my childhood I did doat upon. *Shakspeare.*

Costly thy habit as thy purse can buy,
But not exprest in fancy; rich, not *gaudy*,
For the apparel oft proclaims the man. *Id.*

Go to a gossip's feast, and *gaude* with me,
After so long grief such nativity. *Id.*

Fancies fond with *gaudy* shapes possess,
As thick and numberless
As the gay motes that people the sun-beams. *Milton.*

A gold-finch there I saw, with *gaudy* pride
Of painted plumes, that hopped from side to side.

Dryden.

A plain suit, since we can make but one,
Is better than to be by tarnished *gaudy* known. *Id.*

Some bound for Guiney, golden sand to find,
Bore all the *gaudes* the simple natives wear;
Some for the pride of Turkish courts designed,
For folded turbants finest Holland bear. *Id.*

Age, which is but one remove from death, and
should have nothing about us but what looks like a
decent preparation for it, scarce ever appears, of late,
but in the high mode, the flaunting garb, and utmost
gaudery of youth, with clothes as ridiculously, and as
much in the fashion, as the person that wears them
is usually grown out of it. *South.*

He may surely be content with a fast-to-day, that
is sure of a *gaudy* to-morrow. *Cheyne.*

A man who walks directly to his journey's end will
arrive thither much sooner than he who wanders
aside to gaze at every thing, or to gather every *gaudy*
flower. *Watts.*

In costly sheen and *gaudy* cloak arrayed,
But all aloft, the light-limbed Matadore
Stands in the centre, eager to invade
The lord of lowing herds. *Byron. Childs Harold.*

GAUDEN (Dr. Joseph), son of the Rev. John Gauden, vicar of Mayfield, in Essex, was born at Mayfield in 1605. At the commencement of the civil war, he was chaplain to Robert, earl of Warwick; whom he followed, on his taking part with the parliament against the king. Upon the establishment of the Presbyterian church government he complied with the ruling powers, and was nominated one of the assembly of divines who met at Westminster in 1643, and took the covenant; yet, having offered some objections to it, his name was afterwards struck out of the list. Nor did he espouse the cause of the parliament longer than they adhered to their first avowed principles of reforming only, instead of destroying, monarchy and episcopacy. In this spirit he signed the protestation to the army against the violent proceedings that affected the life of the king; and a few days after his execution published the famous *Εικων Βασιλικη*, A Portraiture of his Sacred Majesty in his Solitude and Sufferings: which ran through fifty editions in the course of a year. Upon the return of Charles II. he was promoted to the see of Exeter; and in 1662 removed to Worcester, where he died the same year. He wrote many controversial pieces, and has generally been considered as the author of the *Eikon Basilike*. After the bishop's death, his widow, in a letter to one of her sons, calls it *The Jewel*; and said her husband had hoped to make a fortune by it. This assertion, as the earl of Clarendon had predicted, was eagerly espoused by the anti-royalists, in the view of disparaging Charles I. But it has been said, that Gauden had too luxuriant an imagination to be able to compose in so chaste but elevated a style; and thence, as bishop Burnet and others argue, that not he, but the king himself, was the true author. The whole of the arguments on each side of this disputed question may be found in Mr. Nichols's *Literary Anecdotes*.

GAUDENS (St.), a town of France, in the department of Upper Garonne, and late province of Languedoc, seated on the Garonne; eight miles north-east of Bertrand.

GAVE. The preterite of give.

Thou can'st not every day give me thy heart ;
If thou can'st give it, then thou never gav'st it :
Love's riddles are, that though thy heart depart,
It stays at home, and thou with losing sav'st it.

Donne.

GAVEL, n. s. A provincial word for ground.

Let it lie upon the ground or *gavel* eight or ten times.

Mortimer.

GAVELET, in law, an ancient and special cessavit used in Kent, where the custom of gavelkind continues, by which the tenant, if he withdraws his rent and services due to the lord, forfeits his land and tenements. The process is thus :—The lord is first to seek by the steward of his court, from three weeks to three weeks, to find some distress upon the tenement, till the fourth court; and if at this time he find none, at this fourth court it is awarded, that he take the tenement in his hand in name of a distress, and keep it a year and a day without manuring; within which time, if the tenant pays his arrears, and makes reasonable amends for the withholding, he shall have and enjoy his tenement as before: if he comes not before the year and day be past, the lord is to go to the next county court with witnesses of what had passed at his own court, and pronounce there his process, to have further witnesses; and then, by the award of his own court, he shall enter and manure the tenement as his own: so that if the tenant desired afterwards to have and hold it as before, he must agree with the lord; according to this old saying: 'Has he not since any thing given, or any thing paid, then let him pay five pound for his were, ere he become healdier again.' Other copies have the first part with some variation: 'Let him nine times pay, and nine times repay.'

GAVELET is also a writ used in the hushings, given to lords of rents in London. Here the parties, tenant and demandant, appear by scire facias, to show cause why the one should not have his tenement again on payment of his rent, or the other recover the lands on default thereof.

GAVELKIND. A term in law. A custom whereby the lands of the father are equally divided, at his death, amongst all his sons; or the land of the brother equally among the brothers, if he have no issue of his own. This custom prevails in divers places in England, but especially in Kent.

Among other Welsh customs he abolished that of *gavelkind*, whereby the heirs female were utterly excluded, and the bastards did inherit as well as the legitimate, which is the very Irish *gavelkind*.

Davies on Ireland.

GAVELKIND is a tenure belonging to lands in the county of Kent, and formerly universal in Ireland. The word is said by Lambard to be compounded of three Saxon words, *gyf*, *eal*, *kyn*, 'omnis cognatione proximis data.' Verstegan calls it *gavelkind*, quasi 'give all kind,' that is, to each child his part: and Taylor, in his history of *gavelkind*, derives it from the British *gavel*, i. e. a hold or tenure, and *cenned*, 'generatio aut familia;' and so *gavel cenned* might signify *tenura generationis*. It is well known what struggles the Kentish men made to preserve their ancient liberties, and with how much suc-

cess those struggles were attended. And as it is principally here that we meet with the custom of *gavelkind* (though it was and is to be found in some other parts of the kingdom), we may conclude, that this was a part of those liberties; agreeably to Selden's opinion, that *gavelkind*, before the Norman conquest, was the general custom of the realm. The distinguishing properties of this tenure are principally these :—
1. The tenant is of age sufficient to alienate his estate by feoffment, at the age of fifteen.
2. The estate does not escheat in case of an attainer and execution for felony; their maxim being, 'the father to the bough, the son to the plough.'
3. In most places he had a power of devising lands by will, before the statute for that purpose was made.
4. The lands descend, not to the eldest, youngest, or any one son only, but to all the sons together; which was indeed anciently the most usual course of descent all over England, though in particular places particular customs prevailed; and it must be allowed, that it is founded on strict justice, however contrary to the present general practice.

GAUGAMELA, in ancient geography, a village of Aturia, lying between the rivers Lycus and Tigris; famous for Alexander's victory over Darius. It is said to have been allowed to Darius Hystaspis for the maintenance of a camel; and hence the name. It was near a more considerable place called Arbela; whence the latter gave the name to the victory. See *ARBELA*.

GAUGE, v. a. & n. s. } French, *gauger*. See
GAUGER, n. s. } **GAGE.** A measure, or standard. He who gauges; an exciseman.

Those earls and dukes have been privileged with royal jurisdiction; and appointed their special officers, as sheriff, admiral, *gauger*, and escheator.

Carew on Cornwall.

If money were to be hired, as land is, or to be had from the owner himself, it might then be had at the market rate, which would be a constant *gauge* of your trade and wealth.

Locke.

There is nothing more perfectly admirable in itself than that artful manner in Homer, of taking measure or *gauging* his heroes by each other, and thereby elevating the character of one person by the opposition of it to some other he is made to excel.

Pope.

GATGE. See **GAGE**.

A **GAUGER** is a king's officer, who is appointed to examine all tuns, pipes, hogsheds, and barrels, of wine, beer, ale, oil, honey, &c., and give them a mark of allowance, before they are sold in any place within the extent of his office.

GAUGING. See **GEOMETRY**.

GAUGING ROD, an instrument used in gauging or measuring the contents of any vessel.

GAUL. See **GALLIA**.

GAULTHERIA, in botany, a genus of the monogynia order, and decandria class of plants; natural order eighteenth, bicornes: *cal.* exterior diphyllous, interior quinquefid: *con.* ovate; the nectarium consists of ten subulated points: *caps.* quinquelocular, covered with the interior calyx formed in the shape of a berry. Species one only, a beautiful Canadian shrub.

GAULTIER (Louis), abbé, was a native of Italy but of French parentage, and taken

early to France. Here, devoted to the education of youth, he conceived the project of smoothing the rugged path by the instructive games, known to children by the name of the 'Abbé Gaultier's Games.' The revolution forced him to quit France, however, for the Hague, where he accepted the situation of tutor to the children of the British ambassador, whom he accompanied to England. We now find him giving instruction gratuitously to the children of French emigrants; until the peace of Amiens allowed him to return to Paris, where he resumed his teaching, which he continued until his death, in 1818, in his seventy-fifth year. Some of his works have gone through twenty editions. The following are the principal—*Leçons de Grammaire suivant la méthode des Tableaux analytiques*, 1787; *Jeu raisonnable et moral pour les Enfants*, 1791; *Méthode pour analyser la pensée et la réduire à ses Principes Élémentaires*; *Méthode pour apprendre grammaticalement la Langue Latine sans connaître les règles de la Composition*; *Traits caractéristiques d'une mauvaise Education, ou Actions et Discours contraires à la Politesse, et regardés comme tels par les Moralistes tant Anciens que Modernes*; *Notions de géométrie pratique, nécessaires à l'exercice de la plupart des Arts et Metiers*, 1807, &c. &c.

GAUNT, *adj.* } Saxon, gewaned, gewant,
GAUNTLY, *adv.* } from *gepanian*, to lessen.
Thin; slender; meagre.

Oh, how that name befits my composition!
Old *Gaunt*, indeed, and *gaunt* in being old;
Within me grief hath kept a tedious fast;
And who abstains from meat that is not *gaunt*?
For sleeping England long time have I watched;
Watching breeds leanness, leanness is all *gaunt*:
The pleasure that some fathers feed upon
Is my strict fast; I mean my children's looks;
And therein fasting, thou hast made me *gaunt*:
Gaunt am I for the grave, *gaunt* as a grave,
Whose hollow womb inherits nought but bones.

Shakspeare. Richard II.

Two mastiffs, *gaunt* and grim, her flight pursued,
And oft their fastened fangs in blood embued.

Dryden.

While the *gaunt* mastiff growling at the gate
Affrights the beggar whom he longs to eat. *Pope.*

Then Judah rag'd by ruffian discord led,
Drunk with the steamy carnage of the dead:
He saw his sons by dubious slaughter fall,
And war without, and death within the wall.
Wide wasting plague, *gaunt* famine, mad despair,
And dire debate, and clamorous strife was there.

Bp. Heber.

GAUNTLET, *n. s.* French, *gantlet*; Italian, *gauntio*; Goth, *vanta*; Belg. *want*; corrupted, probably, of Latin, *manica*, *manus*, the hand. An iron glove, used for defence, and thrown down in challenges; sometimes, in poetry, used for the cestus or boxing glove.

A scaly *gauntlet* now, with joints of steel,
Must glove his hand. *Shakspeare. Henry IV.*

Feel but the difference, soft and rough;
This a *gauntlet*, that a muff. *Cleaveland.*

Then put on all thy gorgeous arms, thy helmet
And brigandine of brass, thy broad habergeon,
Vant-brass, and greaves, and *gauntlet*, add thy spear,
A weaver's beam, and seven times folded shield,
I only with an oaken staff will meet thee.

Milton's Samson Agonistes.

Some shall in swiftness for the goal contend,
And others try the twanging bow to bend;
The strong with iron *gauntlets* armed shall stand,
Opposed in combat on the yellow sand. *Dryden.*
Who naked wrestled best, besmeared with oil;
Or who with *gauntlets* gave or took the foil. *Id.*

The funeral of some valiant knight
May give this thing its proper light;
View his two *gauntlets*, these declare
That both his hands were used to war.

Prior.

So to repel the Vandals of the stage,
Our vet'ran bard resumes his tragic rage;
He throws the *gauntlet* Otway used to wield,
And calls for Englishmen to judge the field.

Southern

GAVOT, *n. s.* Fr. *gavotte*. A kind of dance.

The disposition in a fiddle to play tunes in preludes, sarabands, jigs, and *gavots*, are real qualities in the instrument.

Arbuthnot.

GAVOT, GAVOTTA, or GAVOTTE, is a kind of dance, the air of which has two brisk and lively strains in common time, each of which is twice played over. The first has usually four or eight bars; and the second contains eight, twelve, or more. The first begins with a minim, or two crotchets, or notes of equal value, and the hand rising; and ends with the fall of the hand upon the dominant or mediant of the mode, but never upon the final, unless it be a rondeau: and the last begins with the rise of the hand, and ends with the fall upon the final of the mode.

GAVOTTA, TEMPI DI, is when only the time or movement of a gavotte is imitated, without any regard to the measure or number of bars or strains.

GAURA, in botany, Virginian loose-strife, a genus of the monogynia order, and octandria class of plants; natural order seventeenth, calycanthemæ: cal. quadrifid and tubular: cor. pentapetalous, with the petals rising upwards. The nut is inferior, monospermous, and quadrangular. Species three; natives of North and South America.

GAURITZ, one of the most considerable, as well as a very rapid and dangerous river of the colony of the Cape of Good Hope. It rises in the Nieuweldt mountains, crosses the Karroo and Zevarte Berg, and falls into the Indian Ocean, in long. 21° 40' E., lat. 34° 35' S.

GAUSCHERKIE, a town of Upper Egypt, on the right bank of the Nile, opposite Tahta, supposed by Norden to be the ancient Diospolis. It contains a temple sixty paces in length and forty in breadth; the roof being well preserved; but it is employed by the Arabs as a cattle-shed.

GAUZE, *n. s.* Fr. *gaze*; barbarous Lat. *gaza-tum*; as some have thought from Gaza; whence this silk first came into Europe. A kind of thin transparent silk.

Silken clothes were used by the ladies; and it seems they were thin, like *gauze*.

Arbuthnot.

Brocades and damasks, and tabbies and *gauzes*,
Are lately brought over.

Swift.

GAUZE, GAUSE, or GAWSE, in commerce, is woven sometimes of silk, and sometimes only of thread. To warp the silk for making gauze, they use a peculiar kind of mill, upon which

the silk is wound : this mill is a wooden machine about six feet high, having an axis perpendicularly placed in the middle thereof, with six large wings, on which the silk is wound from off the bobbins by the axis turning round. When all the silk is on the mill, they use another instrument to wind it off again on two beams : this done, the silk is passed through as many little beads as there are threads of silk ; and thus rolled on another beam to supply the loom. There are figured gauzes ; some with flowers of gold and silver, on a silk ground : these last are chiefly brought from China.

GAWK, *n. s.* Saxon, *geac*. A cuckow ; a foolish fellow.

GAWN, *n. s.* } Scotch. A corruption

GAWNTREE, *n. s.* } for gallon : a wooden frame in which beer-casks are set when tunned.

GAY, *adj. & n. s.* } Fr. *gai* ; Italian, *gaio* ;

GAY'ETY, *n. s.* } Arn. *gae*. Cheerful ;

GAY'LY, *adv.* } light ; playful ; or frolic-

GAY'NESS, *n. s.* } some : also applied to cheerful colors.

A virgin that loves to go *gay*. *Bar. vi. 9.*

There I was wont to be right fresh and *gay*.

Of clothing, and of other good array.

Chaucer. The Chanones Y'mannes Tale.

Our *gayety* and our guilt are all besmirched,

With rainy marching in the painful field.

Shakspeare.

And from those *gayeties* our youth requires

To exercise their minds, our age retires. *Denham.*

Morose and untractable spirits look upon precepts in emblem, as they do upon *gays* and pictures, the tooleries of so many old wives' tales. *L'Estrange.*

The ladies, *gayly* dressed, the Mall adorn

With curious dies, and paint the sunny morn.

Gay.

Gay France shall make the Fan her artists' care,

And with the costly trinket arm the fair. *Id.*

Like some fair flower, that early Spring supplies,
That *gayly* blooms, but even in blooming dies.

Pope.

Smooth flow the waves, the zephyrs gently play,

Beliinda smiled, and all the world was *gay*. *Id.*

Even rival wits did Voiture's fate deplore,

And the *gay* mourned, who never mourned before.

Id.

GAY (John), a celebrated English poet, descended from an ancient family in Devonshire, was born at Exeter, and educated at the free school of Barnstaple, under Mr. Rayner. He was afterwards designed for a mercer, but having a small fortune, and considering the attendance on a shop as a degradation of his talents, he resolved to indulge his inclination for the Muses. In 1712 he became secretary to the duchess of Monmouth, and in 1714 accompanied the earl of Clarendon to Hanover. On queen Anne's death, he returned to England, where he was taken particular notice of by queen Caroline, then princess of Wales, to whom he read in MS. his tragedy of the Captives ; and in 1726 dedicated his Fables, by permission, to the duke of Cumberland. From this it was supposed, that he would have been provided for in some office suitable to his inclination and abilities : but being in 1727 offered the place of gentleman usher to one of the youngest princesses, he thought proper to refuse it ; and some warm re-

monstrances were made on the occasion by his friend and patron the duke of Queensberry, who withdrew from the court in consequence. The issue of such dependence on the delusive promises of the great, Gay has figuratively and humorously described in his fable of the Hare with many friends. The profits of his poems he lost in 1720, in the South Sea scheme. But the encouragement he met with from the public soon made ample amends for these private disappointments. In 1727-8, appeared his Beggar's Opera ; the success of which was not only unprecedented, but almost incredible. It had an uninterrupted run in London for sixty-three nights in the first season, and was renewed in the ensuing one with equal approbation. It spread into all the great towns of England ; was acted in many places thirty and forty times, and last of all it was performed at Minorca. Nor was its fare confined to the reading and representation alone ; the card table and drawing-room shared it with the theatre and closet ; the ladies carried about its favorite songs engraven upon their fans, and screens and other pieces of furniture were decorated with them. The profits were so great, both to the author and Mr. Rich the manager, that it gave rise to a popular pun, viz. That it had made Rich gay, and Gay rich. In consequence of this success, Mr. Gay was induced to write a second part to it, which he entitled Polly. But the disgust subsisting between him and the court, together with the report of his having written seditious pamphlets, occasioned a prohibition to be sent from the lord chamberlain, at the time when every thing was in readiness for the rehearsal. A very considerable sum, however, accrued to him from the publication of it afterwards in 4to. He wrote several other dramatic pieces, and many valuable ones in verse. Among the latter, his Trivia, or the Art of walking in the Streets of London, though his first poetical attempt, recommended him to the esteem and friendship of Mr. Pope : but as, among his dramatic works, his Beggar's Opera will perhaps ever stand as an unrivalled masterpiece, so among his poetical works, his Fables hold the highest estimation. Mr. Gay's disposition was affable, his temper generous, and his conversation agreeable. But he had the foible, too often incident to men of great literary abilities, viz. an excess of indolence, without any economy. So that though his emoluments were, at some periods of his life, very considerable, he was at others greatly straitened in his circumstances ; nor could he prevail on himself to follow the advice of his friend Dean Swift, who endeavoured to persuade him to purchase an annuity, as a resource for the exigencies of old age. Mr. Gay therefore, after having undergone many vicissitudes of fortune, and being for some time chiefly supported by the duke and duchess of Queensberry, died at their house in Burlington gardens, in December, 1732. He was interred in Westminster Abbey, where a monument was erected to his memory, at their expense ; with an epitaph by Pope.

GAYAH, or **BOORH GAYAH**, a town of the province of Bahar, Hindostan, one of the most celebrated places of Hindoo pilgrimage. It is

said to have been the birth-place of Boodh, or Budha. The revenue collected by government from the pilgrims amounts to above £16,000 per annum, a business managed entirely by the Brahmins. The image is that of a man sitting cross-legged, and so rudely carved as to give reason to suppose that it is of great antiquity. An inscription on one of the stones says 'The forefathers of him who shall perform the ceremony of the Sradha at this place shall obtain salvation.' 'A crime of an hundred fold shall undoubtedly be expiated from a sight thereof, of a thousand fold from a touch thereof, and of a hundred thousand fold from worshipping thereof.' Gayah is the residence of the civil establishment of the district of Bahar Proper, and has a cantonment for a battalion of native infantry.

GAZA (Theodore), a celebrated Greek of the fifteenth century, born in Thessalonica, in 1398. His country being invaded by the Turks, he retired into Italy; where he at first supported himself by transcribing ancient authors. In 1450 he was invited to Rome by Pope Nicholas V.; and on his death, in 1456, to Naples, by king Alphonso: who dying in 1458 he returned to Rome, where cardinal Bessarion procured him a benefice in Calabria. He translated from the Greek into Latin, Aristotle's History of Animals, Theophrastus on Plants, and Hippocrates's Aphorisms; and into Greek, Scipio's Dream, and Cicero's Treatise on Old Age. He wrote a Grammar and several other works in Greek and Latin; and died at Rome in 1478, aged eighty.

GAZA, in ancient geography, a principal city and one of the five satrapies of the Philistines. It was situated about 100 stadia from the Mediterranean, on an artificial mount, strongly walled round. It was destroyed by Alexander the Great, and afterwards by Antiochus. In the time of the Maccabees it was a strong and flourishing city; but was destroyed a third time by Alexander Jannæus. At present it is a mean place; but some remains of its ancient grandeur appear in the handsome pillars of Parian marble which are found here and there, in different parts of its streets. On the top of the hill, at the north-east corner of the town, are the ruins of large arches sunk low into the earth, and other foundations of a stately building. Soap and cotton cloths are the manufactures. Gaza is the residence of a Turkish bashaw. It was taken by the French under General Kleber in February 1799, and lies fifty miles south-west of Jerusalem.

GAZE, *v. n.*, *v. a.* & *n. s.* } Sax. *ȝerepan*, to
GA'ZER, *n. s.* } see; Goth. *gasia*;
GAZE'FUL, *adj.* } Gr. *αγαζέω*. To
GAZE'HOULD, *n. s.* } look earnestly or in-
GA'ZINGSTOCK, } tently upon: intense
regard, or earnest observation; the object on
which attention is rivetted; the person thus
occupied. A hound, that pursues not by scent,
but by sight. A person gazed at with derision
or abhorrence.

Being lightened with her beauty's beam,
And thereby filled with happy influence,

And lifted up above the world's gaze,
To sing with angels her immortal praise.

Spenser.

The brightness of her beauty clear,
The ravisht hearts of gaze'ful men might rear
To admiration of that heavenly light. *Id.*

Do but note a wild and wanton herd,
If any air of musick touch their ears,
You shall perceive them make a mutual stand,
Their savage eyes turned to a modest gaze,
By the sweet power of musick. *Shakspeare.*

Not a month
'Fore your queen dyed, she was more worth such
gazes

Than that you look on now. *Id.*

A lover's eyes will gaze an eagle blind. *Id.*

What see'st thou there? King Henry's diadem.

Inchased with all the honours of the world:

If so, gaze on. *Id. Henry IV*

Straight toward heaven my wondering eyes I turned,
And gazed awhile the ample sky. *Milton.*

With secret gaze,

Or open admiration, him behold,

On whom the great Creator hath bestowed

Worlds. *Id. Paradis. Lost.*

I must die

Betrayed, captived, and both my eyes put out;

Made of mine enemies the scorn and gaze:

To grind in brazen fetters, under task,

With my heaven-gifted strength. *Id. Agonistes.*

These things are offences to us, by making us gazing
stocks to others, and objects of their scorn and de-
rision. *Ray.*

See'st thou the gazehound! how with glance severe
From the close herds he marks the destined deer!

Tickei.

Bright as the sun, her eyes the gazers strike;

And, like the sun, they shine on all alike. *Pope.*

His learned ideas gave him a transcendent delight,
and yet, at the same time, discover the blemishes
which the common gazer never observed. *Watts.*

High stations tumults, but not bliss, create;

None think the great unhappy, but the great:

Fools gaze and envy; Envy darts a sting,

Which makes a swain as wretched as a king.

Young.

Her ruby lips lock up from gazing sight

A troop of pearls, which march in goodly row:

But when she deigns those precious bones undight,

Soon heavenly notes from those divisions flow.

Fletcher's Purple Island.

With awe and wonder gazed the adoring swain;

His kindling cheeks great Virtue's power confessed

But soon t'was o'er, for Virtue prompts in vain.

When Pleasure's influence numbs the nerveless breast.

Beattie. Judgment of Paris

The tender blue of that large loving eye

Grew frozen with its gaze on vacancy.

Byron. Corsair.

GAZEL, *n. s.* An Arabian deer.

Crystal and marble, plate and porcelain,

Had done their work of splendour; Indian mats,

And Persian carpets, which the heart bled to stain.

Over the floors were spread; gazelles and cats,

And dwarfs and blacks, and such like things, that gain

Their bread as ministers and favorites—(that's

To say, by degradation)—mingled there

As plentiful as in a court or fair.

Byron. Don Juan.

GAZETTE, *n. s.* } *Gazetta* is a Venetian

GAZETTEER, *n. s.* } halfpenny, the price of a
newspaper, of which the first was published in
Venice. A paper of public intelligence. A wri-

ter of news; a dictionary of places or of geography.

And sometimes when the loss is small,

And danger great, they challenge all;

Print new editions to their feasts,

And emendations in gazettes.

Hudibras.

An English gentleman, without geography, cannot well understand a gazette.

Locke.

One cannot hear a name mentioned in it that does not bring to mind a piece of the gazette.

Addison.

All, all but truth, falls dead-born from the press;

Like the last gazette, or the last address.

Pope.

Satire is no more: I feel it die;

No gazetteer more innocent than I.

Id.

He (Brookes) was also the author of a most excellent gazetteer.

Thuring.

And more might be found out if I could poke enough

Into gazettes, but Fame (capricious strumpet)

It seems has got an ear as well as trumpet.

Byron.

GAZETTE is with us confined to that paper of news published by authority. The first English gazette was published at Oxford, the court being there, in a folio half sheet, November 7th, 1665. On the removal of the court to London, the title was changed to the London Gazette. The Oxford gazette was published on Tuesdays, the London on Saturdays; and these continued to be the days of publication, after they were both published in London till very lately. It is now published every Tuesday and Friday evening.

GAZNA, a city of Asia, once much celebrated, and the capital of an extensive empire; now ruined and almost forgotten. During the vast and rapid conquests of the Arabs, all this country had been reduced under their subjection. On the decline of the power of the caliphs, however, the vast empire established by Mahomet and his successors was divided into a number of independent principalities, most of which were but of short duration. In the year of the Hegira 384, answering to A. D. 994, Gazna, with some part of the adjacent country, was governed by Mahmud Gazni; who became a great conqueror, and reduced under his subjection a considerable part of India and most of Persia. This empire continued in the family of Mahmud Gazni for upwards of 200 years. None of his successors, however, possessed his abilities; and therefore the extent of the empire, instead of increasing, was very considerably diminished soon after his death. The Seljuks took Khorasan; the greatest part of the Persian dominions fell off; and in the 547th year of the Hegira, the race of the Gazni sultans was entirely set aside by one of the Gauri, who conquered Khofru Shah the reigning prince, and bestowed his dominions on his own nephew, Gayathoddin Mohammed. These new sultans proved greater conquerors than the former, and extended their dominions farther than even Mahmud Gazni had done. They did not, however, long enjoy the sovereignty of Gazna: for in 1218 Jenghiz Khan, having conquered the greatest part of China and almost all Tartary, began to turn his arms westward; and set out against Gazna at the head of 700,000 men. To oppose this formidable army, Mohammed, the reigning sultan, could muster only 400,000 men; and, in the first battle, 160,000 of his troops perished. After this defeat, Mohammed, not daring to risk a second battle, dis-

tributed his army among the strongest fortified towns in his dominions; all of which Jenghiz Khan took one after another. The rapid progress of his conquests, indeed, almost exceeds belief. Immediately after the destruction of Bamiyan, Jenghiz marched towards Gazna, which was strongly fortified, and where he expected to have found Jaloloddin, who had now succeeded his father Mohammed. But he had left it fifteen days before; and, when Jenghiz Khan's army came up with him near the Indus, he attacked the vanguard in their camp; and having cut them almost all to pieces, without the loss of a man on his side, returned with a considerable booty. Jenghiz Khan, finding by this that he had a vigilant enemy to deal with, proceeded with great circumspection. When he had brought up the main body of his forces, he gave the command of the right and left wings to Jagatay and Oktay; and put himself in the centre, with 6000 of his guards. On the other side, Jaloloddin prepared for battle like one who had no resource but in victory. He first sent the boats on the Indus farther off; reserving only one to carry over his mother, wife, and children. He himself took the command of the main body. His left wing, drawn up under shelter of a mountain, was commanded by his vizier. The battle was terrible, and the success various throughout a whole day. At last, however, Jaloloddin's men, who were in all 30,000, opposed to ten times their number, were seized with a panic, and fled. One part of them retired to the rocks on the shore of the Indus, where the enemy's horse could not follow them; others threw themselves into the river and were drowned, though some had the good fortune to cross over in safety: while the rest, surrounding their prince, continued the fight through despair. The sultan, however, considering that he had scarce 7,000 men left, began to think of providing for his own safety: therefore, having bidden adieu to his mother, wife, and children, he mounted a fresh horse and spurred him into the river, which he crossed in safety, and even stopped in the middle of it to insult Jenghiz Khan, who was now arrived at the bank. His family fell into the hands of the Moguls; who killed all the males, and carried the women into captivity. Jaloloddin, having landed in India, ascended a tree to preserve himself from wild beasts. Next day, as he sauntered among the rocks, he perceived a troop of his soldiers, with some officers, who at the beginning of the defeat had found a boat in which they had escaped, and soon after saw 300 horse coming towards him; who informed him of 4,000 more that had passed the river. For some time after this the sultan's affairs seemed to revive, and he gained some battles in India; but the native princes, envying his prosperity, conspired against him, and obliged him to repossess the Indus. Here he again attempted to make head against the Moguls; but was at last defeated and killed by them, who thus put an end to the once mighty empire of Gazna. The metropolis was reduced by Oktay, who committed the most horrid cruelties in the neighbourhood. The city was well provided for sustaining a siege: had a strong garrison, and a brave and resolute governor; and the inhabitants.

expecting no mercy from Jenghiz Khan, resolved to make a desperate defence. They several times overthrew his works, and broke above 1000 of the battering rams of the besiegers. But one night, after an obstinate conflict, part of the city wall fell down; and a great number of Moguls, having filled up the ditch, entered the city sword in hand. After the massacre had continued four or five hours, Oktay imposed a tax on those who were left alive, to redeem themselves and the city. After this time Gazna never made any considerable figure. It was taken by the Moguls A. D. 1222.

GAZON, *n. s.* Fr. Pieces of fresh earth covered with grass, and used to line parapets and the traverses of galleries, in fortification.

GAZYPPOOR, a town and district of the province of Allahabad, Hindostan, in the collectorship of Benares. It is bounded on the north and east by the river Gogurah, on the south by the Ganges, and on the west by Joanpore. It is remarkably fertile and well watered; producing maize and other grain, cotton, opium, and sago in great abundance: also some very fine indigo, and the otto of roses. The town of Gazypoor stands on the Ganges, and has a palace and mosque both of superior structure.

GAZYPPOOR is also the name of a district of India, on the south bank of the Toombadre.

GEAR, *n. s.* Sax. *gæppe*, furniture; *gýman*, to clothe. Furniture, possessions, and ornaments; hence applied to the traces of oxen and horses: stuff.

An hundred lordes had he with him there,
All armed, save hir hedes, in all hir *gere*
Ful richely in alle manere thinges.

Chaucer. The Knightes Tale.

Into a studie he fell suddenly,
As don these lovers in hir *quainte geres*
Now in the crop, and now down in the breres. *Id.*
Array thyself in her most gorgeous *gear*.

Spenser. Faerie Queene.

If fortune be a woman, she is a good wench for this
gear, *Shakespeare. Merchant of Venice.*

When he found her bound, stript from her *gear*,
And vile tormentors ready saw in place,
He broke through. *Fairfax.*

Apollo's spite Pallas discerned, and flew to Tydeus'
son;

His scourge reacht, and his horse made fresh; then
took her angry run

At king Euneus, brake his *gears*. *Chapman's Iliad.*

When once her eye

Hath met the virtue of this magicke dust,

I shall appear some harmless villager,

Whom thrift keeps up about his country *gear*.

Milton.

The frauds he learned in his frantick years

Made him uneasy in his lawfull *gears*. *Dryden.*

I fancy every body observes me as I walk the street,
and long to be in my old plain *gear* again.

Addison's Guardian.

To see some radiant nymph appear

In all her glittering birthday *gear*,

You think some goddess from the sky

Descended, ready cut and dry. *Swift.*

GEASON, *adj.* Sax. *gæpean*, to see or gaze:
found only in Spenser. Wonderful. See **GAZE**.

It to Leeches seemed strange and *geason*.

Hubbard's Tale.

GEAT, *n. s.* Corruption of jett. The hole through which the metal runs into the mould.

GEBER, a king or chief of the Arabs, who wrote several tracts on chemistry, or rather alchemy, in Latin; printed from a copy in the Vatican, at Dantzic, in 1682 in 16mo. In this work he is styled not only rex Arabum, but philosophus perspicacissimus; and in two of these tracts, viz. Liber Investigationis Magisterii, and Testamentum de salibus animalium, &c., he is also styled Indiæ rex, though it seems difficult to account for such very distinct titles.

GEBER (John), a physician and astronomer of Arabia, who flourished in the ninth century. He wrote a commentary on Ptolemy's Syntaxis Magna, in which he attempted to correct his Astronomy, but Copernicus styles him the Calumniator of Ptolemy. He wrote several other works, and Boerhaave styles him a learned chemist. But his writings are so full of the jargon of the alchemists, that Dr. Johnson traces the derivation of the word gibberish from them. See **GIBBERISH**.

GECK, *n. s. & v. a.* Sax. *geac*; Ger. *geck*, a fool. A bubble (obsolete): to cheat.

Why did you suffer Jachimo to taint his noble heart
and brain with needless jealousy, and to become the
geek and scorn o'th'other's villainy? *Shakespeare.*

Why have you suffered me to be imprisoned,

And made the most notorious *geek* and gull

That e'er invention played on?

Id.

GECKO. See **LACERTA**.

GED (William), a goldsmith of Edinburgh, was an ingenious artist, and has been said to have first attempted to introduce the art of stereotype printing. The invention, first practised by him in 1735, was simply this:—From any types of Greek or Roman, or any other character, he formed a plate for every page, or sheet of a book, from which he printed, instead of using a type for every letter, as is done in the common way. In July, 1729, Ged entered into partnership with William Fenner, a London stationer, who was to have half the profits, in consideration of his advancing all the money requisite. In 1730 the partners applied to the University of Cambridge to print bibles and common prayer books by blocks instead of single types; and, in consequence, a lease was sealed to them, April 23d, 1731. In their attempt they sunk a large sum of money, and finished only two prayer books; so that it was relinquished and the lease given up in 1738. Ged imputed his disappointment to the villany of the pressmen, and the ill treatment of his partners, particularly Fenner. He returned to Scotland in 1733, where he gave his friends a specimen of his performance, by an edition of Sallust. But, being still unsuccessful, he was preparing again to set out for London, to join with his son James as a printer there, when he died October 19th, 1749.

GEDDES (Alexander), LL. D., a Scottish Roman Catholic priest, born in Ruthven, in 1737. He very early discovered a taste for learning, and was accordingly sent to a school in the Highlands where those designed for the Catholic priesthood received their early education; and here Geddes laid the foundation of that intimate acquaintance with the learned languages by which he was afterwards so distinguished. In 1758 he went

to the Scottish University at Paris, and soon after became a student in rhetoric and theology at the college of Navarre. He returned to his native country in 1764, and became priest in the county of Angus; but the following year he was made chaplain to the earl of Traquair; with whom he continued about three years. In 1768 he again visited Paris. Returning again to his native country, early in 1769, he undertook the charge of a congregation at Auchinlarig in Banffshire: the same year, however, he quitted his pastoral charge, and obtained the year following the degree of LL. D. from the University of Aberdeen, which had never so honored any Roman Catholic since the Reformation. About this time he removed to London, where he officiated some time in the imperial ambassador's chapel, and afterwards at that in Duke-street, Lincoln's Inn-fields. In 1782 he began to devote himself to a design which he had long entertained, of giving the world a new English translation of the Old and New Testaments. The prospectus of this work was published in 1786, and the following year an Appendix to it, and a Letter to Bishop Lowth. This year also he gave a display of his controversial talents, in an Answer to Dr. Priestley on the Divinity of Christ. In 1788 he published farther proposals for his Translation of the Bible, and two years after, a general Answer to the Queries, Counsels, and Criticisms, communicated to him relative to the work. He was liberally supported in the undertaking by lord Petre; and the first volume of it, comprising the Pentateuch and the book of Joshua, appeared in 1792; but even those of his own communion directly avowed their disapprobation of it, and some of the Roman Catholic bishops suspended the doctor from his ecclesiastical functions. He replied to these attacks in pamphlets written with great coarseness and illiberality. The second volume of his version was published in 1798; and in it he gives up and daringly combats the inspiration of Scripture. In the spring of 1800 he published his Apology for the Roman Catholics of Great Britain, and the same year Critical Remarks in vindication of his version of Scripture, which he prepared for the press as far as the 118th Psalm; but died on the 26th of February, 1802.

GEDINGOOMA, a fortified town of Kaarta, in Western Africa. Its walls are of stone, and so high that, in the narrow pass here between two hills, they have enabled Doisy the king of this place, to set the power of Bambara at defiance. It is thirty miles north-west of Kemmoo.

GESE. Plural of goose. See **GOOSE**.

GEFLE, or **GIAWLE**, a town on the Gulf of Bothnia, belonging to Sweden, and the seat of several provincial courts. The river Gefle flows through the middle of the town, falling into the gulf in three branches, and forms a good harbour, defended by a long jetty. The inhabitants carry on a brisk maritime traffic, exporting pitch, tar, iron, and planks. It has a castle, which was burnt in 1727, but rebuilt. Population between 5000 and 6000. Sixty miles north of Upsal.

GEFLEBORG, a newly erected government of Sweden, situated between Dalecarlia and West

Norrland, and extending from the gulf of Bothnia to the Norwegian mountains. Its extent is above 9000 square miles, but its population only about 90,000. It is mountainous on the side of Norway, and is, in general, covered with wood. Here are also a number of productive iron mines. The capital is Gefle.

GEHENNA, **GEHINNON**, Gr. *Γέννα*, of Heb. גֵּהֶנְנוֹ, a term which occurs in Matt. v. ver. 22, 29, 30: x. 28; xviii. 9; xxiii. 15, 33. Mark ix. 43, 45, 47. Luke xii. 5. James iii. 6. The authors of the Louvain and Geneva versions retain the word gehenna as it stands in the Greek; as does M. Simon; the English translators render it by hell and hell-fire, and so do the translators of Mons and Father Bouhours. In the valley of Hinnom, near Jerusalem, there was a place named Tophet, where the idolatrous Jews sacrificed their children to Moloch, by fire. (See **BEN-HINNOM** and **MOLOCH**). King Josias, to render this place for ever abominable, made a common sewer of it, where all the filth and carcases of the city were cast; and where a continual fire was kept up, to burn those carcases; for which reason, as the Jews had no proper term in their language to signify hell, they made use of gehenna or gehinnon, to denote a perpetual fire.

GEISLINGEN, a town of Wirtemberg, remarkable for its bone turners, who amount to about 1600 or 1700. In the neighbourhood is a much frequented mineral spring. Twelve miles west of Ulm.

GELA, in ancient geography, a city of great extent on the south of Sicily, so named from the Gelas. It was built by colonists from Rhodes and Crete, forty-five years after the building of Syracuse, in the third year of the twenty-second Olympiad, A. A. C. 690; and originally called Lindii, from the colonists of Lindus, a city of Rhodes, who settled there first. This city, after having stood 408 years, was destroyed by Phintias, tyrant of Agrigentum; and the inhabitants were removed to a new city called Phintias after his name. It is now called Terra Nuova.

GELABLE, *adj.* } Lat. *gelu*. Whatever

GEL'ATINE, *n. s.* } may be reduced to a jelly.

GELAT'INOUS, *adj.* } Gelatine is a term applied

GEL'LY, *n. s.* } to a substance of this

nature which forms part of animal bodies; gelatinous, that which partakes of a thick cohesive character.

My best blood turn

To an infected *gelly*.

Shakespeare. Winter's Tale.

The tapers of the gods,

The sun and moon, became like waxen globes,

The shooting stars end all in purple *gellies*,

And chaos is at hand, *Dryden and Lee's Oedipus.*

That pellucid *gelatinous* substance is an excrement cast off from the shoals of fish that inhabit the main.

Woodward.

The white of an egg will coagulate by a moderate heat, and the hardest of the animal solids are resolvable again into *gellies*.

Arbuthnot.

You shall always see their eggs laid carefully up in that spermatick *gelatine* matter, in which they are reposit.

Derham.

GELATIN, or jelly, an animal substance, soluble in water, capable of assuming a well-known

elastic or tremulous consistence, by cooling, when the water is not too abundant. and liquefiable again by increasing its temperature. This last property distinguishes it from albumen, which becomes consistent by heat. With tannin it forms an insoluble compound already mentioned. Its aqueous solution, evaporated to dryness, is glue. Decomposed by nitric acid, a large quantity of gas disengages, and oxalic acid is formed. In close vessels, it gives over carbonic acid, hydro-carbonic gas, carbonate of ammonia, and empyreumatic oil; its carbonaceous residuum containing phosphate of lime. Hence gelatin is not nearly so much compounded as albumen, having only carbon, hydrogen, azote, phosphorus, lime, and oxygen, as its ultimate elements.

According to the analysis of MM. Gay Lussac and Thenard, gelatin is composed of

Carbon, . . .	47.881
Oxygen, . . .	27.207
Hydrogen, . .	7.914
Azote, . . .	16.998
	<hr/>
	100.000

GELD, *v. a.* } Goth. and Teut. *gelden*,
 GELD'ER, *n. s.* } Germ. *gelten*. To cas-
 GELD'ING, *n. s.* } trate, or emasculate. A
 GELT, *n. s. & part.* } term also used figura-
 tively. The person who performs the operation.
 Any animal thus deprived, particularly the
 horse.

No herde hadde he, ne never none shulde have;
 As smothie it was as it were newe shave;
 I trowe he were a gelding or a mare.

Chaucer. *Prologue to Cant. Tales.*

Geld later with gelders, as many one do.

And look of a dozen to geld away two. *Tusser.*
 Geld bull-calf and ram-lamb as soon as they fall.

Id.

Lord Say hath gelded the commonwealth, and made
 it an eunuch. *Shakespeare. Henry VI.*

He bears his course, and runs me up
 With like advantage on the other side,
 Gelding the opposed continent as much
 As on the other side it takes from you.

Shakespeare.

Though naturally there be more males of horses,
 bulls, or rams, than females; yet artificially, that is,
 by making geldings, oxen, and wethers, there are
 fewer. *Graunt.*

Never old lecher more repugnant felt

Consenting for his rupture to be felt. *Marvell.*

No sow-gelder did blow his horn

To geld a cat but cryed reform. *Hudibras.*

The lord-lieutenant may choose out one of the best
 horses, and two of the best geldings; for which shall
 be paid one hundred pounds for the horse, and fifty
 pounds a-piece for the geldings. *Temple.*

They were diligent enough to make sure work, and
 to geld it so clearly in some places, that they took
 away the very manhood of it. *Dryden.*

The spayed gELTS they esteem the most profitable.

Mortimer.

Let the others be gelt for oxen.

Id. Husbandry.

GELD, in the old English customs, a Saxon
 word signifying money, or tribute. It also de-
 noted a compensation for some crime committed:
 hence wergeld, in their ancient laws, was used

for the value of a man slain; and orfgeld, of a
 beast.

GELDENHARIUS, GELDENHAUR (Gerard
 Eobanus), an historian and Protestant divine,
 born at Nimeguen in 1482. He studied classical
 learning at Deventer, and went through his
 course of philosophy at Louvaine, where he
 contracted a friendship with Erasmus. He be-
 came reader and historian to Charles of Austria,
 and afterwards to Maximilian of Burgundy.
 At length he embraced the Protestant religion;
 taught history at Marburg; and afterwards divi-
 nity till his death, in 1542. He wrote, 1. History
 of Holland; 2. History of the Low Countries;
 3. History of the Bishops of Utrecht; and other
 works.

GELDER-ROSE. A rose supposed to come
 originally from Guelderland. See VIBURNUM.

The gelder-rose is increased by suckers and cuttings.

Mortimer.

GELDER ROSE, VIRGINIAN. See SPIRÆA.

GELDERS. See GULDRES.

GEL'ID, *adj.*

GELID'ITY, *n. s.* } Lat. *gelidus*. Extreme
 GEL'IDNESS, *n. s.* } cold.

From the deep ooze and gelid cavern roused,
 They flounce. *Thomson's Spring.*

GELLAH, or COLLAH, a fortified place of
 Algiers, on a high and conical mountain near the
 Mejerdah. It has become a place of refuge for
 criminals, and has only one narrow path leading
 to it. Eighty-six miles east of Constantina.

GELLAH, a town of Tunis, in Africa, situated
 on a rugged promontory, near the river Mejer-
 dah. Publius Cornelius Scipio fixed his winter-
 quarters here, and it was called after him Castra
 Cornelianæ.

GELLERT (Christian Furchtegott), a Ger-
 man poet and critic, was born in 1715 at Hay-
 nichen, near Freyberg, in Saxony. His father
 was a clergyman, and placed him at a school at
 Meissen, where he contracted an intimacy with
 Rabener and Gaertner, which lasted until their
 respective deaths. In 1734 he went to Leipsic
 to study theology, and returned home, after four
 years, as a preacher. He afterwards became
 private tutor to young gentlemen of fortune,
 with one of whom he returned in 1741 to Leip-
 sic. His first poetical production was, Amuse-
 ments of Reason and Wit, begun 1742. In
 1744 he took the degree of M. A., and published,
 the following year, the first volume of his Fables,
 some plays, and a novel, entitled The Swedish
 Countess. In 1748 appeared the second volume
 of his Fables, and a work called, Consolations
 for Valetudinarians, suggested by the state of his
 own health. In 1751 he was made professor
 extraordinary of philosophy at Leipsic; he died
 13th December, 1769. His works have often
 been published collectively or separately.

GELLERT (Christlieb Ehregott), brother of the
 preceding, a distinguished metallurgist, first
 studied at Meissen, and then at the university
 of Leipsic. Being invited to Petersburg, he
 became an adjunct of the academy there for ten
 years; and very intimate with the celebrated
 Euler. He returned to Saxony about 1746, to
 prosecute his researches, when his mineralogi-

cal lectures attracted a great many strangers to Freyberg. In 1753 he was nominated counsellor-commissary of the mines, and charged with the inspection of machines and the examination of the ores and minerals of his native country. In 1764 he became administrator in chief of foundries and forges at Freyberg; in 1765 professor of metallurgy at the academy of mines in that city; and at length, in 1782, effective counsellor of mines. He suggested great improvements in his mineralogical researches; and was the first introducer of the process of parting metals by amalgamation. He died May, 1795; having published *Elements of Docimastics*, translated from the Latin of Cramer; *Elements of Chemical Metallurgy*, 2 vols. 8vo., &c.

GELLIUS (Aulus), a celebrated grammarian, who lived in the second century under Marcus Aurelius and some succeeding emperors. He wrote a collection of observations on authors, for the use of his children; and called it *Noctes Atticæ*, because composed in the nights of a winter he spent at Athens. The chief value of it is for preserving many facts and monuments of antiquity not to be found elsewhere.

GELT, *n. s.* Corrupted from *gilt*. Tinsel; gilt surface.

I won her with a girdle of *gelt*,
Emboss with bugle about the belt.

Spenser's Pastorals.

GEM, *n. s., v. n. & v. a.* } Sax. *gum*; Ital.
GEM'MARY, *adj.* } and Lat. *gemma*. A
GEM'MEOUS, *adj.* } precious stone of
GEM'MOSITY, *n. s.* } any kind, or what-
ever pertains or tends to gems or jewels. The
first bud of a tree or flower.

This *gem* of chastitee, this emeraude
And eke of martyrdome the rubie bright,—
Ther he with wrote yowen lay upright.

Chaucer. The Prioresses Tale.

I saw his bleeding rings,
Their precious *gems* now lost, became his guide,
Led him, begged for him, saved him from despair.
Shakspeare.

From the joints of thy prolific stem
A swelling knot is raised, called a *gem*;
Whence, in short space, itself the cluster shows.

Denham.

Last rose, in dance, the stately trees, and spread
Their branches, hung with copious fruit; or *gemmed*
Their blossoms. *Milton's Paradise Lost.*

The principle and *gemmary* affection is its translucency: as for irradiancy, which is found in many *gems*, it is not discoverable in this. *Brown.*

Love his fancy drew;
And so to take the *gem* Urania sought. *Sidney.*
Emboldened out they come,
And swell the *gems*, and burst the narrow room.

Dryden.

Sometimes we find them in the *gemmeous* matter
isort. *Woodward.*

Court-virtues bear like *gems* the highest rate,
Born where heaven's influence scarce can penetrate.
Pope.

Full many a *gem* of purest ray serene
The dark unfathomed caves of ocean bear;
Full many a flower is born to blush unseen,
And waste its sweetness on the desert air.

Gray's Elegy.

But, as the *gem* of richest cost,
Is ever counterfeited most,
So always, imitation

Employs the utmost skill she can
To counterfeit the faithful man,
The friend of long duration.

Cowper

Deep in yon mountain's womb, where the dark
cave
Howls to the torrents everlasting roar,
Does the rich *gem* its flashy radiance wave,
Or flames with steady ray the imperial ore.
Beattie. Judgment of Paris.

Her hair was starred with *gems*; her veil's fine fold
Below her breast was fastened with a band
Of lavish pearls, whose worth could scarce be told.

Byron. Don Juan.

GEMAPPE, or **JEMAPPES**, a small town of the Netherlands, in Hainault, near the Scheldt, on the road from Mons to Valenciennes, two miles from the former. It is chiefly remarkable for the victory gained here by Dumouriez over the Austrians, 6th November, 1792, and gave name to a department when the Netherlands were subject to France. Inhabitants 2300.

GEMARA, or **GHEMARA**, the second part of the Talmud. The Hebrew word גמרא, *gemara*, is commonly supposed to denote a supplement; but in strictness it rather signifies complement, or perfection; being formed of the Chaldee גמר, *gemar* or *ghemar*, 'to finish, perfect, or complete any thing.' The rabbins call the Pentateuch simply the law: the first part of the Talmud, which is only an explication of that law, or an explication thereof to particular cases, with the decisions of the ancient rabbins thereon, they call the *Mischna*, i. e. second law; and the second part, which is a more extensive explication of the same law, and a collection of decisions of the rabbins posterior to the *Mischna*, they call *Gemara*, q. d. perfection, completion, finishing; because they esteem it the finishing of the law, or an explication beyond which there is nothing farther to be desired. The *Gemara* is often called simply the Talmud, the common name of the whole work. In this sense, there are two *Gemaras* or Talmuds; that of Jerusalem and that of Babylon; though in strictness the *Gemara* is only an explication of the *Mischna*, given by the Jewish doctors in their schools. See *MISCHNA*. A commentary, Mons. Tillemont observes, was wrote on the *Mischna*, by one Johanan, whom the Jews placed about the end of the second century; but Father Morin proves, from the work itself, wherein mention is made of the Turks, that it was not written till the time of Heraclius, about A. D. 620; and this is what is called the *Gemara*, or Talmud of Jerusalem, which the Jews do not use or esteem much because of its obscurity. They set a much greater value on the *Gemara*, or Talmud of Babylon, begun by one Asa; discontinued for seventy-three years, on occasion of the wars with the Saracens and Persians; and finished by one Josa, about the close of the seventh century. See *TALMUD*. Though the name Talmud in its latitude includes both the *Mischna* and the two *Gemaras*, yet it is properly that of Asa and Josa alone which is meant under that name. This the Jews prize above all their other writings, and even set it on a level with Scripture itself: in effect, they conceive it as the word of God derived by tradition from Moses, and preserved without in-

terruption to their time. R. Jehuda, and afterwards R. Johanan, R. Asa, and R. Josa, fearing the traditions should be lost in the dispersion of the Jews, collected them into the Mischna and the Gemara.

GEMATRIA, or **GAMETRIA**, the first kind of artificial cabbala used by the Jews. The word is formed from the rabbinical Hebrew גימטריא, by corruption of the Greek. Gematria is a geometrical or arithmetical method of explaining these words, whereof there are two kinds; the first bearing a more immediate relation to arithmetic, and the latter to geometry. Thus a cabbalist, taking the two first words in Genesis, בראשית, **ב**רא, and by addition getting the sum total of all the numbers signified by those letters, finds that these two words signify the same as those other three, בראש-חשנה-נכרא. For as to the first, **ב**, is 2; **ר**, 200; **א**, 1; **ש**, 300; **י**, 10; **ת**, 400; **ב**, 2; **ר**, 200; and **א**, 1; which, together, make 1116. And as to the latter, **כ** signifies 2; **ר**, 200; **א**, 1; **ש**, 300; **ח**, 5; **י**, 10; **ש**, 300; **ת**, 5; **י**, 10; **ב**, 2; **ר**, 200; and **א**, 1; which, summed up, yield the same number 1116.

Whence the cabbalist concludes, בראשית, **ב**רא in the beginning he created, signifies the same thing as בראש-חשנה-נכרא, it was created at the beginning of the year: and, accordingly, the received opinion of the cabbalists is, that the world was created at the beginning of the month Tisri, which was anciently the first month in the year, and answers to our first month in autumn, viz. September.

GEMBLOURS, or **GIBLOU**, a town of France, in the department of Dyle, and ci-devant province of Austrian Brabant, seated on the Orne. In 1578 a battle was fought near it between the Dutch and the Spaniards, under Don John of Austria, wherein the former were defeated. It was twice burned down, viz. on the 6th of August, 1678, and 17th August, 1712. It lies ten miles north-west of Namur, and twenty-two south-east of Brussels.

GEMELLIPAROUS, *adj.* Lat. *gemelli* and *pario*. Bearing twins.

GEMINATE, *v. a.* } Lat. *geminio*. Repe-
GEMINATION, *n. s.* } tition; whether used
GEMINY, *n. s.* } in relation to beings
GEMINOUS, *adj.* } or arguments.

Have grated upon my good friends for three privies for you, and your couch-fellow, Nim; or else you had looked through the grate, like a *gemying* of baboons. *Shakspeare.*

Christians have baptized these *geminous* births, and double consancesses, with several names, as conceiving in them a distinction of souls. *Browne.*

Be not afraid of them that kill the body; fear him, which, after he hath killed, hath power to cast into hell: yea, I say unto you, with a *gemyination*, which the present controversy shows not to have been causeless fear him. *Boyle.*

A *gemying* of asses split will make just four of you.

Congreve.

GEMINI, in astronomy, the Twins; a constellation or sign of the zodiac, the third in order, representing Castor and Pollux; and marked thus, ♊. See **ASTRONOMY**.

GEMINIANI (Francis), a celebrated musician and composer, born at Lucca in 1680. He received his first instructions in music from Alex. Scarlatti; he next became a pupil of Charles Ambrose Lunati, surnamed *Il Gobbo*, a celebrated performer on the violin; after which he was a disciple of Corelli. In 1714 he came to England, where he soon recommended himself greatly by his performances. In 1716 he published and dedicated to baron Kilmansegge, chamberlain to king George I. as elector of Hanover, twelve sonatas a violino violino e cembalo: the first six with fugues and double stops; the last with airs of various measures, as almandes, courants, and jiggs. This publication was so much admired by the baron, that he mentioned Geminiani to the king as an excellent performer; in consequence of which he had the honor to perform before his majesty, in concert with Handel. But, though Geminiani was exceedingly admired, he had no genius for associating music with poetry, nor do we find that he ever became a public performer. He was therefore obliged to depend for his subsistence on the friendship of his patrons, and the profits which accrued to him from teaching. He was also an enthusiast in painting, and the versatility of his temper was such, that, to gratify this passion, he neglected to exercise his musical talents, and became involved in debt. In 1727 he was offered the place of master and composer of the state music in Ireland; but this could not be conferred on a Catholic, and Geminiani refused to change his religion. He then began to compose parts to the opera quinta of Corelli; and to make concertos of the first six of his solos. This work he completed, and, with the help of a subscription, at the head of which were the names of the royal family, he published it in 1726. In 1732 he published his *Opera Secunda*, containing a celebrated minuet that goes by his name, which did not much improve his circumstances; but Geminiani was an utter stranger to the business of the orchestra, and had no idea of the labor necessary in the instruction of singers, for the performance of music to which they were strangers. The consequence of this was, that a concerto spirituale, which he had advertised for his own benefit in 1748, failed entirely in the performance. He now went to Paris for six or seven years, and, about 1755, returned to England. In 1761 he went over to Ireland, where he was kindly received by Mr. Matthew Dubourg, who had been his pupil, and who was then master of the king's band. Here he died under very peculiar circumstances. He had spent many years in compiling an elaborate treatise on music, which he intended for publication; but soon after his arrival, by the treachery of a female servant, who, it was said, was recommended to him for no other end, but that she might steal it, it was conveyed away and could not be recovered. The greatness of this loss, and his inability to repair it, hastened his end; at least he survived it but a short time, dying on the 17th September, 1762. Of his solos the *Opera Prima* is esteemed the best. Of his concertos some are excellent, others of them scarce pass the bounds of mediocrity. The sixth

of the third opera not only surpasses all the rest, but, in the opinion of the best judges of harmony, is one of the finest instrumental compositions extant.

GEMSHIKHANA, Silver House, a well-built town of Asia Minor, on the frontiers of Armenia. Its name is derived from a silver mine in its neighbourhood, which, however, does not yield now a third part of the metal it once did. Inhabitants 7000. Thirty miles south of Trebisond.

GEMISTUS (George), surnamed Plethe, a native of Constantinople, from which, upon its capture by the Turks, he retired to Florence. In 1438 he distinguished himself at the council of Florence, by his learning and abilities. He wrote, 1. Commentaries upon the Magic Oracles of Zoroaster; a work of considerable erudition; 2. A Comparison between Plato and Aristotle; and 3. Historical Treatises; wherein he discovers great knowledge of Grecian history. He died aged above 100.

GEMMA (Reinier), an eminent Dutch physician, born in Friesland, in 1508. He was well versed in astronomy, and wrote several works on that and other branches of mathematics. He died in 1755, aged forty-seven.

GEMMA, or bud, in botany. See **BOTANY**. Buds, as well as bulbs, which are a species of buds, constitute that part of the herb called by Linnaeus *hybernaculum*, or the winter-quarters of the future vegetable. Buds are placed at the extremity of the young shoots, and along the branches, being fixed by a short foot-stalk upon a kind of brackets, the remainder of the leaves, in the wings or angles of which the buds in question were formed the preceding year. They are sometimes placed single; sometimes two by two, either opposite or alternate; sometimes collected in greater numbers in whirls or rings. With respect to their construction, buds are composed of several parts artificially arranged. Externally, we find a number of scales that are pretty hard, frequently armed with hairs, hollowed like a spoon, and placed over each other like tiles. These scales are fixed into the inner plates of the bark, of which they appear to be a prolongation. Their use is to defend the internal parts of the bud; which, being unfolded, will produce, some flowers, leaves, and stipule; others, foot-stalks and scales. All these parts, while they remain in the bud, are tender, delicate, folded over each other, and covered with a thick clammy juice, which is sometimes resinous and odoriferous, as in the *tachamahac* tree. This juice serves not only to defend the more tender parts of the embryo plant from cold, the assaults of insects, and other external injuries; but likewise from excessive perspiration, which, in its young and infant state, would be very destructive. It is conspicuous in the buds of horse-chestnut, poplar, and willow-trees. See **BOTANY**.

GEMOTE, *n. s.* Sax. *gemor*, from *mezan*, to meet (obsolete). A public meeting: as of the court, with the hundred, the nobles, &c. See **FOLKNOTE**.

GEMUND, an old and once free town of the empire of Germany, now subject to Wirtemberg. Its extent is considerable; but its population

VOL. X.

much thinner since the decay of its manufactures in cottons, plate, and jewellery, and does not exceed 5500. It is twenty-four miles south of Stuttgart.

GENAP, or **GENAPPE**, a small town of South Brabant, in the Netherlands, on the Dyle. It was the scene of an action between some French and British cavalry, on the retreat of the French 17th of June, 1815, toward Waterloo; and of a great slaughter of the French by the Prussians on the 18th, after that memorable battle. Population 1200.

GENDARMERIE, in military affairs, was a select body of cavalry that took precedence of every regiment of horse in the French service, and ranked immediately after the king's household. The reputation of the gendarmerie was so great, and its services so well estimated by the king of France, that when the emperor Charles V. in 1552 sent a formal embassy to the court of Versailles, to request a loan of money, and the assistance of the gendarmerie to enable him to repulse the Turks, Francis I. returned the following answer:—'With respect to the first object of your mission,' addressing himself to the ambassador, 'I am not a banker; and with regard to the other, as my gendarmerie is the arm which supports my sceptre, I never expose it to danger, without personally sharing its fatigue and glory.' The uniform of the gendarmerie, as well as of the light cavalry, under the old French government, was scarlet, with facings of the same color. The coat was formerly more or less laced with silver, according to the king's pleasure. The waistcoat of buff leather, and the bandolier of the same, silver-laced; the hat was edged with broad silver lace. The horse-cloths and holster-caps were red, and the arms of the captain embroidered on the corners of the saddle-cloths, and on the front of the holsters. The gendarmerie are now however little more than an armed police.

GENDARMES, Scots, were originally instituted by Charles VII. of France, about the middle of the fifth century, and formed a part of his guard; in which station also they acted under other princes. It was their prerogative to take precedence of all the companies of the gendarmerie of France; and, on particular occasions, they even preceded the two companies of the king's mousquetaires. The sons of the Scottish monarchs were the usual captains of this company; and, after Mary's accession to the throne, its command belonged to them as a right. Hence James VI. made a claim of it for his son prince Henry. This honor, and its emoluments, were also enjoyed by Charles I., and the next in command to this prince was Lewis Stuart, duke of Lenox. George Gordon, marquis of Huntley, succeeded him in 1624, and took the title of commander in chief when Charles I. mounted the English throne. It is not certain whether Charles II. was ever captain of this company; but it was conferred on his brother the duke of York, who was captain of the Scots gendarmes till 1667, when he resigned his commission into the hands of the French king. After that time no native of Great Britain enjoyed this command.

D

GENDER, *n. s.* Fr. *genre*; Lat. *genus*. A quality; but seldom used in this sense: difference of sex; a denomination given to nouns, from being joined to an adjective in this or that termination.

Our bodies are our gardens, to the which our wills are gardeners; so that if we will supply it with one *gender* of herbs, or distract it with many, the power and corrigible authority of this lies in our will. *Shakspeare.*

The other motive,
Why to a publick court I might not go,
Is the great love the general *gender* bare me. *Id.*
Cubitus, sometimes cubitum in the neutral *gender*, signifies the lower part of the arm on which we lean. *Arbutnot.*

Ulysses speaks of Nausicaa, yet immediately changes the word into the masculine *gender*. *Broome.*

GENDER, in grammar, is a division of nouns to distinguish the two sexes. This was the original intention of gender: but afterwards other words, which had no proper relation either to the one sex or the other, had genders assigned them, rather out of caprice than reason; which is at length established by custom. Hence genders vary according to the languages, or even according to the words introduced from one language into another. Thus, arbor, a tree, in Lat. is feminine, but arbre in Fr. is masculine; and dens, a tooth, in Lat. is masculine, but dent in Fr. is feminine, though the meaning is the same. The oriental languages frequently neglect the use of genders, and the Persian has none at all. The Latins, Greeks, &c., generally content themselves to express the different genders by different terminations; as bonus equus, a good horse; bona equa, a good mare, &c. But in English we frequently go further, and express the difference of sex by different words: as boar, sow; boy, girl; buck, doe; bull, cow; dog, bitch, &c. We have also feminines distinguished from the males by the variation of the termination of the male into ess; as abbot, abbess; count, countess, &c.

GENDER, *v. a & v. n.* Fr. *engendrer*. To produce; to beget; the act of generation or breeding.

Thou shalt not let thy cattle *gender* with a diverse kind. *Lev. xix. 19.*

Foolish and unlearned questions avoid, knowing that they do *gender* strife. *2 Tim. ii. 23.*

A cistern for foul toads

To *gender* in. *Shakspeare. Othello.*

GENDRE (Gilbert Charles le), marquis of St. Aubin, counsellor in the parliament of Paris, and master of requests. He wrote several other works; but is chiefly distinguished by his *Traité de l'Opinion*, 9 vols., 12mo.; a curious performance, in which the author attempts to show, by historical examples, the powerful empire of fancy over the works of art and science. He died at Paris in 1746, aged fifty-six.

GENDRE (Louis le), a French historian, educated under the patronage of De Harlai, afterwards archbishop of Paris, became a canon and subchanter of the cathedral of Notre Dame. He published a life of his patron, and a valuable *Histoire de la France*, 3 vols., folio, Paris, 1718; reprinted in 8 vols. 12mo. This work includes a catalogue of the ancient and modern French

historians, with criticisms on their writings; an able account of the manners and customs of the French in different ages, &c. &c. He was made abbot of Notre Dame de Claire Fontaine, in the diocese of Chartres, and died February 1st, 1733.

GENDRE (Adrian Marie Le), professor of mathematics at the Military school of Paris, member of the Académie des Sciences, &c., was first distinguished in 1787 in verifying the points placed between Dunkirk and Boulogne, with a view to compare the true position of the Paris and London observatories. Cassini and Mechain were also employed in this operation, and the means which they employed gave a much more exact result than any which had been before tried. In 1794 M. le Gendre published his *Memoire sur les transcendentes elliptiques*, and his *Elemens de Géometrie*. Le Gendre also made about this time many researches on the subject of the attraction of elliptical spheroids; and commenced others on heterogeneous spheroids. In 1774 he assisted de Prony to form his trigonometrical tables for the decimal division of the circle, and in 1795 was a member of the superintendancy of weights and measures. M. le Gendre was also a member of the Institute from the formation of that body; and was named under the imperial government counsellor for life of the university. On the re-establishment of the king he became, in 1815, member of the council for public instruction, and in 1816, conjointly with M. Poisson, examiner of the candidates for the Polytechnical school. He published, besides the above-mentioned works, *Nouvelle Théorie de Paralleles*; *Nouvelles Méthodes pour la détermination des Orbites de Comètes*; *Supplément à l'Essai sur la Théorie des nombres*; *Exercices de Calcul integral*.

GENEALOGY, *n. s.* } Gr. *γεννα* and *λογος*.
GENEALOGICAL, *adj.* } That which pertains to
GENEALOGIST, *n. s.* } descents or families.
He who traces these descents. History of the regular succession in families: pedigree.

Thei schulden not teche otherwie neither ghyue tent to fablis: and *geneologies* that ben uncertain. *Wiclif. 1 Tim. i.*

The ancients ranged chaos into several regions; and in that order successively rising one from another, as if it was a pedigree or *genealogy*.

Burnet's Theory.

GENEALOGY, is more particularly a series or succession of ancestors, or progenitors; or a summary account of the relations and kindred of a person, or family, both in the direct and collateral lines. In various chapters and military orders, it is required that the candidates produce their genealogy, to show that they are noble by so many descents. The genealogical degrees are usually represented in circles, ranged over, under, and aside of each other.

The ancients had similar tables, which they called stemmata, from a Greek word, signifying a crown, or garland. See **CONSANGUINITY**.

The Jews were anxious to preserve their genealogies entire and uninterrupted; and this care on their part affords an argument of considerable importance with respect to the accomplishment of those prophecies that pertain to the Messiah.

Accordingly, in their sacred writings, we find genealogies carried on for above 3500 years. It is observed (Ezra ii. 62) that such priests as could not produce an exact genealogy of their families were not permitted to exercise their functions. Josephus says that they had, in his nation, an uninterrupted succession of priests for 2000 years; that the priests were particularly careful to preserve their genealogies, not only in Judæa, but also in Babylonia and Egypt; and that, wherever they were, they never married below themselves, and had exact genealogical tables prepared from those authentic documents which were kept at Jerusalem, and to which they had recourse; and that, in all their wars, persecutions, and calamities, they always were diligent in securing those documents, and in renewing them from time to time. Jerome says (ad Tit. iii.) that the Jews know so perfectly the genealogies, that they can repeat all the names from Abraham to Zerubbabel, as easily as their own. Nevertheless, since the war of the Romans against the Jews, about thirty years after the death of our Saviour, and since their entire dispersion in the reign of Adrian, the Jews have lost their ancient genealogies; and perhaps there is not even one of the sacerdotal race who can produce authentic proofs of his genealogy. This circumstance has been alleged by Christian writers as a presumptive proof of the actual advent of the Messiah, whose genealogy, corresponding to ancient predictions, the Jews are no longer able to trace, and consequently of the truth of Christianity.

The most natural order of genealogical tables seems to be to place the common stock at the head of the table, and the several collateral descendants and succeeding generations, each in a lower line appropriated to it; and not to make the order of generations to proceed from the left hand to the right, as is done by some. But every distinct generation should by all means be placed in a line, or space appropriated to itself; otherwise our ideas will be greatly confused. The order of birth in the same generation may easily be observed (as is done in some of our best tables) by placing the first-born to the left hand in the table, and the rest, according to the order of birth, to the right.

There is a variety of other relations, besides mere natural descent, of which it is very useful to have a clear idea, as the connexion by marriage, by adoption among the Romans, &c., by which different families are intermixed. And it is possible, by different kinds of lines, joining the names so connected, how remote soever, in the table of generation, to express all those relations without the use of words. But as the attempt to express them all by characters disfigures the table with a great variety of lines, many of them of considerable length, and extending themselves in every direction, it seems most convenient to express natural descent only by characters, and to subjoin to each name an account, in words, of all its other connexions, referring at most from one to another, by marks contrived for that purpose. This method Rapin has taken in the excellent genealogical tables in his History of England. Valuable tables of

genealogy may be seen at the end of Petavius's Chronology.

GENERABLE, *adj.* Lat. *genero*. That which may be produced.

GENERAL, *adj.* } Fr. *general*; Latin
GENERALITY, *n. s.* } *generalis*. Here the
GENERALLY, *adv.* } simple or origin and
GENERALNESS, *n. s.* } root meaning of the
GENERALTY, *n. s.* } word general is a
GENERAL, *n. s.* } whole as opposed to
GENERALISSIMO, *n. s.* } particulars; and under

a great variety of modifications it preserves this meaning throughout; thus it is applied to things; when to persons, as general and generalissimo, it is an official term of honor given to those who have supreme command over one or more armies.

Flaterie is *generally* wrongful preising.

Chaucer. The Persones Tale.

Because the curiosity of man's wit doth with peril wade further in the search of things than were convenient, the same is thereby restrained unto such *generalities* as, every where offering themselves, are apparent to men of the weakest conceit.

Hooker.

They, because some have been admitted without trial, made that fault general which is particular.

Whitgift.

I've been bold,

For that I knew it the most *general* way.

Shakspeare.

Neither my place, nor ought I heard of business, Hath raised me from my bed; nor doth the *general* care

Take hold on me; for my particular grief

Ingluts and swallows other sorrows.

Id.

I am not a woman to be touched with so many giddy fancies as he hath *generally* taxed their whole sex withal.

Id.

Nor would we deign him burial of his men,

Till he disbursed at St. Colmeskill Isle

Ten thousand dollars to our *general* use.

Id.

Necessity, not extending to the *generality*, but resting upon private heads.

Raleigh's Essays.

Generally we would not have those that read this work of Sylva Sylvarum, account it strange that we have set down particulars untried.

Bacon.

Symachus the orator in his dayes, to procure a *general* toleration, used this argument, 'Because God is immense and infinite, and his nature cannot be perfectly known, it is convenient he should be as diversely worshipped, as every man shall perceive or understand.'

Burton's Anatomy of Melancholy.

In like sort amongst Papists, fasting at first was *generally* proposed as a good thing.

Id.

Commission of *generalissimo* was likewise given to the prince.

Clarendon.

Nor failed they to express how much they praised, That for the *general* safety he despised

His own.

Milton's Paradise Lost.

The wall of Paradise upsprung,

Which to our *general* sire gave prospect large

Into his nether empire neighbor'ing round.

Milton.

The municipal laws of this kingdom are of a vast extent, and include in their *generality* all those several laws which are allowed as the rule of justice and judicial proceedings.

Hale.

Yet they by restless toil became at length

So proud and confident of their made strength,

That they with joy their boasting *general* heard

Wish then for that assault he lately feared.

Marvell.

Pompey had deserved the name of great; and Alexander, of the same cognomination, was *generalissimo* of Greece.

Broune.

They had with a *general* consent, rather springing by the *generalness* of the cause than of any artificial practice, set themselves in arms. *Sidney.*

A *general* is one that hath power to command an army. *Locke.*

In particulars our knowledge begins and so spreads itself by degrees to *generals*. *Id.*

A *general* idea is an idea in the mind, considered there as separated from time and place, and so capable to represent any particular being that is conformable to it. *Id.*

The *generals* on the enemy's side are inferior to several that once commanded the French armies. *Addison on the War.*

The war's whole art each private soldier knows, And with a *general's* love of conquest glows. *Addison.*

I have considered Milton's *Paradise Lost* in the fable, the characters, the sentiments, and the language; and have shewn that he excels, in *general*, under each of these heads. *Id.*

The *generality* of the English have such a favourable opinion of treason, nothing can cure them. *Id.*

They publish their ill-natured discoveries with a secret pride, and applaud themselves for the singularity of their judgment, which has found a flaw in what the *generality* of mankind admires. *Id.*

Though what he learns he speaks, and may advance Some *general* maxims, or be right by chance. *Pope.*

Generally speaking, they have been gaining ever since, though with frequent interruptions. *Swift.*

To conclude from particulars to *generals* is a false way of arguing. *Broome.*

Where the author speaks more strictly and particularly on any theme, it will explain the more loose and *general* expressions. *Watts.*

The knights oppressed with wounds and travel past,
Did soon retire, and now were near to fainting :
With that a winged post him speeded fast
The *general* with these heavy news acquainting :
He soon refreshed their hearts that 'gan to tire.
But, let our weary muse awhile respire :
Shade we our scorched heads from Phebus' parching fire. *Fletcher's Purple Island.*

I mean only to say that ludicrous writing in *general* is extremely subject to the injuries of time : and that therefore the wit and humour of the ancient Greeks and Romans might have been far more exquisite than we at present have any positive reason to believe. *Beattie.*

Why *general*, if he hath no greater fault
In war than love, he had better lead the assault. *Byron.*

The second object was to profit by
The moment of the *general* consternation,
To attack the Turk's flotilla which lay nigh
Extremely tranquil anchored at its station. *Id.*

GENERAL, in military affairs, is an officer in chief, to whom the prince or senate of a country have judged proper to intrust the command of their troops. He holds this important trust under various titles : as captain-general in England and Spain ; feldt-mareschal in Germany ; or mareschal in France. In the British service the king is in his own proper right captain-general. He has ten aides-de-camp ; every one of whom enjoys the brevet rank of full colonel in the army. Next to his majesty is the commander in chief. But the more *general* use of the word is with regard to the commander of an army in actual service in the field. The office of a *general* is to regulate the march and encampment of

the army ; in the day of battle to choose out the most advantageous ground ; to make the disposition of the army ; to post the artillery, and, where there is occasion, to send his orders by his aides-de-camp. At a siege he is to cause the place to be invested, to regulate the approaches and attacks, to visit the works, and to send out detachments to secure the convoy and foraging parties. In the day of battle, the station of a *general* is with the reserve, where he remains so situated, that he can see every thing which is going forward ; and by means of his own observations, or the communications of his aides-de-camp, he is enabled to send reinforcements, as the exigencies of the conflict may require. For *LIEUTENANT-GENERAL*, *MAJOR-GENERAL*, *BRIGADIER-GENERAL*, &c., see their respective articles.

GENERAL, *ADJUTANT*, in the art of war, one who attends the *general*, assists in councils, and carries the *general's* orders to the army. He distributes the daily orders to the majors of brigade. He is likewise charged with the general detail of the duty of the army. The majors of brigade send every morning to the adjutant-general an exact return, by battalion and company, of the men of his brigade. In a day of battle he sees the infantry drawn up ; after which he places himself by the *general*, to receive any orders which may regard the corps of which he has the detail. In a siege he orders the number of workmen demanded, and signs the warrant for their payment. He receives the guards of the trenches at their rendezvous, and examines their condition ; he gives and signs all orders for parties. He has an orderly serjeant from each brigade of infantry in the line, to carry such orders as he may have occasion to send from the *general*.

GENERAL is also used for the chief of an order of monks ; or of all the houses and congregations established under the same rule ; as, the *general* of the Franciscans, Cisterrians, &c.

GENERAL is also used for a particular march, or beat of drum ; being the first which gives notice, commonly in the morning early, for the infantry to be in readiness to march.

GENERAL TERMS, among logicians, those which are made the signs of general ideas. See *LOGIC* and *METAPHYSICS*.

GENERALISSIMO is called also captain-general, and simply *general*. He commands all the military powers of a nation ; gives orders to all the other general officers, and receives no orders himself but from the king. M. Balzac observes, that cardinal Richelieu first coined this word, of his own absolute authority, upon his going to command the French army in Italy.

GENERANT, <i>n. s.</i>	} Lat. <i>genero</i> . To cause ; produce ; beget or give life : the act of production : progeny ; family ; an age or period : the faculty of propagation or fruitfulness. In all these and similar meanings the radix is increase. The power or being by whose agency this is effected.
GENERATE, <i>v. a.</i>	
GENERATION, <i>n. s.</i>	
GENERATIVE, <i>adj.</i>	
GENERATOR, <i>n. s.</i>	

Great father he of *generation*
Is rightly cold, the author of life and light :
And his faire sister for creation

Minist'reth matter fit, which tempred right
With heate and humour, breeds the living wight.
Spenser. Faerie Queene.

Every where throughout all generations and ages of
the Christian world, no church ever perceived the
word of God to be against it. *Hooker.*

Y^e are a dog.

— Thy mother's of my generation : what's she, if
I be a dog ? *Shakspeare. Timon.*

The bar'rous Scythian,

Or he that makes his generation messes,
To gorge his appetite, shall to my bosom
Be as well neighboured. *Id. King Lear.*

A marvellous number were excited to the conquest
of Palestine, which with singular virtue they per-
formed, and held that kingdom some few generations.

Raleigh's History.

He gave to all, that have life, a power generative,
thereby to continue their species and kinds. *Id.*

Sounds are generated where there is no air at all.

Bacon.

Seals make excellent impressions ; and so it may
be thought of sounds in their first generation : but then
the dilatation of them, without any new sealing,
shews they cannot be impressions. *Id.*

Those creatures which being wild generate seldom,
being tame, generats often. *Id.*

The last of these vegetal faculties is generation,
which begets another by means of seed, like unto
itself, to the perpetual preservation of the species.

Burton. Anatomy of Melancholy.

Had I the power of creation

As I have of generation

Where I the matter must obey,

And cannot work plate out of clay,

My creatures should be all like thee,

'Tis thou should'st their idea be.

Cowley.

God created the great whales, and each

Soul living, each that crept, which plenteously

The waters generated by their kinds. *Milton.*

He longer will delay, to hear thee tell

His generation, and the rising birth

Of nature, from the unapparent deep. *Id.*

Or find some other way to generate

Mankind. *Id. Paradise Lost.*

Some believe the soul made by God, some by
angels, and some by the generant ; whether it be im-
mediately created or traduced hath been the great ball
of contention. *Glanville's Scep sis.*

Imagination assimilates the idea of the generator
into the reality in the thing engendered. *Browne.*

In grains and kernels the greatest part is but the
nutriment of that generative particle, so disproportion-
able unto it. *Id.*

If we deduce the several races of mankind in the
several parts of the world from generation, we must
imagine the first numbers of them, who in any place
agree upon any civil constitutions, to assemble as so
many heads of families whom they represent.

Temple.

Whatever generates a quantity of good chyle, must
likewise generate milk. *Arbuthnot.*

If there hath been such a gradual diminution of the
generative faculty upon the earth, why was not there
the like decay in the production of vegetables ?

Bentley.

And if one lady's slip could leave a crime on
All generations, I should like to know
What pedigree the best would have to show ?

Byron.

And when his bones are dust, his grave a blank,
His station, generation, even his nation,

Become a thing, or nothing, save to rank
In chronological commemoration,

Some dull MS. oblivion long has sank,
One gravenstone found in a barrack's station
In digging the foundation of a closet
May turn his name up as a rare deposit.

Id. Don Juan.

To GENERATE, in music, is used to signify the
operation of that mechanical power in nature,
which every sound has in producing one or
more different sounds. Thus any given sound,
however simple, produces, along with itself, its
octave, and two other sounds extremely sharp,
viz. its twelfth above, that is to say, the octave of
its fifth ; and the other the seventh above, or, in
other words, the double octave of its third major.
Whether we suppose this procreation of sounds
to result from an aptitude in the texture and mag-
nitude of certain particles in the air, for convey-
ing to our ears vibrations that bear those pro-
portions one to another, as being determined at
once by the partial and total oscillations of any
musical string ; or from whatever economy of
nature we choose to trace it ; the power of one
sound thus to produce another, when in action,
is said to generate. The same word is applied,
by signior Tartini, and his followers, to any two
sounds which, simultaneously heard, produce a
third.

GENERATED, or GENITED, *part. adj.* is
used, by some mathematical writers, for what-
ever is produced, either in arithmetic, by the
multiplication, division, or extraction of roots ;
or, in geometry, by the invention of the contents,
areas, and sides ; or of extreme and mean pro-
portionals, without arithmetical addition and
subtraction.

GENERATING LINE, or FIGURE, in geo-
metry, is that which, by its motion of revolution,
produces any other figure, plane or solid. See
GENESIS.

GENERATION is also used, though somewhat
improperly, for genealogy, or the series of
children issued from the same stock. Thus the
gospel of St. Matthew commences with the book
of the generation of Jesus Christ, &c. The lat-
ter and more accurate translators, instead of ge-
neration use the word genealogy.

GENERATION, in mathematics, is used for the
formation or production of any geometrical fig-
ure ; as of equations, curves, solids, &c.

GENERATION, in physiology. See ANATOMY.

GENERATION OF FISHES. See ICHTHYOLOGY,
and ZOOLOGY.

GENERATION OF INSECTS. See ENTOMOLOGY,
and ZOOLOGY.

GENERATION OF PLANTS. See BOTANY.

GENERATOR, in music, signifies the principal
sound or sounds by which others are produced.
Thus the lowest C for the treble of the harpsi-
chord, besides its octave, will strike an attentive
ear with its twelfth above, or G in alt, and with
its seventeenth above, or E in alt. The C,
therefore, is called their generator, the G and E
its products or harmonics. But in the approxi-
mation of chords, for G, its octave below is sub-
stituted, which constitutes a fifth from the gene-
rator, or lowest C ; and for E, is likewise sub-
stituted its fifteenth below, which, with the above
mentioned C, forms a third major. To the low-
est notes, therefore, exchanged for these in alt by

substitution, the denominations of products or harmonies are likewise given, whilst the C retains the name of their generator. But still, according to the system of Tartini, two notes in concord, which when sounded produce a third, may be termed the concurring generators of that third.

GENERICAL, *adj.* } Fr. *generique*; Lat. *GENERIC*, *adj.* } *genus*. That which
GENERICALLY, *adv.* } comprehends the genus without reference to the species.

The word consumption being applicable to a proper, and improper to a true and bastard consumption, requires a *generical* description quadrate to both.

Harvey on Consumptions.

These have all the essential characters of sea-shells, and shew that they are of the very same species gravity with those to which they are so *generically* allied.

Woodward.

Though wine differs from other liquids, in that it is the juice of a certain fruit; yet this is but a general or *generick* difference; for it does not distinguish wine from cyder or perry; the specific difference of wine, therefore, is its pressure from the grape.

Watts's Logic.

GENERICAL NAME, in natural history, the word used to signify all the species of natural bodies, which agree in certain essential and peculiar characters, and therefore comprehending all of the same genus, family or kind; so that the word used as the *generical* name equally expresses every one of the genus, and other words expressive of the peculiar qualities or figures of each species are added, in order to denote them distinctly, and make up what is called the specific name. See BOTANY and ZOOLOGY.

GENEROUS, *adj.* } Fr. *generosité*; Lat. *GENEROUSLY*, *n. s.* } *generositas*. The dis-
GENEROUSLY, *adv.* } position or act of li-
GENEROUSNESS, *n. s.* } berality and magnanimity; courage and strength in animals; nobility of birth, mind, or heart; and the exercise of these several qualities.

Lo here Semiramis, the Quene of grete Babilon,
The moste *generous* gem and the floure of lovly favor;
Whose excellent power from Mede unto Septentrion,
Flourished in her regally, as a mightie conqueror.

Chaucer. The Nine Ladies Worthie.

A cup of *generous* wine to those whose minds are still or motionless, is, in my opinion, excellent physie.

Burton.

So the imperial eagle does not stay
Till the whole carcase he devour,
As if his *generous* hunger understood
That he can never want plenty of food,
He only sucks the tasteful blood.

Cowley.

Having in a digestive furnace drawn off the ardent spirit from some good sack, the phlegm, even in this *generous* wine, was copious.

Boyle.

A *generous* virtue of a vigorous kind,
Pure in the last recesses of the mind.

Dryden.

When all the gods our ruin have foretold,
Yet *generously* he does his arms withhold.

Id.

It would not have been your *generosity*, to have passed by such a fault as this.

Locke.

Can he be better principled in the grounds of true virtue and *generosity* than his young tutor is?

Id. on Education.

When from his vest the young companion bore
The cup the *generous* landlord owned before,
And paid profusely with the precious bowl
The staid kindness of this churlish soul.

Parnell.

Actæon spies

His opening bounds, and now he hears their cries:
A *generous* pack.

Addison.

Is it possible to conceive that the overflowing *generousness* of the divine nature would create immortal beings with mean or envious principles?

Collier on Kindness.

The *generous* critic fanned the poet's fire,
And taught the world with reason to admire.

Pope.

She speaks, behaves, and acts, just as she ought,
But never, never reached one *generous* thought.

Id.

That *generous* boldness to defend

An innocent or absent friend.

Swift.

Those who in southern climes complain,

From Phæbus' rays they suffer pain,

Must own that pain is well repaid,

By *generous* wines beneath a shade.

Id.

GENEROSITY, the name of an order of knighthood, established in 1685, by Frederick III., when elector of Brandenburg. The badge was a gold cross of eight points enamelled *azure*, bearing in the centre La Générosité, and pendent to a blue riband.

GENESEE, a level county of the state of New York, North America, erected in 1802 from Ontario county, and situated between 42° 30' and 43° 22' N. lat. It is bounded by that county on the east, Lake Ontario on the north, Allegany county, and a small angle of Cataraugus county, on the south, and on the west by Niagara county. Its area is reckoned at 1743 square miles. It is generally fertile and has but little of waste. The alluvial flats on the shores of the river are distinguished for their superior richness. The chief town is Batavia.

GENESEE, a river of the United States, which rises in Pennsylvania, and runs through the western part of the state of New York into Lake Ontario, between Gates and Boyle. At its entrance is a harbour of this name. Within five miles of its mouth are falls of seventy-five and ninety-six feet in height, from which the river is navigable for boats seventy miles, when other falls occur from sixty to ninety feet in height, one mile apart, south of Leicester.

GENESIS, *n. s.* Gr. *γενεσις*. The first book of Moses, so called because it treats of the origin of all things.

GENESIS, the first book of the Old Testament, contains the history of the creation, and the lives of the first patriarchs. This book stands at the head of the Pentateuch. Its author is held to be Moses: it contains the relation of 2369 years, viz. from the beginning of the world to the death of Joseph. The Hebrews called it Bere-schith, בְּרֵאשִׁית, in the beginning, because beginning with that word. The Greeks gave it the name Γενεσις, q. d. production or generation, because it begins with the history of the production, or generation, of all beings. This book, besides the history of the creation, contains an account of the original innocence and fall of man; the propagation of mankind; the general defection and corruption of the world; the deluge; the restoration of the world; the division and peopling of the earth; and the history of the first patriarchs to the death of Joseph. The human means by which Moses might obtain information on the subject of the fall, &c., are worthy of more notice than a superficial reader would observe, for the account of so

many years had to travel through but few hands; for from Adam to Noah there was one man, viz. Methuselah, who lived so long as to see them both: in like manner Shem conversed with Noah and Abraham; Isaac with Abraham and Joseph, from whom the facts recorded in this book might easily be conveyed to Moses by Amram, who was contemporary with Joseph.

GENESIS, in geometry, denotes the formation of a line, plain, or solid, by the motion or flux of a point, line or surface. See **FLUXIONS**. The genesis or formation, e. g. of a globe or sphere, is conceived by supposing a semicircle to revolve upon a right line, drawn from one extreme thereof to the other, called its axis, or axis of circumvolution: the motion or revolution of that semicircle is the genesis of the sphere, &c. In the genesis of figures, &c., the line or surface that moves is called the describent; and the line round which, or according to which, the revolution or motion is made, the dirigent.

GENET, *n. s.* Fr. The word originally signified a horseman, and perhaps a gentleman or knight. A small-sized, well-proportioned, Spanish horse.

You'll have your nephews neigh to you; you'll have coursers for cousins, and *genets* for germanes.

Shakspeare. Othello.

He shews his statue too, where placed on high,
The *genet* underneath him seems to fly. *Dryden.*

It is no more likely that frogs should be engendered in the clouds, than Spanish *genets* be begotten by the wind. *Ray.*

GENETHLIACAL, *adj.* } Gr. γενεθλι. What-
GENETHLIACS, *n. s.* } ever refers to cal-
GENETHLIAT'IC, *n. s.* } culating' nativities
from the stars which were predominant at birth.

The night immediately before he was slighting the art of those foolish astrologers, and *genethliacal* ephe-merists, that used to pry into the horoscope of nativities.

Hovell's Vocal Forest.

The truth of astrological predictions is not to be referred to the constellations; the *genethliatics* conjecture by the disposition, temper, and complexion of the person. *Draumond.*

GENETHLIACI, in astrology, from γενεθλι, origin, generation, or nativity, persons who erect horoscopes, and pretend to foretell what shall befall a man by means of the stars which presided at his nativity. The ancients called them chaldaei, and mathematici. Hence the several civil and canon laws, made against mathematicians, only respect the *genethliaci*, or astrologers. They were ordered to be expelled Rome by a formal decree of the senate; and yet found so much protection from the credulity of the people, that they remained therein unmolested. Hence an ancient author speaks of them as hominum genus, quod in civitate nostra semper et vetabitur et retinebitur.

GENESIUS (Josephus), one of the Byzantine historians of the tenth century. He flourished about the year 940, and wrote, by order of Constantine Porphyrogenitus, a history of Constantinople, in four books: it extends from Leo the Armenian, to Basilus the Macedonian. It was imperfectly printed in 1733 at Venice, by Pasquali, in his edition of the Byzantine historians.

GENEVA, *n. s.* A corruption of French *genèvre*; It. *ginepro*; Lat. *juniperus*, a juniper-berry; a spirit distilled from the juniper-berry.

The best *geneva* we now have, is made from an ordinary spirit, distilled a second time with an addition of some juniper-berries; but the original liquor of this kind was prepared in a very different manner.

Dr. A. Rees.

GENEVA, a city, and the capital of a canton of Switzerland, is situated on the western shore of the lake of that name, on the confines of France and Savoy. The Rhone has here its efflux from the lake and divides Geneva into three parts, the city, the town or quarter of St. Gervais, and the island.

Its situation and surrounding scenery (among which Mont Blanc rises pre-eminent), with its political history, and literary fame, render Geneva one of the most interesting cities in Europe. The lofty houses towering above the walls, and enclosed by the verdure of the glacis, give to the distant prospect the appearance of an assemblage of country seats, encompassed with gardens and lawns. On entering the city, however, the streets are found not regular, and the principal one is encumbered with a row of shops on each side, between the road and a sheltered foot-path. But the upper town contains many elegant houses. The public buildings of note are the college, the cathedral, the hotel de ville, the public library, the theatre, the hospital, and the arsenal. The library was founded at the Reformation, and contains about 50,000 volumes. The hospital, which is very extensive, was formerly a monastery. The town-house is chiefly remarkable for the manner of ascending to its upper floors, which is by an inclined plane, instead of a staircase. The city is supplied with water from the Rhone, by a machine which raises it to the height of 100 feet.

The Genevese, partaking early of the benefits of the Reformation, exhibit, very similarly to our Scottish neighbours, the advantages of universal education and industry. The morals of the lowest orders are in general exemplary, and the traveller is not here shocked by those objects of distress which infest almost every other continental city. Wages are on the whole high; and when a family is really unable to support itself by its own labor, it receives relief from various well directed funds. On the other hand, the excess of luxury is discouraged by sumptuary laws, and it is only since 1764 that the city has contained a theatre. Watch-making is the staple manufacture, and it is said to employ 7000 persons; manufactures of silk, woollen, muslin, chintz, and porcelain are also carried on; as well as the making of mathematical, surgical, and other instruments, jewellery, toys, &c. The richer citizens are merchants of extensive agency, and conduct money operations in all the public funds of Europe.

Literary societies abound among the citizens, and a decided taste for reading is prevalent in both sexes. Several private individuals possess good collections of natural history. The principal are those of De Luc, Boissier, and Sausure, the son of the traveller of that name: they are shown to strangers with great readiness. Besides the public library, there is a botanical garden, a museum of paintings, a public school, and a university. The school is conducted by eleven masters, and the university by twenty-two

professors; the number of students at the latter amounting generally to 1000.

The Physical and Natural History Society of Geneva was founded in 1790, by a number of those distinguished individuals who devoted themselves to the pursuits of science. The principal papers read at their meetings found a place in the *Philosophical Transactions*, in the *Memoirs of the Institute*, or in those of the Academies of Berlin and Turin; while those which were of a less elaborate nature were transmitted to the popular scientific journals of the day. In consequence, however, of the deliverance of Geneva from a foreign yoke, all the public institutions received a vigorous impulse; and the Physical Society, strengthened with an accession of members, as well as of zeal, has of late found itself in a situation to print its own *Memoirs*.

Calvin and Casaubon distinguished Geneva by their residence; it also ranks among its illustrious men Rousseau, Tronchin, Bonnet, Saussure, Mallet de Pan, Necker, Berenger, Picot, Pictet, Boissier, and Sismondi. In the delightful environs of this city are Ferney, once the residence of Voltaire; and Copet, the retreat of M. Necker, and of his accomplished daughter the baroness de Staël.

In the time of Charlemagne the city and territory of Geneva made part of his empire; and under his successors, they became subject to the German emperors. By reason of the imbecility of these princes, however, the bishops of Geneva acquired such authority over the inhabitants, that the emperor had no other means of counterbalancing it than by augmenting the privileges of the people. In those barbarous ages also the bishops and counts had constant disputes, of which the people took the advantage; and by combining sometimes with one, and sometimes with the other, they obtained an extension of their privileges from both. The house of Savoy at length purchased the territory, and succeeded the counts with additional power. The bishops and people, therefore, united to resist their encroachments: and, during this period, the government was strangely complicated, by the various pretensions of the three parties. The counts of Savoy, however, had at last the address to dissolve the union between the bishops and citizens, by procuring the episcopal see for their brothers, and illegitimate children; by which means their power became gradually so extensive, that towards the commencement of the sixteenth century, Charles III. of Savoy, though the government was accounted republican, obtained an almost absolute authority over the people, and exercised it in a most unjust and arbitrary manner. Thus violent commotions took place; and the citizens became divided into two parties, one of which, viz. the patriots, were styled *Eidgenossen*, or confederates; the partisans of Savoy being disgraced by the appellation of *Mammellues*, or slaves. The true period of Genevan liberty may therefore be considered as commencing with the treaty concluded with Berne and Fribourg in 1526; in consequence of which the duke was soon deprived of his authority, the bishop driven from the city, and the reformed religion and a republican form of government

introduced. A long war commenced with Savoy on this account; but the Genevans proved superior to their enemies, partly by their own bravery and partly by the assistance of the inhabitants of Berne.

In 1584 the republic concluded a treaty with Zurich and Berne, by which it became allied to the Swiss cantons. The house of Savoy made their last attempt against Geneva in 1602, when the city was treacherously attacked in the night time during a profound peace; 200 soldiers had scaled the walls, and got into the town before any alarm was given; but they were repulsed by the desperate valor of a few citizens, who perished in the encounter. A petard had been fastened to one of the gates by the Savoyards; but the gunner was killed before it could be discharged. The war occasioned by this treachery was next year concluded by a solemn treaty, which has ever since been observed on both sides; though the independence of Geneva was never formally acknowledged by the king of Sardinia till 1754. The restoration of tranquillity from without, in consequence of the above treaty, was, however, soon followed by the flames of internal discord, so common in popular governments; so that, during the whole of the seventeenth century, the history of Geneva affords little more than an account of the struggles betwixt the aristocratical and popular parties. About the beginning of the eighteenth century the power of the grand council was become almost absolute; but, to restrain its authority, an edict was procured in 1707 by the popular party, enacting that every five years a general council of the citizens and burghers should be summoned to deliberate upon the affairs of the republic. In consequence of this law, a general assembly was convened in 1712; and the very first act of that assembly was to abolish the edict by which they had been convened. A proceeding so extraordinary can scarcely be accounted for on the principles of popular fickleness and inconstancy. Rousseau, in his *Miscellaneous Works*, ascribes it to the artifices of the magistrates, and the equivocal terms marked on the billets then in use. For the question being put, 'Whether the opinion of the council for abolishing the periodical assemblies should pass into a law?' the words approbation or rejection, put upon the billets by which the votes were given, might be interpreted either way. Thus, if the billet was chosen on which the word approbation was written, the opinion of the councils which rejected the assemblies was approved; and by the word rejection, the periodical assembly was rejected of course. Hence several of the citizens complained that they had been deceived, and that they never meant to reject the general assembly; but only the opinion of the councils.

In consequence of the abolition of the general assemblies, the power of the aristocratical party was greatly augmented, till at length the inhabitants, exerting themselves with uncommon spirit and perseverance, found means to limit the power of the magistrates, and enlarge their own rights. In 1776, as Mr. Coxé informs us, the government might be considered as a mean betwixt that of the aristocratical and popular cantons of Switzerland. The members of the senate, or little

council of twenty-five, enjoyed in that capacity several very considerable prerogatives. By them half the members of the great council were named; the principal magistrates were supplied from their own body; they convoked the great and general councils, deliberating previously upon every question which was to be brought before these councils. They were vested also with the chief executive power, the administration of finances, and had, in a certain degree, the jurisdiction in civil and criminal causes. Most of the smaller posts were likewise filled by them, and they enjoyed the sole privilege of conferring the burghership. These, and other prerogatives, however, were balanced by those of the great council, and the privileges of the general council. The former had a right to choose the members of the senate from their own body; receiving appeals in all causes above a certain value, pardoning criminals, &c., besides which they had the important privilege of approving or rejecting whatever was proposed by the senate to be laid before the people. The general council, or assembly of the people, was composed of the citizens and burghers of the town, their number, in general, amounting to 1500, though usually not more than 1200 were present; the remainder residing in foreign countries, or being otherwise absent. They met twice a year, chose the principal magistrates, approved or rejected the laws and regulations proposed by the other councils, imposed taxes, contracted alliances, declared war or peace, and nominated half the members of the great council, &c. But the principal check to the power of the senate arose from the right of re-election, or the power of annually expelling four members from the senate at the nomination of the syndics or principal magistrates, and from the right of representation. The syndics were four in number, chosen annually from the senate by the general council; and three years elapsed before the same members could be again appointed. In choosing these magistrates, the senate appointed from its own body eight candidates, from whom the four syndics were to be chosen by the general council. The latter, however, had it in their power to reject not only the first eight candidates, but also the whole body of senators in succession; in which case four members of the senate retired into the great council, and their places were filled by an equal number from that council. As to the power of representation, every citizen had the privilege of applying to the senate to procure a new regulation in this respect, or of remonstrating against any act of the magistracy. To these remonstrances the magistrates were obliged to give an explicit answer; for if a satisfactory answer was not given to one, a second was immediately presented. The representation was made by a greater or smaller number of citizens, according to the importance of the point in question. Since 1776, however, several changes have taken place. This right of re-election, which the aristocratical party were obliged to yield to the people in 1768, soon proved very disagreeable, being considered by the former as a kind of ostracism; for which reason they caught at every opportunity of procuring its abolition. They were now distin-

guished by the title of negatives, while the popular party had that of representants; and the point in dispute was the compilation of a new code of laws. This measure the negatives opposed, as supposing that it would tend to reduce their prerogatives; while, on the other hand, the representants used their utmost endeavours to promote it, in hopes of having their privileges augmented by such means. At last, in January 1777, the negatives were obliged to comply with the demands of their antagonists; and a committee for forming a new code of laws was appointed by the concurrence of the little, great, and general councils. The committee was to last for two years, and the code to be laid before the three councils, for their joint approbation or rejection. A sketch of the first part of the code was presented to the little and great councils on Sept. 1st, 1779, that they might profit by their observations before it was presented to the general council. Great disputes arose: and at length it was carried by the negatives that the code should be rejected, and the committee dissolved. The opposite party complained of this as unconstitutional, and violent disputes ensued; the issue of which was, that the great council offered to compile the code, and submit it to the decision of the public. This did not give satisfaction to the popular party, who considered it as insidious: the contentions revived with more fury than ever, until at length the negatives supposing, or pretending to suppose, that their country was in danger, applied to the guarantees France, Zurich, and Berne, intreating them to protect the laws and constitution. This was productive of no good effect; so that the negatives found no other method of gaining their point than by sowing dissension among the different classes of inhabitants. The natives were discontented and jealous on account of many exclusive privileges enjoyed by that class named citizens: they were besides exasperated against them for having, in 1770, banished eight of the principal natives, who pretended that the right of burghership belonged to the natives as well as to the citizens, and demanded that this right should be gratuitously conferred instead of being purchased. The negatives, in hopes of making such a considerable addition to their party, courted the natives, by all the methods they could think of, promising, by a public declaration, that they were ready to confer upon them those privileges of trade and commerce which had hitherto been confined exclusively to the citizens. The designs of the negatives were likewise openly favored by the court of France, and despatches were even written to the French resident at Geneva, to be communicated to the principal natives who sided with the aristocratic party. The attorney-general, conceiving this mode of interference to be highly unconstitutional, presented a spirited remonstrance; by which the French court were so much displeased, that they procured his deposition from his office; and thus their party was very considerably increased among the natives. The representants endeavoured to conciliate the favor of the same party, and even promised what they had hitherto opposed in the strongest manner, viz. to facilitate the acquisition of the burgher-

ship, and to bestow it as the recompense of industry and good behaviour. Thus two parties were formed among the natives themselves; and the dissensions becoming every day worse and worse, a general insurrection took place on the 5th of February 1781.

The representants seized the avenues of the city, and though they agreed to an augmentation of the commercial privileges of the natives, they absolutely refused to fulfil their promise of awarding the burghership to them. Alarmed, however, at the number and threats of the natives, and prevailed upon by the deputies from Zurich and Berne, who had been sent to conciliate the differences, they laid down their arms; and this was no sooner done, than the same deputies declared the edict in favor of the natives to be null and illegal. The senate declared themselves of the same opinion; and maintained, that the assent of the councils had been obtained only through fear of the representants who were under arms, and whom none at that time durst oppose. The representants, exasperated by this treacherous proceeding, presented another remonstrance on the 18th March, 1782, summoning the magistrates once more to confirm the edict; but a month afterwards, received the laconic answer, that 'the government was neither willing nor able to confirm it.' At last, however, but not until a universal tumult had ensued, and the body of the citizens had deposed several members of both councils, the great council executed the edict for conferring the burghership upon a number of the natives; and appointed a committee of safety, composed of eleven members, with considerable authority.

The conciliation of the opposite party was now clearly the course of safety; for the French and Sardinians had both advanced towards the city to support its pretensions. But the French general, Jaucourt, proposed such humiliating terms to those in power, that it was unanimously determined to resist his entrance. The fortifications were strengthened; at the hour in which it was expected that an attack would begin, the ramparts were filled with defenders; and though the most zealous of the popular party had calculated only on 3000, upwards of 5000 appeared in the public cause. The French general, however, justly alarmed for the prisoners, who were now in imminent danger, again prolonged the period proposed for the capitulation. By these repeated delays, the ardor of the defendants began to abate. At last the committee of safety themselves, who had so strenuously declared for hostilities, entirely changed their mind. A new council, composed of about 100 citizens, was formed; in which the chiefs of the popular party, by various manoeuvres, first intimidating, and then endeavouring to persuade the members, of the necessity of surrendering, found means, first to take the thoughts of the people entirely off from the defence of the city, and then to engage them in a scheme of general emigration. A declaration was now drawn up to be delivered to the syndics with the keys of the city; the chiefs summoned the principal officers from their posts, ordered the cannon of several batteries to be rendered unfit for service,

and at last took care of themselves by quitting the town, followed by large bodies of the people; so that when the Sardinians entered it in the morning, they found it almost deserted. This was followed by the restoration of the former magistrates, a complete subjection of the popular party, and the establishment of a military government.

The changes which took place on this occasion, were: 1. An abolition of the right of re-election. 2. The abolition of that right by which the general council nominated half the vacancies in the great council. 3. The right of remonstrating was taken from the citizens at large, and vested in thirty-six adjuncts, who might be present in the great council the first Monday of every month. 4. The introduction of the grabeau, or annual confirmation of the members of the senate and of the great council, vested entirely in the latter. By this law, part of the authority both of the senate and general council was transferred to the great council; and, by subjecting the senate to this annual revision, its power was greatly lessened, and it was made, in fact, dependent upon the general council. 5. The circles or clubs in which it was customary to convene the citizens, and all public assemblies whatever, were prohibited: and so rigorously was this carried into execution, that even the Society of Arts was forbidden to meet. 6. The militia were abolished; firing at marks, even with bows and arrows, was prohibited, and the town, instead of being guarded by its own citizens, was now put under the care of 1000 foreign soldiers, whose colonel and major were both to be foreigners. These troops were to take an oath of fidelity to the republic, and of obedience to the great council and the committee of war; but were under the immediate command and inspection of the latter, and subject to the superior control of the former. 7. No person was permitted to bear arms, whether citizen, native, or inhabitant. It was not to be expected, that this constitution would be agreeable to people who had such a strong sense of liberty, and had been accustomed to put such a value upon it as the Genevans. But after the public resentment had time to subside, most of those who fled at first, returned; and, in the opinion of Mr. Coxe, not more than 600 finally left their country, on account of the revolution in 1782.

Above 1000 persons, however, of both sexes, applied to the earl of Temple, then lord lieutenant of Ireland, expressing a desire to settle in that kingdom: and the proposal met with such general approbation, that the Irish parliament voted £50,000 towards defraying the expenses of their journey, and affording them a proper settlement. Lands were purchased for £8000 near Waterford; part of New Geneva was actually completed at the expense of £10,000; a charter was granted with very considerable privileges; the standard of gold was altered for the accommodation of the watch manufacturers; and the foundation of an academy laid upon a useful and liberal plan. Several Genevans landed in Ireland, in July 1783; but, when the nation had expended nearly £30,000 on the scheme, it was sud-

denly abandoned by all parties. Several of the emigrants finally settled at Constance and at Brussels.

In 1789 the people again rose on the magistracy, dissatisfied with a new regulation respecting the price of bread. The soldiers of the city on the 29th of January were driven from their posts and disarmed, while the gates were seized by the people. The solicitor-general at this time advocated the ancient liberties of the people, urging for them, however, those moderate demands which were received with universal satisfaction. A new edict of pacification was now published, under the title of *Modifications à l'Édition de 1782*, and approved by the senate, great council, and general council. The sons of the principal negatives frequented the circles of the burghers; and the magistrates obtained the confidence of the people, by dismissing the military, evacuating the barracks, and devoting them to the use of the university and public library. In a word, the constitution established in 1789, became a just medium between the too democratic form established in 1768, and the too aristocratic one of 1782. In 1798, however, the popular and aristocratic parties were both destined to feel the dire effects of the revolutionary principles of France, and their contiguity to that political volcano. The French had always actively promoted the civil dissensions of Geneva, and, when the power and energy of the country was by these means so completely reduced that it was unable to defend itself against foreign encroachment, they seized upon the city, and annexed it this year, sans ceremonie, to the territory of the republic.

In 1813 the willingness of the inhabitants to shake off the yoke of France was abundantly manifest; and on the Austrians under general Bubna entering the city the restoration of the old republic was to their great joy proclaimed. In September of the following year the diet admitted Geneva into the Swiss confederation. A constitution was framed for its future government in which it was declared that 'no patricians or privileged classes are acknowledged by the state, but that all the Genevese are equal before the law,' and the public affairs were vested in the hands of a great council of 250 members, and a smaller council of twenty-eight, the latter being the executive. The late treaties also augmented the territory of the republic to an area of 120 square miles, with a population of 25,000, exclusive of the citizens. The canton furnishes to the Swiss confederation 600 men, and nearly £1000 sterling. The soil is gravelly, and not very fertile, but it is remarkably well cultivated, and the climate is salubrious, though cold. Geneva is forty-two miles north of Chambéry and seventy north-east of Lyons.

GENEVA, LAKE OF. This lake, anciently called Lemanus (whence the name of the late French department, *Lac Léman*), is in the shape of a crescent; along the concave side of which Mr. Coxé travelled fifty-four miles. Switzerland forms the concave, and Savoy the convex part: the greatest breadth being about twelve miles, and its greatest depth about 1000 feet. The country on the side of Mont Blanc is full of high

and craggy mountains; but from Geneva to the environs of Lausanne it slopes to the margin of the lake, and is very rich and fertile. The banks rise considerably in the neighbourhood of Lausanne, and form a most beautiful terrace, with a rapid descent a few miles beyond the town. A plain begins in the neighbourhood of Vevay, which continues for a great way beyond the end of the lake, but contracts towards the water by the approach of the mountains. The lake itself appears at a distance of a beautiful blue color, and the water is very clear and transparent. Near Geneva the coast abounds with pebbles; between that city and Lausanne it is sandy; from thence to Chillon it is bounded by hard calcareous rocks; and the extremity of the shore is a marsh formed by mud collected from the Rhone. The greatest depth of this lake, found by M. de Luc, is 160 fathoms. Here the birds called tippet grebes appear in December; but retire in February to other places where they breed, and make floating nests of reeds, as the lake of Geneva affords none. This lake, like all others situated between mountains, is subject to sudden storms. The Rhone runs through its whole extent from its east to its south-west extremity. It is never frozen. De Saussure published a full account of its natural history, and notices the remarkable influence of electrical clouds on its surface.

GENEVA, or GIN, is an ordinary malt spirit, distilled a second time, formerly with the addition of some juniper berries. The berries were added to the malt in the grinding; so that the spirit thus obtained was flavored with the berries from the first, and exceeded all that could be made by any other method. At present, they leave out the berries entirely, and give their spirits a flavor by distilling them with a proper quantity of oil of turpentine; which, though it nearly resembles the flavor of juniper-berries, has none of their valuable virtues.

GENEVIEVE (St.), the patroness of the city of Paris, flourished in the end of the fifth century, and died A. D. 512. Five years after her death, Clovis erected the church of St. Genevieve, under the name and invocation of St. Peter, where her relics were long said to be preserved, her shrine visited, and her image carried, with great processions and ceremonies.

GENEVIEVE (St.), FATHERS OF RELIGIOUS OF, a congregation of regular canons, established in France, in the seventeenth century. It was a reform of the Augustine canons, begun by St. Charles Faure, in the abbey of St. Vincent de Senlis, in 1618. In 1634 the abbey was made elective; and a general chapter, composed of the superiors of fifteen houses, who had received the reform, chose F. Faure coadjutor of the abbey of St. Genevieve, and general of the congregation. It increased very much, and consisted of above 100 monasteries; in some of which the religious were employed in the administration of parishes and hospitals; and in others, in the instruction of ecclesiastics. It took its name from the abbey of St. Genevieve, which was the chief of the order, and whose abbot was the general.

GENEVIEVE (St.), a district and town of the

Missouri territory, in North America, bounded south-east by Apple Creek, north by the Merimack river, north-east by the Mississippi. Upon the latter it extends upwards of 100 miles. Its limits to the west are indefinite. The land is various, and perhaps less fertile than some of the neighbouring districts. It is rich, however, in minerals, particularly lead and salt. The town extends itself back upon ground considerably more elevated than the river. On an elevation in the rear of the town a handsome stone building has been erected for an academy, which commands a fine prospect. This town has a considerable trade, being a place of dépôt for the lead obtained from the famous mines on the Marameck, and also the store-house from which those employed in working in the mines obtain their principal supplies. The mines are about fifty miles west of this town, and are so rich that 100 lbs. of the ore will yield eighty or ninety of fine lead. Inhabitants about 1500. The produce under the present management is about 100 tons annually.

GENEVIEVE BAY, a bay on the coast of Newfoundland, in the straits of Belleisle, twenty miles north of St. John's Bay.

GENEVOIS, a province of Savoy, bounded on one side by a part of the French frontier, on another by Savoy Proper. It lies to the southward of Geneva, and came to the house of Savoy in the fifteenth century. Its surface is mountainous, but cultivated with great and well-rewarded care. It belonged to France from 1793 to 1815, forming a part of the department of Mont Blanc. Population 70,000.

GENEVRE, MONT, a celebrated mountain of the Alps, the boundary between Piedmont and France. Its altitude is about 6000 feet above the level of the sea; but the top, on which is a village and monastery, is of comparatively mild temperature. It is nine miles from Briançon.

GENIAL, *adj.* } Lat. *genialis*. That which
GENIALLY, *adv.* } contributes to propagation;
support; mental endowments or cheerfulness.

Nor will the light of life continue long,
But yields to double darkness, night at hand;
So much I feel my *genial* spirits droop. *Milton.*

Higher of the *genial* bed by far,
And with mysterious reverence I deem. *Id.*

Some men are *genially* disposed to some opinions,
and naturally averse to others. *Glanville.*

It chiefly proceedeth from natural incapacity, and
genial indisposition. *Browne's Vulgar Errors.*

Creator Venus, *genial* power of love,
The bliss of men below and gods above! *Dryden.*

In *genial* Spring, beneath the quiv'ring shade,
Where cooling vapours breathe along the mead,
The patient fisher takes his silent stand
Intent his angle trembling in his hand. *Pope.*

The Spring drew near, each felt a breast
With *genial* instinct filled :

They paired, and would have built a nest,
But found not where to build. *Cowper.*

GENICULATED, *adj.* } Latin *genicula-*
GENICULATION, *n. s.* } *tus*. The quality in
plants of having knobs or joints.

A piece of some geniculated plant seeming to be
part of a sugar-cane. *Woodward on Fossils.*

GENII, in the Mahomedan theology, a sort
of intermediate beings, supposed to exist between

men and angels. They are of a grosser fabric than the latter, but much more active and powerful than the former. Some of them are good, others bad, and they are capable of future salvation or damnation like men. The orientals pretend that these genii inhabited the world many thousand years before the creation of Adam, under several princes, who all bore the common name of Solomon; that falling at length into an almost general corruption, Eblis was sent to drive them into a remote part of the earth, there to be confined; and that some of that generation still remaining, were by Tahmurath, one of the ancient kings of Persia, forced to retreat into the famous mountain of Kaf. Of this king's successions and wars they have also many fabulous and romantic stories. They likewise suppose several ranks and degrees or different species among this kind of beings; some being peculiarly called Jin, or genii; some Peri, or fairies; some Div, or giants; and others Tocwins, or fates.

GENIO, *n. s.* Ital. *genio*; Lat. *genius*. A man of a particular turn of mind.

Some *genios* are not capable of pure affection; and a man is born with talents for it as much as for poetry, or any other science. *Tatler.*

GENIOSTOMA, in botany, a genus of the monogynia order and pentandria class of plants: cal. a tubinated quinquefid perianthium: cor. monopetalous and tubular; the stamina five short filaments; the antheræ oblong: seed numerous and subangulate, placed on a filiform receptacle. Species one only; a native of the island of Tama.

GENISTA, broom, or dyers'-weed, a genus of the decandria order, and diadelphia class of plants; natural order thirty-second, papilionaceæ: cal. bilabiate, the upper lip bidentate, the under one tridentate; the vexillum is oblong and reflexed, turned back from the pistil and stamina. There are several species; of which the following are the most remarkable:—

G. cytisus, or cytiso-genista, or common broom; which is too well known to need description. Its young flowers are sometimes preserved as pickles; and the plant, when burnt, affords a tolerably pure alkaline salt. Dr. Mead relates the case of a dropsical patient, who was cured by taking half a pint of a decoction of green broom tops, with a spoonful of whole white mustard seed, every morning and evening. The patient had been tapped three times, and tried the usual remedies before. An infusion of the seeds, drunk freely, has been known to produce similar happy effects. Cows, horses, and sheep, refuse the plant.

G. tinctoria is also a native of Britain. It rises with shrubby stalks three feet high, garnished with spear-shaped leaves, placed alternate, and terminated by several spikes of yellow flowers, succeeded by pods. The branches are used by dyers for giving a yellow color, from whence it is called dyers'-broom, green-wood, wood-waxen, or dyers'-weed. A dram and a half of the powdered seeds operates as a mild purgative. A decoction of the plant is diuretic; and, like the former, has proved serviceable in

dropical cases. Horses, cows, goats and sheep, eat it.

GENITALS, *n. s.* Lat. *genitalis*. The organs of generation.

Ham is conceived to be Jupiter, who was the youngest son, who is said to have cut off the *genitals* of his father. *Broune.*

GENITES, among the Hebrews, those descended from Abraham without any mixture of foreign blood. The Greeks distinguished by the name of genites, such of the Jews as were issued from parents who, during the Babylonish captivity, had not allied with any gentile family.

GENITING, *n. s.* A corruption of janeton, an early apple gathered in June.

In July come early pears and plumbs in fruit, *genitings* and codlins. *Bacon.*

GENITIVE, *adj.* Lat. *genitivus*. In grammar, the name of a case, which, among other relations, signifies one begotten, as, the father of a son; or one begetting, as, son of a father.

The **GENITIVE** is the second case of the declension of nouns. The relation of one thing considered as belonging in some manner to another, occasioned, in the Greek and Latin, a peculiar termination of nouns called the genitive case; but in the modern tongues a particle is prefixed to express the relation of this case. In English we prefix the particle *of*; in French *de* or *du*, &c.; though in strictness there are no cases in either of these languages; inasmuch as they do not express the different relations of things by different terminations, but by prepositions.

GENIUS, *n. s.* Fr. *genie*; Lat. *genius*. A fabled ruling power; a person of superior mental faculties; peculiar disposition or nature.

GENII, *n. s.* Plural of genius, and always used in its primary sense: the annexed illustration is an example.

If there be infinite planetary and firmamental worlds, as some will, there be infinite *Genii*, or commanding spirits belonging to each of them.

Burton. Anat. Mel.

But if it be thei of evil life,
Whom *Genius* cursed, man and wife
That wrongly werke again Nature;—
None soche I love.

Chaucer. Romaunt of the Rose.
—in the porch there sate

A comely personage of stature tall,
And semblaunce pleasing more than naturall,
That travelers to him seemed to entise;
His looser garment to the ground did fall,
And flew about his heeles in wanton wize
Not fit for speedy pace or manly exercise,
They in that place him *Genius* did call.

Spenser's Faerie Queene.

There is none but he

Whose being I do fear: and, under him,
My *genius* is rebuked; as it is said
Antony's was by Cæsar. *Shakspeare. Macbeth.*
The *genius* and the mortal instruments
Are then in council; and the state of man.

Like to a little kingdom, suffers then. *Shakspeare.*

And as I awake, sweet musick breathe,
Sent by some spirit to mortals good,
Or the' unscen *genius* of the wood. *Milton.*

For they 'tis credible have sense

As we of love and reverence;

And underneath the coarser rind

The *Genius* of the house do bind. *Marvell.*

The state and order does proclaim

The *genius* of that royal dame. *Waller.*

And the tame demon that should guard my throne
Shrinks at a *genius* greater than his own. *Dryden.*

To your glad *genius* sacrifice this day;

Let common meats respectfully give way. *Id.*

Studious to please the *genius* of the times,
With periods, points, and tropes, he slurs his crimes. *Id.*

A happy *genius* is the gift of nature. *Id.*

Your majesty's sagacity, and happy *genius* for natural history, is a better preparation for enquiries of this kind than all the dead learning of the schools.

Burnet's Theory. Preface.

There is no little writer of Pindarick who is not mentioned as a prodigious *genius*. *Addison.*

When I read an author of *genius* without method, I fancy myself in a wood that abounds with many noble objects, rising among one another in the greatest confusion and disorder. *Id. Spectator.*

In Poets, as true *Genius* is but rare,
True Taste as seldom is the Critic's share;
Both must alike from Heaven derive their light
These born to judge, as well as those to write.

Pope's Essay on Criticism.

Chaucer, whose native manners-painting verse
Well mortalized, shines through the Gothic cloud
Of time and language o'er thy *genius* thrown.

Thomson's Summer.

The proverb ought to run, A fool and his words
are soon parted; a man of *genius* and his money.

Shenstone.

But if there is any writer whose *genius* can enabelish impropriety, and whose authority can make error venerable, his works are the proper objects of critical inquisition.

Johnson's Rambler.

In fashioning the character, and in giving impulse and direction to *genius*, the influence of habit is certainly very great. *Beattie.*

There is a tomb in Arqua;—reared in air,

Pillared in their sarcophagus, repose

The bones of Laura's lover: here repair

Many familiar with his well-sung woes,

The pilgrims of his *genius*—He arose

To raise a language, and his land reclaim

From the dull yoke of her barbaric foes:

Watering the tree which bears his lady's name

With his melodious tears, he gave himself to fame.

Byron. Child Harold.

GENIUS, a good or evil spirit or dæmon, whom the ancients supposed set over each person, to direct his birth, accompany him in life, and to be his guard. See **DÆMON**. Among the Romans, Festus observes, the name *genius* was given to the god who had the power of doing all things, deum qui vim obtineret rerum omnium gerendarum: which Vossius, de Idol., rather chooses to read *genendarum*, who has the power of producing all things: by reason Censorinus frequently uses *gerere* for *gignere*. Festus adds, that Aufustus spake of the *genius* as the Son of God, and the Father of men, who gave them life; others represented the *genius* as the tutelary god of each place; and it is certain, the last is the most usual meaning of the word. The ancients had their *genii* of nations, of cities, of provinces, &c. The following was a very common inscription on their medals, **GENIUS POPULI ROM.** 'The *genius* of the Roman people.' The Platonists, and other eastern philosophers, supposed the *genii* to inhabit the vast region of air between earth and heaven:

that they were a sort of intermediate powers, who acted as mediators between gods and men: that they were the interpreters and agents of the gods; communicated their wills to men; and the prayers and vows of men to the gods. As they thought it below the majesty of the gods to enter into such trifling concerns, they esteemed this the lot of the genii, whose nature was a mean between the two; who derived immortality from the one, and passions from the other; and who had a body framed of an aerial matter. Most of the philosophers, however, held, that the genii of particular men were born and died with them; and Plutarch attributes 'the ceasing of oracles partly to the death of the genii. See ORACLE. Those heathens, who considered the genii as the guardians of particular persons, believed that they rejoiced and were afflicted at the good or ill fortune that befel their wards. They never, or very rarely, appeared to them, and then only in favor of some person of extraordinary virtue or dignity. They likewise held a great difference between the genii of different men; and that some were much more powerful than others: on this principle a wizard in Apian bids Antony keep at a distance from Octavius, as Antony's genius was inferior to and stood in awe of that of Octavius. There were also evil genii, who took a pleasure in persecuting men, and bringing their evil tidings; such was that in Paterculus, &c., which appeared to Brutus the night before the battle of Philippi.

GENNESARETH, in ancient geography, a lake of Lower Galilee, called also Cinnereth, Cinereth, or Chinnereth, by Moses; 140 stadia in length, and forty in breadth; abounding in fish. St. Matthew calls it the Sea of Galilee, and St. John the Sea of Tiberias.

GENOA (Ital. Genova), a handsome maritime city of Italy, formerly the capital of a republican state of this name, which extended along the shores of that part of the Mediterranean called the gulf of Genoa. This territory, while independent, was described as about 152 miles in length, but varying in its breadth from eight to twenty miles. It was bounded on the north by Piedmont, the Milanese, and the Parmesan, on the east by the states of the duke of Tuscany, on the south by the Mediterranean Sea, and on the west by the county of Nice. It was a part of the ancient Liguria, whence the French named it in modern times the Ligurian Republic. It lies between 7° 27' and 9° 25' E. long., and between 43° 40' and 45° 0' N. lat. It was transferred to Sardinia by the congress of Vienna, and now forms a province of that kingdom.

The city of Genoa rises from the northern extremity of the gulf in the form of an amphitheatre, the hill on which it is situated exhibiting its large white houses, and numerous public edifices, in striking contrast with the dark cliffs of the shore, and the naked sterility of the Appennines behind them. On the land side a double wall surrounds this ancient abode of commerce and the arts: the inner one is about six miles in circuit; the outer, called the Nuova Thura, including several hills, is perhaps twice that length. Two of the streets at one time consisted entirely of a double

straight row of magnificent palaces: and the Strada Balbi, the Strada Nuova, and the Strada Nuovissima, are still spoken of by travellers as having a striking and magnificent coup d'œil. The others, though clean and well paved, are generally narrow, crooked, and some of them remarkably steep. The palaces of the ci-devant nobility are almost all of marble, and many of them are painted on the outside. That where the doge resided, and where the great and little council, and the two colleges of the procuratori and governatori assembled, is a large stone building in the centre of the city. It contains some fine paintings in fresco; two statues of Andrew and John Doria in white marble; and an arsenal, which used to contain arms for 34,000 men, and thirty-three coats of mail, which, it is said, were worn by as many Genoese heroines in a crusade. The residences of the Durazzo, Doria, Pallavicini, Balbi, and Corrego families are also much admired. Many of the façades of these palaces are painted in fresco in a very superior style.

The Palazzo Durazzo, still belonging to a signore of that name, is one of the finest in Genoa. Lady Morgan's lively description of it will give the reader a correct idea both of the rest of these edifices and the existing manners of the Genoese. 'The superb portico is ornamented with columns of white marble of the Doric order—its vast court is rich in architecture, fountains, and hanging terraces, and four flights of broad marble steps lead to its immense anti-chamber, the first apartment of that attic suite, called in Genoa the Mezzari Nobili Superiori; for the household economy of Genoa, as in many other cities of Italy, is the reverse of what it is in England. The narrow street and high dark opposite walls make the lower floors exceedingly disagreeable and gloomy; and the garret contains the rooms of state and ceremony, the cabinets of the relics of former grandeur; while the impoverished or degenerated lords are niched into an entresol, or mezzanini, half way between the first floor and the last.

'The porticoes, or entrances of the Genoese palaces, resemble in nothing the hall of a noble English residence, or the court of a French hotel. There is no sturdy porter to be roused from his 'leathern convenience,' to give or deny admission, with a growl and a frown: no bluff Swiss, nor *manière demoiselle*, to pop their head over the half-door of the lodge, and receive commands and answer enquiries. The sole occupant of these magnificent structures (where there is any) is a cobbler, perhaps, or a stocking-grafer, who pays for being permitted to ply his profession amidst the sculptures of Michael Angelo and the frescoes of Carloni, by keeping out dogs, or preventing the idle and the filthy from sleeping on the stairs, or corridors,—all open to public intrusion. In one of the porticoes of these beautiful palaces we found a mattress-cleaner very busy at his filthy work; and in the nobler apartments of another, the anti-room was occupied by a laundress. Several of the lower and lesser rooms were hired out to poor tradesmen; and many of the superior apartments were occupied by the ministers of the corps diplomatique

Some, however, were inhabited by the noble families to whom they belonged; but in the autumn almost all the Genoese aristocracy are at their villas. It was to one of these Jobsons we were frequently indebted (when we went alone) for information of how we were to proceed, or which flight of stairs we were to ascend, or where we had a chance of finding the custode or person retained for showing the palace: but their Genoese jargon occasionally prevented our deriving any benefit from their information:—though all the lower orders understand Italian, few speak it.

As we ascended the magnificent stairs of the Durazzo, we met a half-starved dog chasing down a hen; and, after repeatedly ringing at the folding doors of the anti-room of the Mezzari nobili superiori, they were at last thrown open by a man with a boot on one hand and a brush in the other—who, at once understanding the object of our visit, drew on a fine old livery coat, which hung upon a marble bust by Filippo Parodi, and led the way through that long and interminable suite of apartments, whose walls were enriched with chefs-d'œuvre of the arts, whose floors were of marble, and whose roofs were of gold. Galleries, cabinets, terraces, rooms variously named and variously decorated, appeared in endless succession—all covered with dust, touched by decay, and abandoned to solitude. Still there is something very fine in the Genoese nobility, under the weight of their ruined fortunes and depressed spirits, retaining these noble mansions, preserving the least of their countless objects of art, and consecrating these images of their ancient wealth and influence to the memory of their nation's past prosperity, and to the admiration of foreign curiosity. They can indeed no longer spread the splendid board, nor fill the gilded hall; but their palaces are still open to gratify the stranger's research, and to improve his taste. They are not even closed against the visitors of that nation who imposed the chain, while they accepted the rites of hospitality; and who, under the semblance of liberty and friendship, betrayed the confidence, and broke the trust, reposed in them by their generous hosts.

The architectural defects of the Palazzo Durazzo appear to be the breaking up of its vastness into a number of small rooms; each indeed interesting, as bearing the name of the great master whose works cover its walls; but defective as forming a part of the great whole. Even the famous gallery is but a long narrow strip, infinitely too small for its splendid and curious collection of statues and sculptures, ancient and modern. The ornaments and roof of this apartment, all of the richest carving, gilding, and painting, are by Parodi. The frescoes represent the destruction of the four great empires; a good republican subject, and curiously treated. Each empire is represented by some of its well-known historical tyrants, as Darius, Sardanapalus, Ptolemy, and Augustulus, surrounded by Syrens—the Montespons, Pompadours, Nell Gwins, &c. of antiquity. Besides the historical paintings of the great masters, the family portraits of the Durazzo, as in all the other palaces, by such painters as Titian, Vandyke, and Tintoretto, are of great interest. Here, in their habits of ceremony, as

doges and ambassadors, range the ancient Durazzo, with all their insignia of wealth and splendor. Here too with large, languid, dark eyes, and primitive airs, still bloom the Madonna Francescas, Caterinas, and other beauties of this distinguished house. Some of them are encircled (as the mothers of free states should be) by their children; and all of them, clothed in the stand-on-end velvet of the Genoese looms, exhibit great richness of ornament, and are covered with Venetian chains and foreign gems, the produce of their husbands' commerce in the Levant. Among these domestic portraits, we found a picture of our own unfortunate Anne Boleyn, by Holbein. It is extremely curious for its costume; but in the meagre red-haired lady, here represented, there is nothing to excuse the adulterous passion of Henry VIII. though something to account for his cutting off a head, which had not one charm to plead for it. Holbein, though a bold, was a most unlovely painter. Opposite to Anne Boleyn hangs a delicious picture of the holiest and fairest of royal saints, queen Catherine of Sweden, by that painter whose type of beauty was all divine, yet all melancholy, the true delineator of a crucified Deity—Carlo Dolce! The Sala Paolo, so called from its chef-d'œuvre, by Paul Veronese, is the most interesting of the suite, merely because it does contain this picture, so well known, so often and so accurately copied, so delightful to gaze on, so dangerous to describe. The subject is Mary Magdalen at the feet of Christ in the house of the Pharisee. Never was a sacred subject so humanly conceived, more divinely executed.

Genoa is the see of an archbishop who presides over the four suffragan dioceses into which the former republic is divided. The established religion is Catholic, but all other sects (including even the Jews) are tolerated. There is an old university here having a vast library, but all 'the faculties' seem to languish within its walls. Before the late revolutionary times, the number of churches in Genoa was thirty-two, and of religious houses seventy. Several of the former are master-pieces of architecture, but all are most gaudily ornamented. The church of the Annunciation, and the cathedral, are the most admired. That of Carignano was built at the expense of a single citizen, whose grandson erected the bridge of that name, which joins two hills, and forms one of the most favorite promenades. The theatres are three in number. The great hospital for the sick and infirm, and the Albergo dei Poveri, or poor-house, are noble buildings; but their once ample funds have been greatly intruded upon by their late masters. The public stores of wine, oil, and wood, from which the middling and lower classes may purchase, are however still kept up: and the inns here are considered commodious.

Genoa still conducts a considerable export trade in rice, fruit, and olive oil, as likewise in her manufactures, of silk, damasks, and velvets. The annual value of the silk and satin manufactures is from £200,000 to £300,000; the raw material being partly raised at home, and partly imported from Sicily, Calabria, and the Levant. From Sicily also corn is imported, and occasionally from Barbary; iron and naval stores from

the Baltic, linen and sail-cloth from Germany, and from England, tin, lead, hardware, and cottons. To these may be added wool from Spain, wax and cotton from the Levant, and colonial produce from the United States, and fish from Newfoundland. A considerable transit trade was facilitated by a law passed in 1751, which enabled the merchants to deposit goods in a quarter of the town called Porto Franco, duty free unless taken out for consumption. The exchange transactions are also considerable, though the different denominations and modes of reckoning money are complex, and the celebrated bank of Genoa no longer exists. The Genoese vessels in the coasting trade, do not exceed 100, and fifty perhaps trade in the open sea; but the chief business of the city is carried on under foreign flags.

The port of Genoa is formed by two moles, with a light-house on one mole head, and a fort on the other, distant from each other a quarter of a mile: the depth within is seven to three fathoms, and, though a south wind throws in a considerable swell, it is sufficiently secure. Both east and west the shore is lined with towns and villages. Genoa contains a population of about 80,000 souls.

The ancient history of Genoa, like that of many other places, is involved in fable. Some say it was built by Genuus, a son of Saturn; others by the god Janus, agreeably to which origin the ancient Latin authors often call it Janua. Be that as it may, the city of Genoa was a celebrated emporium in the time of the second Punic war; and, having declared for the Romans, was plundered and burnt by Mago the Carthaginian. It was afterwards rebuilt by the Romans; and with the rest of Italy continued under their dominion till the overthrow of the western empire in 476. In 493 it fell under the power of Theodoric the Ostrogoth; who, having defeated the usurper Odoacer, became king of Italy. Not long after, the Goths being almost entirely subdued by Belisarius, Justinian's general, Genoa was re-annexed to the Roman or rather eastern empire. In 670 it was plundered and burnt by the Lombards, whose king, Protharis, erected it into a provincial dukedom. The Lombards continued masters of Genoa till 774, when they were conquered by Charlemagne. He reduced Liguria to its ancient bounds settled by Augustus, and erected it into a marquisate: appointing his relation Audemar the first count or margrave. In 806 the Genoese reduced Corsica. Genoa at this time being distinguished for its wealth and populousness, began to give its name to the whole coast; and continued under the dominion of these counts for about 100 years, till the Carolingian race became extinct in Italy, and the empire was transferred to the German princes. In 935, while the Genoese forces were absent on some expedition, the Saracens surprised the city, which they plundered and burnt, putting to death a great number of the inhabitants, and carrying others into captivity. Having embarked their captives, together with an immense booty, they set sail for Africa; but the Genoese, immediately returning, pursued the invaders; and, having entirely defeated them, recovered all the captives and booty, and took a great number of the enemy's ships. About A. D. 950, the Franks having

lost all authority in Italy, the Genoese began to form themselves into a republic, and to be governed by their own magistrates, who were freely elected, and took the name of consuls. To support their independence they applied themselves to commerce and navigation; and being apprehensive that some of the German emperors, who often invaded Italy, might renew their pretensions to their states, they acknowledged Berengarius III. duke of Friuli, who had been elected emperor by a party of Italian nobles. Berengarius, who with difficulty maintained himself in his new dignity, endeavoured by his concessions to enlarge the number of his adherents: and accordingly confirmed the new republic in all its privileges. After this the Genoese began to extend their commerce from Spain to Syria, and from Egypt to Constantinople; their vessels being fitted for fighting as well as merchandise. Having thus acquired great reputation, they were invited in 1017, by the Pisans, who had likewise formed themselves into a republic, to join with them in an expedition against Sardinia, which had been conquered by the Moors. In this expedition they were successful; the island was reduced; but from this time an enmity took place between the two republics, which did not end but with the ruin of that of Pisa. The first war with the Pisans commenced about thirty years after the Sardinian expedition, and lasted eighteen years; when the contending parties having concluded a peace, they sent their united forces against the Moors in Africa, of whom they are said to have killed 100,000.

The Genoese were very active in the time of the crusades, and had a principal share in the taking of Jerusalem. They also waged considerable wars with the Moors in Spain, whom they generally defeated. They also prevailed against the neighbouring states; and, in 1220, had enlarged their territories beyond the skirts of the Apennines, so that the rest of Italy looked upon them with a jealous eye; but in 1311 the factions which had long reigned in the city, notwithstanding all its wealth and power, induced the inhabitants to submit for twenty years to the dominion of the emperor Henry VII. That emperor, however, died in August 1312; and the vicar he had left soon after went to Pisa, upon which the dissensions in Genoa revived with greater fury than ever. In 1317 a quarrel happened between the families of Spinola and Doria; which came to such a height, that both parties fought in the streets for twenty-four days without intermission, raised battering engines against each other's houses, and filled the city with blood. At last the Spinolæ quitted the city, and retired to their territories in the Apennine mountains. The civil war continued till 1331: when, by the mediation of the king of Naples, it was agreed that all exiles should return to the city; that the republic should be governed by the king's vicar, and all the offices of the state be equally divided between the Guelphs and the Gibellines, the two contending parties. By this ruinous war the coast of Genoa, formerly adorned with palaces and vineyards, was now reduced to the appearance of a barren waste. So great was the desolation that, according to Petrarch, the spectators who sailed along were struck with

astonishment and horror. Villani, a contemporary author, relates, that the losses each party had sustained would have been sufficient to have purchased a kingdom; the Genoese republic being esteemed in his time the richest and most powerful state in Christendom. Stella informs us that, before the war, the most extravagant profusion and luxury prevailed among the Genoese; but that, towards the end, many noble families were reduced to indigence; so that, for about 100 years after, it became fashionable for the nobles to live in a plain and frugal manner. In 1336 both parties, suspending their animosities, sent two fleets of twenty galleys each into the German Ocean, to assist Philip VI. king of France, against Edward III. of England. This naval expedition proved the cause of a most remarkable revolution in the Genoese government. The sailors accused their officers of defrauding them of their pay, proceeded to an open mutiny, and having expelled the admiral, and other commanders, seized the galleys. Philip VI., being chosen arbitrator, decided in favor of the officers, and imprisoned sixteen chiefs of the mutineers. Upon this several of the sailors left the fleet, and returned to Genoa; where they went round the coasts, repeating their mutinous complaints, which were eagerly listened to upon a false report that the mutineers were broken upon the wheel. The factious spirit increased; and at last the Genoese insisted on having an abbot of their own choosing, and twenty of the people, with the consent of the captains of the republic, assembled for that purpose. While the multitude, however, were impatiently expecting their decision, a mechanic mounted a bench and proposed that Samuele Bucanigree should be chosen abbot. This being instantly echoed, by the populace, he was first declared abbot, then lord, and at last doge, of Genoa. But the dissensions continued as violent as ever, notwithstanding the power of the new magistrate; and by these perpetual divisions the republic was at last so much weakened that, in 1390, Charles VI., king of France, was declared lord of Genoa. However the Genoese soon became exceedingly impatient of the French government; and, in 1422, the duke of Milan obtained the sovereignty. With this situation they were soon equally displeased, and therefore revolted in 1436. In 1458, finding themselves pressed by a powerful fleet and army sent by Alphonso king of Naples, they conferred the sovereignty of their state upon Charles VII. of France. But in 1460 they revolted, and four years after put themselves again under the protection of the duke of Milan; from whom they revolted in 1478. He was again declared sovereign of the republic in 1483; and in 1499 the city and territories of Genoa were conquered by Louis XII. of France. The fickleness of the Genoese was not corrected by this misfortune. They revolted in 1506; but next year were again subdued by Louis. In 1512 they again revolted; and in 1516 the city was taken and plundered by the Spaniards. In 1528 the celebrated Andrew Doria, then an admiral in the French service, undertook to rescue his country from the dominion of foreign princes, and restore it to its liberty. He told his countrymen that the French,

who had again obtained the sovereignty, had left them only a shadow of liberty, while they pretended to protect them from their enemies. To the nobility he represented the disgrace of suffering the government to be vested in the hands of foreigners less worthy of authority than themselves. Thus he soon formed a strong faction, and when almost three-fourths of the French garrison had been carried off by the plague, he advanced with 500 men. His friends having opened the gates of the city to him, he seized the principal posts, and thus became master of it without drawing his sword. The garrison retired to the forts, where they soon after capitulated, and being driven out of the city, Doria re-established the ancient form of government. See DORIA.

The republic continued throughout the rest of the eighteenth century to preserve her liberty, though greatly fallen from her ancient splendor. In 1684, the Genoese having fallen under the resentment of Louis XIV., the city was almost destroyed by a formidable bombardment. In 1688 it was bombarded by admiral Byng, and forced to capitulate: but the British government had no view of making a permanent conquest of it. In 1713 the emperor Charles VI. sold the town and marquisate of Finale to the republic, which, in 1743, involved it in a bloody war; for the queen of Hungary having, by the treaty of Worms, ceded to the king of Sardinia her right to Finale, the Genoese formed an alliance with France, Spain, and Naples: and, in 1745, declared war against the king of Sardinia, who soon made himself master of great part of the state, while several Genoese ports were bombarded by the British, and the city of Genoa was taken by the Imperialists: but after a terrible slaughter they were driven out by the Genoese; who again defeated them in 1747, when they attempted to recover it. In 1730 the island of Corsica revolted from the Genoese, and could never afterwards be reduced by them: for which reason they at last sold it to the French, who in 1770 totally reduced it. See CORSICA.

The ancient constitution, from the time of its establishment by the brave Andrew Doria, in 1528, was aristocratic, though not so much so as that of Venice. The nobility alone were capable of holding the chief offices in the republic. From this body were elected the doge, the great council, and the senate. The doge, or duke, was elected for two years, and was incapacitated from being re-elected for five years after; but had a procurator's office assigned him, and a pension of 500 scudi for life. No person could be elected doge till he was fifty years of age, and had left off trade for fifteen years before. The great council consisted of eighty counsellors, in whom the sovereignty chiefly resided. The senate consisted of twelve senators, who, with the doge, had the administration of affairs. In November, 1797, this form of government was overturned, hereditary titles and honors abolished, and a new democratic constitution established, by Buonaparte, with a directory, two councils, &c., similar to the then constitution of France; while the whole state, according to the then frantic rage of the French for republicanism, was called

the Ligurian republic, and, being under the control of the rulers of France, it long shared in the warfare of that country. In 1801 the city sustained a severe siege from the Austrian army and the British fleet, till literally starved; which obliged the French General, Massena, to evacuate it on the 7th of June. It was however soon afterwards delivered up to the French, upon the celebrated victory of Marengo; and the republic restored to tranquillity by the treaty of Amiens. But Buonaparte having afterwards abjured his republican notions, and assumed the titles of emperor of France and king of Italy, this, with the other republics which his military power had contributed to raise in Europe, was to experience another revolution. Early in 1805 he forcibly seized upon the whole of this republic, abolished its constitution, and united it to his kingdom of Italy. In 1805 it was incorporated with its territory into the French empire, forming the departments of Genoa, Montenotte, and the Appennines. It remained subject to Buonaparte until his final reverses in Germany, and the invasion of France in 1814, when a British naval force once more blockaded the harbour. To this force the Genoese surrendered, April 18th 1814, and received a garrison, in the expectation of being reinstated in their former liberty. The congress of Vienna, however, decided otherwise, and made over the city, with its territory, to the king of Sardinia. It is now said to be governed by its own laws; the inhabitants preserving their senate, their supreme court of justice, and provincial councils, who impose all new taxes, and conduct the entire police.

Genoa is distant 224 miles north-west of Rome, and stands in N. lat. 44° 25, and E. long. 8° 50'.

GENOVESI (Anthony), a modern Italian writer of celebrity, was born at Castiglione in 1712. He was brought up as a clergyman, but practised the law; and, in 1741, was appointed professor of metaphysics at Naples. He afterwards exchanged this for the ethical chair. He became also an unsuccessful candidate for the professorship of theology. He was made, however, professor of political economy; which place he held at his death, which took place in 1769. He wrote—1. *Disciplinarum Metaphysicarum Elementa Mathematicum in morem adornata*, 4 vols. 8vo; 2. *Elementorum Artis Logico-critice Libri Quinque*; 3. *Delle Lezioni di Commercio*; 4. *Meditazioni Filosofiche Sulla Religione e Sulla Morale*, &c.

GENTEEL, <i>adj.</i>	Fr. <i>gentil</i> ; Italian <i>gentile</i> ; Lat. <i>gentilis</i> . These words are indifferently applied to persons, dispositions, and manners, and primarily imply softness; ease; grace; elegance; superiority; rank: used either as descriptive, or ironically as terms of ridicule. The word gentle also is used for a worm used in angling: the

only verb amongst them, which means to elevate or make gentle, is quite obsolete.

Fayre was this yonge wif; and, therewithal,
As any wesel hire body *gent* and smal.

Chaucer. The Milleres Tale.

—And he that wol han pris of his *genterie*,
For he was boren of a *gentil* hous,
And had his elders noble and vertuous—
And nill himselfen do no *gentil* dedes,
Ne folwe his *gentil* auncestre that ded is,—
He n'is not *gentil* be he duk or erl;
For vilains sinful dedes make a cherl.
For *gentillesse* n'is but the renorce
Of their auncestres for hir high bountee,
Which is a strange thing to thy persone:
Thy *gentillesse* cometh fro God alone.
Than cometh our very *gentillesse* of grace;
It was no thing bequeathed us with our place.

Id. The Wif of Bathes Tale.

A *gentilwoman*, porter of the gate,
There shal ye find, hire name is Countenance.

Id. The Assembled of Ladies.

Than opened she the gate, and in we go;
With wordes faire she saide full *gentilly*
Ye are welcome ywis. *Id.*

Adue, the *gentildest* that er I knewe!
Adue my most excellent paramour,
Fairer than rose, sweter than lylly flour.

Id. Lament of Mary Magdalene.

Adue, my sovaine and very *gentilman*
Farewel, dere herte! as hertely as I can. *Id.*
Some in France, which will needs be *gentlemen*,
have more *gentleship* in their hat than in their head.

Ascham's Schoolmaster.

Thereto the heavens, alwayes joviall
Lookte on them lovely, still in stedfast state,
Ne suffred storme nor frost on them to fall,
Their tender huds or leaves to violate;
Nor scorbing heat nor cold intemperate,
To' afflict the creatures which therein did dwell;
But the mild ayre with season moderate
Gently attrempted, and disposed so well
That still it breathed forth sweet spirit and holesom smell.
Spenser's Faerie Queene.

Vespasian, with great spoil and rage,
Forewasted all: till Genuissa, *gent*
Persuaded him to cease. *Id.*

He holdeth himself a *gentleman*, and scorneth to work, which, he saith, is the life of a peasant or churl; but enureth himself to his weapon, and to the *gentlemanly* trade of stealing. *Spenser.*

When people began to espy the falsehood of oracles, whereupon all *gentility* was built, their hearts were utterly averted from it. *Hooker.*

He to-day that sheds his blood with me,
Shall be my brother; be he never so vile,
This day shall *gentle* his condition. *Shakspeare.*

Where is my lovely bride?
How does my father? *Gentles*, methinks you frown. *Id.*

Pyramus is a sweet-faced man; a proper man as one shall see in a summer's day; a most lovely *gentlemanlike* man. *Id.*

You have trained me up like a peasant, hiding from me all *gentlemanlike* qualities. *Id.*

Inquire me out some mean-born *gentleman*,
Whom I will marry strait to Clarence' daughter. *Id.*
The queen's kindred are made *gentlefolk*. *Id.*

Her *gentlewomen*, like the Nereids,
So many mermaids, tended her i' the' eyes.
And made their bends adorning. *Id.*

Shew us so much *gentry* and good-will,
As to extend your time with us a-while. *Id.*

Her voice was ever soft,
Gentle and low; an excellent thing in woman. *Id.*

My lord Sebastian,
The truth, you speak, doth lack some *gentleness*. *Id.*
The *gentleness* of all the gods go with thee. *Id.*
As *gentle*, and as jocund, as to jest,
Go I to fight. *Id. Richard II.*

Sir Thomas More, the Sunday after he gave up his
chancellorship, came to his wife's pew, and used the
usual words of his *gentleman* usher, Madam, my lord
is gone. *Camden.*

Gentlewomen may do themselves much good by
kneeling upon a cushion, and weeding. *Bacon.*

Gavelkind must needs in the end, make a poor *gen-*
tility. *Davies on Ireland.*

And though this sense first *gentle* musick found,
Her proper object is the speech of men. *Davies.*

She that was noble, wise, as fair and *gent*,
Cast how she might their harmless lives preserve. *Fairfax.*

Of all vanities and fopperies, to brag of *gentility* is
the greatest. *Burton. Anat. Mel.*

Consider the beginning, present estate, progresse,
ending of *gentry*, and then tell me what it is. *Id.*

Art thou virtuous, honest, learned, well qualified,
religious, are thy conditions good: thou art a true
nobleman, perfectly noble, although born of Thersites.
* * * * *

neither sword, nor fire, nor water, nor sickness, nor
outward violence, nor the devil himself can take thy
good parts from thee. Be not ashamed of thy birth
then, thou art a *gentleman* all the world over. *Id.*

The true *gentleman* is extracted from ancient and
worshipful parentage. When a pepin is planted on a
pepin stock, the fruit growing thence is called a reneate,
a most delicious apple, as both by sire and damme
well descended. Thus his blood must needs be well
purified who is *gentilely* born on both sides. *Fuller.*

Your brave and haughty scorn of all,
Was stately and monarchical;
All *gentleness* with that esteemed,
And dull and slavish virtue seemed. *Cowley.*
Still she retains

Her maiden *gentleness*, and oft at eve
Visits the herds. *Milton.*

These are the studies wherein our noble and *gentle*
youth ought to bestow their time. *Id. on Education.*

My *gentler* rest is on a thought,
Conscious of doing what I ought. *Marvell.*

She with her wedding-cloaths undresses
Her complaisance and *gentileesses*. *Hudibras.*
He will in the three hot months bite at a flag-worm,
or at a green *gentle*. *Walton's Angler.*

A civil war was within the bowels of that state, be-
tween the *gentleman* and the peasants. *Sidney.*

They entering and killing all of the *gentle* and rich
faction, for honesty sake broke open all prisons. *Id.*

He hither came a private *gentleman*,
But young and brave, and of a family
Ancient and noble. *Ottway's Orphan.*

You say a long-descended race
Makes *gentlemen*, and that your high degree
Is much disparaged to be matched with me. *Dryden.*

He had a genius full of *genteelness* and spirit, hav-
ing nothing that was ungraceful in his postures and
dresses. *Id. Dufresnoy.*

The perpetual *gentleness* and inherent goodness of
the Ormond family. *Id. Fables, Dedication.*

The mischiefs that come by inadvertency, or igno-
rance, are but very *gently* to be taken notice of. *Locke.*

Those that would be *genteelly* learned, need not
purchase it at the dear rate of being atheists. *Glanville.*

After a long fatigue of eating and drinking, and
babbling, he concludes the great work of dining *gen-*
teelly. *South.*

So spruce that he can never be *genteel*. *Tatler.*

The same *gentlemen* who have fixed this piece of
morality on the three naked sisters dancing hand in
hand, would have found out as good a one had there
been four of them sitting at a distance, and covered
from head to foot. *Addison.*

Their poets have no notion of *genteel* comedy, and
fall into the most filthy double meanings when they
have a mind to make their audience merry. *Id. On Italy.*

The many-coloured *gentry* there above,
By turns are ruled by tumult and by love. *Prior.*

He had such a *gentle* method of reproving their
faults, that they were not so much afraid as ashamed
to repeat them. *Atterbury.*

Of *gentle* blood, part shed in honour's cause,
Each parent sprung. *Pope.*

He had a *genteeler* manner of binding the chains of
this kingdom than most of his predecessors. *Swift to Gay.*

Gentlefolks will not care for the remainder of a bot-
tle of wine; therefore set a fresh one before them. *Swift.*

How cheerfully the hawkers cry
A satyr, and the *gentry* buy. *Id.*

Several ladies that have twice her fortune, are not
able to be always so *genteel*, and so constant at all
places of pleasure and expence. *Law.*

He is so far from desiring to be used as a *gentleman*,
that he desires to be used as the servant of all. *Id.*
Nor shall my verse that elder bard forget,
The *gentle* Spenser, Fancy's pleasing son;
Who, like a copious river, poured his song
O'er all the mazes of enchanted ground. *Thomson. Summer.*

Women ought not to think *gentleness* of heart des-
picable in a man. *Clarissa.*

Gentle he was, if *gentle* birth
Could make him such, and he had worth,
If wealth can worth bestow. *Couper.*

In truth he was a strange and wayward wight,
Fond of each *gentle* and each dreadful scene. *Beattie. The Minstrel.*

Though some unhappy instances of frivolous duels
have occurred, I cannot think that it is the vice of the
times to be fond of quarrelling; the manners of our
young men of distinction are certainly not of that
cast, and if it lies with any of the present age, it is
with those half made up *gentry*, who force their way
into half-price plays in boots and spurs, and are cla-
morous in the passages of the front boxes of a crowded
theatre. *Cumberland.*

A band of children, round a snow-white ram,
There wreath the venerable horns with flowers;
While peaceful, as if still an unweaned lamb,
The patriarch of the flock all *gently* cowers
His sober head, majestically tame,
Or eats from out the palm, or playful lowers
His brow, as if in act to butt, and then,
Yielding to their small hands, draw back again. *Byron Don Juan.*

An honest *gentleman* at his return
May not have the good fortune of Ulysses;
Not all lone matrons for their husbands mourn
Or shew the same dislike to suitor's kisses. *Id.*

Why did he love him? Curious fool!—be still—
Is human love the growth of human will?
To her she might be gentleness.

Byron.

GENTIAN, *n. s.* Fr. *gentiane*; Lat. *gentiana*, *cynceus*; Gr. *κυανος*, blue; because this plant has a blue flower, *κυανος*. A root used in medicine. See below.

If it be fistulous, and the orifice small, dilate it with gentian roots.

Wiseman's Surgery.

The root of *gentian* is large and long, of a tolerably firm texture, and remarkably tough; it has a faintish and disagreeable smell, and an extremely bitter taste.

Hill's Mat. Med.

GENTIANA, gentian, in botany, a genus of the digynia order, and pentandria class of plants; natural order twentieth, rotaceæ: cor. monopetalous: cap. bivalved and unilocular: there are two longitudinal receptacles. The most remarkable species are the following:—

1. *G. centaureum*, the less centaury of the shops, is a native of many parts of Britain. It grows on dry pastures; and its height is commonly proportioned to the goodness of the soil; as, in rich soils, it grows to the height of a foot; but in poor ones not above three or four inches. It is an annual plant, with upright branching stalks, garnished with small leaves, placed by pairs. The flowers grow in form of an umbel at the top of the stalk, and are of a bright purple color. They come out in July, and the seed ripens in autumn. The plant cannot be cultivated in gardens. The tops are a useful aperient bitter, in which view they are often used in medicine.

2. *G. lutea*, the common gentian of the shops. It is a native of the mountainous parts of Germany; whence the roots, the only part used in medicine, are brought to this country. These have a yellowish brown color, and a very bitter taste. The lower leaves are of an oblong oval shape, a little pointed at the end, stiff, of a yellowish green, and have five large veins on the back of each. The stalk rises four or five feet high, garnished with leaves growing by pairs at each joint, almost embracing the stalk at their base. They are of the same form with the lower, but diminish gradually in their size to the top. The flowers come out in whorls at the joints on the upper part of the stalks, standing on short foot-stalks, whose origin is in the wings of the leaves. They are of a pale yellow color. The roots of this plant are often used in medicine as stomachic bitters. In taste they are less exceptionable than most of the substances of this class. Infusions of gentian root, flavored with orange peel, are sufficiently grateful. Some years ago a poisonous root was discovered among the gentian brought to London; the use of which occasioned violent disorders, and in some cases death. This root is easily distinguished from the gentian, by its being internally of a white color, and void of bitterness.

GENTIANELLA, *n. s.* A kind of blue color.

GEN'TILE, *n. s.*

GEN'TILISM, *n. s.*

GEN'TILITIOUS, *adj.*

GEN'TILITY, *n. s.*

Fr. *gentil*; Lat. *gentilis*, *gens*. Applicable to individuals of all nations as opposed to

Jews; peculiar to a nation; hereditary disposition; Heathenism; of or belonging to national distinction.

Tribulation and anguish upon every soul that doeth evil, of the Jew first, and also of the *gentile*.

Romans.

Fine Basil desireth it may be her lot

To grow as a gilliflower, trim in her pot;

That ladies and *gentiles*, for whom we do serve,

May help him as needeth, poor life to preserve.

Tusser.

Gentiles or infidels, in those actions, upon both the spiritual and temporal good, have been in one pursuit conjoined.

Bacon.

A toleration of Jews is in most provinces of Europe: in Asia they have their synagogues. Spaniards permit Moors to live among them; the Mogullians, *Gentiles*; the Turks all religions.

Burton's Anat. Mel.

That an unsavory odour is *gentilitious*, or national unto the Jews, reason or sense will not induce.

Broune.

If invocation of saints had been produced in apostolical times, it would have looked like the introducing of *gentilism* again.

Stillingfleet.

The common cause of this distemper is a particular and perhaps a *gentilitious* disposition of body.

Arbuthnot.

GENTILE. The Jews called all those who were not of their race גוים, *gojim*, i. e. gentes, which in the Greek translations of the Old Testament is rendered *ἔθνη*; in which sense it often occurs in the New Testament; as in Matt. vi. 32. 'All these things do the Gentiles (or nations) seek.' Whence the Latin church also used gentes in the same sense as our Gentiles, especially in the New Testament. But the word gentes soon obtained another signification, and no longer meant all who were not Jews; but those only who were neither Jews nor Christians, but followed the superstitions of the Greeks and Romans, &c. In this sense it continued among the Christian writers, till their religion was publicly, and by authority, received in the empire; when gentiles, from gentes, came into use: and then both words had two significations, viz., in treatises or laws concerning religion, they signified pagans, neither Jews nor Christians; and, in civil affairs, they were used for all such as were not Romans.

GENTILE, in the Roman law and history, sometimes expresses what the Romans otherwise called barbarians, whether they were allies of Rome or not: but this word was used in a more particular sense for all strangers not subject to the Roman empire.

GENTILESCHI (Horatio), an Italian painter, born at Pisa in 1563. After painting with great reputation at Florence, Rome, Genoa, and other parts of Italy, he removed to Savoy, thence to France, and at last came over to England, upon the invitation of Charles I., who appointed him lodgings in his court, with a considerable salary; and employed him in his palace at Greenwich, and other public places. The most remarkable of his performances in England, were the ceilings of Greenwich and York house. He painted also a Madonna, a Magdalen, and Lot with his two daughters, for king Charles. After the death of

the king, when the royal collection was sold, nine of these pictures drew £600. His most esteemed work abroad was the portico of cardinal Bentivoglio's palace at Rome. He made several attempts at portrait painting, but with little success; his talent lying altogether in historical or mythological figures. After twelve years residence in England, he died in 1647, aged eighty-four; and was buried in the Queen's Chapel at Somerset House. His head was drawn by Vandyke.

GENTILESCHI (Artemisia), daughter of the preceding, was little inferior to her father in historical painting, and excelled him in portraits. She drew some of the royal family, and many of the nobility.

GENTLEMAN originally comprehended all above the rank of yeoman; whereby even noblemen are properly called gentlemen. See **COMMONALTY**. A gentleman is usually defined among heralds, to be one who, without any title, bears a coat of arms, or whose ancestors have been freemen: and by the coat that a gentleman giveth, he is known to be, or not to be, descended from those of his name who flourished many hundred years before. The Gauls observing that, during the empire of the Romans, the scutarii and gentiles had the best appointments of all the soldiers, became insensibly accustomed to apply the same names, gentils-hommes and ecuyers, to such persons. Gentlemen and esquires are confounded together by Sir Edward Coke; who observes, that every esquire is a gentleman, and a gentleman is defined to be one 'who bears coat armour.' It is indeed a matter somewhat unsettled, what constitutes the distinction, or who is a real esquire; for it is not an estate, however large, that confers this rank upon its owner. 'As for gentlemen,' says Sir Thomas Smith, 'they be made good cheap in this kingdom: for whosoever studieth the laws of the realm, who studieth in the universities, who professeth liberal sciences, and who can live idly and without manual labor, and will bear charge and countenance of a gentleman, he shall be called master, and shall be taken for a gentleman.'

GENTLEMAN USHER OF THE BLACK ROD. See **USHER**.

GENTLEMEN OF THE CHAPEL; officers whose duty and attendance is in the royal chapel, being in number thirty-two. Twelve of them are priests: the other twenty, commonly called clerks of the chapel, assist in the performance of divine service. One of the first twelve is chosen for confessor of the household servants, to visit the sick, examine and prepare communicants, and administer the sacrament. One of the twenty clerks, well versed in music, is chosen first organist, who is master of the children, to instruct them in music, and whatever else is necessary for the service of the chapel; a second is likewise an organist; a third a lutanist; and a fourth a violist. There are likewise three vergers, so called from the silver rods they carry in their hands; being a serjeant, a yeoman, and groom of the vestry: the first attends the dean and sub-dean, and finds surplices and other necessities for the chapel; the second has the whole care of

the chapel, keeps the pews and seats of the nobility and gentry; the groom has his attendance within the chapel door, and looks after it.

GENTOOS, in modern history, according to the common acceptation of the term, denote the professors of the religion of the bramins or brachmans, who inhabit the country called Hindostan, or Indostan, in the East Indies, from the word stan, a region, and hind or hindoo: which Ferishteh, as we learn from colonel Dow's translation of his history, supposes to have been a son of Ham, the son of Noah. Hindoo, however, is not the name by which the inhabitants originally styled themselves; but, according to the idiom of the Sanscrit which they use, jumbodeep, from jumboo, a jackall, an animal common in their country: and deep, a large portion of land surrounded by the sea; or bliertekhunt, from khunt, i. e. a continent, and blierhuth, the name of one of the first Indian rajahs. They have assumed the name of Hindoos only since the era of the Tartar government, to distinguish themselves from their conquerors the Mussulmans. The term gentoo or gent, in the Sanscrit dialect, denotes animal in general, and, in its more confined sense, mankind, and is never appropriated particularly to such as follow the doctrines of Brhima. The Gentoos are divided into four great tribes, each of which has its own separate appellation; but they have no common or collective term that comprehends the whole nation, under the idea affixed by Europeans to the word Gentoo. Mr. Halhed, in the preface to his translation of the Code of Gentoo Laws, conjectures, that the Portuguese, on their first arrival in India, hearing the word frequently in the mouths of the natives, as applied to mankind in general, might adopt it for the domestic appellation of the Indians themselves; or perhaps their bigotry might figure from the word Gentoo a fanciful allusion to Gentile. The Hindoos, or Gentoos, vie with the Chinese as to the antiquity of their nation. They reckon the duration of the world by four jogues, or distinct ages: The first is the Sutte jogue, or age of purity, which is said to have lasted about 3,200,000 years; during which the life of man was 100,000 years, and his stature twenty-one cubits: The second, the Tirtah jogue, or the age in which one-third of mankind were reprobated; which consisted of 2,400,000 years, when men lived to the age of 10,000 years: The third, the Dwapar jogue, in which half of the human race became depraved; which endured to 600,000 years, when men's lives were reduced to 1000 years: and, fourth, the Collee jogue, in which all mankind were corrupted, or rather diminished, which the word collee imports. This is the present era, which they suppose will subsist for 400,000, of which nearly 5000 are already past; and man's life in this period is limited to 100 years. Many authors suppose that most of the Gentoo shasters, or scriptures, were composed about the beginning of the collee jogue: but an objection occurs against this supposition, viz. that the shasters take no notice of the deluge; to which the bramins reply, that all their scriptures were written before the time of Noah, and the deluge never extended to Hindostan. Nevertheless, it ap-

pears from the shasters themselves, that they claim a much higher antiquity than this; instances of which are recited by Mr. Halhed. The doctrine of transmigration is one of the distinguishing tenets of the Gentoos. It is their opinion, according to Mr. Holwell, that those souls which have attained to a certain degree of purity, either by the innocence of their manners or the severity of their mortifications, are removed to regions of happiness proportioned to their respective merits; but that those who cannot so far surmount the prevalence of bad examples, and the powerful degeneracy of the times, as to deserve such a promotion, are condemned to undergo continual punishment, in the animation of successive animal forms, until, at the stated period, another renovation of the four jogues shall commence, upon the dissolution of the present. They imagine six different spheres above this earth; the highest of which, called suttee, is the residence of Brhima or Brahma, and his particular favorites. This sphere is also the habitation of those men who never uttered a falsehood, and of those women who have voluntarily burned themselves with their husbands; which practice is expressly enjoined in the code of the Gentoos laws. This code, printed by the East India Company in 1776, is a very curious collection of Hindoo jurisprudence, which was selected from curious originals in the Sanscrit language, by the most experienced pundits, or lawyers; who were employed for this purpose from May 1773 to February 1775; afterwards translated into the Persian, and then into English, by Mr. Halhed. The institutes contained in this collection are interwoven with the religion of the Gentoos, and revered as of the highest authority. The curious reader will discover an astonishing similarity between the institutes of this code and many of the ordinances of the Jewish law; between the character of the brahmins or priests, and the Levites; and between the ceremony of the scape goat under the Mosaic dispensation, and a Gentoos ceremony called the ashummed jug, in which a horse answers the purpose of the goat. Many obsolete customs and usages, alluded to in many parts of the Old Testament, may also receive illustration from the institutes of this code. It appears from the code, that the brahmins, who are the priests and legislators of the country, have resigned all the secular and executive power into the hands of another cast or tribe; and no brahmin has been properly capable of the magistracy since the time of the suttee jogue. The only privilege of importance which they have appropriated to themselves, is an exemption from all capital punishment: they may be degraded, branded, imprisoned for life, or sent into perpetual exile; but it is every where expressly ordained, that a brahmin shall not be put to death on any account whatsoever. The four great and original tribes into which the Gentoos are divided, according to their theology, proceed from the four different members of Brahma, the supposed immediate agent of the creation under the spirit of the Almighty. These tribes are, 1. The Brahmins, which proceeded from the mouth, and whose office is to pray, read, and instruct: 2. The Chehteree, which proceeded from his arms,

whose office is to draw the bow, to fight, and to govern: 3. The Bice, which proceeded from his belly or thighs, who are to provide the necessities of life by agriculture and traffic: and, 4, The sooder, from his feet, which are ordained to labor, serve, and travel. Few Christians, says the translator of the Gentoos code, have expressed themselves with a more becoming reverence of the grand and impartial designs of Providence, in all his works, or with a more extensive charity towards all their fellow creatures of every profession, than the Gentoos. It is indeed an article of faith among the brahmins, that God's all merciful power would not have permitted such a number of different religions, if he had not found a pleasure in beholding their varieties.

GENUFLECTION, *n. s.* Lat. *genu*, the knee, and *flecto*, to bend. The act of kneeling; adoration expressed thereby.

Here use all the rites of adoration, *genuflections*, wax-candles, incense, oblations, prayers only excepted. *Scillingfleet.*

GENUFLECTION, says the Jesuit Rosweyd in his Onomasticon, has been a very ancient custom in the church, even under the Old Testament dispensation; and was observed throughout the year, excepting on Sundays, and from Easter to Whitsuntide, when kneeling was forbidden by the council of Nice. Others have shown, that the custom of not kneeling on Sundays had obtained from the time of the Apostles, as appears from St. Irenaeus, and Tertullian; and the Ethiopic church, scrupulously attached to the ancient ceremonies still retains that of kneeling at divine service. The Russians esteem it an indecent posture to worship God on the knees. The Jews usually prayed standing. Rosweyd gives the reasons of the prohibition of genuflexion on Sundays, &c., from St. Basil, Anastasius, St. Justin, &c.

GENUINE, *adj.* } Lat. *genuinus*. True;
GENUINELY, *adv.* } real; opposed to what-
GENUINENESS, *n. s.* } ever is false, adulterated, impure, or mixed.

Experiments were at one time tried with *genuine* materials, and at another time with sophisticated ones.

Boyle.
 There is another agent able to analyze compound bodies less violently, more *genuinely*, and more universally than the fire. *Id.*

A sudden darkness covers all;
 True *genuine* night: night added to the groves.

Dryden.
 The stream of pure and *genuine* love
 Derives its current from above;
 And earth a second Eden shows,
 Where'er the healing water flows. *Cowper.*

GENUS, *n. s.* Lat. A scientific term to designate a class of being which comprehends many species: thus quadruped is a genus including almost all terrestrial beasts.

If minerals are not convertible into another species, though of the same *genus*, much less can they be surmised reducible into a species of another *genus*.

Harvey on Consumptions.

A general idea is called by the schools *genus*, and it is one common nature agreeing to several other common natures: so animal is a *genus*, because it agrees to horse, lion, whale, and butterfly. *Watts.*

GENUS is also used for a character or manner applicable to every thing of a certain nature or condition: in which sense it serves to make divisions in divers sciences, as medicine, natural history, &c.

GENUS, in medicine. See MEDICINE.

GENUS, in metaphysics and logic, denotes a number of beings which agree in certain general properties common to them all; so that a genus is nothing else but an abstract idea, expressed by some general name or term. See LOGIC and METAPHYSICS.

GENUS, in natural history, a subdivision of any class or order of natural beings, whether of the animal, vegetable, or mineral kingdoms, all agreeing in certain common characters. See BOTANY and ZOOLOGY.

GENUS, in rhetoric. Authors distinguish the art of rhetoric, as well as orations or discourses produced thereby into three genera, demonstrative, deliberative, and judiciary. To the demonstrative kind belong panegyrics, genethliacons, epithalamiums, funeral harangues, &c. To the deliberative, persuasions, dissuasions, commendations, &c. To the judiciary, accusations and defences.

GEOCENTRICK, *adj.* Fr. *geocentrique*; Gr. $\gamma\eta$ the earth, and *κέντρον*. Applied to a planet or orb having the earth for its centre, or the same centre with the earth.

GEODÆSIA, *n. s.* } Gr. *γεωδαισια*. A term
GEODETICAL, *adj.* } that has been sometimes applied to that part of geometry which contains the doctrine of measuring surfaces, and finding the contents of all plain figures.

GEOFFRÆA. See GEOFFROYA.

GEOFFREY, of Monmouth, bishop of St. Asaph, called by our ancient biographers Gallofridus Monumetensis. Leland conjectures that he was educated in a Benedictine convent at Monmouth, where he was born; and that he became a monk of that order. Bale, and after him Pits, call him archdeacon of Monmouth; and it is generally asserted, that he was made bishop of St. Asaph, in 1151 or 1152 in the reign of king Stephen. His history was probably finished after 1138. It contains a

fabulous account of British kings, from Brutus the grandson of Æneas the Trojan to Cadwallader in 690. But Geoffrey, though we may blame his credulity, was not the inventor of the legendary history. It is a translation from a MS. written in the British language, and brought to England from Armorica by his friend Gualter, archdeacon of Oxford. But the achievements of king Arthur, Merlin's prophecies, and many speeches and letters, were chiefly his own additions.

GEOFFROY (Stephen Francis), M. D., a celebrated French physician, botanist, and chemist, born in Paris, in 1672. After having finished his studies he travelled into England, Holland, and Italy. In 1704 he received the degree of M.D. at Paris; and at length became professor of chemistry, and physician of the Royal College. He was F.R.S. of London, and of the Academy of Sciences. He wrote several very curious theses in Latin, which were afterwards translated into French; and a treatise entitled *Tractatus de Materia Medica, sive de Medicamentorum Simplicium, Historiâ, Virtute, Delectu, et Usu*. He died in Paris, in 1731.

GEOFFRÆA, or GEOFFROYA, in botany, a genus of the dicandria order, and diadelphica class of plants; natural order thirty-second, papilionaceæ: CAL. quinquefid, the fruit an oval plum, the kernel compressed. Species three, the principal is,

G. inermis, the cabbage-bark tree, a native of Brasil and Jamaica. The wood is used in building; but it is chiefly valued for its bark, which is administered as an anthelmintic medicine. From this medical property it is also called the worm-bark tree. This bark is of a gray color externally, but black and furrowed on the inside. It has a mucilaginous and sweetish taste, and a disagreeable smell. It is given in cases of worms, in form of powder, decoction, syrup, and extract. The decoction is preferred, and is made by slowly boiling an ounce of the fresh dried bark in a quart of water, till it assume the color of Madeira wine. This sweetness is the syrup; evaporated, it forms an extract.

G E O G R A P H Y.

GEOGRAPHER, *n. s.* } Gr. $\gamma\eta$ the earth,
GEOGRAPHICAL, *adj.* } and *γραφω*, to de-
GEOGRAPHY, *n. s.* } scribe. The science
GEOGRAPHICALLY, *adv.* } that treats or dis-
courses of the earthly globe; its seas, nations, habits, customs, &c.

Metinks it would please any man to look upon a geographical map.

Burton. *Anat. Mcl.*

A greater part of the earth hath ever been peopled than hath been known or described by geographers.

Browne.

The bay of Naples is called the Crater by the old geographers.

Addison.

According to ancient fables the Argonauts sailed up the Danube, and from thence passed into the Adriatick, carrying their ships upon their shoulders: a mark of great ignorance in geography.

Arbutnot.

From sea to sea, from realm to realm I rove,
And grow a meer geographer by love.

Tickel.

Minerva lets Ulysses into the knowledge of his country; she *geographically* describes it to him.

Browne on the *Odyssey*.

GEOGRAPHY, as a science, embraces, together with a description of the earth itself, and its physical peculiarities, the consideration of all its great political and statistical divisions: the latter being sometimes detailed in systems; sometimes, as in gazetteers, alphabetically. It has its own history as a science, and it is intimately connected with all history.

As we regard society in its earlier stages, and the progenitors of mankind gradually peopling the earth, the materials of this science accumulate. The progress of the wanderers becomes bounded by this formidable mountain range, or that mighty ocean barrier: nations, and even races of men, are discriminated by the direction of the

greater rivers of the world, and their access to them; while their political and intellectual character, and even their moral and religious habits, are affected by the extent of their migrations, the intercourse they maintain with their parent tribes and with each other, and the climate in which they finally settle. When history becomes more important, the name and description of each groupe of human abodes are still more interesting.

As the circle of civilisation spreads and enlarges, the knowledge of distant regions becomes at once more exact and more widely diffused. Whether we trace its enlargement on a greater or less scale, as conducted by the emigration or extended dominion of the more enlightened tribes, or as connected with the enterprise and restlessness of individuals, man appears designed to multiply his accommodations by exchanging the varied advantages and productions of every part of the earth: and he either becomes, with his extended knowledge of them, more contented with his existing allotment on its surface, or stimulated to seek out for himself a better.

If even we contemplate the march of conquest, and the actual foundation which it has supplied of the existing political arrangements of the world, geographical information will be often found to have invited the successful expedition—always to have attended it. Ignorance, in fact, of the horrors of a northern winter, will appear to have providentially hastened the downfall of a modern Alexander; while Alexander of Macedon will be seen to have added greatly to our knowledge of the earth, by including some of the ablest of ancient geographers in his suite; charged with the duty of making observations on both the coasts and the interior of the provinces through which he passed. In their journals, it is well known, we find to this day some of the oldest and most important land-marks between the real and fabulous geography of Asia.

We propose to call the attention of our readers in this article to I. A History of the Progress of Geographical Discovery from the earliest periods. II. The Physical and Political Geography of the Globe. III. A Sketch of Technical or Artificial Geography.

PART I.

OF THE PROGRESS OF GEOGRAPHICAL DISCOVERY.

This will be found conveniently divided into the History of Ancient and Modern Geography; that is, the progress of this science as known to the ancient world, or until the period of the first Portuguese voyages; and its important and rapid advances since that period. The geography of the middle ages has no distinctive characters that require in this place particular consideration.

SECT. I.—OF ANCIENT GEOGRAPHY.

Some portions of geographical knowledge are found amongst the most uncivilised tribes; but it is local, and confined to their own immediate haunts, or wild and visionary, associated with innumerable superstitions. The geography of the most ancient nations was long and necessarily of the

former character: it was limited by the sphere of their own wants and their own experience. As mankind settled themselves in permanent abodes they had more time to become speculative about distant regions; as they spread themselves on the surface of the earth they acquired a real knowledge of its productions and peculiarities. It is easy to perceive how rapidly this kind of knowledge would thus be generated amongst men, considered as a whole, and that it would of necessity, as amongst the most useful, be found amongst the earliest of their acquirements: but mankind never long remained as a whole; there were the same means of geographical as of many other kinds of knowledge in the ancient, as in the modern world, but the difficulties of communicating and therefore of perfecting it were great, and the methods of perpetuating it few and very partially cultivated.

The antediluvian geography is altogether a matter of sacred history; for, while all nations retain traditions of the flood and its consequences, in the writings of Moses only have we any consistent account of either: to the few traces, therefore, of this the 'earliest dawn' of the science, preserved in those writings, we may at once refer the reader. It chiefly involves two or three curious questions of biblical criticism, such as the locality of Eden, the site of Ararat, &c.

Both before and after the flood the longevity of man was favorable to the diffusion and transmission of this and every other kind of knowledge; but the dispersion of mankind, according to the most approved construction of Gen. xi., would more than counterbalance this: they were now compulsorily the dependent and pilgrim beings they were so unwilling to acknowledge themselves; and, thinly peopling large districts, would soon lose the remembrance of a common origin. It is worthy of remark, however, that near the plains of Shinar, where Moses fixes the scene of their early attempt to settle themselves, and the point of their dispersion, the two earliest empires, Assyria and Babylon, were established; and a more central spot, from which all the countries first inhabited could be reached (including even China) cannot be found upon the earth.

The Egyptians are the earliest settled people of whose internal polity we have any account. Some writers have supposed that Misraim, which Moses informs us was its ancient name, is a word of dual termination, derived from Maser, a fortress; and consider it to designate the two Egypts, Upper and Lower. This is conjectural enough; but in the time of Abraham, 1920 years before the Christian era and above 1000 prior to the birth of Herodotus the father of Grecian history, we learn from the pentateuch that Egypt was a monarchy, under a king of the name of Pharaoh; under tillage, perhaps, or a corn country, and therefore a resort in famine: and after the lapse of about 200 years we find it under the same form of government, rich and well cultivated; possessing an established priesthood, whatever were their pretensions, who had a considerable lauded property; and that the rest of

the lands were held in fee simple, as we should say, by the private occupiers. It had also a class of men styled in our translation 'physicians.' Its monarch was surrounded by a court and appointed officers. We read also of his chariots; and of waggons, vestures of fine linen, rings, gold chains, silver cups, and other traces of civilisation and opulence among the people.

The Phœnicians, less favored in regard to the soil of their country, are the first people of whose maritime expeditions we have any consistent account; their situation on the shores of the Mediterranean familiarised them to the sea; and so early as 600 years after the deluge, the navigation and commerce of Sidon (one of their cities) had acquired a celebrity that the patriarch Jacob mentions at the moment of his death, Gen. xlix. 13. At a later period these merchants founded colonies in Africa, Spain, and other countries of the Mediterranean; and even extended their navigation beyond the Pillars of Hercules into the ocean. It seems also certain that they navigated the Indian seas; for the ships of Hiram are said to have brought gold to Solomon from Ophir, which is generally thought to have been situated on the western side of that peninsula. They seem, indeed, to have been the early carriers of all civilised nations, and to have been as careful to conceal their discoveries as possible, that they might retain this monopoly.

We now come to the earliest traces of geographical knowledge among the Greeks. Homer, in the eighteenth book of the *Iliad*, describes the shield of Achilles as representing the cosmography of the age, and on it the earth is figured as surrounded by the sea, or rather by a large river, the sources of which Hesiod afterwards placed near the pillars of Hercules. The disk included the Mediterranean much contracted on the west, the *Ægean* and part of the *Euxine* seas, so that Greece is the centre of Homer's world. On the west, the geography of the poet did not extend beyond the kingdom of Ulysses, comprehending the isles of *Same*, *Zacynthus*, and some others, with a part of the neighbouring continent: beyond this his knowledge was vague and confined, and the strait which separates Sicily from Italy may be considered as the vestibule of his fabulous world; where the floating rocks, the howling of the monster *Scylla*, and the terrific *Charybdis*, all demonstrate that we are in the regions of romance.

Sicily, though known to Homer by its appropriate name of *Thinacia* (afterwards *Thrinacia*), is also peopled with wonders. Here he places the flocks of the sun guarded by nymphs; the Cyclops, and the *Lestrygonæ Anthrophagi*. In following the poet west of Sicily, we find ourselves in the regions of pure fable, amongst the enchanted isles of *Circe* and *Calypso*, and the floating domains of *Eolus*. It is, indeed, evident that Homer must have been almost totally ignorant of the geography of the Mediterranean, west of Sicily; for he makes Ulysses go from the Isle of *Circe* to the entrance of the ocean in one day, and allows him only the same time to return from the Isle of the Enchantress to the Strait of Sicily.

Following the poet to the north-east, we find

him in like manner gradually immersing into the regions of fable. After passing through the *Hellespont*, &c., into the *Euxine*, he mentions the *Halizones*, a people possibly inhabiting the banks of the *Ilalys*, beyond whom are the *Amazons*, a nation of female warriors, to whose country succeeds the kingdom of *Colchis*, near the circumference of the disk, on which the poet places the palace of the sun, and the theatre of the amours of *Apollo*, with a daughter of the ocean.

The geography of Homer to the south-east is more rational: we find him acquainted with the whole west coast of *Asia Minor*; and not entirely ignorant of the country of the Phœnicians, whose purple stuffs, gold and silver works, naval science, avidity, and cunning, afford him the subjects of several strains; nor of *Egypt*, whose river he knew by the name of *Egyptos*, and of whose inhabitants he praises the medical skill. Between *Egypt* and the Pillars of Hercules the distance is much shortened, and is occupied by a country named *Lybia*, where, says the poet, 'the lambs are born with horns, and the sheep bring forth three times a-year.'

Above the earth, according to Homer, was a solid vault or firmament, under which the sun and moon performed their daily journeys in chariots rolling on the clouds. In the morning the luminary of day arose from the bosom of the eastern ocean, and in the evening sunk in the western; a golden vessel, the workmanship of *Vulcan*, during the night, transported him back by the north to the east. Beneath the earth the poet also placed a vault, named *Tartarus* corresponding with the firmament, where, in eternal night, dwelt the *Titans*, the enemies of the gods. Hesiod even determines the height of the firmament, and the depth of the gulf of darkness; an anvil, says he, would be nine days falling from the heavens to the earth, and as many descending from the earth to the bottom of *Tartarus*.

On the west, Homer's world was terminated by two fabulous countries. Near the sources of the ocean, and not far from the dismal caves of the dead, were the *Cimmerians*, an unhappy people, immersed in eternal darkness; beyond them in the ocean, and, consequently, according to the poet, beyond the limits of the earth and the empire of the winds and seasons, is *Elysium*; where neither tempests nor winter are ever felt, where the soft zephyr continually murmurs, and where the elect of *Jupiter*, snatched from the common lot of mortals, enjoy eternal felicity. Beyond this happy region, the earth was enveloped by an indefinite chaos; 'a confused mixture of existence and nothing; a gulf, where all the elements of heaven and *Tartarus*, of the earth and the ocean, were confounded; a gulf, dreaded by the gods themselves.'

Near the unhappy *Cimmerians*, and the ever blessed inhabitants of *Elysium*, Hesiod places the *Macrobians*, a people of large stature, adorned with all the virtues, and whose lives were prolonged to 1000 years at least; 'the nectar of flowers was their food, and the dew of heaven their beverage.' In the same neighbourhood this poet places the *Arimaspeæ*, a very clear-

sighted people though with but one eye; and the Grigions or guardians of the precious metals in the Rhipæan mountains. As the geography of the west was extended, all these marvellous people were transferred onwards; the Cimærians to Asia Minor and Germany, where two people were found with names somewhat similar, inhabiting the shores of the Cimærian Bosphorus, and the Cimbric Chersonesus. The Hyperboreans, another fabulous people of the Greeks, were successively transferred to an island which corresponds with Great Britain, and to the northern extremities of the earth, where they were made to inhabit a very agreeable country, explained by the days and nights being each six months long, or by the momentary proximity of the sun, when, according to the ideas of Homer, he passes during the night by the northern ocean to return to his palace in the east.

In the age of Homer indeed the Greeks were so little skilled in navigation, that the most trifling voyage was considered an heroic enterprise. Thus Menelaus employed eight years in visiting the Isle of Cyprus, Phœnicia, Egypt, and Lybia; and none but pirates ventured, he tells us, at the risk of their lives, to steer direct from Crete to Lybia.

The ancient and famous voyage of the Argonauts is founded on the Homeric cosmography. Jason and his companions, according to Hesiod, passing from the Mediterranean by the Euxine and Phasis into the Eastern Ocean, were prevented from returning by the same route, in consequence of the fleet of Colchis blockading the Bosphorus, and were obliged to make the circuit of the coast of the Ethiopians, and to cross Lybia by land, drawing their vessels with them. After a journey of four days, in this manner, they arrived at the gulf of Syrtis in the Mediterranean. Other ancient writers conduct the Argonauts back by the Nile, which they supposed to communicate with the Eastern Ocean, while later ones endeavour to reconcile the ancient tradition with the discoveries of their own times, and make them take a route by the Palus Mæotis and Tanais into the northern ocean, and round the supposed northern limits of the earth, by the west to the Strait of Hercules, by which they again enter the Mediterranean. Finally, when the non-existence of the communication between the Palus Mæotis and the northern ocean was proved, the Argonauts were supposed to have ascended the Danube; a branch of which was thought to empty itself into the Adriatic.

These vague geographical traditions were gradually, however, exploded by the foreign wars of the Greeks, and by the growing spirit of ambition, which obliged or induced a portion of them to seek new countries, and new sources of riches and power. The Milesians and Megarians formed commercial establishments on the Euxine. The Corinthians colonised Sicily, while the Phœceans, flying from oppression, settled in Sardinia, in Corsica, and in Gaul, where they founded Marseilles. Coleus, a Samian, driven out of his course by a tempest, passed the Strait of Hercules, and navigated the

Atlantic. After visiting Tartessus, the Peru of these ages (probably a portion of the South of Spain), he returned to Greece with such riches as awakened the enterprise of other adventurers. The Phœnicians in vain attempted to check the navigation of the Greeks; the latter, on the contrary, appear to have procured some of the charts of that people, and Anaximander, a Milesian, first published a map of the world. He, however, compared the earth to a cylinder, Leucippus to a drum, Heracitus to a boat, while others gave it a cubic form, and Xenophon and Anaximenes are said to have thought it a vast mountain whose base extended to infinity, and which the heavenly bodies illuminated by revolving round it.

Herodotus now, however, challenges the praise of narrating only what he saw himself or learned from ocular witnesses. He visited in the course of his long voyages and journeys the Greek colonies of the Euxine from the Bosphorus to the Phasis, but he adheres to the Homeric system in many respects. He describes the world as divided into three parts; but Europe separated, according to him, from Asia, by the rivers Phasis and Araxes and by the Caspian Sea, he supposes larger than Asia and Lybia taken together. He believes that a fleet sent by Darius circumnavigated Asia from the Indus to the confines of Egypt, while, with regard to Africa, he was unacquainted with any point between Carthage and the Pillars of Hercules. On the east coast, he was well acquainted with the shores of the Arabian Gulf, but makes this continent terminate considerably north of the equator. He has also preserved to us the traditionary relation of a voyage of the Phœnicians round Africa. With respect to the North of Europe, he knew that the Phœnician colony of Gadez received tin and amber from these regions, but could not fix the position of the Cassiterides, whence came the first of these objects, and was yet more ignorant of the country where they obtained the second.

A voyage of Hanno, prince of the Carthaginians, the descendants of the Phœnicians, was performed about the time of Herodotus. He sailed from Carthage to found colonies on the coast of Lybia, beyond the Pillars of Hercules, with a fleet of sixty vessels, each rowed by fifty oars, and escorting a convoy with 30,000 persons of both sexes. Some geographers limit the extent of Hanno's navigation on the coast of Africa to Cape Nun, others extend it to Cape Threepoints on the coast of Guinea. Major Rennell terminates it near Sierra Leone.

Hamilcar, in the same century, after a voyage of four months to the North, arrived at the isles Ostryrnides, probably Sicily, and on the coast of Albion. It seems also probable, that the Carthaginians had even before this discovered the Canaries. Aristotle speaks of an island, the beauty of which had drawn to it in his time such numbers of the Carthaginians, that the senate forbade any further emigration thither, on pain of death; and Diodorus mentions a similar discovery of them.

These ideas of a fertile distant island of the ocean, Plato found circulating in Egypt, and,

clothing them in his own poetic language, creates his celebrated Atlantic Island, 'the most beautiful and fertile country of the universe, producing abundance of corn and fruits of the most exquisite flavor; containing immense forests, vast pastures, mines of various metals, hot and mineral springs, in short, every thing necessary to the wants or pleasures of life. Its political government was admirable, being governed by ten sovereigns, all descended from Neptune, and who, though independent of each other, all lived in harmony; its commerce was flourishing, and it contained several large cities with a great number of towns and rich and populous villages. Its ports were crowded with foreign vessels, and its arsenals filled with materials for the construction and equipment of fleets. Neptune, who was the father, legislator, and god of the Atlantides, had here a temple a stade in length, covered with silver and ivory, and which contained a golden statue of the god, the height of the temple. The descendants of Neptune reigned over the island 9000 years, and extended their conquests over all Lybia to Egypt, and over Europe to Tyrrhenia, their incursions even extending to Greece, but here they were repelled by the Athenians. At length this warlike nation, after having rendered its name celebrated throughout the world, suddenly disappeared, an inundation, caused by an earthquake, submerging the whole island in a night and a day.'

About the time of the Peloponnesian war, Scylax collected the itineraries of the navigators of his time, and what has been preserved of the collection contains the coasts of the Palus Mæotis, the Euxine, the Archipelago, the Adriatic, and all the Mediterranean, with the west coast of Africa as far as the isle of Cerné of Hanno, or Fedalle, according to Gosselin. Beyond this, says the Greek, the sea is not navigable on account of the thick herbs with which it is covered.

Half a century after, Eudoxus of Cnide first applied geographical observations to astronomy; and Aristotle inferred about the same time the sphericity of the earth from the observations of travellers, that the stars seen in Greece were not visible in Cyprus or Egypt. The same philosopher supposed the coasts of Spain not very distant from those of India; and describes the habitable earth as a great oval island surrounded by the ocean, terminated on the west by the river Tartessus, (probably the Guadalquivir), on the east by the Indus, and on the north by Albion and Ierne.

Nearly in the century after Aristotle (B. C. 344) the voyage of Pytheas took place, respecting which great diversity of opinion exists amongst geographers. He is said to have departed from Marseilles, coasted Spain, France, and the east side of Britain, to its northern extremity; whence, still continuing his course to the north, after six days' navigation he arrived at a land called Thule, the situation of which is a great object of discussion: the most probable conjecture is that it is a part of the coast of Jutland.

We have intimated how important was the

expedition of Alexander to the progress of this science. As well as the direct services performed by his suite, we owe to him our knowledge of the books previously buried in the archives of Babylon and Tyre, which were now by his order transferred to the city to which he gave his name; and thus the astronomical and hydrographical observations of the Phœnicians and Chaldeans became accessible to the Greeks.

Commercial enterprise soon after stimulated the Greeks to further exertion: the Marsellais, endeavouring to follow the route of Pytheas, visited the north; and Euthymenes, in a voyage along the west coast of Africa, arrived at a large river, probably the Senegal, which he described as similar to the Nile. At about the same period the Greek kings of Egypt caused a trade to be opened with India from the ports of Berenice and Myoschormos on the Red Sea; and Ptolemy Philadelphus sent geographers into Asia. In the same reign Timosthenes published a description of the known sea-ports, and a work on the measure of the earth. The navigation of the Indian seas, however, was at this time very imperfect; the Greek fleets continuing to creep along the shores as far as the Indus, but having their chief intercourse with the coasts of Ethiopia and Arabia Felix: the monsoons appear indeed to have been entirely unknown to them.

Hipparchus, it would seem, had some notions of India beyond the Ganges. He attempted to reduce geography to astronomical and mathematical bases; but, having few celestial observations, his map of the world is filled with erroneous hypotheses. He was the first who conceived the notion of a southern continent uniting Africa and India. Eudoxus of Cyzicus first suggested the possibility of sailing round Africa by the south. Strabo relates, after Possidonius, the grounds on which that navigator made this conjecture, and the voyage in which he found the prow of a ship, which came from the west, in returning towards the Arabian Gulf from India. But he never seems himself to have completed a voyage in that direction.

Polybius was the first Roman writer whose contributions to geographical science are of any importance. He himself examined the coast of Africa as far as Mount Atlas, and first ventured to think that the torrid zone might be habitable.

Strabo, at the commencement of the Christian era, formed a complete system of geography. He first describes Iberia (Spain), with the coasts of which he seems pretty well acquainted. Near them he places the Cassiterides or Isles of Tin, which according to one part of his writings, are north of the port of Artabre (Corunna), according to another parallel with Britain. For all the geographers of this period made Britain a triangular island, of which the southern point was but little distant from the northern coast of Spain. The Cassiterides were therefore evidently the Scilly Islands, long the Carthaginian point of refreshment in their visits to Britain for tin.

Strabo was not so well acquainted with the coast of Gaul, and still less with Albion and

lerne; the latter he says is reported to be altogether sterile and inhabited only by Anthropophagi. This is the last country of his geography towards the north, and, as he disbelieved the voyage of Pytheas, the continent of Europe terminated with him at the Elbe.

This writer was also but imperfectly acquainted with the north coast of Africa; for he makes the distance between Sicily and the pillars of Hercules only 13,000 stades. On the west coast his map is limited to about Cape Roxo, for he seems to have been unacquainted with Hanno's voyage, and on the east coast his knowledge did not extend, it would seem, beyond Cape Bandellans, his *Noti Cornu* or southern Horn. Thus the coasts of Africa were unknown beyond the latitude of $12\frac{1}{2}^{\circ}$ N. Strabo places at the south-west extremity the Ethiopes *Etherii*, and at the south-east the region of Cinnamon. Between these extremes he admits but a small space, which the great heat had prevented being visited, and this extremity of Africa he supposed to be washed by the Indian and Atlantic Oceans, which here met: an opinion which maintained its ground against the idea of India and Africa being united, until the discovery of the Cape of Good Hope. Eastward the details of Strabo's geography seem only to have included the mouth of the Indus; though he had some conjectural knowledge of Taprobana (Ceylon), derived from the Greek expeditions to this neighbourhood.

It is only in the later years of the Roman republic that we find any accurate description of the Canaries amongst that people. This was given by Statius Sebosus; who collected at Gadez all the particulars which Sestorius and others who had previously fled from Rome thither had transmitted into Spain; and they now received the name of the Fortunate Islands.

In the first century of the Christian era appeared the *Periplus* of the Erythrean Sea, a work which marks distinctly the progress of discovery at this time on the coasts of Africa and India. The *Noti Cornu* of Strabo, no longer bounded the voyages undertaken along the eastern shores of the former continent, but they were extended to the port of Rapta and the isle of Menutias, corresponding with *Bandel Velho* and the island of *Magadoxea*. Beyond Rapta however, says the writer, 'the ocean is entirely unknown, but is believed to continue its western direction, and after having washed the south coast of Ethiopia to join the western ocean.' The *Periplus* gives a description of the west coast of India from the Indus to Ceylon, and mentions a part of the coast between Bombay and Goa as infested with pirates. The east coast of the Indian Peninsula is less accurately traced. India beyond the Ganges was known to the author of the *Periplus* only by report. This work however mentions the monsoon of these seas.

Great Britain seems to have been first ascertained to have been an island by the Roman fleet sailing round its north extremity, in the reign of Vespasian. Ireland also became at this period better known from the intercourse of the Imperial armies with the Britons. The Roman armies in the same century are thought to have reached the shores of the Baltic through Ger-

many: they named this the Sarmatic Sea. The Cimbric Chersonesus of Ptolemy is evidently the Danish peninsula; the Codanus Sirius of Pliny, the Cattegat; and the isles of Scandia, east of the Chersonesus, the larger Danish isles and perhaps the coast of Schonen. The Nerigon of Pliny is probably a part of the southern coast of Norway.

Pliny, indeed, considers the Ganges as the north-eastern limit of Asia, from which he supposed the coasts to turn to the north and to be washed by the sea of Serica, between which and the pretended strait communicating from the Caspian Sea to the Scythian or Northern Ocean he admits but a small space: hence he supposes it possible, that some Indians might have been driven in a storm from their own coasts to those of Germany. In the system of Pliny, it therefore follows, that the ocean occupies the vast spaces of Siberia, Mogul, Tartary, China, &c.

Ptolemy's knowledge of the east coast of Africa was bounded on the south by the promontory of *Pracum* (Brava), and by the bay of Gonzales de Cintro on the west. He thought that to the south of this bay the coast of Africa, after first forming a gulf which he names *Hespericus*, extended indefinitely between the east and south to India. On the coast of that country beyond the Ganges he places a great gulf, now supposed to be the bight of Martaban, which on the east bounded the Golden Chersonesus; the Thine of this writer was the boundary of classical geography in this direction.

Two remarkable specimens remain of Roman itineraries. The first is that of Antoninus, containing merely, like our common road books, the names of the different places, and their distance from each other. The other, the *Peutingerian Table*, is of later origin, and professes to exhibit a map of the world. This is twenty one feet in length, and one foot broad. Every feature in fact, is increased immeasurably in one direction, and diminished as much in the other: the Mediterranean and Black Seas appear like rivers, rolling an amazing length; while the three continents are narrow strips of land through which they flow. In the longitudinal measures the space from Babylon to the Eastern Ocean occupies only one-eighth of the map, though it fills nearly half the space represented. In fact, the only object of this production appears to have been to exhibit the great roads leading from east to west through the Roman empire; and every other purpose of a map was sacrificed, if indeed at all contemplated, to this.

On the decline of the Roman empire, geography, with every other species of scientific knowledge, was committed, in the Christian nations, to the custody of monks and ecclesiastics. The only original work of cosmography that appeared between the second and sixth centuries, or rather the only one that has come down to us, is that of Cosmas, an Egyptian monk, who wrote about the latter period. He conceived of the earth as a vast square plain, surrounded by a wall which supported the vault of the firmament; and the succession of day and night as the effect of a great mountain placed to the north of the earth, behind which the sun conceals himself

every night. This system, differing only from that of Homer in the square figure of the earth, was adopted by many Christian writers of the middle ages.

The earth, in a chart constructed in 787, is represented as a circular planisphere, composed of three unequal portions; and beyond Africa to the south, there is said to be a fourth, which the extreme heat of the sun prevents us from visiting, and on the confines of which are the fabulous antipodes.

The followers of Mahomet, however, cultivated astronomy and geography more successfully. In the ninth century the Arabian navigators had visited China, Sumatra, Java, and other islands of the Malay archipelago, while on the eastern coast of Africa their religion was established from the Red Sea to cape Corientes. Edrisi, however, who composed a treatise on geography in 1153, seems to have been ignorant of the union of the Atlantic and Indian Oceans; for he depicts a large country extending from the coast of Africa to India beyond the Ganges. The navigation of the Arabs on the west coast of Africa does not appear to have extended beyond Cape Blanco; but they speak of an apocryphal voyage of discovery to the west, which at the best seems only to have extended to the Canary Isles.

All the Arabian geographers adopted the ancient idea of the earth being every where bounded by an ocean: one of them curiously enough compares it to an egg floating in water. Abulfeda, after Eratosthenes, describes the sea as terminating Africa immediately on the other side of the mountains of the moon. But their information respecting the Niger is the most curious. This they describe as the Nile of the Negroes, every where bordered by opulent states, and flowing from east to west into the sea.

Their countrymen, it is to be observed, had at this time subdued all Egypt and the northern coast of Africa, held by their descendants the Moors to this day. Hence by means of the caravans, which penetrated Africa then as now, their information on the subject of its interior geography was not so far behind ours as the distance of time would teach us to expect. Their arms, on the other hand, at the period of which we are speaking, had not yet penetrated up the Nile into Nubia; therefore all that tract of country, with Abyssinia, is described by them in a very confused manner. In Asia they occupied Persia, Cabul, Bukharia, and all the finest provinces of Hindostan. Thus they acquired very extensive opportunities of becoming acquainted both with the interior and eastern extremities of that continent. The provinces of Khwarezm and Bukharia are described in narratives, which form still our chief authority for the interior of those countries. India was divided into two parts, Sind and Hind, the former comprehending the western, and the other the eastern part of that vast region. Of the peninsula of the Decan, scarcely any thing was known except the coast of Malabar, considered as forming part of Sind, and along which the Arabs had sailed as far as Cape Comorin. Their Seranda is evidently the Indian name for Ceylon, and their Lamery is

marked, by its productions of camphor, dyeing-wood, gold, ivory, &c. to be Sumatra; Java also is mentioned under the name of Al-Djavah. These geographers also knew that the Spice Islands were situated somewhere in this region. In Eastern Asia, Thibet is designated under the appellations of Tobbat or Alboton, and China under those of Cathay, and Tchin or Sin; the former denoting the northern, and the latter the southern provinces of that empire. Indeed all the regions, known to us as India beyond the Ganges, seem by them to have been comprehended under the name of Sin. But the northern extremity of Asia was a portion of the continent little known to these writers.

Perhaps we should not omit to notice, that they chiefly regarded it as the terrific abode of Gog and Magog, two enormous giants, who gradually retreated before the march of discovery. At this period their castle was seriously described as surrounded with walls of iron cemented with brass, and towers to the skies. Towards its base was a gate fifty cubits high, also of iron, and secured by enormous bolts and bars. The people belonging to these chieftains appear to have comprehended all those which extended to the north and north-east of Asia. Those of Magog, the most remote, are described as of small stature.

The Norwegians, about A. D. 860, discovered the Faroe Islands and Iceland. In the conclusion of the same century Othæ made a voyage from Norway to Biarma (the Dwina), or the White Sea, which is the first time we hear of the North Cape of Lapland being doubled.

In 952 an Icelandic nobleman devoted a period of exile from his country to voyages of discovery: and, having heard that land had been seen far to the west, he directed his course that way, and arrived at a verdant shore, to which he gave the name of Groen or Greenland, and which was shortly after colonised by the Icelanders and Norwegians.

Biorn, an Icclander, in 1001, sailing from Norway to Greenland, was driven upwards of 1000 miles to the south-west, where he discovered a country, to which, on a second visit, he gave the name of Winland, from the wild grapes he saw there. Five years after its discovery the Norman Greenlanders formed a colony in this country; and in 1121 Greenland sent a bishop hither to convert the pagan colonists; but from this period Winland becomes lost to the world; many modern geographers think it to be Newfoundland.

Important additions were made to the geography of Asia in the thirteenth century by Marco Paulo, a Venetian of noble birth. He penetrated by land to China, about 1270, and describes it in detail from his own observation. Of Japan he speaks from the accounts of others: but he visited the coast of Tsiompa, notices Great and Little Java, which seem to be Borneo and Sumatra, and the isles Neaurau and Angana, in the Bay of Bengal (Naucauvery, one of the Nicobars, and Andaman), the inhabitants of which, according to him, were anthropophagi, with the heads of dogs! India he describes throughout the east and west

coasts of the peninsula, between the Ganges and the Indus: but, on the east of Africa, his knowledge extended no farther than Zanguebar and the opposite part of Madagascar which he first made known.

ECT. II.—OF MODERN GEOGRAPHY.

The invention of the mariner's compass is the important connecting link between ancient and modern geography. The first person who availed himself of it is said to have been a friar and astronomer of Oxford, Nicholas Lynn, who steered to the northern isles of Europe with the new guide, A. D. 1360.

But the Portuguese have the merit of leading the way in that more extended career of maritime enterprise which has distinguished modern times. Early in the fifteenth century, in one of their voyages to the coast of Africa, Puerto Sancto, or the Holy Haven, the least of the Madeiras, was discovered; in 1432 another of their navigators was driven on the Azores, which were at first supposed to be to the easternmost of Marco Paulo's oriental islands. It was not, however, until 1471 that the equator was crossed, and the islands in the gulf of Guinea discovered. In 1484 they arrived at the river Zaire; and here the country was taken formal possession of for the king of Portugal, by virtue of a papal bull, obtained in 1432, from Alexander IV., an instrument which granted the full sovereignty and property of the countries of the Infidels discovered by his subjects, to that prince.

At length, the terrors of the torrid zone being gradually dissipated, a fleet was fitted out under Bartholemew Diaz for the express purpose of attempting the passage to India by the south of Africa. This commander coasted Africa to within sight of its southern point, to which he gave the name of Cabo de Todos los Tormientos, from the violent storms he experienced off it; but the want of provisions obliged him to return to Lisbon: and it was not until ten years afterwards (20th November, 1497) that Vasco de Gama had the honor of doubling the promontory. He now passed along the eastern coasts of Africa, through the Mosambique channel to Melinda, and arrived at Calicut six months afterwards.

In the interim Columbus (see our article AMERICA) had performed his first three voyages. Vaso Nunez, in 1513, first obtained a glimpse of the Pacific Ocean from the mountains of Darien, and gave it the absurd name of the South Sea; and two years afterwards the coast of South America had been explored to the southern tropic.

Between 1510 and 1515 the Portuguese had visited all the islands of the Malay archipelago to the Moluccas. But a discovery greater than any hitherto made was reserved for the Spaniards. In 1519 Magellan discovered and passed the straits which still bear his name: after which, sailing north-west across the Grand Ocean for three months and twenty days without seeing land, he fell in with an island in fifteen degrees south, and shortly after with another in nine degrees, to which he gave the name of Desaventurados, or Unfortunate, from their

affording him neither water nor refreshments, when his crew were perishing with famine. From these islands, the situation of which is not exactly known, steering still to the north-west, he arrived at the group which he named the Ladrões, or islands of thieves, from the dishonest disposition of the natives; and thence directing his course to the west, on the Saturday of Passion Week he discovered what he called the Archipelago of St. Lazarus, but which were subsequently named the Philippines. The first of this archipelago that Magellan touched at was Cebu, with whose king he took part in a war against his neighbours, and was killed in an invasion. The squadron sailed thence to Borneo and the Moluccas; discovered Timor; and, after many disasters, one vessel only, the Victoria, the Admiral's ship, returned to Spain, round the Cape of Good Hope, arriving at Seville the 7th September 1522. This being the first ship that circumnavigated the globe, she was in great triumph drawn up into the city of Seville, and long preserved there. Her commander, Sebastian Cano, was ennobled, and received orders to wear for his coat of arms, a terrestrial globe, with the motto 'Primus circumdedisti me.' On their return to Spain the companions of Magellan were not a little surprised on being the first to realize the well-known problem of losing a day in sailing round the world westerly.

The progress of discovery was now rapid: the Portuguese would appear to have reached New Guinea, and even New Holland, between 1530 and 1540. Passing over minor discoveries of the Spaniards in the Pacific, in 1577 we find our own countryman, Drake, first conspicuous in this noble career. He obtained a commission from queen Elizabeth, by virtue of which he equipped a squadron of five vessels, the largest only 100 tons and the smallest fifteen, with a complement of 104 persons. With this small force he sailed from Plymouth the 15th of November, 1577, entered the Strait of Magellan the 20th of August the next year, and cleared it the 6th of September: an extraordinarily short passage, for no navigator since has been able to accomplish it in less than thirty-six days. Having coasted the whole continent to the north extremity of Mexico, and being laden with the spoils of the enemy, he determined to seek a northern passage into the Atlantic. In this pursuit he sailed along the coast to which, from its cliffs, he gave the name of New Albion, and took possession of it in the usual form for England. At Cape Blanco he found the cold so great, that he gave up the search of a passage by the north, and crossed the Pacific to the Molucca Islands, in which long route his only discoveries were some islands in twenty degrees north, which have not been since identified; and, after an absence of 1501 days, arrived at Plymouth, the 3d of November, with only his own ship and fifty-seven men.

Drake was followed by Cavendish, Schouten, Quiros, Dampier, and other celebrated navigators, who each touched at numerous archipelago which stretches across the Pacific at different points. Meanwhile Cabot having discovered Newfoundland, Cortereal, a Portuguese navigator, followed him to the north of Hudson's

Bay, to which he gave the name of the strait of Anian, and to the country that of Tierra de Labrador. It was now concluded that India might be reached in this direction; and a large extent of the north-west coast of America was explored by the Spaniards from California. The attempt to find a passage in this direction was afterwards made from the opposite side by Frobisher, Davis, and Baffin, who explored in this way the great bays of Hudson and Baffin, the coast of Greenland, &c.

Nor was the Frozen Ocean of Northern Asia neglected during this period. The English and Dutch made vigorous exertions to open a passage through the icy barriers of that ocean; and discovered Nova Zembla, the strait of Waygat, and Spitzbergen. Russian travellers also penetrated to Okhotsk, on the eastern shore of the continent; and Beering finally rounded the eastern shore of Asia. The extent and boundaries of the Pacific were now the most unascertained problems in geography. A vast continent was still supposed to surround the South Pole; and in the north the separation of Asia and America was doubted. At this period our immortal Cook commenced his survey of this vast expanse of waters. He completely established the non-existence of a southern continent; examined the north-west coast of America, and the eastern coast of New Holland, and sailed round New Zealand. He also discovered New Caledonia, and made Europe acquainted with those interesting groups the Society, the Friendly, and the Sandwich Islands. See Cook. A succession of French and English navigators, Perouse, Vancouver, Labillardiere, Flinders, Wilson, &c., followed, and completed the survey of the large islands which have been sometimes denominated Australasia. The issue of their researches meets us in every part of our Gazetteer.

After all, large portions of terra incognita invite to future efforts. The interior of Africa or Asia, but especially the former, is little known: America has been more fortunate. We must still, however, not forget the obligations of science to a Park, Browne, Barrow, Lucas, Tuckey, Houghton, Denham, &c., with regard to the first of these objects; the efforts of Messrs. Elphinstone, Hodges, Kenneir, Malcolm, and Mercer, with regard to the second; or that the spirit of enterprise and discovery is roused to a greater extent than ever throughout the civilised world. The result cannot fail to give increasing interest to the study of this science.

At the head of the writers on modern geography may be placed Sebastian Munster, the author of a valuable *Cosmography*, of the sixteenth century, and who has been called the Strabo of Germany. Next in order stands the *Thesaurus Geographicus* of a Fleming of the name of Ortelius, a work of considerable and laborious research; while superior to both in importance is Mercator's edition of Ptolemy's *Geography*, and the improvement he made in the construction of maps. The chart which bears his name was invented by him about the year 1557; but the true principles of its construction were first

given by an Englishman of the name of Wright in 1599. Mercator was also a Fleming.

In the seventeenth century the whole science was revolutionised by the successive efforts of the erudite Cluverius, the well-informed astronomer Riccioli, and the profound Varenus. Sir Isaac Newton, it is well known, translated and commented upon the works of the last of these writers. Ancient geography was also systematised at this period by Cellarius; while maps were much improved in France by Sanson, in Holland by Blaeuw, and in Sweden by Bureau.

One of the greatest geographical names in the last century is that of D'Anville. He greatly improved the method of comparing ancient and modern geography, abolished many foolish and arbitrary modes of delineation; and accomplished a complete reform in the historical part of the science. Statistical science in the mean time received an increased share of attention, and has been much indebted to the accurate Busching and his successors; among whom may be mentioned Bruns, Ebelins, and Wahl. Other continental geographers of eminence in the eighteenth century were Delisle, Cassini, Lacaille, and Lalande, who, with several of their fellow-contributors to the papers of the French Academy, much advanced the mathematics of the science; Gosselin, Voss, Mannert, and Le Brun. We may also mention among the most distinguished of modern names in this science, our own countrymen Major Rennell, Dr. Vincent, and the late Mr. Pinkerton.

PART II.

OF PHYSICAL AND POLITICAL GEOGRAPHY.

The *physical* geography of the world, would in strict language embrace a complete description of its internal and external organization and productions. Other sciences, however, take up the greater part of the details of these multifarious topics: geography only glances at them generally, and in their great outlines. Its principal topics are 1. The earth; 2. The ocean and waters; 3. The atmosphere; 4. The animal tribes; and, 5, The vegetable productions. Metals and minerals will be fully disposed of in the following article GEOLOGY; or in METALLURGY or MINERALOGY.

Political geography regards the general state of human society in the several divisions of the globe. This has been divided into the savage, the barbarous, the half civilised and civilised states. These are again diversified by the political institutions of each part of the world. On the whole we feel that this is a topic which it is impossible to treat correctly, but in detail; and therefore refer the reader to the successive accounts of the political state and institutions of each portion of the globe; as they will be found in the body of this work.

1. Of the *earth*. Geology and mineralogy explain the formation and value of the various strata of which what we know of the earth is composed.

This is indeed but little. The deepest excavations that have been made by art do not exceed 2400 feet, which is less than half a mile, i. e. about $\frac{1}{16000}$ th part of the diameter of the earth; so that

whatever lies below that depth is utterly unknown. We need here only observe that the substances which have been extracted from those excavations are not in general of a nature different from those which in some particular places have been found immediately upon the surface. The mean density of the earth, according to the observations of the late astronomer royal Dr. Maskelyne, is four and a half, reckoning water, as usual, the standard of comparison. In this calculation Dr. Hutton also coincides. The late Mr. Cavendish assigned a greater quantity, or about five and a half, from an elegant experiment on the principle of torsion. Perhaps the true proportion would be found to lie between these limits.

The most obvious natural division of the earth's surface is into sea and land; about seven-tenths of it being occupied by water, although to what comparative depth is unknown. The remaining three-tenths consist of land, elevated more or less above the level of the sea, interspersed in some parts with small collections of water, at various heights, and, in a few instances, somewhat lower than the surface of the ocean.

There is no regular plan or principle on which the relative distribution of land and water seems at present to be made. Le Brun's *Precis de la Géographie Universelle*, thus calculates the proportion of dry land in the two hemispheres.

In the northern frozen zone . . .	0,400
temperate zone . . .	0,559
northern tropic. . .	0,297
<hr/>	
In the northern hemisphere . . .	1,256
In the southern frozen zone . . .	0,000
temperate zone . . .	0,075
southern tropic . . .	0,312
<hr/>	
In the southern hemisphere . . .	0,387

According to Mr. Myers, if the distribution of land be considered with respect to the two hemispheres (London and our antipodes being taken for the poles of the hemisphere), formed by the equator and the zones, into which they are divided, the quantities will be found to be nearly in the following proportions, where the area of each zone respectively is taken for unity.

In the northern part of the torrid zone . . .	297
In the northern temperate zone . . .	559
In the northern frigid zone . . .	400
The same estimate for the southern hemisphere, gives,	
In the southern part of the torrid zone . . .	312
In the southern temperate zone . . .	075
In the southern frigid zone . . .	000

By adding the numbers of the respective zones together, and dividing each sum by 2, we may obtain the proportion of land and water in each.

The whole of the torrid zone being 1,	
the land is . . .	3045
Two temperate zones being 1, the	
land is . . .	317
Two frigid zones being 1, the land is . . .	200

From these calculations, it is easy to ascertain the proportional quantities of land and water in

each, when the whole surface of the earth is represented by unity. The respective numbers for the quantities of land are, for the

Whole of the torrid zone . . .	121191
The two temperate zones . . .	164523
The two frigid zones . . .	0166
<hr/>	
The total proportion of land . . .	302314

This writer calculates on the above basis that there are on the entire surface of the globe 4,988,181 square leagues of land; and 11,511,819 square leagues of water; the northern hemisphere containing more than three times the quantity of land which is in the southern.

The great outlines of the land are diversified in a very remarkable manner. All the great promontories, both in the Old and New World, excepting the peninsulas of Jutland and Yucatan, are directed towards the south. Those in the Old World have been thus enumerated; Scandinavia, Spain, and Portugal, Italy, Greece, Africa, Arabia, Hindostan, Malacca, Cambodia, Corea, and Kamschatka: those in the New are California, Alaska, Greenland, Florida, and the whole of South America. There seems to be no other uniform feature in the general outline of the masses of land.

The character of its elevations may be considered as professor Jameson suggests under the denominations of high and low lands. 'In Europe,' he says, 'we find but two high lands, and one low land. The one is the great European or Southern, the other is the Scandinavian or Northern. The one has its middle point in Switzerland, in the Tyrol, and in the Alps of Savoy. Hence it passes through three-fourths of France, traverses the whole of Spain and Portugal, includes nearly two-thirds of Germany, passes through the greater part of Italy, and also part of Hungary and Turkey, and terminates on the borders of the Black Sea. The course of this high land determines that of the great low land. Saxony lies nearly on the border of this low-land or plain. It passes through the north part of Saxony to the east or Baltic Sea. It also passes by the foot of the rocky mountains through the upper part of Westphalia, and further through the whole of Holland, the Netherlands, and a part of France; it even reaches the east coast of this island. It extends very considerably towards the north, including in its course Prussia, Poland, and nearly all Russia in Europe, and reaches to the Uralian Mountains, including the greater part of Moldavia. The other high land rises in Norway and Sweden, comprehends a portion of Russia, and extends with some interruption to the Uralian Mountains.'

In the New World we find, however, the most remarkable and largest continued range of elevated land, stretching from Cape Horn to Bheering's Strait. Through the whole of South America this range is within a short distance of the Pacific Ocean, and contains the most magnificent elevations. Chimborazo, near the equator, is its highest point; whence it declines on one side to the southern extremity of the continent and on the other to the straits of Panama. In Mexico this chain assumes its former volcanic character and majestic height. Then in a north-

west direction it declines again to the height of about 5000 feet, till at its northern extremity appears the lofty Mount St. Elias. On the eastern side of this continent, another chain runs parallel to the Atlantic; and forms the Alleghany and Appalachian Mountains, at the back of the United States. North America is thus divided into two high, and three low land, districts. Of the latter the two which are between the mountain chains and the ocean, particularly that which borders on the Pacific, are the narrowest. The third, which occupies the space between these chains, is of great extent; is partly occupied by the noble lakes of the interior, and watered throughout with the finest rivers in the world. In a similar manner we find in South America the sloping plain between the Andes and the Pacific Ocean is contracted to the breadth of only a few miles, while that which borders on the Atlantic expands far into the interior. Here again the low land of the central regions is interrupted by a branch of the Andes which separates various branches of the Marañon from those of the La Plata: then it expands to the north-east, and on the one side gives egress to the largest river on the globe; while far to the south, on the other, it supplies the mouths of the La Plata with their mighty collection of waters.

Humboldt considers the mountains of Kamtschatka and of north-eastern Asia, as a prolongation of the western chain of America. Their long south-western continuation, known as the Sianovas, the Yablonay, and the Altaic ranges, extends through the greater part of Asia, till, in approaching the sea of Aral, it meets another chain from the south-east, which, under the names of Hemalleh and Hindoo Coosh, has been supposed to include the loftiest summits in nature. In traversing Persia these chains descend considerably, but throw up immense masses in Armenia, Asia Minor, and the frontier of Syria.

These ridges, it is worthy of remark, form Asia, like America, into three low lands, of which the first, between Hemalleh and the Indian Ocean, consists of the maritime provinces of Persia, of Hindostan, and India beyond the Ganges; the second, between the Hemalleh and Altai Mountains, includes Bukharia, the great desert of Shamo and Cobi, and the greater part of China; the third, stretching from the Altai to the Northern Ocean, is composed of the bleak plains of Siberia.

In Africa only this species of distinction becomes uncertain. The Atlas at the north-western extremity rises to a great height, but it sinks entirely before reaching the eastern coast. To the south extends an immense plain, composed chiefly of sandy desert: and at its termination are found two very high ranges of mountains, running inwards, one from the eastern and the other from the western coast, which are generally supposed to unite and form a continuous chain across the continent. Similar ranges extend behind Congo and Monomopata; and the southern extremity of Africa defends itself by a high mountain wall against the expanse of ocean which it overlooks. But the limits of mountain and plain, throughout all this part of Africa, are wholly unknown.

VOL. X

It has been remarked, from this general view of the earth's surface, that the principal chains of America and Asia are arranged in a species of irregular arch; and that it is not improbable, if we could connect the mountains of Arabia with those of Abyssinia and central Africa, they would form a continuation of the same figure; the whole being ranged around the shores of the great ocean, in a species of semicircle corresponding to that formed by the shores of the three continents; and forming the common mighty bulwark of nature against the encroachment of the seas.

Some modern geologists contend that the series of rugged and elevated peaks which we find in some of these extensive chains, has always its base in granite rock; while the gentler and more uniform declivities are generally gneiss formations. See our article GEOLOGY.

Baron Humboldt mentions one remarkable difference between the formation of the mountains in the Old and New Worlds. Mont Blanc and others of the higher Alps rear their peaks of granite above the clouds. But, in America, the newest flint trap, or whinstone, which in Europe appears only in low mountains, or at the foot of those of great magnitude, covers the mightiest heights of the Andes. Chimborazo and Antisana are crowned by vast walls of porphyry, rising to the height of 6000 or 7000 feet; while basalt, which in our continent has never been observed higher than 4000 feet, is, on the pinnacle of Picluncha, seen rearing aloft its crested steeps, like towers amid the sky. Other secondary formations, as limestone, with its accompaniment of petrified shells and coal, are also found at greater heights in the New than in the Old World; though the disproportion is not so remarkable in these.

Volcanoes, one of the great physical distinctions of mountains, occur most commonly in the islands and promontories of the Old World unconnected with the principal chain; but penetrate every part of the New. These observations, however, must only be taken generally: the following is Mr. Jameson's statement of the relative situation of all the principal ones:—

Continent of Europe . . .	1
European Islands . . .	12
Continental Asia . . .	8
Asiatic Islands . . .	58
Continent of America . . .	97
American Islands . . .	19
Total . . .	195

Vesuvius is the only one on the continent of Europe; those in the islands are chiefly in Iceland, Sicily, and Stromboli. The volcanoes of continental Asia are on the peninsula of Kamtschatka, and on some of the islands between that point and Sumatra. No volcano has yet been discovered on the continent of Africa. Upon the subject of earthquakes, as connected with volcanoes, see our article EARTHQUAKES.

The low lands are divisible into valleys or river districts and plains: under the former we classify those fertile tracts generally bordered by hills or mountains, and sloping toward a middle

point or Line where a river runs; often of considerable magnitude, and fed by the mountain streams.

The larger plains, which are neither interrupted by mountain or river, are necessarily sterile, and consist generally either of hard, unproductive clay land, or loose sand, as in the torrid regions of Africa; the central parts of Persia, &c.

2. *Of the Ocean and Waters of the Earth.*—The immense body of terrestrial waters is divisible into two great basins. That which may be denominated *The Great Atlantic basin*; and *The Great Pacific, or Grand Ocean*, as it has been called; for it has strictly no particular relation to any quarter of the globe.

1. The Great Atlantic basin will include the Northern Frozen Ocean, or Arctic Sea, surrounding the North Pole, and washing the northern extremities of both the old and new continents. Its other branches in this part of the world are the White or Lapland Sea, and Baffin's Bay. This noble expanse of water now separates Europe and Africa from America, and is limited on the south by a line drawn from the Cape of Good Hope to Cape Horn. The portion of this ocean north of the tropic of Cancer to the polar circle is the North Atlantic, that south of the tropic of Capricorn the South Atlantic, and that included between the tropics the Equinoctial Atlantic.

The branches of the North Atlantic on the side of the old continent are, 1. *The Sea of Norway*, comprised between the coasts of Norway and Iceland, and the Zetland and Ferroe Islands, extending from the Polar Circle to the sixtieth degree. 2. *The British Sea*, between Great Britain and the continent from the sixtieth degree to the Strait of Dover. The name of *North Sea* given to this branch of the Atlantic, first probably by the Dutch, in whose country alone it is applicable, has been generally adopted by the French and English, particularly in their sea charts; it is also frequently designated by its ancient name of the *German Ocean*. 3. *The Baltic*, which communicates with the British Sea by the *Scagerrack* and *Cattgat*, the former of which may be confined to the space between the south coast of Norway and the north-west coast of Jutland, which extends nearly north-east and south-west; leaving the *Cattgat* as a discriminating turn for the channel between the east coast of Jutland and the coast of Sweden. 4. *The English Channel*, separating England and France. 5. *The Irish Channel*, sometimes improperly called the *Irish Sea*, separating Great Britain and Ireland. 6. *The Bay of Biscay*, washing but twenty leagues of the coast of Biscay, while it has 120 leagues of the coast of France, should receive the name of the *Gulf of France*. 7. *The Mediterranean* is the last branch of the North Atlantic on the side of the old continent, and the Equinoctial Atlantic on this side has only the *Gulf of Guinea*, between capes Palmas and Negro.

On the American side of the North Atlantic, the branches are, 1. *Davis's Strait*, separating the southern extremity of Greenland from the continent of America, and forming the entrance into the *Bay of Baffin, Barrow's Straits*, &c. 2. *Hudson's Bay*, which is properly a Northern Mediterranean sea.

On the American side of the Equinoctial Atlantic are the *Gulf of Mexico*; and the *Caribbean Sea*, running between the West India islands and the continent of America.

Round the promontory of Africa is the *Indian Sea*, one of the most extensive and important branches of this division of the ocean; bounded on the west by the east coasts of Africa and Arabia, on the north by India, on the east by the west coast of New Holland, or Terra Australis, and the Great Asiatic Archipelago, and on the south by a line drawn from the Cape of Good Hope to the south-west point of New Holland. The branches of this sea on the west are, 1. *The Channel of Madagascar*, or of *Mosambique*, separating the island of Madagascar from the continent. 2. On the north-west the *Great Gulf of Arabia*, or sea of *Oman*, the limits of which are capes Guardafui and Comorin. The *Red Sea* and *Gulf of Persia* are branches of the Great Gulf of Arabia.

The north-east extremity of the Indian Sea forms the *Bay of Bengal*, which with more propriety would be named the *Gulf of Indostan*; its limits are the south point of Ceylon and the north-west point of Sumatra. On the east the Indian Sea forms a large gulf between the Sunda Isles on the north, and New Holland on the south.

To the east of the Indian Sea, and within the tropics, are several portions of the ocean, forming seas enclosed by the Malay Archipelago; as the *China Sea*, the seas of *Java, Celebes*, and the *Moluccas*. The collective name of the *Sunda Sea* has been given to the last three.

II. The second great basin we have noticed separates Asia from America. It has the general denominations of South Sea and Pacific Ocean; but the more appropriate name of *Grand Ocean* has been proposed for this great basin by M. Fleuriot. The great divisions of this ocean are, 1. *The Great Northern Ocean*, extending from the Arctic Circle to the Northern tropic. 2. *The Pacific, or Grand Equinoctial Ocean*, included between the tropics. 3. *The Great South Sea*, extending from the southern tropic to the south cape of Van Diemen's Land and Cape Horn.

The *Great Northern Ocean* has several branches; the first of which to the north is comprised between the north-east extremity of Asia, the north-west extremity of America, and the Aleutian Islands, for which has been proposed, with great propriety, the name of *Bering's Basin*, from the navigator who first visited it. On the coast of Asia to the north-west it forms the *Gulf of Anadyr*, and on that of America to the south-east the great *Bristol Bay* of Cook. On the coast of Asia to the south, we now meet a series of internal seas from Kamtschatka to Formosa; the first bounded by Kamtschatka on the east, and by Russian Tartary, or Siberia, on the west and north, is named by the Russians, the *Sea of Ochotsk*, from a miserable town and river on it, and the *Sea of Lama* by the Tongouth Tartars who inhabit its shores; in some geographies it is also called the Sea of Kamtschatka; as more appropriate, we propose to name it the *Sea of Tartary*, and to leave that of *Gulf of Ochotsk* to its western extremity.

The second of the interior chain of seas, called

the *Sea of Japan*, is bounded by Chinese Tartary on the west, by the island of Sagalin on the north, and by the Japan Islands on the east and south: it has been called, with propriety, the *Sea of Japan*.

Southward this sea communicates with a third internal sea by the *Strait of Corea*. The gulf which it forms on the north, between Corea and China, is called by the Chinese the *Yellow Sea* (Hoang-hai), from the muddiness of the water, but which may with more propriety be named the *Gulf of Corea*. The Chinese (from the clearness of its waters) give the name of *Blue Sea* to the portion of the sea of Corea, between the south coast of the Peninsula and the island of Formosa.

The Pacific or Grand Equinoctial Ocean has several branches included between the chains of islands from Formosa on the north-west to New Caledonia on the south-east, which Mr. Tuckey has arranged under the following nomenclature. 1. The space between Formosa and the Philippines on the west, the chain of Mariannes on the east, and the Pelew Islands on the south, he proposes to call the *Philippine Sea*.

2. The space between the chain of New Philippines or Carolinas (of which the Pelew Islands are the western extreme) on the north, Lord Mulgrave's range on the east, and New Guinea and Solomon's Islands or the Papua Archipelago on the south, he calls the *Papua Sea*. 3. To the space of the Grand Ocean comprised between the Papua Archipelago on the north, Terra Australis or New Holland on the west, the New Hebrides, New Caledonia, and New Zealand on the east, he gives the name of the *Sea of New Holland*, or of Australia. At its north-west extremity, it forms the *Gulf of Louisiade* of Bougainville, which by *Torre's Strait* communicates with the *Gulf of New Holland* and the Indian Sea.

On the coast of America south of Behring's basin the Grand Ocean has but the three gulfs formed, 1. By the peninsula of Alaska on the west, and the continent on the north and east. 2. That formed within the peninsula of California, called by the Spaniards the *Vermilion Sea*, and sometimes the *Gulf of California*. 3. The *Gulf of Panama*, between North and South America. The *Great Southern Ocean* and the *Southern Frozen Ocean* may be considered as the last grand divisions of this basin.

Lakes form, from their occasional magnitude, the next topic of our consideration. Those which have no visible communication with the sea, and form the final receptacle of rivers, are the Caspian and the Lake Aral, already noticed, in the heart of Asia. Similar ones have been reported to occupy part of the interior of Africa, but they have not yet been found. The great lakes of North America have already been adverted to, in our article of that name; it may suffice to notice here that the St. Lawrence sweeps through them all; and that South America presents us with no lake of comparative magnitude. That of Chucuito or Titicaca, in Peru, is the only one worth noticing.

The great *rivers* of the earth descend usually from the upper part, and fall down the opposite

sides of a chain of mountains. Their channels are broad or steep in proportion to the quantity of water, and the level of the district through which they run. The principal rivers that have great periodical inundations, are, the Nile, the Senegal, the Euphrates, the Indus, the Ganges, the rivers of Pegu, of Siam, and of Cambodia, the Amazons and Plata, and, in general, all the great rivers within the tropics; the cause of these inundations being the heavy periodical rains in the equatorial regions. In several of these large rivers a phenomenon is observed, caused by an extraordinary strong ascending tide repelling the current of the river, when the conflict produces a mountainous ridge of water, capable of sweeping large ships from their moorings.

Many great rivers of slow current form bars of sand across their mouths, as the Nile, the Senegal, &c.; while others rush with such rapidity, and volume to the sea, that they freshen and discolor its waters for many leagues; as the Danube, the Plata, &c.

The velocity of rivers depends more on the weight and quantity of the anterior waters than on the declivity of their beds. Hence the stream of a river, whose bed has twice the declivity of another, does not move with twice the velocity only, but with treble or quadruple that velocity, according to the volume of its waters. If, therefore, we intend to give greater velocity to a river or canal, by deepening its bed, the greatest declivity should be near the head, diminishing almost to a cypher at its mouth, as is naturally the case near the mouths of large rivers, where, though the declivity of the bed is imperceptible, the velocity of the stream is increased by the accumulated weight of the anterior waters: some rivers are even known to acquire so rapid a movement, as not only to retain their velocity across a considerable extent of level ground, but also to surmount an eminence without spreading much.

The following is major Rennell's estimate of the proportional courses or lengths of the great rivers of the globe, taking the Thames as *unity*:

EUROPE.		ASIA.	
Thames . . .	1	Oby . . .	10½
Rhine . . .	5¼	Amour . . .	11
Danube . . .	7	Lena . . .	11½
Volga . . .	9½	Hoanho . . .	13½
		Kian Keu . . .	15½
ASIA.		AFRICA.	
Indus . . .	6¾		
Euphrates . . .	8½	Nile . . .	12½
Ganges . . .	9½		
Burrampooter . . .	9½	AMERICA.	
Ava River . . .	9½	Mississippi . . .	8
Jenissei . . .	10	Amazons . . .	15¾

Waters impregnated with saline and mineral particles, warm springs, &c., are so few, and have generally such remarkable local peculiarities, that we at once refer the reader to their alphabetical places for a description of them. For the phenomena of tides and currents, see *TIDES* and *SEA CURRENTS*.

3. *Of the atmosphere.*—To the articles *AIR*, *ATMOSPHERE*, and *CLIMATE*, we may also refer the reader for every thing important in the consideration of this great element of our earthly sys-

tem. M. Humboldt's isothermal lines, the greatest modern improvement in the consideration of climates, are inserted in the last article; the manner in which these, however, affect congelation, is by no means uniform. Radiation and various local circumstances must be taken into account. Thus on the side of Chimborazo, near the equator, the line of perpetual congelation is found to be at the height of 15,746 feet; and in the 20° of north latitude, on the Mexican mountains, 15,090 feet, giving a difference in 20° of latitude of only 656, when professor Leslie's table would

teach us to expect 1729 feet. In Tartary, again, according to the late observations of captain Webb, fine pastures are found on the Sutledge river at an elevation of 15,000 feet above the level of the sea; while, on Mont Blanc, the line of perpetual snow is marked by Saussure at 8640 feet. At 16,814 feet, not a vestige of snow appeared, according to the foregoing writer, on the Nittie Pass of the great Hinnalaya chain. The principal circumstances that had been previously observed on the subject, are thus brought together by baron Humboldt:—

	TORRID ZONE.		TEMPERATE ZONE.				FRIGID ZONE
	Lat. 0 deg. Andes Quito.	Lat. 20 deg. Mount of Mexico.	Caucasus Latitude 42½ deg.	Pyrenees Latitude 42½ deg.	Alps. lat. 45½ to 46 deg.		Lat. 57½ to 78 degrees. Lapland.
					N. Aspect	S. Aspect.	
Inferior limit of perpetual snow . . .	2460 fath.	2350 fath.	1650 fath.	1400 fath.	1370 fath.	1370 fath.	550 fath.
Mean annual temperature at that height	34·7°			25·7°	24·8°		21·2° Fahr.
Mean temperature of winter at that height	34·4°				14°		4·9°
Mean temperature of August at that height	35·15°				42·8°		49·1°

Distance between the snow and corn .	860 fath.		630 fath.		700 fath.		450 fath.

4. *Of the animal tribes.*—Over a considerable portion of the globe we find the Linnæan *vermes* diffused; while the zoophytes and marine insects, those particularly which produce coral, are restricted to particular regions; the latter, generally, to the torrid zone of the Pacific and Indian oceans. The haunts of insects, and the brilliant plumage of the feathered tribes, belong to the same warm climates. The former are both more numerous and of incomparably more annoying qualities in the torrid, than in temperate zones. Here they lay waste whole regions over which they pass, driving the inhabitants before them, with the fury of a tempest; and particularly wherever forests and moisture abound in these climates, they swarm in countless myriads. In these regions also the

reptile and lizard tribes arrive at a fearful perfection. Here also fish of the largest size, the most ferocious habits, and most brilliant colors are found. The shark of the tropics is said to be unequalled in rapacity in any other region, and to rival even the wild beasts of the forest in that respect. Migratory fishes abound chiefly in the northern regions, and descend toward the equator. In the higher latitudes of those regions, also, the finny tribes attain their greatest magnitude.

Birds in the peculiarity of their food, as well as their plumage, indicate the regions to which they belong. The vulture and eagle haunt the highest peaks over which animal life is ever found to hover—the Cordilleras of the Andes, and the summits of the Alps and the Appenines;

the sea-eagle, or osprey, is more common. The temperate zone is remarkable for the migration of birds as well as fishes; the stork and the crane, as well as the swallow, instinctively selecting their summer as well as winter abodes, and the same individual birds sometimes returning in spring to the same nests they left in autumn. The parrot tribes seem confined to the East Indies, the south-east of Asia, and the shores of Western Africa; while the celebrated birds of Paradise are found in New Guinea and its neighbourhood alone.

M. Humboldt has asserted, and is confirmed in it by the distinguished naturalist Latrielle, that no quadruped, terrestrial bird, and hardly any insect is common to the New and Old worlds. We must beg leave, however, to doubt the correctness of this last item. See our article ENTOMOLOGY. There are, at any rate, certain useful animals which thrive almost equally in all the zones, till the severity of the polar frosts chills them, or the hardened ground refuses subsistence. 'In this class, beneficent nature has placed all those whose services, in a domesticated state, are most useful to man; the horse, the ox, the sheep, the hog, the goat, the dog, and the cat. Others may be added, in the wide diffusion of which nature cannot be considered as having been so bounteous; among these are the fox, the hare, the rabbit, the stag, the rat, and the mouse. These common features, however, leave room for others, in which the different climates are widely distinguished from each other.'

'In the torrid zone, it has been justly observed, we find the same rank luxuriance of animal as of vegetable life. The inundated meadows, and the banks of rivers, are covered with the most overgrown and gigantic forms. The mighty elephant here dwells in the depths of the ancient forests, while the rhinoceros, and the hippopotamus, roll their enormous bulks along the banks of the streams. Other wild animals, not marked by so huge a size, distinguish themselves by power and fierceness. The lion and the tiger extend little beyond the torrid zone. The same may be said of the leopard, the panther, the ounce, and the hyæna. This zone produces also animals of striking beauty, and of a gentle and harmless disposition; such are the antelope, the zebra, and the cameleopard. It is still more advantageously characterised by an eminently useful species, that of the camel and dromedary, without whose services vast tracts of land in this zone would be wholly uninhabitable; and to which may be added, in the New World, the lama and the vicuña.'

The wild beasts of temperate climes are but of two kinds, the wolf and wild boar; while here are reared in their highest perfection the horse and all the domestic tribes. In the higher latitudes, the ox, sheep, &c., are stunted in their growth, and gradually disappear, and give place to the elk, the sable, the ermine, and other well furred animals. The most valuable animal in these climes, perhaps, is the rein-deer, devoted to most of the occupations of the horse and ox of the temperate zone.

The dog has been observed to be the faithful companion of man in all climates; but as he

approaches the equator, on the one hand, he loses his noble voice and bark; while on the other, in Kamschatka, or even when removed from a temperate to a frozen clime, he assumes a new and thicker covering. Some of the different species of fox are said also to be found almost every where.

5. *Of the vegetable productions of the earth.*—The geography of plants has been ably illustrated by modern writers, among whom baron Humboldt is, as in many other branches of science, most conspicuous. He considers the species of plants at present known, to amount to 44,000. Of these 6000 are cryptogamous. The remaining 38,000, phanerogamous plants, are distributed in the following manner: viz.

In Europe	7,000
— the temperate regions of Asia	1,500
— Asia within the tropics, and islands	4,500
— Africa	3,000
— both the temperate regions of America	4,000
— America between the tropics	13,000
— New Holland and the islands of the Pacific	5,000

In the *Prolegomena* to his *Nova Genera et Species Plantarum*, M. Humboldt states that the proportion of plants which grow in latitudes 0° , 45° , 68° , are as the numbers 12, 4, 1. The mean annual temperature in these regions is $81\frac{1}{2}^{\circ}$, $55\frac{1}{2}^{\circ}$, $32\frac{1}{2}^{\circ}$; the mean summer temperature $82\frac{1}{2}^{\circ}$, 70° , $53\frac{1}{2}^{\circ}$. Within the tropics, the monocotyledinous plants are to the dicotyledinous, as one to six. Between the latitudes 36° and 52° , as one to four; and at the polar circle as one to two. In Germany the monocotyledinous plants are to the whole phanerogamous plants as 1 to $4\frac{1}{2}$; in France as 1 to $4\frac{2}{3}$. The same proportion seems to hold good in North America.

Our author, in the spring of 1816, read to the French Institute, an important paper on the Distribution of Vegetable Forms; on which we shall now mainly rely. 'The vegetables,' he remarks, 'which cover the surface of the globe present, when studied by natural classes, or families, striking differences in the distribution of their forms. It is to the laws of this distribution that I have recently turned my attention. On limiting them to the countries where the number of the species is exactly known, and dividing this number by that of the glumaceæ, the leguminous plants, the labiated, and the compound, we find numerical relations, which form very regular series. We see that certain forms become more common from the equator towards the poles, like the ferns, the glumaceæ, the ericineæ, and the rhododendrons. Other forms, on the contrary, increase from the poles to the equator, and may be considered in our hemisphere as southern forms: such are the rubiaceæ, the malvaceæ, the euphorbia, the leguminous and the composite plants. Finally, others attain the maximum in the temperate zone, and diminish towards the equator and the poles. Such are the labiated plants, the amentaceæ, the crucifereæ, and the umbellifereæ.' In the planes of the torrid zone, the crucifereæ and umbellifereæ almost entirely disappear.

In considering the manner in which numerous families of plants are distributed over the equatorial, temperate, and frigid zones, this writer further observes, that the vegetable forms present constant relations under the same isothermal lines. The grasses form in England a twelfth, in France a thirteenth, in North America a tenth of all the phanerogamous plants. The glumaceæ form in Germany one-seventh; in France one-eighth; in North America one-eighth; in New Holland, according to the researches of Brown, also one-eighth of the known phanerogamous plants. The composite plants rather increase in the northern parts of the transatlantic continent; for, according to the new Flora of Pursch, there is between the parallels of Georgia and Boston one-sixth; in France one-seventh, and in Germany one-eighth, of the total number of species which are endowed with a visible fructification. In the whole temperate zone, the composite plants and the glumaceæ together constitute nearly one-fourth of the phanerogamous class; the glumaceæ, the compositæ, the cruciferae, and the leguminosæ together, nearly one-third. The last two classes, therefore, form the difference between one-third and one-fourth, which is one-twelfth of the whole flowering class. * It results from these researches, that the forms of organised being have a mutual dependance upon each other, and that the unity of nature is such that the forms are limited, according to constant laws of determination. When, upon any point of the globe, we know the number of species presented by one of the great families of the glumaceæ, the compositæ, the cruciferae, or the leguminous plants, both the whole number of phanerogamous plants, and the number of species that compose the other vegetable families, may be estimated with considerable accuracy. Thus, by knowing the number of cyperaceæ, or composite plants, under the temperate zone, we may approximate to that of the graminous or leguminous plants in the same regions. The differences between the relations exhibited in the central parts of Europe, and the same latitude in North America, are accounted for by the different temperatures of these regions. The Flora of North America is a mixture of several Floras. The southern parts give it an abundance of malvaceæ and composite plants; the northern regions, being colder than the same latitudes of Europe, furnish to this Flora numerous rhododendrons, amelleaceæ, and coniferæ. The caryophylleæ, the umbelliferae, and the cruciferae are in general more scarce in North America, than in the temperate zones of the old continent.

These constant relations observed on the surface of the globe, in the plains from the equator to the poles, are again traced in the midst of perpetual snows on the summits of the mountains. On the Cordilleras of the torrid zone the northern forms, in general, become more frequent. Hence it is that the ericineæ, the rhododendrons, and the graminous plants, prevail at Quito, and on the summits of the Andes. On the contrary, the labiatae, the rubiaceæ, malvaceæ, and the euphorbiaceæ, become as rare as in Lapland. This analogy, however, is not agreed in the ferns, and the composite plants.

The latter abound on the Andes, but the former gradually disappear, above the height of 1800 fathoms. Thus the climate of the Andes resembles that of the north of Europe, only with respect to the mean annual temperature. The heat of the different seasons is very different, and exercises great influence on the phenomena of the vegetable kingdom. In general the forms which prevail among the Alpine plants are, according to my researches, under the torrid zone, the gramineæ, the compositæ, and the caryophylleæ; under the temperate zone, the compositæ, the caryophylleæ, and the cruciferae; and under the frozen zone, the caryophylleæ, the ericineæ, and the ranunculaceæ.

M. Humboldt delineates the distribution of plants at different altitudes in the torrid, temperate, and frigid zones, according to our plate. The names of the plants are placed at the heights at which they cease respectively to grow. The numbers mark the annual temperature, according to the centigrade scale: those between brackets indicate the temperature of August. The fathom is six French feet—6·39453 English feet.

Upon the question whether there are plants common to the new and old world; he concludes, that many of the mosses and lichens are to be found both in the equinoctial regions of America and in Europe. But the case is not the same with the vascular agamæ as with the agamæ of the cellular texture. The ferns and the lycopodiaceæ do not follow the same law as the mosses and the lichens. The former, in particular exhibit very few species universally to be found; and the examples cited are frequently doubtful. In reference to phanerogamous plants, with a few exceptions, the law of Buffon seems to be correct as to the species furnished with two cotyledons. It is not true that the ridges of the Cordilleras of Peru, where the climate is analogous to that of France, or Sweden, produce similar plants. The oaks, the pines, the yews, the ranunculi, the rose trees, the draba of the Peruvian and Mexican Andes, have nearly the physiognomy of the species of the same genera of North America, Siberia, or Europe. But all these Alpine plants of the Cordilleras, without excepting one among 3000 or 4000 that have been examined, differ specifically from the analogous species of the temperate zone of the old continent. In general, in that part of America situated between the tropics, the monocotyledinous plants alone, and the cyperaceæ and the gramineæ, almost exclusively, are common to the two worlds. These two families form an exception to the general law. M. Humboldt has given in his Prolegomena a catalogue of the plants common to the shores of the Orinoco, Germany, and the East Indies; the number of which does not exceed twenty-four species.

The gigantic growth of timber in the new continent has already been noticed by us. See AMERICA, NORTH. There are said to be 137 species in North America, whose trunks exceed the height of thirty feet, while in Europe scarcely forty-five species reach that height: but no firs are to be found in the mountains of South America, between the tropics. In temperate zones the same species of plants frequently grow toge-

ther in clusters; but in the torrid zone the woods are formed of a much greater variety of trees. 'The vegetable forms near the equator,' says baron Humboldt, 'are in general more majestic, more imposing; and the varnish of the leaves is more brilliant. The largest trees are perpetually adorned with flowers larger, more beautiful, and more odoriferous, than herbaceous plants in the temperate zone.'

PART III.

OF TECHNICAL OR ARTIFICIAL GEOGRAPHY.

Our preceding divisions have placed all the great natural features of this science before the reader. Geography, technically considered, teaches the doctrine of the figure, magnitude, and motions of the earth; of the various lines, parallels, climates, zones, &c., with which those who have systematised the science have supposed its surface to be diversified; the nature of latitude and longitude, and different positions of the sphere, &c.

SECT. I.—OF THE FIGURE AND MAGNITUDE OF THE EARTH.

The earth is a planet moving round the sun in an orbit nearly circular, and completing its revolution in the course of a year; at the same time it revolves continually upon its own axis, which is inclined to the plane of its orbit at an angle of sixty-six degrees and a half; the time of a revolution being twenty-three hours and fifty-six minutes. The revolution of the earth round the sun is called its *annual motion*, and the rotation it performs on its own axis is called its *diurnal motion*.

While the earth revolves round the sun in the course of its annual motion, its axis, round which the diurnal motion is constantly performed, moves always parallel to itself. It is by the parallelism of the axis, and the annual motion of the earth, that the changes of the seasons are produced, while by the diurnal motion all places on the earth's surface are alternately turned towards the sun, and by these means the changes of day and night follow.

When the earth was once known to be spherical, the curiosity of man would naturally lead him to endeavour to measure its dimensions; and we accordingly learn from history that such attempts were made. But the first accurate admeasurement that was made of the earth, of which we have any certain knowledge, was that executed by M. Picard, in France, towards the end of the seventeenth century, and which has been since several times verified.

It is not difficult to understand in what way the earth may be measured. The direction of gravity is always perpendicular to the earth's surface; hence it follows that the zenith of any place, or point of the heavens directly over our head, and also the horizon, which is a plane touching the earth's surface at that place, will be continually changing according as we change our position on the earth's surface. It follows accordingly, that, as we travel from south to north, the pole of the heavens (or that point in the heavens, in which the earth's axis when produced meets the sphere of the fixed stars) will

be more and more elevated above the horizon; the meridian altitude also of the stars in the northern regions of the heavens will appear to increase; while that of the stars in the southern quarter will be diminished. By the elevation or depression of the stars, we shall know the angle formed at the point of concurrence of perpendiculars drawn to the earth's surface at each extremity of the terrestrial arc; for this angle is equal to the difference of the meridian altitude of the same star as seen from the extremities of the arc, diminished by the angle which the arc itself subtends as seen from the star; which last angle is altogether insensible. The number of degrees in the arc being found, it is only necessary to determine its length in some known measure, as a fathom, &c.; but, as it would be a work of great labor to apply a measure to an arc of great extent, it will be sufficient if its extremities be connected by a series of triangles to those of a base line of 3000 or 4000 feet in length; and, considering the accuracy with which the angles of these triangles can be observed, the length of the arc may be found with great precision. It is in this way that degrees of the meridian have been repeatedly measured. In France, for example, about 1793, an arc was measured extending from Dunkirk to Barcelona (for the purpose of setting a universal standard of weights and measures); and the degree whose middle is situated in lat 45° was by this means found to be 57,029 toises.

Although the spherical figure is the most simple, and it is natural for man to suppose objects to be of that form which he most readily conceives, yet the simplicity of nature is not always measured by that of our conceptions. Infinitely varied in her effects, Nature is only simple in her causes; and her economy consists in producing a great number of phenomena, often the most complicated, by means of a few general laws. The figure of the earth is a result of these laws, which, modified by a great variety of circumstances, may cause it to deviate sensibly from a spherical figure; and certain small variations repeatedly observed in the length of degrees of the meridian, sufficiently indicate that such a deviation exists.

The Academy of Sciences in France, in which this question has been warmly agitated, concluded with reason, that the difference of magnitude in the degrees of the meridian, if real, would be most sensibly perceived by the comparison of degrees measured at the equator and towards the poles. Accordingly a company of academicians was sent to the equator, where, having measured a degree of the meridian, they found it to contain 56,753 toises; which was shorter by 274 toises than a degree in lat. 45° north. Other academicians were sent to the north, and having measured a degree of the meridian in Lapland, about the latitude of $66^{\circ} 20'$, they found it to be 57,458 toises, which was greater than the degree at the equator by 685 toises; and by these measurements it was completely proved, that the earth was not exactly spherical; and other measurements of degrees made since that period have all tended to show, that the degrees of the meridian gradually increase from the equator to the poles.

The ellipse is the next curve in point of simplicity to the circle, and the earth has been considered as a spheroid formed by the revolution of an ellipse about its lesser axis : its oblateness or compression in the direction of its poles, is a necessary consequence of the observed increase of the degrees of the meridian from the equator to the poles. For the radii of these degrees being in the direction of gravity, they are by the law of the equilibrium of fluids perpendicular to the surface of the ocean, with which the earth is in a great measure covered. They do not therefore, as in the sphere, tend to the centre of the spheroid; neither are they in the same direction, nor of the same magnitude, as the radii drawn from the centre to its surface; which cut it obliquely every where, except at the equator and poles. The point at which two adjoining perpendiculars, situated under the same meridian, meet each other, is the centre of the small terrestrial arc which they comprehend between them. If this arc were a straight line, these perpendiculars would be parallel; or they could only be considered as meeting at an infinite distance; but, in proportion as this arc became curved, they would meet at a distance so much the less, as the curvature of the arc was the greater. Hence it follows, that seeing the extremity of the lesser axis is the point where the curvature of the ellipse is the least, the radius of a degree at the pole, and consequently that degree itself, must be the greatest of any degree on the earth's surface. On the contrary, at the equator, or at the extremity of the greater axis, the curvature is the least, and therefore the degree in the direction of the meridian is there the smallest. And, in going from the equator to the pole, the degrees increase in such a manner, that, if the ellipse be not very eccentric, the increase is nearly proportional to the square of the sine of the latitude.

If the earth were exactly an oblate spheroid, its magnitude, as well as the proportion of its axes, might be determined by the mensuration of two degrees in the direction of the meridian. It should also follow, that by a comparison of all the degrees hitherto measured, taken two and two, we should obtain the same proportion between the axes. This, however, has not been the case. The results have indeed shown, that the earth is flattened at the poles; but they have left an uncertainty as to the quantity of the compression, extending from between the 170th to the 330th part of the radius of the equator. Between these two quantities, the former of which is nearly double of the latter, most of the results are placed; but in such a manner, that those most entitled to credit are much nearer to the least extreme than to the greater.

In consequence of this disagreement in the result of comparisons of degrees of the meridian, measured in different latitudes, it has been concluded by mathematicians, that the figure of the earth is not that of a spheroid; nor does it even appear, that the parts of it on each side of the equator are exactly similar.

It will, however, be sufficient for the purposes of geography, to suppose the earth a spheroid. Upon this hypothesis, La Place, by a comparison of the arc of the meridian measured at the equator, and another measured between Dunkirk and

Mountjoy, has found, that the polar diameter is less than the equatorial by 1-334th part of the latter; and that a fourth part of the elliptic meridian is 5,130,740 toises; the toise being that used in measuring the earth in Peru, and reduced to a temperature of sixteen degrees and a quarter of a mercurial thermometer, divided into 100 degrees from the freezing point to that of water, boiling under a pressure equivalent to a column of mercury seventy-six centimetres in height, or about thirty inches English measure. This determination also agrees nearly with the results from the combination of a great number of experiments, made at different places of the earth, upon the pendulum.

Because the measure of a degree at the equator has been assumed, in the preceding calculation, at 56,753 toises, it follows that the equatorial diameter is 3,271,267, and the polar diameter 3,261,471 toises; the difference between them being 9796 toises. From these data, and the rules of mensuration, it will be easy to find the surface, solidity, &c., of the earth, also the number of miles in a degree, &c.

The following table of the dimensions of the earth is by Dr. Hutton:—

The diameter . . .	79,579 $\frac{3}{4}$ miles.
The circumference . . .	25,000 miles.
A degree contains . . .	69 $\frac{1}{2}$ English miles.
The superficies . . .	198,944,206 square miles.
The solidity . . .	263,930,000,000 cub. miles.

SECT. 2.—OF THE CIRCLES SUPPOSED TO BE DESCRIBED ON THE EARTH'S SURFACE.

In geography the circles which the sun apparently describes in the heavens, are supposed to be extended as far as the earth, and marked on its surface. In like manner we may imagine as many circles as we please to be described on the earth, and their planes to be extended to the celestial sphere, till they mark concentric ones on the heavens. The most remarkable of those supposed by geographers to be described in this manner are the following:—

1. The *axis* of the earth, or that imaginary line passing through the earth's centre, round which it continually revolves from west to east.

2. The *poles*, or points at which the axis meets the earth's surface. One of these is called the north-pole, and the other the south. These correspond to the poles of the heavens, or the points where the earth's axis, when produced, meets the starry sphere.

3. The *equator*, a great circle on the earth's surface, equally distant from both poles, and corresponding to the equinoctial circle in the heavens. It divides the earth's surface into two equal portions, called the northern and southern hemispheres. The equator is also sometimes, called the *line* or *equinoctial line*.

The distance of any place, northward or southward, from the equator, is called its *latitude*, and is reckoned in degrees and minutes, &c. The distance between the poles and equator, which is a quadrant of a great circle passing through the poles, has by all geographers hitherto been supposed to be divided into ninety degrees; and each of these again subdivided into sixty minutes, &c. But some French astronomers, and in particular La Place, in his *Exposition du Systeme*

du Monde, as well as in his *Traité de Mécanique Céleste*, has adopted the decimal division of the meridian. They have supposed the distance between the equator and the poles to be divided into 100 degrees, and each degree to be subdivided into 100 minutes, each minute into 100 seconds, and so on.

All places lying on the north side of the equator are said to have north latitude; on the contrary, all places on the south side of the equator are said to have south latitude.

Parallels of latitude are lesser circles upon the earth's surface parallel to the equator. They may be considered as indefinite in number; all places that lie directly east or west from each other are said to lie in the same parallel of latitude.

The *tropics* are two lesser circles on the earth, parallel to the equator, and twenty three degrees and a half distant from it. That which lies on the north side of the equator is called the *tropic of Cancer*; and that which lies on the south side is called the *tropic of Capricorn*. These circles correspond to the circles of the same name, which limit the sun's north and south declination from the equinoctial in the heavens.

The *polar circles* are two lesser circles upon the earth's surface, parallel to the equator. They are as far distant from the poles, which they surround, as the tropics are from the equator. That which lies towards the north pole is called the *arctic circle*, and that which lies next to the south pole is called the *antarctic circle*. To these there are corresponding circles, bearing the same names, in the heavens.

Great circles passing through the poles of the earth, and therefore perpendicular to the equator, are called *meridians*. The meridian passing through any particular place lies in the plane of the celestial meridian of that place. It also divides the surface of the earth into two equal portions, called the eastern and western hemispheres, in respect of that place. The meridians may be considered as indefinite in number; and all places lying directly north and south from each other are upon the same meridian. Sometimes by the meridian of a place is understood the half of a great circle, passing through that place, and extending from the one pole to the other; and the other half of the circle is called the opposite meridian.

If we suppose twelve great circles, one of which is the meridian of a given place, to intersect each other at the poles of the earth, and divide the equator into twenty-four equal parts, these are the *hour* or *horary* circles of that place. These are by the poles divided into twenty-four semicircles, corresponding to the twenty-four hours of the day and night. The distance between each two of these semicircles is 15° , being the twenty-fourth part of 360.

The *longitude* of any place on the earth is an arc of the equator intercepted between the meridian passing through that place and some other meridian previously agreed upon which is called the first meridian. The longitude is reckoned eastward and westward from the first meridian, by which means all places lying in the hemisphere to the eastward of that place, through which the first meridian passes, will have east

longitude; and all places lying in the hemisphere to the westward of that place will have west longitude.

Geographers at different periods, and in different countries, have fixed upon different places for the first meridian. The rule among the ancients was to make it pass through the place farthest to the west that was known. But the moderns, knowing that there is no such place on the earth as can be considered the most westerly, have laid aside that method of reckoning the longitude. Ptolemy assumed the meridian that passes through the farthest of the Canary Islands, as his first meridian. After him, as more countries were discovered in that quarter, the first meridian was removed farther off. The Arabian geographers fixed the first meridian upon the utmost shore of the western ocean. Then again it was fixed at the island of St. Nicholas, near Cape Verd; then at the isle of St. James; and by Mercator at the isle Del Corvo one of the Azores, because there the magnetic needle pointed due north at that time.

The Dutch fixed upon the Peak of Teneriffe as their first meridian, when it was considered the highest mountain on the globe; and the French, by order of Louis XIII., on the island of Ferro, one of the Canaries.

In Great Britain, we reckon the longitudes of places eastward and westward from the royal Observatory, Greenwich, and the United States of America adopt the same meridian. The differences of longitude between the last-mentioned meridians, all of which are occasionally referred to, or constantly used by geographers, is as follows (from Greenwich Observatory):—

Paris	2° 20' 15" E.
Peak of Teneriffe	16 39 45 W.
Isle of Ferro	17 39 45 W.

The *horizon* of a place is either sensible or rational. The *sensible horizon* of any place is a circle of the sphere, the plane of which touches the spherical surface of the earth at that place.

The *rational horizon* is a great circle of the sphere, the plane of which passes through the centre of the earth, and is parallel to the plane of the sensible horizon. This horizon divides the celestial sphere into two equal portions or hemispheres; one of these is visible, but the other, by reason of the interposed body of the earth, is invisible.

By the sensible horizon of a place is also sometimes understood a circle, which determines the segment of the surface of the earth, which is visible to the eye; called also the *visible horizon*. It is evident that this circle will be most accurately defined at sea, and equally distant every where from the eye of an observer, but below the level of his eye. It will also be so much the more extensive, as the eye is raised above the earth's surface.

The *zenith* of a place is the point of the heavens directly over the head of an observer; and the *nadir* is the point in the opposite hemisphere, directly under his feet; or the zenith and nadir are the poles of the horizon.

Great circles of the sphere passing through the zenith and nadir are called *vertical circles*, or *azimuths*. They are also sometimes called secondaries of the horizon; and in general any

great circle passing through the poles of another is called its secondary. That vertical circle, which has its plane perpendicular to the plane of the meridian, is called the *prime vertical*. The meridian and prime vertical, by their intersections with the horizon, divide it into four equal parts: the points of their intersection are called the *cardinal points*. The meridian cuts the horizon at right angles in the north and south points, and the prime vertical cuts it at right angles in the east and west points. Lesser circles of the sphere parallel to the horizon are called parallels of *altitude* or *almucantars*.

The *armillary sphere* was a machine formerly in use, which represented the principal circles above described, the poles of the earth, &c.; but since globes which contain all those circles have been more general, this machine is become exploded.

The degrees of longitude are not equal like those of latitude, but diminish in proportion as the meridians incline, or their distance contracts as they approach the pole. Thus in 60° of latitude, a degree of longitude is but half the length of a degree of the equator. We therefore here add

A Table, showing the Number of Miles contained in a Degree of Longitude in each Parallel of Latitude from the Equator.

Degrees of Latitude.			Degrees of Latitude.			Degrees of Latitude.		
Miles.			Miles.			Miles.		
100th parts of a mile.			100th parts of a mile.			100th parts of a mile.

For the methods of calculating the latitude and longitude, see LATITUDE and LONGITUDE.

SECT. III. OF THE DIFFERENT POSITIONS OF THE SPHERE, THE ZONES, CLIMATES, &c.

If we suppose an inhabitant of the earth living at either of the poles, he will there have one of the celestial poles always in his zenith and the other in his nadir, the equator coinciding with the horizon. Hence all the celestial parallels are also parallel to the horizon; and hence a person, or people, are said to live in a *parallel sphere*, or to have a parallel horizon.

Those who live under the equator have both poles in the horizon, all the celestial parallels cutting the horizon at right angles; whence they are said to live in a *right sphere*, or to have a *right horizon*.

Those who live between either of the poles and the equator are said to live in an oblique sphere, or to have an oblique horizon; because the celestial equator cuts their horizon obliquely, and all the parallels in the celestial sphere have their planes oblique to that of the horizon. In this sphere some of the parallels intersect the horizon at oblique angles, some are entirely above it, and some entirely below it; all of them, however, so situated, that they would obliquely intersect the plane of the horizon extended.

The largest parallel which appears entire above the horizon of any place, in north latitude, is called by ancient astronomers the arctic circle of that place. Within this circle, i.e. between it and the arctic pole, are comprehended all the stars which never set in that place, but are carried perpetually round the horizon, in circles parallel to the equator.

The largest parallel which is hid entirely below the horizon of any place, in north latitude, was called the antarctic circle of that place by the ancients. This circle comprehends all the stars which never rise in that place, but are carried perpetually round below the horizon, in circles parallel to the equator.

In a parallel sphere, however, the equator may be considered as both arctic and antarctic circles; for, being coincident with the horizon, all the parallels on one side are entirely above it, and those on the other entirely below it. In an oblique sphere, the nearer any place is to either of the poles the larger are the arctic and antarctic circles, as being nearer to the celestial equator, which is a great circle. In a right sphere, the arctic and antarctic circles have no place, because no parallel appears either entirely above or below it.

By the ancients the arctic circle was called *maximus semper apparentium*, and *circulus perpetuæ apparitionis*; the antarctic circle, on the other hand, being named *maximus semper occultorum*, and *circulus perpetuæ occultationis*.

By the arctic and antarctic circles, however, modern geographers in general understand two fixed circles, at the distance of 23° 30' from the poles. These mark out the space all round the globe where the sun appears to touch the horizon at midnight in mid-summer, and to be entirely sunk below it in winter.

According to the different positions of the

globe, with regard to the sun, the celestial bodies exhibit different phenomena to the inhabitants. Thus, in a parallel sphere, they appear to move in circles round the horizon; in a right sphere they appear to rise and set as at present, but always in circles cutting the horizon at right angles; but, in an oblique sphere, the angle varies according to the degree of obliquity, and the position of the axis of the sphere with regard to the sun. The phenomena thence arising will be sufficiently understood from what is said under the article *ASTRONOMY*.

The space between the two tropics, called the torrid zone, extends 47° of latitude all round the globe; and throughout the whole of that space the sun is vertical to some of the inhabitants twice a year, but to those who live directly under the tropics only once. Throughout the whole torrid zone also there is little difference between the length of the days and nights. The ancient geographers found themselves considerably embarrassed in their attempts to fix the northern tropic; for though they took a very proper method, namely, to observe the most northerly place where objects had no shadow on a certain day, yet they found that on the same day no shadow was cast for a space of no less than 300 stadia. The reason of this was, the apparent diameter of the sun; which, being about half a degree, seemed to extend himself over as much of the surface of the earth, and to be vertical every where within that space.

The division of the earth into zones has arisen from the various appearances of the sun, and the effects of his light and heat upon different parts of it. These are five in number: 1. The torrid zone lying between the two tropics for a space of 47° of latitude. This is divided into two equal parts by the equator; and the inhabitants have the sun vertical to them twice a year, excepting only those who dwell under the tropics, to whom he is vertical only once. 2. The two temperate zones lie between the polar circles and the tropics, containing a space of 43° of latitude. And, 3. The two frigid zones lie between the polar circles and the poles. In these last the longest day is never below twenty-four hours; in the temperate zones it is never quite so much, and in the torrid zone it is never above fourteen. The zones are named from the degree of heat they were supposed to be subjected to. The torrid zone was supposed by the ancients to be uninhabitable by reason of its heat; but this is now found to be a mistake, and many parts of the temperate zones are more intolerable in this respect than the torrid zone itself. Towards the polar circles, also, these zones are intolerably cold during winter. Only a small part of the northern frigid zone, and none of the southern, is inhabited. Some geographers reckoned six zones, dividing the torrid zone into two by the equator.

From the difference in the length and positions of the shadows of terrestrial substances, ancient geographers have given different names to the inhabitants of certain places of the earth; the reason of which will be easily understood from the following considerations:—1. As the sun in

his apparent annual revolution never removes farther from the equator than $23^{\circ} 30'$, none of those who live without that space, or beyond the tropics, can have that luminary vertical to them at any season of the year. 2. All who live between the tropics have the sun vertical twice a year, though not all at the same time. Thus, to those who live directly under the equator, he is directly vertical in March and September at the equinox. If a place is in 10° north latitude, the sun is vertical when he has 10° north declination; and so of every other place. 3. All who live between the tropics have the sun at noon sometimes north and sometimes south of them. Thus, they who live in a place situated in 20° north latitude, have the sun at noon to the northward when he has more than 20° north declination, and to the southward when he has less. 4. Such of the inhabitants of the earth as live without the tropics, if in the northern hemisphere, have the sun at noon to the south of them; but to the north, if in the southern hemisphere. 5. When the sun is in the zenith of any place, the shadow of a man or any upright object, falls directly upon the place where they stand, and consequently is invisible; whence the inhabitants of such places were called *Ascii*, or without shadows. Those who live between the tropics, and have the sun sometimes to the north and sometimes to the south of them, have of consequence their shadows projecting north at some seasons of the year and south at others; whence they were called *Amphiscii*, or having two kinds of shadows. They who live without the tropics have their noon shadows always the same way; and are therefore called *Heteroscii*, that is, having only one kind of shadow. If they are in north latitude the shadows are always turned towards the north, and, if in the southern hemisphere, towards the south. When a place is so far distant from the equator that the days are twenty-four hours long or longer, the inhabitants were called *Periscii*, because their shadows turn round them.

Names have likewise been given the inhabitants of different parts of the earth, from the parallels of latitude under which they live, and their situation with regard to one another. Thus, when two places are so near each other that the inhabitants have only one horizon, or at least that there is no perceptible difference between them, the inhabitants were called *Synœci*, that is, near neighbours; the seasons, days, nights, &c., in both places being perfectly alike. Those who lived at distant places, but under the same parallel, were called *Periœci*, that is, living in the same circle. Those who are on the same side of the equator have the seasons of the year at the same time; but, if on different sides, the summer season of the one is the winter of the other; as explained under *ASTRONOMY*. Some writers, however, by the name of *Perœci*, distinguish those who live under opposite points of the same parallel, where the noon of the one is the midnight of the other. When two places lie under parallels equally distant from the equator, but in opposite hemispheres, the inha-

bitants were called Antæci. These have a similar increase of days and nights, and similar seasons, but in opposite months. According to some, the Antæci were such as lived under the same geographical meridian, and had day and night at the same time. If two places are in parallels equally distant from the equator, and in opposite meridians, the inhabitants are called Antichthones with respect to one another, that is, living on opposite sides of the earth; or Antipodes, having their feet opposite to one another. When two persons are Antipodes, the zenith of the one is the nadir of the other. They have a like elevation of the pole, but it is of different poles: they have also days and nights alike, and similar seasons of the year; but they have opposite hours of the day and night, as well as seasons of the year. Thus, when it is mid-day with us, it is midnight with our Antipodes; when it is summer, with us, it is winter with them, &c.

From observing the diversity in the length of the days and nights, the rising and setting of the sun, with the other phenomena already mentioned, ancient geographers divided the surface of the earth into certain districts which they called CLIMATES (see our article of that title); and instead of the method of describing the situation of places by their latitude and longitude, as we do now, they contented themselves with mentioning the climate in which they were situated. When more accuracy was required they mentioned also the beginning, middle, and ending of the climates.

This distinction, however, was vague and inaccurate: for the only method they had of determining the difference was by the length of the day; and a climate, according to them, was such a space as had the day in its most northerly part half an hour longer than in the most southerly. For the beginning of their first climate they took that parallel under which the day is twelve hours and three-quarters long: those parts of the world which lie nearer the equator not being supposed to be in any climate, either because in a loose sense they may be considered as in a right sphere, or because they were unknown, or thought to be uninhabitable by reason of the heat. The principal ancient climates are mentioned in the article above referred to.

A parallel was said to pass through the middle of a climate when the day under that parallel is a quarter of an hour longer than that which passes through the most southerly part. Hence it does not divide the space into two equal parts, but that part next the equator will always be the larger of the two; because, the farther we recede from that circle, the less increase of latitude will be sufficient to lengthen the day a quarter of an hour. Thus, in every climate there are three parallels; one marking the beginning, the second the middle, and the third the ending of the climate; the ending of one being always the beginning of another. Some of the ancients divided the earth by these parallels; others by a parallel did not mean a mere line, but a space of some breadth: and hence the parallel may be understood as the same with half a climate.

SECT. IV.—THE METHOD OF FINDING THE LENGTH OF THE DAY, AND THE BEGINNING AND ENDING OF THE TWILIGHT.

This has been represented mathematically, thus:—

Let PZES of the diagram represent the celestial meridian of any place, P and S being the poles of the sphere; let EQ be the equator and HOR the horizon, stereographically projected upon the plane of the meridian; let PCS represent the six o'clock hour circle, and mOn the parallel of declination described by the sun or a star at any given day of the year; the point O being that in which it cuts the horizon; then nO represents half the arch described by the sun when above the horizon, and Om the half of the arch described when below the horizon. Let P OS represent an hour circle passing through the sun or star when in the horizon, and meeting the equator EQ in A; the arch EA of the equator intercepted between the meridian and hour circle, being found, and converted into time (allowing fifteen degrees to an hour), will evidently give half the time that the sun or star remains above the horizon, as the arch AQ will give half the time it remains below the horizon. As the arch EC contains ninety degrees, and corresponds to six hours, it is only necessary to find the arch CA, which is called the sun's ascensional difference, it being the difference between his right ascension and his oblique ascension; and, having converted it into time, to add it to or subtract it from six hours, according as the latitude of the place and sun's declination are of the same or of contrary names, that is both north or both south, or the one north and the other south, and the sum or difference shall be half the length of the day as required.

In the spherical triangle CAO, right angled at A, we have AO the complement of the sun's declination, to be found from astronomical tables, and the angle ACO, the complement of the latitude of the place, in order to find AC the right ascension. Hence, from the principles of spherics, we have the following proportion:—

As radius to the tangent of the latitude, so is the tangent of the sun's declination to the sine of the sun's ascensional difference required.

When the sun is in the same hemisphere with any place, and his declination is equal to the complement of its latitude, which can only happen to places in the polar circles, then mn , the

parallel of declination, will not cut the horizon, and consequently the sun will not set in those places during the time his declination exceeds the co-latitude; but when the sun and place are in opposite hemispheres, then he will never rise at that place so long as his declination exceeds the co-latitude; and hence it is easy to see how to find the time when the sun begins to shine constantly upon any given place within the polar circle; and also the time when that place begins to be wholly in the dark for a considerable time together.

It has been observed, in our article *ASTRONOMY*, that the twilight commences in the morning and ends in the evening when the sun is eighteen degrees below the horizon. The time of its commencement, or ending, may be found by spherical trigonometry as follows:—Let *Z* be the zenith, *P* the pole of the sphere, and *T* the place of the sun, eighteen degrees below the horizon *H*. In the spherical triangle, *PZT*, we have *PZ* the distance of the pole from the zenith, which is equal to the co-latitude of the place, and *PT* the complement of the sun's declination; also *ZT* the distance of the sun from the zenith, which, in this case, is always $90^\circ + 18^\circ$ or 108° . From these we are to find the hour angle *ZPT*, which may be had by the following proportion. Let $V = \frac{1}{2}$ the perimeter of the triangle. Then, as $\text{sine } ZP \times \text{sine } PT$ to the square of the radius, so is $\text{sine } (V - ZP) \times \text{sine } (V - PT)$ to the square of the sine of half *ZPT*. The angle *ZPT* being turned into time will give the time from noon of the beginning or ending of the twilight.

SECT. V.—OF THE CONSTRUCTION AND USE OF MAPS.

A map is a representation of the earth, or a part of it. A map of the world is a delineation in perspective of the globe, as it would appear to an eye placed in a particular point. The circles bounding such a map represent the brass meridian; and the curve lines running across, at every ten degrees, show the latitude north or south of the equator. The top and bottom are the north and south poles; and the curve lines uniting them are other meridians passing through every tenth degree of the equator, and showing the longitude east or west from the first meridian. The straight line intersecting these meridians, and passing through the centre, is the equator or equinoctial; at proper distances from which, on each side, are curve lines representing the tropics and polar circles.

Maps and charts, especially the latter, are sometimes drawn on what is called Mercator's projection, so called from the inventor, Gerard Mercator, an eminent geographer in Flanders, who, about the middle of the sixteenth century, published a map of the world on this construction. In these maps the meridians and parallels are

straight, and the former equidistant from each other. The degrees of longitude in every parallel are the same; while the degrees of latitude are all unequal, being lengthened towards the poles. Charts drawn on this construction are particularly of use to navigators, because the rhumbs, which point out the bearings of places, and consequently the courses to be steered to arrive at them, are all straight lines. See our chart of the world on this projection.

In maps of particular countries the top is generally considered as the north, the bottom as the south; and the east is consequently on the right hand, and the west on the left. Where this rule is not followed a fleur-de-lis is usually placed on some part of the map, pointing towards the north, by which the other points may be easily known. From the top to the bottom of the map are drawn meridians, or lines of longitude; and from side to side parallels of latitude. The outermost of the meridians and parallels are marked with degrees of latitude and longitude, by means of which, and the scale of miles commonly placed in the corner of the map, the situation, distance, &c., of places may be found. Thus, to find the distance of two places, suppose London and Paris, by the map, we have only to measure the space between them with the compasses, and to apply this distance to the scale of miles, which shows that London is 210 miles distant from Paris. If the places lie directly north or south, east or west, from each other, we have only to observe the degrees on the meridians and parallels; and by turning these into miles we obtain the distance without measuring. Rivers are described in maps by black lines, and are wider towards the mouth than towards the head or spring. Mountains are sketched on maps as on a picture. Forests and woods are represented by a kind of shrub; bogs and morasses by shades; sands and shallows are described by small dots; and roads usually by double lines. Near harbours the depth of the water is expressed by figures denoting fathoms.

Having discovered by maps, or any other way, the true situation of the different places of the earth with regard to each other, we may easily know many other particulars relative to them; as, their distance from us, the hour of the day, the season of the year, &c., at any particular place. As each of these problems, however, would require a particular and sometimes troublesome calculation, machines have been invented, by which all the calculations may be saved, and every problem in geography may be solved mechanically, and in the most easy and expeditious manner. These machines are the celestial and terrestrial globes, for the use of which see *GLOBE*.

For the mechanical details of the construction of maps, see *MAPPING*.

G E O L O G Y.

GEOLOGY; from Gr. *γη*, the earth, and *λογος* a discourse; is a modern science which undertakes to explain the structure of the earth. Some of its more decided votaries have dignified it with the title of 'geognosy,' or the *knowledge*

of the earth; but, when we consider how small a portion of even the crust of the earth has as yet been examined and arranged by it, we prefer the less assuming as the more suitable appellation.

Those speculations and fictions which, under

the title of theories of the earth, amused the public in the infancy, or rather before the birth of this science, while they excited surprise by their paradoxical boldness or ingenious contrivance, neither originated in observation, nor applied to existing appearances; they were formed in the closet by men who had never probably ascended a mountain or explored a mine; who had never examined Nature in her operations, and of course were not fitted to become her interpreters. The enumeration and structure of the simple minerals, the arrangement of fossil bodies into mountain masses, or into the more level parts of the earth's crust, the order in which the individual strata are placed with regard to each other, and the relation they bear to those parts that are not stratified, had not with them become an object of attention or enquiry. The theories or dreams which they formed must therefore be viewed merely in the light of philosophical romances, or ingenious works of fancy, and would apply to any other planet as well as to ours. Nineteen of them may be found in the introduction to Mr. Accum's Chemistry. They bear the same relation to the state and appearances of the earth as the Oceana or the Utopia bear to actually existing governments; and can no more account for its phenomena than the fictions of enchantment can explain the events of history.

This general character, which will apply to all the attempts at forming geological systems antecedent to the last thirty or forty years, will save us the trouble of enumerating those productions, or of pointing out their errors and defects. Within this time the science of mineralogy has made very rapid progress, and geological enquiry and classification have kept pace with it. The comprehensive mind of Werner, upon an extensive acquaintance with the mineral kingdom, formed a new nomenclature and arrangement, by which simple fossil bodies may be discriminated and described. Carrying the same inquisitive and generalising talents to the examination of the crust of the earth, he discovered and pointed out the structure of its compound masses, the relations of its different strata or beds to each other, the method in which they succeed each other, in ascending from the lowest level to the pinnacle of the highest mountain-group, and those great arrangements of them that prevail, with few interruptions, round the globe. He has given names to those different formations, and detailed the characters by which they may be distinguished. The apparent irregularities, disorder, and contortions, which interrupt the more general formations, have not escaped his notice nor transcended his powers of arrangement. These, with the veins occurring in the strata, the metallic and other deposits that fill them, have all been remarked, named, and classified. Ascending from the consideration of present appearances to their cause, and inferring from changes that are now in progress the past history and revolutions of our globe, his disciples have formed a system of geology, with regard to the earth's formation, more reconcileable with observed phenomena, explaining a greater body of facts, and liable to fewer objections, than any previous or contemporary theory. This theory has been often called the Neptunian, from its

being founded on the supposed agency of water in the original modification of the earth: there is but another modern theory called the Plutonian, from its supposing the agency of fire in a similar manner, that is at all worth the student's notice.

Since the system of Werner has been adopted, and his disciples scattered all over Europe, ardor has been excited, and the number of observers multiplied. Adventurous travellers, carrying with them a precise nomenclature and distinctive marks of discrimination, have visited, and are visiting, the most distant regions, observing the surface of the earth in situations the most remote from each other, and diffusing the results of their examination over the scientific world. We need only mention as instances such names as those of baron Humboldt, and M. Von Buch. More minute surveys are daily making in the different parts of civilised Europe; facts are thus perpetually accumulating, and collections increasing. In our country a taste for mineralogy and geology has been created, and rapidly diffused, by the labors and fame of Mr. Jameson, one of Werner's most eminent disciples; by those of professor Buckland of Oxford; by the institution and labors of the Geological Society; and by the attractive nature of the science itself, and its important contributions to the arts.

In giving a brief notice of the present state of geology, the following natural division of the science will probably be found both comprehensive and precise.

The first will contain a general description of the surface of the earth, and an explanation of the terms to be employed in discussions concerning it.

The second will contain a description of its internal structure, and a similar detail of its nomenclature.

The third will embrace a geological survey of our globe, with an account of the particular structure, relative position, and geographical distribution of its various mineral masses.

The fourth division will employ the knowledge thus collected, in support of some rational theory, with regard to its formation, or in overturning the fabric of chimerical hypotheses.

In the present stage of the science, this last part will contain a short view of the Plutonian and Wernerian theories; the doctrines of which respectively compose the creeds or articles of faith in geology, of the two sects into which the mineralogists of this country are divided.

1. We shall first then begin with a description of the earth's surface, and shall avail ourselves of the phraseology of Werner, employed by Mr. Jameson in his System of Mineralogy, as being more precise, and more generally received, than any other that has hitherto been invented.

The dry land of our globe may be, for the sake of precision and convenience of description, divided into four classes of inequalities, comprising, 1. The high land and low land; 2. Alpine land and plain; 3. Mountain range and valley; 4. Single mountain and ravine. From the soundings taken in different seas, and in different parts of the ocean, the portion of the globe covered with water would appear to be similar in its surface to that part of it which we inhabit, and to possess eminences and depressions as strongly

marked, if not so easily examined. Indeed, without any experiment to ascertain this fact, it might have been pretty certainly inferred from analogy, when we consider that the ocean covers more than a half of the crust of the earth, and that the various islands and continents that compose the exposed part of it, are merely to be viewed as elevations of greater or less extent, that rise out of its waters, and continuations of those below them. The bottom of the ocean may therefore be as much diversified by mountains and valleys as the surface of our continents. The most general division of the dry land is into high and low land. The low land is composed principally of plains, though it admits sometimes of mountainous and hilly ground of no considerable elevation. It does not rise much above the level of the sea, and is made up principally of alluvial deposits or of secondary formations. The high land is composed of alpine, mountainous, and hilly ground, each rising above the other, and forming a suite of elevations from the low land to the most prominent points of a continent. The general distribution of the high lands we have stated in our preceding article on GEOGRAPHY.

The characteristic feature of the mountain groups is the superior elevation of its central chain, and the gradual sinking of the mountain masses towards its extremities. Mountainous land is distinguished from Alpine by its less height, and by its want of that aggregation of eminences that constitute the mountain-group; and hilly land, although it sometimes possesses this appearance, is distinguished from the two former by its less elevation, and by the rounded wavy aspect of its inequalities. From the central chain of the mountain-group all the other parts decline on both sides. It is never intersected totally in its course, and is generally commensurate in length with the extent of the group. It is divided from those subordinate chains that are arranged with it, by valleys frequently traversed by rivers. The mountain-chain is subdivided into individual mountains, which are separated from each other by small valleys or ravines, neither wide, deep, nor long, and seldom permeated by streams and rivers.

Most mountains have a foot, an acclivity, and a summit; meaning by these terms, what is generally understood by them, the lowest portion, the intervening space, and the highest point. Sometimes the acclivity is perpendicular, and then there can be no foot; sometimes inclined at an angle, that will not permit the growth of trees; and sometimes possessing such a gentle inclination as allows it to have soft mould, and to become fertile in vegetables. The character of the summit is very various, according to the kind of rock that predominates, and other causes. Granite and limestone often present angular, precipitous, and sharp-pointed summits, as may be seen in the Alps, the Appennines, the rock of Gibraltar, and other mountains. Gneiss forms flat or round-backed summits; basalt, and some other, obtuse conical ones.

Mountain-groups vary very much in their length, their breadth, the shapes of their individual mountains, and the height of their summits. It is almost needless to mention instances of these

varieties, or to give terms by which they may be discriminated, as they cannot fail to occur to every one in the least acquainted with the elements of geography.

The direction and magnitude of rivers frequently indicate the direction in the inequalities of the regions through which they flow, and in their course sometimes present us with particular appearances, which have not yet been enumerated in any of the foregoing divisions. We allude to those basins, or concavities, which they seem once to have formed or occupied, and through which they now flow. These concavities are of various shapes, sometimes inclining to circular or oval, and other times more elongated. The lips of the basin seem in general to rise pretty high from its bottom, and to be composed of rocks or earths in a different state of aggregation. In the basin itself the surface consists chiefly of gravel, sand, clay, loam, or chalk, that appear to be late mechanical deposits from water, or rolled and rounded by its action. The sides or lips of it are either parts of mountains, or similar to the ground without it in structure. Examples of these concavities will occur to almost every one. They are met with in the course of the Rhine, the Rhone, the Elbe, and the Danube. The Vallais, and the concavity in which the lake of Geneva is situated, may serve to show this appearance in the line of the Rhone; the lake of Constance in that of the Rhine; the circular valley of Bohemia, and the plain on which Dresden is situated, in that of the Elbe; and the Danube, beside many others, traverses a basin of this kind that composes a great part of Hungary. They occur in Scotland in Dumfriesshire, Perthshire, and Aberdeenshire. The Tay at Perth, before issuing from the narrow pass between the hills of Kinnoul and Moncrieff, points out one instance of them.

These inequalities, which we have enumerated under the terms of low land and high land, mountain-groups and alpine summits, are not more remarkable for the manner in which they diversify the surface of the earth, than for the difference of the mineral masses which they exhibit. The more elevated regions are composed of bare cliffy rocks, masses generally crystallised to a certain extent, and in some cases highly indurated, and presenting pointed abrupt surfaces. As we descend, the rocks lose their crystalline appearance, and we meet with slime and clayey fossils in greater abundance. Still lower down, we find fragments of rock, rolled pieces of sandstone, sand, soil, or mould, and other soft, discontinuous, and fortuitously arranged substances. Another remarkable distinction of the fossils, examined at these different altitudes, consists in their state with regard to petrifications of organic remains. In the higher elevations, and among the fossils highly crystallised, such as granite, we can discover no trace of the *exuviae* of organised being, no petrification of animal forms. In the middle regions these appearances are rare, and exhibit little variety. They increase in abundance, and in the perfection of the animal structure, as we descend, till we arrive at petrifications of the animals that now inhabit the earth along with us. That many of those appearances

which we have pointed out in the inequalities of the earth's surface have been modified by the action of the elements both mechanical and chemical, in a long course of ages, cannot be denied, and might be admitted with greater facility, did our limits permit us to describe the processes that are now advancing, under the same causes. Differences of temperature in promoting a disunion of contiguous portions; great floods or continued falls of rain in swelling rivers, brooks or mountain torrents, and enabling them to detach and carry along pieces of rock or parts of loose soil from the higher to the lower ground; the masses of snow and ice accumulated during the colder seasons, and precipitated on the lower ground by thaws; the powers of violent storms and earthquakes on the shores and lower levels, are among the agents whose forces and effects ought in such a view to be appreciated. Nor would the operation of chemical agency be undeserving of notice, when we consider the vast quantities of lime and other matters that are held dissolved in springs and streams, and which, being deposited gradually from their waters, incrust the edges of their channels, or petrify the wood upon their banks. Appearances of this kind occur frequently in the Velino, the Tevere, and many other rivers of Italy, and present us sometimes with the appearance of petrified thickets. The deposition of saline substances in many places, and the stalactitical form in which fossils of the flint genus sometimes occur, demonstrate that chemical precipitates from water are not confined to calcareous minerals. From these facts we may infer, that many of the phenomena on the earth's surface, which must have taken place in remote periods, are similar to those mechanical and chemical results, the causes of which are now in action; and that we have thus, as it were, before our eyes, though on a very diminished scale, a specimen of these mighty processes by which, under Providence, our globe was brought into a state fitted for becoming our habitation; but this inference we shall leave for future discussion, and proceed at present,

II. To give a very brief description of the *internal structure* of the earth's crust, and the relative position of its parts. And here fossils may be considered either, 1. With regard to the structure of the smaller portions or fragments into which they may be divided; or, 2. With regard to their distribution, arrangement, and relative position, as composing greater or smaller portions of the frame of our globe. When viewed in regard to their fragments, or hand-specimens, they are either simple or compound. Simple fossils may be defined to be those, the whole mass of which is uniform and homogeneous, of which every separate division affords the same materials, and exhibits the same appearances, and of which any given portion may be taken as a specimen or sample of the whole. Of this kind are limestone, serpentine, and varieties of other rocks.

Compound minerals, from the manner in which their particles or individual portions are joined, are denominated either cemented or aggregated. The cemented structure is formed when the individual particles may be perceived

by the eye to be connected with a cement, and occurs in breccia, pudding-stone, and other fossils. The appearance of this structure allows us to infer, that the materials of the stone, where it is found, are not at present in the situation where they were first formed into a solid; but that they have been broken off from larger fragments, that they have been carried from their original place, and, after being modified in their course, have been deposited from a fluid, and connected by a finer extraneous substance. The aggregated structure is distinguished from the cemented, by the immediate connexion of the parts of the rock where it occurs, without the intervention of cement. Of the aggregated structure there are two kinds, simple and double, and each of these has its own subordinate differences.

Simple aggregation may characterise two states of a body. One of the component parts may predominate so much as to constitute a basis in which the others are imbedded, and consequently may prevent these others from mutual contact; or the fossils may be so arranged, that all the parts may be brought into immediate and reciprocal connexion. The first of those kinds of simple aggregation is again divided into two subordinate differences, denominated the porphyritic and amygdaloidal structure. The characteristic distinction of a porphyritic mineral is the dispersion of one of its constituent parts through a basis in the shape of grains or crystals; the amygdaloidal structure, on the other hand, presents vesicles or spongy-like spaces, dispersed irregularly through a basis, sometimes half-filled, sometimes empty, and sometimes completely filled. The crystal or grains in the first kind of rock appear to be of contemporaneous formation with the base, the matter that fills up the vesicular spaces in the amygdaloidal structure. Those fossils that possess that kind of simple aggregation, in which all the parts come into contact without the intervention of a base, are either granular or slaty. The granular structure is exhibited by rocks whose parts are nearly equal in all the dimensions of length, breadth, and thickness, and appear an aggregate of contemporaneous formations. The slaty structure, on the other hand, though its constituents seem of contemporaneous formation, is composed of parts whose length and breadth are more considerable than their thickness. Of the former kind of aggregation, granite and sienite are good examples; of the latter, gneiss and mica-slate may serve as instances of frequent occurrence.

Besides the aggregation called simple, which we have just described, there is what is called the compound aggregation, divided into five distinct subordinate kinds; 1. The granular slaty; 2. The slaty granular; 3. Granular porphyritic; 4. The slaty porphyritic; 5. The porphyritic amygdaloidal. The five kinds of compound aggregated structure, it will be seen from the name, are merely combinations of the four simple ones formerly mentioned, and do not require, in an abridged account like the present, to be particularly described. It may be proper only to remark, that, when the two adjectives descriptive of the compound structure are applied to a mass, the former expresses the appearance it exhibits

in the small or more confined view of it, and the latter in the great, or on the more extensive scale. Thus, to take an example, granular slaty describes a specimen which is granular in the small but slaty in the great, such as gneiss where the quartz and felspar form the granular texture, and the mica is disposed in the direction of the slaty structure. With these terms, and under the head of simple and compound minerals, we might enumerate and describe the different kinds of fossil masses that compose the crust of the earth. But referring to the body of the work, and the following head, for a description and an analysis of them, we proceed to describe the structure of mountain-masses, and of their general arrangement and relative position, as constituting the habitable globe. And here we quote Mr. Jameson's account of those arrangements, as the passage of his work which contains it expresses every thing necessary to be observed, in language so perspicuous and concise, that it would be useless to extend it, and almost impossible to abridge it.

STRUCTURE OF MOUNTAIN-MASSSES.

In the structure of mountain-masses, we have two principal kinds of structure to describe. These are the *stratified structure*, or that of strata, and the *seamed structure*, or that of distinct concretions.

Stratified structure.—When a mountain, or mountain-mass, composed of one species of rock, is divided, by means of parallel seams, into masses, whose length and breadth are greater than their thickness, or into what may be denominated tabular masses, which extend through the whole mountain, it is said to be stratified, and the individual masses are termed strata. Of this kind of structure we have instances in granite, limestone, clay-slate, and mica-slate. But if the mountain or mountain-mass consists of an alternation of different rocks, as of clay-slate and greenstone, or of gneiss and limestone, it is said to be composed of beds. The seams that separate the strata, are named strata seams, or seams of stratification.

Strata are in general from four to six feet thick in the older formations; but less considerable in the newer. They also vary very much in their position. The examination of this appearance of strata is of great importance to the geognost and mineralogical geographer.

The position of a stratum is determined by observing its inclination, dip, and direction.

The inclination is the angle which the stratum forms with the horizon, and is determined by the quadrant.

The dip is the point of the compass towards which the stratum inclines.

The direction is the angle which the stratum makes with the meridian, and is determined by the compass. It is always at right angles to the dip.

In making observations of this kind, it is of the greatest importance to distinguish the general direction and inclination from the partial. To effect this, we must take the results of a number of particular observations, and compare them together; and those similar angles which

are the most numerous are to be considered as expressive of the general inclination and direction. It sometimes happens, that this general position has also its variations; these must also be attended to and noted. An acquaintance with the shape of a mountain group, will assist us very much in such investigations, as it is intimately connected with the general disposition of the stratification of the masses of which it is composed. It is also of importance to know the fall or declivity of a mountain group, as its direction and inclination are generally conformable, particularly in the older formations, with that of the super-imposed masses. Sometimes, indeed, there are exceptions to this rule; but these are easily explained.

It is often very difficult to determine, whether the rock we are examining be stratified or not, and, when the seams of stratification are hid, to know the direction of the strata. The following observations will be useful in removing some of the difficulties attending such investigations. 1. Strata are almost always parallel with the slaty structure of the stone. In certain porphyritic granites, the crystals of felspar appear to lie parallel with the strata; the latter character, however, is by no means so decisive as the former. 2. Strata can only be formed by parallel seams, which have the same direction and extent through the mountain-mass. Where parallel rents occur in different directions in the same species of rock, as in granite, sandstone, limestone, &c., it is evident that they are to be considered as accidental. 3. The seams of tabular distinct concretions, which are often of considerable extent, must not be confounded with strata seams, because their extent is not so considerable; and in each group of concretions the direction is different. 4. Where parallel rents have a different direction from the slaty structure of the stone, they are certainly accidental. Inattention to this circumstance has led several mineralogists into error. A striking instance of these rents was observed in a quarry of gneiss, in the forest of Tharand, in Upper Saxony. The gneiss, at first sight, appeared to be disposed in vertical strata, and as such it was viewed by De Luc; on a closer examination, however, the apparent vertical seams proved to be merely accidental parallel rents, perpendicular to the slaty structure of the stone; therefore the strata were horizontal, not vertical. 5. Beds are always parallel with the strata; these, therefore, point out the direction of the strata. 6. Although the slaty structure points out to us the direction which the strata must have, it does not follow, that a rock, having a slaty structure, is stratified. 7. In sandstone, limestone, and rock-salt, regular and very extensive stripes are sometimes observed, which have been confounded with true seams of stratification. An attentive examination, however, always discovers them traversing the real strata seams. Von Buch, in his description of Landeck, and geognostical observations made in Italy and Germany, and Friesleben, in his observations on Thuringia, describe striking instances of stripes resembling strata-seams.

Strata vary very considerably in the angle which they form with the horizon: they occur

from horizontal to vertical, but the general inclination is between horizontal and 45°. The differences are either original, or have been produced by subsequent changes. In strata composed almost entirely of mechanical depositions, any deviation from the horizontal position is generally to be considered as caused by a change of original position. We must be careful, however, not to confound highly inclined strata of sandstone with accidentally changed strata. This sandstone is in its original situation, and it owes this situation to the great portion of chemically dissolved matter combined with it, and the inclination of the bottom on which it is deposited. It may be said, that the bottom on which it rests has been forced up while the strata were soft, and has thus given them their present situation; but this explanation will not suffice, as these strata sometimes rest on walls of clay-slate; sometimes on loose sand-stone; sometimes on faces composed of horizontal beds of sandstone. In strata composed of chemical precipitates, all the variety of inclination depends on the inequality of the bottom. If the bottom be very much inclined, so are the strata; if it be very flat, the superincumbent strata are also flat. It is therefore a fact, says this author, that all inclined strata, with a very few exceptions, have been formed so originally, and do not owe their inclination to a subsequent change.

Respecting the formation of strata and beds, many opinions have been proposed. Werner's explanation is satisfactory. He remarks, that strata and beds appear to be particular and individual depositions from a state of solution or suspension in water.

The stratified structure, as well may be supposed, occurs in many different rocks, and, in a more extended view, probably in all. Gneiss, mica-slate, and clay-slate, are always stratified; granite frequently; sienite sometimes stratified, sometimes unstratified; porphyry is seldom stratified; primitive limestone occurs both stratified and unstratified; flint-limestone, sandstone, and chalk, are most distinctly stratified.

When we examine the structure of a mountain, we must be careful that our observations be not too micrological, otherwise we shall undoubtedly fail in acquiring a distinct conception of it. This will appear evident, when we reflect that the geognostic features of nature are almost all on the great scale. In no case is this rule to be more strictly followed than in the examination of the stratified structure.

By not attending to this mode of examination, geognosts have fallen into numberless errors, and have frequently given to extensive tracts of country a most irregular and confused structure. Speculators building on these errors have represented the whole crust of the globe as an irregular and unseemly mass. It is, indeed, surprising, that men possessed of any knowledge of the beautiful harmony that prevails in the structure of organic beings, could for a moment believe it possible, that the great fabric of the globe itself, that magnificent display of omnipotence, should be destitute of all regularity in its structure, and be nothing more than a heap of ruins.

Seamed structure.—This structure is formed in

those cases where there are seams which are parallel in one direction, but intersect each other in another. The most striking example of it is the columnar. The columns are sometimes regular, sometimes approach to the globular form, and occur even curved. They are from a few inches to many fathoms long, the length being determined by the direction of the seams in one direction. In the islands of Staffa and Egg there are admirable examples of this kind of structure. These columns are sometimes collected into groups, and such groups are often separated from each other by seams, or rather rents, which render them more distinct. Such groups may be considered as immense distinct concretions. The columns of such a group often tend towards a centre, some are parallel or perpendicular, others are horizontal; and all this variety sometimes occurs in the same hill. The columns are sometimes jointed, so that the convex extremity of the one column is fitted to the concave extremity of the other; and these columns are usually composed of globular distinct concretions. These globular concretions are composed of curved lamellar concretions. The spaces between the different globular concretions are composed of a looser matter than the concretions themselves; and it is by the falling out of this less compact substance that the structure of such columns is first developed. No rock shows this kind of structure more distinctly than basalt; in it we have all the varieties of the seamed structure, from the smallest, which is the lamellar distinct concretion, to the largest, which is formed by the grouping of columns. This kind of structure occurs also in porphyry and greenstone. Lava never presents any of the varieties of the seamed structure; a negative character which sufficiently distinguishes it from greenstone or basalt, with which it has been confounded.

Another kind of seamed structure, which deserves to be described, is the tabular seamed structure. It is distinguished from the lamellar by being always straight and much thicker. It is generally from three to nine feet in length, and rarely thicker than two or three inches. Basalt, in the lower parts of an individual deposition, has often this kind of structure. At first sight it is not unlike stratification. It also occurs in columnar porphyry.

The last, or third kind of seamed structure, is the large globular, or massive, in which all the dimensions are nearly alike. It occurs alone (that is, without any other kind of structure), and is from one to three or more fathoms in diameter. The larger balls show lamellar distinct concretions, which, we may observe, are always more solid the nearer we approach the centre. The roundish balls of granite, found dispersed over low countries, have been considered as boulder or rolled stones, and many theories have been formed to account for their transportation. The granite of the island of Arran presents this kind of structure.

STRUCTURE OF FORMATIONS.

By a rock-formation we understand a determinate assemblage of similar or dissimilar rock-

masses, which are characterised by external and internal relations as an independent whole, that is, as a unity in the series of rock-formations. These masses are either simple or compound. When the mass is uniform throughout, as is the case with limestone or sandstone, it constitutes what may be denominated a simple formation. Granite, gneiss, and mica-slate, are also of this kind. When dissimilar masses occur in a formation, as in the case of black-coal and flötz-trap, it is said to be a compound formation.

Similar rocks are often repeated in very different periods. Each of these individual depositions is a particular formation, and the whole is denominated a series or suite of formations. Thus there is a limestone, a porphyry, a granite suite, &c.

It is a determinate character of certain formations, to constitute the principal mass of the mountain in which they occur: this is the case with gneiss, clay-slate, porphyry, and others. With other formations, on the contrary, it is as essential a character to occur only in single beds in the others, and these are said to be embedded. The older porphyry, limestone, and many others, are of this kind. When such individual beds occur in different principal formations (that is, are not confined to a single one), as primitive limestone, and primitive trap in gneiss, mica-slate, and clay-slate, &c.; when they, as is the case with these, form single independent wholes, which always continue the same, notwithstanding the difference of the rocks in which they are embedded; and lastly, when they form members of a series of formations, as is also the case in these instances, they are to be considered as independent formations. If, on the contrary, they are confined to one rock mass; if they bear no marks of a whole; and lastly, if they are connected with no series, or suite of formations, they are associated with the formation in which they are embedded, and it is said that they are subordinate to it. Roestone in the second sandstone formation, and copper-slate in the first flötz-limestone, are examples of this kind. Beds composed of various fossils sometimes occur in different rock-masses. These fossils are usually those of which the rock-mass is principally composed, irregularly mixed, or are simple stones. Such beds are usually very irregular, do not extend through the whole rock-mass, and, in general, exhibit apparently great irregularity in all their relations. They are not alone capable of any discrimination, and are referred to the rock in which they occur. They have been, but rather improperly, denominated foreign beds. When single beds are well distinguished by the kind of stone of which they are composed, and if their composition shows certain peculiarities (as, for example, the determinate presence of metallic fossils, &c.), they are referred to the particular repositories, which we shall afterwards consider particularly. Beds of iron-pyrites and magnetic ironstone are of this kind.

STRUCTURE OF THE CRUST OF THE GLOBE.

The last kind of structure we have to describe is by far the most extensive and important. It is the structure of the crust of the globe itself,

in so far as it is composed of rock formations of different magnitudes, laid over each other in certain directions.

Under the five following heads, Werner comprehends every relation respecting the extent and relative position of formations in general. 1. The original extent of formations. 2. Their present extent and continuity. 3. The position and direction of the strata of formations, in respect to the fundamental rock. 4. The direction of the strata themselves, without reference to the fundamental rock. 5. The relation of the outgoings of the strata to the exterior of the mountain.

It may be previously remarked, that when one formation lies on another, it is said to rest on it, and the rock on which it rests is termed the fundamental rock; and the plane, which separates the fundamental rock from the formation that covers it, is denominated the plane of separation, which is always parallel with the seams of the strata.

1. *Of the original extent of formations.*—Werner observes, that the greater number of formations have been universally deposited; and these he denominates universal formations. A very few, however, are to be considered as exceptions; and these he terms partial or anomalous formations.

Universal formations extend around the whole globe (not, however, without interruption), and constitute by far the greater part of the mass of which its crust is composed. Almost all the primitive, transition, and flötz formations, are universal depositions; of these we may mention granite, gneiss, porphyry, limestone, and basalt.

Partial formations occur only here and there, and in single spots, and accompanied with appearances that indicate the partiality of their depositions. Thus, at Wehraw, in Lusatia, there is an excellent example of a partial formation. It consists of sandstone, limestone, bituminous shale, and iron-clay; and these rest on loose sand. The sandstone resembles in many respects that found in other sandstone formations; yet it does not belong to any of them, as is evident from its position, and the rocks with which it is associated. Werner conjectures that it may have been formed by a small and partial flood.

The examination of these partial appearances is of much importance, not only in extending our knowledge of the variety of formations, but in connecting the history of the earth more nearly with that of man.

2. *Of the present extent and continuity of formations.*—The present extent and continuity of formations is very different from what it was originally. We find them either extended uninterruptedly over great tracts of country, or they appear isolated, of little extent, and frequently resembling partial formations. In the one case they are said to be unbroken, in the other broken. The broken formations occur in small detached masses; and these have peculiar denominations, according to their position and shape.

When detached portions occur on the summits of hills, these are called cops. When portions occur, filling up hollow spaces between moun-

tains, they are denominated upfittings. And when a portion occurs only on one side of a mountain, it is said to be shield-formed, or to have the shape of a shield.

3. *Of the position and direction of strata in regard to the fundamental rock.*—When strata have the same direction as the fundamental rock, they are said to be conformable with it; if the direction is different, they are said to be unconformable. If they differ only in direction, we say that they are simply unconformable; but if they differ not only in direction, but lie over the ends of the strata of the fundamental rock, they are said to be unconformable and overlying. Overlying strata occur more frequently than simply unconformable, and have far greater extent.

4. *Of the direction of the strata themselves, without reference to the fundamental rock.*—Strata are either straight, that is, disposed in one direction on the fundamental rock, or they turn around it, and enclose it; in this case they are said to be mantle-formed, or mantle-shaped. If the strata are not only wrapped around the fundamental rock, but also cover its extremities, they are said to be saddle-shaped.

When the upper part of the saddle-shape is carried away, the mantle-shape is formed.

Strata are sometimes concave, and they are then said to be basin-shaped; but, if the concavity be oblong, they are named trough-shaped. In the concave, that is, the basin and trough-shaped, and convex, that is, the saddle and mantle-shaped strata, the outgoings form circles; in the concave the outer and greatest circle is the oldest; in the convex, on the contrary, the outer and largest circle is the newest.

5. *Of the relation of the outgoings of the strata to the exterior of the mountain.*—We have to consider, first, the relation of the outgoings of strata to mountain-masses of considerable extent; and, secondly, to mountain caps.

In mountain-masses, the strata either cover each other completely, or the outgoings are open and exposed. When the outgoings are exposed, the newer strata have a rising or sinking level.

There are three different kinds of mountain-caps. In the first, the cap rests on a fundamental rock; the seams of the strata are parallel with the plane on which the strata rest, and these are unconformable and overlying; the second kind of cap is formed by a rock rising through the surrounding strata; and the third kind of cap is formed by portions of harder beds remaining after the superincumbent and softer strata have been carried away.

In the first, the rock is unconformable and overlying. The flint-trap and porphyry formations afford numerous examples of this kind of mountain-cap.

In the second, the newer strata are mantle-shaped. Granite often occurs in caps of this kind.

In the third, all the strata are conformable, so that the subjacent and superincumbent strata have the same direction with the bed which forms the cap. Primitive greenstone, in clay-slate, sometimes forms caps of this kind.

These strata and formations, and the kinds of

rocks that compose them, follow one another in rising from the lower levels toward the higher; or, in other words, are placed above one another, not in an irregular or promiscuous manner; they follow a certain order of succession, and exhibit certain determinate relations. We do not, for instance, find a stratum of granite alternating with a stratum of sandstone, nor a formation of gneiss covering a bed of pit-coal. In examining the crust of the earth to discover this order of superposition we observe a great class of rocks pushing in alpine chains, their summits above all the flatter strata, and affording on their sides, and at their base below, a resting place, or support for them. These rocks are found under every other stratified mass, and never covering, or resting upon, any.

In like manner the rest of the strata have certain relations to each other, from the granite to the most superficial mould.

III. We proceed now to the third division of the subject of geology, which was to give a short view of the various classes of *rocks and mineral masses*, that compose the earth's crust, arranged according to their relative situation. We shall best execute this part of our duty, by presenting to our readers Dr. Thomson's compressed, but comprehensive account of the Wernerian arrangement, drawn up with his usual acuteness, and displaying his usual extent of information and research. Some of the observations may be found in the article MINERALOGY, and under the titles of the different minerals to which they refer; but we could not on that account omit the repetition of them, without destroying the continuity and systematic connexion of this article.

Werner has chosen the relative situation of rocks as the basis of his classification. He divides them into five classes. The first class consists of those rocks, which, if we were to suppose each layer to be extended over the whole earth, would in that case lie lowest, or nearest the centre of all the rocks which we know, and be covered by all the other rocks. The second class consists of those rocks which in that case would be immediately above the first class, and cover them. The third class would cover the second in the same manner; the fourth the third; and the fifth would be uppermost of all, and constitute the immediate surface of the earth. The first class of rocks are covered by all the rest, but never themselves lie over any other. The others lie in order over each other. These grand classes of rocks he has denominated formations, and distinguished them by the following specific names: 1. Primitive formations; 2. Transition formations; 3. Flatz formations; 4. Alluvial formations; 5. Volcanic.

The primitive formations are of course the lowest of all, and the alluvial constitute the very surface of the earth; for the volcanic, as is obvious, are confined to particular points. Not that the primitive are always at a great depth under the surface, very often they are at the surface, or even constitute mountains. In such cases, the other classes of formations are wanting altogether. In like manner the transition, and other formations, may each in its turn occupy

the surface, or constitute the mass of a mountain. In such cases, all the subsequent formations which ought to cover them are wanting in that particular spot.

Each of these grand classes of formations consists of a greater or smaller number of rocks, which occupy a determinate position with respect to each other, and which, like the great formations themselves, may often be wanting in particular places. Let us take a view of the rocks which compose all these different formations.

CLASS I.—PRIMITIVE FORMATIONS.

The rocks which constitute the primitive formations are very numerous. They have been divided therefore into seven sets; which constitute as many primitive formations, and are distinguished each by the name of that particular rock which constitutes the greatest proportion of the formation. These seven sets of primitive formations are the following:—1. Granite; 2. Gneiss; 3. Mica-slate; 4. Clay-slate; 5. Newest primitive porphyry; 6. Sienite; 7. Newer serpentine.

The granite is the undermost, and the sienite the uppermost of the primitive formations. Granite is scarcely mixed with any other rock; but in gneiss, mica-slate, and clay-slate, there occur beds of old porphyry, primitive trap, primitive limestone, old serpentine, quartz rock. For that reason, these rocks are said to constitute formations subordinate to gneiss, mica-slate, and clay-slate. Gypsum occurs in beds in mica-slate, and old flint-slate occurs in the same way in clay-slate. Thus, besides the seven principal primitive formations, there occur seven subordinate formations, interspersed through the second, third, and fourth formations; and topaz rock, which lies over gneiss and under clay-slate, must be added to the list; so that the primitive formations altogether amount to fifteen.

If we suppose the nucleus of the earth to have been first formed, and the formations to have been afterwards deposited in succession upon this nucleus, it will follow that the lowest formation is the oldest, and that the formations are newer and newer according as they approach the surface. This supposition accounts for some of the names given to the primitive formations. That porphyry, for example, is considered as the oldest which lies lowest down in the series of formations, and those formations of porphyry which lie nearer the surface are considered as newer. Granite, of course, according to this way of speaking, is the oldest formation of all, while the alluvial are the newest of all. The following table exhibits a synoptical view of the primitive formations:—

Principal.	Subordinate.
1. Granite.	
2. Gneiss.	{ 6. Older porphyry. 7. Primitive-trap. 8. Primitive limestone. 9. Older serpentine. 10. Quartz. 11. Gypsum. 12. Older flint-slate
3. Mica-slate.	
4. Topaz-rock.	
5. Clay-slate.	

13. Newer porphyry.

14. Sienite.

15. Newer serpentine.

Let us consider each of them in the order of the formations.

1. *Granite* is the lowest of all the formations, and the basis upon which the others rest. It is composed of felspar, quartz, and mica; each in a crystallised state, and cohering together without any cement. The felspar is usually the most abundant ingredient, and the mica the smallest in quantity. The color of the quartz and mica is usually gray; but the felspar has a considerable variety of colors, occurring in different shades of white, gray, red, and green. The size of the constituents of granite varies considerably. Sometimes the grains are very large, and sometimes they are so small that the granite has the appearance of a sandstone. Sometimes it is porphyritic, large crystals of felspar occurring in a basis of fine-grained granite. Sometimes this rock is distinctly stratified, but in other cases no stratification can be perceived. The unstratified or massive granite is frequently composed of large globular masses, each of which is composed of concentric lamellar distinct concretions. The intervals between these balls consist of a softer granite, subject to crumble down when exposed to the action of the weather.

Besides the three constituents of which granite essentially consists, other crystallised minerals occasionally occur in it, though only in small quantities. These crystals are chiefly of schorl; sometimes garnet and tin-stone.

Granite very seldom contains among its strata beds of any foreign rock. Beds of felspar alone have occasionally been observed in it. It is not so rich in ores as some of the other formations. Tin and iron are the metals which are most abundant in it. Hitherto molybdena has been found chiefly in granite. It contains also silver, copper, lead, bismuth, arsenic, cobalt, tungsten, and titanium.

Besides the great granite formation, which has been just described, Werner has discovered a second; which is supposed to occur nearly in the same geognostic situation as porphyry and sienite. The granite veins which traverse gneiss, mica-slate, and clay-slate, belong to this formation: There are several particularities by which this newer granite may be distinguished from the other. It usually occurs in a lower level; it has commonly a deep red color; contains garnets; and is not porphyritic.

When granite is not covered by any other formation, it forms high insulated cliffs and steep rugged rocks.

2. *Gneiss* is the formation which lies immediately over granite, and into which indeed it gradually passes. Gneiss consists of the same constituents as granite; namely, felspar, quartz, and mica; but it differs in its structure, being disposed into slates from the prevalence of the mica. The texture of the individual slates is granular. Hence the structure of gneiss is granular slaty. Gneiss is always distinctly stratified. It sometimes contains crystals of schorl; but they are smaller and much more uncommon than in granite. Tourmaline is more common,

and so likewise is garnet. It contains in it many foreign beds, which is not the case with granite. Beds of three of the first six subordinate formations are found in it. It is, perhaps, richer in metallic ores than any other formation. Almost every metal occurs in it, either in beds or veins.

When gneiss is not covered by any other formation, it forms round-backed mountains, and likewise crags; but less steep and insulated than those composed of granite.

3. *Mica-slate*.—The formation which lies immediately over gneiss, and into which it insensibly passes, is mica-slate. This rock, like the preceding, is compound, and composed essentially of quartz and mica. Like gneiss it is slaty, but it differs from that rock in containing no felspar. It is always stratified. It very frequently contains garnet crystals in considerable quantity, so as to give it a porphyritic appearance. Its structure is then slaty porphyritic. It sometimes also contains crystals of tourmaline, cyanite, and granatite. Felspar likewise occurs in it occasionally; not, however, as a constituent, but in kidney-form and irregular masses. Like gneiss, it contains many foreign beds (older porphyry, primitive trap, primitive limestone, older serpentine, and gypsum, occur in it). It is rich in ores; containing beds of magnetic ironstone, pyrites, galena, copper pyrites (containing gold), blende, cinnabar, cobalt glance, magnetic pyrites, and sometimes even native gold. It abounds also in metalliferous veins.

4. *Clay-slate*.—Mica-slate gradually passes into clay-slate, the formation immediately over it. Clay-slate consists essentially of the mineral described in the preceding chapter under that name. This rock is always slaty and always stratified. When it approaches mica-slate, grains of quartz, and also of mica, may be distinguished in it. Occasionally also it contains crystals of felspar, schorl, tourmaline, garnet, and hornblende.

Under the name of clay-slate formation are included not only clay-slate, strictly so called, but likewise chlorite-slate, talc-slate, whet-slate, drawing-slate, and alum-slate; all of which occur along with pure clay-slate, are similarly stratified, and gradually pass into it and into each other, and therefore are considered as only constituting a part of the same formation; but these substances affect a particular order. The following table exhibits that order, beginning with the lowest or oldest, as it is called, and terminating with the uppermost or newest:—

1. Light yellowish gray clay-slate.
2. Dark gray clay-slate.
3. Green clay-slate.
4. Chlorite slate and potstone.
5. Talc slate.
6. Whet slate.
7. Bluish gray clay-slate.
8. Red clay-slate.
9. Drawing slate.
10. Alum slate.

Besides these different beds, which are considered as constituting the clay-slate formation, it contains also beds of all the eight subordi-

nate formations. It contains also a considerable number of metallic ores in beds; as iron pyrites, copper pyrites, arsenic pyrites, cobalt, galena, &c. It contains also a variety of mineral veins.

Having now described the first four primitive formations, let us proceed to the subordinate formations; taking topaz rock along with them, on account of its rarity. These are the older porphyry, primitive trap, primitive limestone, older serpentine, quartz, topaz rock, gypsum, and primitive flint-slate.

5. *Older porphyry*.—By porphyry, as defined by Werner, is to be understood a rock consisting of a basis or ground of some compact mineral, and in this ground are interspersed crystals of some other mineral. The ground or basis varies in different porphyries. Sometimes it is clay-stone, sometimes pitch-stone, &c.; and the porphyry is named from this basis. The following are the species of porphyry that have been described:—1. Clay porphyry; 2. Horn-stone porphyry; 3. Felspar porphyry; 4. Pitch-stone porphyry; 5. Sienite porphyry; 6. Obsidian porphyry; 7. Pearl-stone porphyry.

The crystals interspersed through the different bases are commonly felspar, sometimes quartz, and sometimes hornblende and mica; but the last two are uncommon, especially the mica.

There are two very different formations of porphyry; the first is found in beds in gneiss, mica-slate, and clay-slate; whereas the second always lies over all these formations. Hence the first is distinguished by the name of older, and the second is called newer porphyry. It is the first of these that we are to consider at present.

The basis of the older porphyry is usually a species of horn-stone, and sometimes felspar; and the crystals which occur in it are felspar and quartz. Hence the older porphyry consists chiefly of horn-stone porphyry, and felspar porphyry. When not covered by other formations it sometimes forms single rocks, but never large mountains.

6. *Primitive trap*.—The word trap is Swedish, and signifies a stair. It was applied by the Swedish mineralogists to certain rocks, whose strata when exposed, from the one jutting out under the other, gave an appearance somewhat like a stair. The term was adopted by other nations, and was applied indiscriminately to a great variety of rocks, which bore a certain resemblance to each other. This generalisation introduced much confusion into the subject, which was first cleared up by Werner and his disciples. Under the term traps Werner comprehends certain series of rocks, distinguished chiefly by the hornblende, which they all contain. In the most ancient, the hornblende is almost pure; this purity gradually diminishes, and in the most recent traps the hornblende degenerates to a kind of indurated clay. There are, then, three formations of trap: 1. Primitive trap; 2. Transition trap; 3. Flötz trap. The first only occupies our attention at present.

The primitive trap formation contains a considerable number of rocks; which, occurring in different parts of the earth in similar situations, and as it were substituted for each other, are con-

sidered altogether as constituting only one formation. The following table exhibits a list of the rocks belonging to this formation:

- I. Hornblende.
 1. Granular or common hornblende.
 2. Hornblende slate.
- II. Hornblende and felspar united.
 - i. Granular.
 1. Common green-stone.
 2. Porphyritic green-stone.
 3. Green-stone porphyry.
 4. Green porphyry.
 - ii. Slaty.
 1. Green-stone slate.
- III. Hornblende and mica united.
 1. Porphyritic trap.

The first two of these rocks consist essentially of the minerals described under the names of common hornblende and hornblende slate. The latter sometimes passes into fine slaty gneiss and into chlorite slate.

Common green-stone is composed of hornblende and felspar, both in the state of grains or small crystals, and the hornblende usually constitutes by far the greatest proportion of the mass. The felspar is almost always tinged green from the hornblende. This rock sometimes contains a little mica; sometimes it is intersected by small veins of quartz and actinolite; and sometimes also, though less frequently, of felspar and calcareous spar.

Porphyritic green-stone, like the preceding rock, is a compound of granular hornblende and felspar; but it contains likewise large crystals of felspar and quartz, interspersed through the green-stone ground.

Green-stone porphyry (black porphyry of the antiquary) is a rock consisting of granular green-stone, so small grained that at first sight it has the appearance of being a simple stone; containing in it large crystals of felspar, colored green from hornblende.

Green porphyry (the verde antico serpentine) is a rock which has for its ground a mixture of hornblende and felspar, so intimate that the two ingredients cannot be distinguished by the naked eye, and having a blackish green or pistachio green color. This trap contains greenish colored felspar crystals, often cruciform.

Green-stone slate is a rock composed of hornblende and felspar, and sometimes a little mica, and having a slaty texture. It is very hard, but, like the other species of greenstone, soon withers when exposed to the air.

Porphyritic trap is a rock composed of an intimate mixture of hornblende and felspar, containing in it large plates of mica, which give it a porphyritic appearance.

All the rocks of the primitive trap formation are characterised by containing a mixture of iron pyrites. Their stratification is indistinct; and, indeed, if we except green-stone slate and hornblende slate, usually not perceptible. When primitive trap is not covered by any other formation, it constitutes considerable hills and cliffs. It abounds in ores, especially green-stone slate.

7. *Primitive limestone*.—Limestone occurs in all the four grand classes of formations, but it assumes a peculiar and characteristic appearance in each. In the primitive it is distinctly crystalline and transparent. The crystalline texture gradually becomes less and less distinct, as the formations advance, till at last the limestone assumes the appearance of an earthy deposit.

Primitive limestone occurs usually in beds, and seldom forms entire mountains. Its color is usually white, sometimes it is gray, but very seldom assumes any other color. It is the species of limestone described already under the name of granular foliated. It sometimes contains in it quartz, mica, hornblende, actinolite, garnet, tremolite, talc, clay-slate, serpentine, asbestos, blende, galena, common and magnetic pyrites, and magnetic ironstone. The ores are usually found at the lower part of the beds of limestone. It is sometimes stratified, and sometimes not. When not covered by any other formation, it forms steep bare rocks; and, when it occurs in considerable quantities, often contains caverns.

8. *Older serpentine*.—The serpentine formation consists essentially of the mineral described already under that name. Two subspecies were thus described; namely, the common and precious serpentine. The latter (at least chiefly) constitutes the formation at present to be described. It occurs, like the other subordinate primitive formations, in beds in gneiss, mica, and clay-slate, and alternates with limestone. It is seldom stratified. It contains in it galena, and auriferous arsenic pyrites.

9. *Quartz* occurs in beds, and in no great quantity. It is usually granular and of a white color; sometimes it contains a mixture of mica, which gives it a slaty texture. It is very often unstratified; but, as it abounds in rents, these have often been mistaken for strata.

10. *Topaz rock*.—The rock which constitutes this formation is very rare, having been observed only in Saxony, where it constitutes a mountain. There it rests on gneiss, and is covered by clay-slate. It is composed of three ingredients; namely, fine granular quartz, schorl in thin prismatic distinct concretions, and topaz almost massive. These are arranged in thin layers, and these again are divided into roundish and granular distinct concretions, so that the rock is slaty granular. The intervals between these concretions are filled up with a yellowish or greenish colored lithomarge.

11. *Gypsum* was formerly believed to be peculiar to the flint formations; but an immense bed of it has lately been discovered in Switzerland in mica-slate. This primitive gypsum is characterised by containing mica and clay-slate.

12. *Primitive flint slate*.—This rock consists essentially of the mineral, described already under the name of flint slate. It is often traversed by veins of quartz. There are two formations of it; namely, the primitive, which occurs in beds in clay-slate, and another which belongs to the transition formations.

Having now described the eight formations

which are subordinate to gneiss, mica, and clay-slates, let us proceed to the remaining primitive formations, which always cover clay-slate, and are therefore considered as newer than it. These are the newer primitive porphyry, sienite, and the newer serpentine.

13. *Newer Porphyry*.—To this formation belong the following species of porphyry; namely, clay porphyry, pitchstone porphyry, obsidian porphyry, pearlstone porphyry, and sometimes felspar porphyry. Clay porphyry is by far the most common. To this formation also belongs claystone, a mineral already described. It constitutes the basis of clay porphyry, and frequently occurs without any crystals of felspar or quartz. To it we must also refer a kind of breccia porphyry, composed chiefly of fragments of hornstone porphyry and felspar porphyry.

14. *Sienite*.—This rock occurs usually along with porphyry; and, when they are both together, the sienite generally forms the uppermost part of the hill.

Sienite is a rock composed essentially of felspar and hornblende, the same constituents which form green-stone; but in sienite the felspar is the prevailing ingredient, whereas in green-stone it is the hornblende. In sienite the felspar is usually red, and very seldom has a tinge of green, whereas in green-stone the felspar is never red, but almost always greenish white. The structure of sienite is granular, and the grains vary greatly in size; sometimes small grained sienite contains in it large crystals of felspar; it is then called porphyritic sienite. When the two ingredients that constitute sienite are so small, and so intimately mixed, that they cannot be distinguished by the naked eye, and when such a rock contains crystals of felspar and quartz, it is denominated sienite porphyry.

Sienite, like porphyry, contains few foreign beds; but it is rich in ores, containing gold, silver, iron, tin, copper, lead, &c., always however in veins.

The rocks of sienite are often divided into columns. Like the newer porphyry it often occurs in round masses.

15. *Newer serpentine*.—This formation consists of the rock composed essentially of the mineral called common serpentine. It bears a striking resemblance to the newer porphyry formation, and occurs in similar situations.

CLASS II.—TRANSITION FORMATIONS.

Having described the primitive formations, let us now proceed to the second great class, the transition, which lie immediately over them. These are by no means so numerous, since they consist only of four sets; namely, 1. Greywacke; 2. Transition limestone; 3. Transition trap; 4. Transition flint-slate. They all alternate with each other.

It is in the transition rocks that petrifications first make their appearance; and it deserves particular attention that they always consist of species of corals and zoophytes, which do not at present exist, and which therefore we must suppose extinct. The name transition has been imposed, as they are supposed to have

been formed when the earth was passing from an uninhabited to an inhabited state.

1. *Greywacke*.—This formation consists of two different rocks, which usually alternate with each other, and pass into each other. These are greywacke and greywacke slate. The first characterises the formation. Greywacke is a rock composed of pieces of quartz, flint slate, felspar, and clay-slate, cemented together by a basis of clay-slate. The pieces are sometimes as large as a hen's egg; sometimes so small that they cannot be perceived by the naked eye. The clay-slate basis likewise varies in quantity considerably. It often contains soft plates of mica, and quartz veins are very common in it; sometimes it is so hard that it appears indurated by some siliceous cement. The texture of greywacke becomes gradually finer and finer grained, till at last it can no longer be perceived, and a slaty structure succeeds. It then passes into greywacke slate.

Greywacke slate is in fact a variety of clay-slate; distinguished from primitive slate by seldom showing a greenish or light yellowish grey color, or the silvery uninterrupted lustre of primitive slate. It contains no beds of quartz, but very often veins of that mineral; no crystals of felspar, schorl, tourmaline, garnet, or hornblende; nor beds of garnet, chlorite slate, talc, or magnetic ironstone. It contains petrification. The greywacke rocks are stratified. It contains immense beds of transition limestone, trap, and flint slate; and is rich in ores both in beds and veins, and the veins are often of an uncommonly large size.

2. *Transition limestone*.—This, like primitive limestone, is a simple rock; but it approaches more to compact, and is less transparent than the primitive. It contains often veins of calcareous spar, and exhibits a variety of colors, which give it a marbled appearance. It contains marine petrifications of corals and zoophytes, which no longer exist, and which do not occur in the subsequent limestone formations. These petrifications increase in quantity as the beds of transition limestone advance farther and farther in their position from the primitive formations. It is often mixed with greywacke slate, which gives it a slaty texture. It occurs in beds of greater and smaller size, and often forms whole mountains. It contains no foreign beds except of transition trap. It is scarcely stratified. It is rich in ores.

3. *Transition traps*.—This formation, as the name imports, consists of rocks distinguished by the great proportion of hornblende which they contain. It comprehends four species of rocks; namely, 1. Transition greenstone. 2. Amygdaloid. 3. Porphyritic transition trap. 4. Globular trap (kugel fels).

Transition greenstone is a rock composed of fine granular hornblende and felspar intimately mixed together, and not so distinctly crystallised as in primitive greenstone. Sometimes the mixture is so intimate that the two minerals cannot be distinguished. In that state it often becomes loose in its texture, and approaches wacke and basalt. In this last case it often contains ves-

cles. When these are filled up with other minerals, the rock passes into amygdaloid.

Amygdaloid is nothing more than this last state of greenstone. The vesicles are filled up with calcareous spar, chalcedony, quartz, jasper agate, green earth, amethyst, &c., either completely or partially.

Sometimes the transition greenstone, in this softened state, contains crystals of felspar colored green by the hornblende. It then constitutes porphyritic transition trap.

Globular trap is a fine granular hornblende rock of a loose texture, and tending very strongly to clay; of a liver brown color, and containing in it globular masses composed of concentric lamellar concretions, and containing a hard kernel.

The transition trap rocks are only doubtfully stratified. They alternate with the other transition formations in beds, and sometimes compose whole mountains. Common and lenticular clay ironstone occurs in it in beds.

4. *Transition flint slate.*—This formation consists essentially of common flint slate and Lydian stone, which pass into each other. It is a simple stone, but is characterised by containing many veins of quartz. It is not stratified. When it constitutes rocks they are usually steep, and appear very much lacerated and worn down by the weather. This is occasioned by the numerous rents which this species of rock contains.

To this formation seems to belong riband jasper, which sometimes constitutes whole rocks. It may possibly occur also in some of the subsequent formations.

To these formations may be added transition gypsum, which Von Buch discovered, constituting a bed in greywacke slate, at Leogang in Salzburg.

CLASS III.—FLOETZ FORMATIONS.

The next grand class of formations have received the name of floetz, because they lie usually in beds much more nearly horizontal than the preceding. When not covered by a succeeding formation, they form hills which do not rise to the same height as the primitive or transition. They contain abundance of petrifications; and these much more various in their nature than those which occur in the transition formations, consisting of shells, fish, plants, &c. indicating that they were formed at a period when organised beings abounded. The floetz formations lie immediately over the transition in the following order.

1. *Old red sandstone.*—This formation lies immediately over the transition, or, where they are wanting, over the primitive rocks. Hence it is considered as the oldest of the floetz formations.

Sandstone is composed of grains of quartz, or some other siliceous stone, cemented together by some basis, and can only be considered as a mechanical mixture. The cement is sometimes clay, sometimes quartz, lime, marl, &c., and the sandstone is named, in consequence, argillaceous, siliceous, calcareous, marly, &c. This cement varies much in quantity, but never pre-

dominates; sometimes it is too small in quantity to be perceived. The size of the grains is no less subject to variation; when they are large the rock is sometimes called pudding stone. Of the old red sandstone the grains are large. It is distinctly stratified, and contains few ores. Cobalt, however, occurs in it; and it is often impregnated with copper.

2. *First floetz limestone.*—Floetz limestone is of a gray color; its fracture compact; has no lustre, and is only translucent on the edges. Sometimes thin beds of granular foliated limestone occur in it; but they contain petrifications, which distinguish them from primitive limestone. Floetz limestone is well characterised by the masses of hornstone and flint which it contains.

The first floetz limestone is characterised by a bed of bituminous marl slate, containing copper. This bed is always lowest, and therefore immediately contiguous to the sandstone. It contains but few petrifications. They consist chiefly of fish. Various beds of marl occur in this formation, and likewise a species of vesicular limestone, known in Germany by the name of rauch wacke.

3. *First floetz gypsum.*—Gypsum, in general, may be considered as a simple rock; sometimes, however, it contains crystals of boracite, arragonite, and quartz. Sulphur is likewise found in it, both disseminated and in compact masses. There are two formations of it.

The first floetz gypsum lies immediately over the first floetz limestone. It consists chiefly of foliated and compact gypsum, together with a good deal of selenite. It is in this formation that swinestone occurs, either in beds or mixed with the gypsum. Rock salt also belongs to it, and appears to lie over it in short thick beds, being usually mixed with a species of saline clay. Hence the saline springs, which obviously originate from rock salt, are likewise peculiar to this formation.

4. *Variegated sandstone.*—This formation lies immediately over the preceding. The rock which composes it consists of a fine granular argillaceous sandstone, usually of a green, brown, red, and white color. Several of these colors alternate in stripes, which gives the stone a variegated appearance. Hence the name. It often contains masses of a fat clay, of a greenish, reddish, or yellowish color.

This formation is characterised by two species of rocks, which occur in it in beds. These are, 1. The subspecies of limestone, described under the name of roestone; and, 2. Sandstone slate.

5. *Second floetz gypsum.*—This formation lies over the preceding in beds, and is sometimes, to a certain degree, mixed with it. It contains foliated gypsum, but scarcely any selenite, and no swinestone; and is characterised by the fibrous gypsum, of which it is in a great measure composed. It is of no great extent, and destitute of petrifications.

6. *Second floetz limestone, or shell limestone.*—This formation is separated from the first floetz limestone by the beds of older gypsum, of variegated sandstone, and of second gypsum,

which constitute the third, fourth, and fifth formations. It is characterised by the vast number of shells which it contains in the state of petrifications. Particles of galena are likewise found scattered through it.

7. *Third sandstone, or freestone*.—The relative position of this formation has not been well ascertained, yet it is known to cover all the preceding, and therefore to be much newer than either the first or second formations. It consists mostly of a sandstone of a white color, well adapted for building. It contains traces of coal, but no sandstone, slate, nor roe-stone; and gypsum never occurs either immediately over or under it. It is usually stratified, and contains natural rents or seams, which cross each other at right angles; the one parallel to the stratification, the other perpendicular to it, so that it can be easily quarried into large square blocks. This indeed is a character that in some measure applies to all the sandstones. When not covered by any other formation it forms beautiful hills and romantic valleys.

8. *Chalk*.—Chalk is one of the newest flætz rocks. It is always near the sea coast. It contains numerous beds of nodular flint, often full of vesicles. Various petrifications of echinates, belemnites, &c., occur in it. It is indistinctly stratified, and forms beautiful round knolls and hills of very small height. Pyrites is sometimes found in it, but scarcely any other metallic ore.

9. *Independent coal formation*.—This formation is deposited in detached patches, usually in valleys over the preceding flætz rocks, or over the transition formation when the flætz rocks are wanting. These patches, in general, have no connexion with each other. Hence the epithet independent, by which the formation is distinguished; but they are found in considerable quantities in the most distant parts of the earth, Europe, America, New Holland, and always similarly situated with respect to the other formations. Coal occurs in it in great abundance; though in the preceding formations it is very scarce, and indeed is only found in thin individual beds. Hence it is considered as characteristic of this formation. The rocks of which this formation is composed (not reckoning the coal) are the following: sandstone, coarse conglomerate, slate-clay, bituminous shale, indurated clay, limestone, marl, clay ironstone, porphyritic stone, greenstone.

Layers of these rocks alternate a great many times with each other, and in them the coal occurs in numerous beds, varying extremely in thickness. The subspecies of coal which occur in this formation are coarse coal, foliated coal, cannel coal, slate coal, and a little pitch-coal. Professor Jameson has likewise discovered glance coal in this formation.

All the different rocks of which this formation is composed seldom or never occur together. Hence it is presumed, that there are several subordinate formations belonging to the independent coal, which occupy determinate situations with respect to each other. Three such formations have been characterised. The oldest or lowest is composed of beds of indurated clay, limestone, marl, porphyritic stone, slate clay, bitu-

minous shale, greenstone, and soft sandstone, and is characterised by containing in it some metallic ores. These are ores of copper, iron, lead, and perhaps also mercury. The second is composed of beds of indurated clay, marl, limestone, and porphyritic stone. It contains some pyrites, but no other ore. The third, or newest, is composed of soft sandstone, conglomerate, and slate-clay, and contains no ore.

The rocks belonging to this formation are very distinctly stratified. Abundance of vegetable petrifications occur in it, especially in the sandstone and bituminous shale.

10. *Flætz trap*.—The rocks of this formation are very remarkable. They cover the other flætz rocks, precisely as the newer porphyry and sienite do the primitive. The level of the uncovered flætz formations becomes gradually lower, in the order in which they have been described; but that of the flætz trap is high, as it covers them all, and often forms the summit of hills, whose lower part consists of older formations. The rocks belonging to the flætz-trap formations are of two kinds: namely, those which are peculiar to it, and those which occur also in other formations. The following are the rocks peculiar to this formation: wacke, iron-clay, basalt, pitchstone, greenstone, porphyry slate, graystone, amygdaloid, trap-tuff.

Basalt, in many treatises, claims the first place, as it characterises the flætz formation; but it is now often referred to the volcanic formations. It consists essentially of the mineral described in another place under the name of basalt, for a basis, containing crystals of basaltic hornblende, augite, olivine, and iron-sand, which give it a porphyritic structure. It contains also vesicles, which are filled with zeolite, calcareous spar, lithomarge, &c. The vesicles are sometimes filled with water. Sometimes it passes into wacke; sometimes into graystone; and sometimes, though rarely, into porphyry slate.

Wacke is sometimes the simple mineral described already under that name. Sometimes it contains basaltic hornblende and mica, which give it a porphyritic appearance: sometimes it is spotted, from crystals which it contains. It passes sometimes into clay; sometimes into basalt. The iron-clay likewise has been described already.

Pitchstone was first observed in this formation by professor Jameson. It is distinguished from that which occurs in the older rocks by the following circumstances: Its colors are usually black or green; it is composed of lamellar distinct concretions, and it contains crystals of glassy felspar, or mionite as it is called.

Porphyry-slate is much less common than basalt; but where it does occur it usually forms considerable hills. This rock is slaty in the large, compact and splintery in the small. The basis of it consists of clinkstone; the crystals which it contains are of felspar and hornblende. It contains also zeolite, iron-sand, and some minerals not yet described.

Greystone is still less common than porphyry slate. It appears to consist of an intimate mixture of much white felspar and a little black hornblende. This basis contains augite and olivine.

Flætz greenstone is an intimate mixture of

grains of felspar and hornblende. It is distinguished from primitive and transition greenstone by the more intimate mixture and less crystallised appearance of the constituents. It passes into basalt.

Amygdaloid has for its basis sometimes wacke; sometimes a fine granular greenstone, frequently already somewhat decomposed. The vesicles which it contains are filled with green earth, lithomarge, steatite, &c. Sometimes they remain empty; sometimes this basis contains crystals of hornblende, &c., which gives the rock both a porphyritic and amygdaloidal structure.

Trap-tuff consists of fragments of flötz trap and other rocks, cemented by a basis of alluvial clay. The minerals which this formation contains, in common with others, are not so numerous as the preceding. They are the following: sand, quartz sandstone, clay, limestone, coal.

The grains of sand are of all degrees of magnitude. The clay sometimes contains schaum earth. The coal consists chiefly of the following subspecies; common brown coal, bituminous wood, and pitch coal. Sometimes, though seldom, glance coal and columnar coal occur in this formation.

It is chiefly in the beds of plaster that the great number of fossil bones of land animals have been found, for the description of which we are chiefly indebted to Cuvier.

CLASS IV.—ALLUVIAL FORMATIONS.

The alluvial formations constitute the great mass of the earth's surface. They have been formed by the gradual action of rain and river water upon the other formations, and may be considered as very recent formations; or rather as deposits, the formation of which is still constantly going on. They may be divided into two kinds; namely, those deposited in the valleys of mountainous districts, or upon the elevated plains which often occur in mountains; and those deposited upon flat land.

The first kind consists of sand, gravel, &c., which constituted the more solid parts of the neighbouring mountain; and which remained when the less solid parts were washed away. They sometimes contain ores (particularly gold and tin) which existed in the neighbouring mountains. Sometimes the alluvial soil is washed, in order to separate these ores. On mountain plains there occur also beds of loam.

The second kind of alluvial deposite, or that which occupies the flat land, consists of loam, clay, sand, turf, and caletuff. Here also occur earth and brown coal (in this mineral amber is found), wood coal, bituminous wood, and bog iron ore. The sand contains some metals, among others gold. The caletuff is a chemical deposite, and extends widely. It contains plants, roots, moss, bones, &c., which it has encrusted. The clay and sand often contain petrified wood, and likewise skeletons of quadrupeds.

CLASS V.—VOLCANIC FORMATIONS.

The volcanic formations are of two kinds; namely, the pseudo-volcanic and the true volcanic.

The pseudo-volcanic consist of minerals altered in consequence of the burning of beds of coal situated in their neighbourhood. Porcelain Jasper, earth slag, burnt clay, columnar clay-iron stone, and perhaps also polishing slate, are the minerals which have been altered.

The real volcanic minerals are those which have been thrown out of the crater of a volcano. They are of three kinds; 1. Those substances which, having been thrown out from time to time, have formed the crater of the mountain: 2. Those which have been thrown out of the crater in a stream, and rolled down the mountain; they constitute lavas: 3. The water which is occasionally thrown out of volcanoes, containing ashes and other light substances, gradually evaporating, leaves the earthy matter behind it; this substance constitutes volcanic tuff.

Of veins.—Veins are mineral repositories which cut through the strata or beds of which a mountain is composed, and which are filled with substances more or less different from the rocks through which they pass. We shall have a very distinct notion of veins, if we suppose that the mountains in which they occur were split by some means or other, and that the rifts thus formed were filled up by the matter which constitutes veins. They are distinguished from beds by their direction, which is either perpendicular to the stratifications, or at least forms an angle with it.

Sometimes the strata through which veins pass are merely separated from each other; so that if we cut through the vein we find the same strata of the rock on both sides of it; but sometimes also the corresponding strata on one side are lower than on the other, as if the portion of the rock on one side of the vein had sunk a little, while the portion on the other side kept its original position. In such cases the side of the rock against which the vein leans, or the floor of the vein, has always its strata highest up; while the strata of the portion of rock which leans over the vein, or the roof of the vein, are always lowest. So that this is the portion which appears to have sunk. Such a change of position in the strata is known in this country by the name of a shift.

In considering veins, there are two circumstances which claim our attention; namely, 1. The shape of veins; and, 2. The substances with which they are filled.

All those mineralogists who have had the best opportunity of examining the shape of veins with correctness, agree in representing them as widest above, and as gradually diminishing in size as they deepen, till at last they terminate in a point, exactly as if they had been originally fissures. Sometimes, indeed, veins widen in different parts of their course, and afterwards contract again to their former size; but more commonly they continue diminishing gradually to their extremity.

Sometimes these veins are either partially or entirely empty. In that case they are denominated fissures, but most commonly they are filled with a matter more or less different from the rock through which they pass. Sometimes the vein is filled up with one species of mineral.

Thus we have veins of calcareous spar, of quartz, &c.; but, when it is of any size, we frequently find a variety of substances; these are disposed in regular layers always parallel to the sides of the vein, and they follow in their position a very regular order. One species of mineral constitutes the centre of the vein; on each side of this central bed the very same layers occur in the same order from the centre to the side of the vein. Almost every mineral substance which occurs in the mass of rocks has been found in veins.

Veins of course, according to our theory, are newer than the rocks in which they occur; and, when two veins cross, that is obviously the newest which traverses the other without interruption, as the fissures constituting the second vein must have been formed after the first vein was filled up. But when different veins contain the same minerals, arranged in the same order, Werner conceives that they were filled at the same time, and says that such veins belong to the same formation.

A general Synoptical Table of Geology was a desideratum in this science to a very late period. Dr. Aime Boué supplies us with the following: professing it to be his design to exhibit the science reduced to its most simple terms, and to enable every one to contemplate at a glance the principal geognostical facts ascertained by the labors of geologists. For the more clearly following the details in the synoptical table, he gives the following sketch of his theoretical views.

‘1. All geologists who have had opportunities of examining burning and extinct volcanoes, agree in admitting the existence of extinct volcanoes, or of very anciently volcanised countries. 2. The greater number of geologists, and especially those who have visited extinct volcanoes, believe in the igneous origin of tertiary basalt, in the form of streams (*coulées*), beds, cones, and veins, and also that of trachyte. 3. A good many distinguished geologists agree in considering it as probable, that the secondary or flötz trap rocks are of igneous origin, because these rocks agree in nature, position, and accidents, with basalt and trachyte. 4. And lastly, The intimate connexion of the porphyries with gra-

nite, syenite, and other unstratified rocks, not only in nature, but also in position, has induced some geologists to consider these also as of igneous formation.

‘All the stratified rocks, with the exception of those of the first class, called primitive, are generally admitted to be of Neptunian origin. These rocks are distinguished by their peculiar texture, and by the imbedded crystalline minerals they contain, and which are foreign to stratified rocks. Although the stratified primitive rocks are placed under the head Neptunian, I consider them as Neptunian rocks which have been brought to their present state by the agency of heat, and that the imbedded minerals they contain were introduced among them by the action of some igneous power, as stated in the *Edinburgh Philosophical Journal* for July 1823, and *Annales des Sciences Naturelles* 1824. These stratified primitive rocks, then, are partly of Neptunian, partly of igneous formation. The tufaceous or conglomerated productions of ancient and modern volcanoes are more appropriately placed immediately after the igneous rocks, from which they are derived, than amongst the Neptunian rocks. Although the salt and gypsum deposits probably owe their origin to submarine solfataras, we have not separated them from the Neptunian series, because they were deposited by water. If these were removed from the Neptunian series, for the same reason we should be obliged also to separate from it masses of iron ore, and of other ores, certain salts, &c.

‘My theoretical ideas have induced me to separate from the Neptunian series the metalliferous veins, because their contents are more easily traced to Plutonic than to Neptunian agents. The alterations occasioned in Neptunian rocks, by their proximity to those of igneous origin, are stated in the table only in a cursory way, although phenomena of high interest.

‘The synoptical table also presents the most striking zoological characters of each formation, the different periods of the appearance and disappearance of the different classes of vegetables and of animals, and a proper selection of synonyms of the different denominations given to the rock formations.’

CLASS I.—PRIMITIVE ROCKS.

STRATIFIED OR NEPTUNIAN ROCKS.

GNEISS FORMATION.—Ex.: Erzgebirge, Bohmerwaldgebirge, Alps of Northern Styria, Black Forest, Lismousin, Scotland, Sweden, Canada, &c.

Hornblende rocks, {
Hornblende gneiss.
Hornblende rock (Scand. Scot.)
N.B. Carbonate of strontian
only here and in metal-
liferous veins.

Chief im-
bedded
masses, or
short sub-
ordinate
beds.

Limestones, { granular (Sweden, Scotland).
compact (Isle of Tiree).

Quartz rock,—granular.

Great variety of crystal-
line minerals dissemi-
nated, as garnet, gre-
nate, kyanite, beryl,
macle, corundum, cry-
solite, lazulite in lime-
stone; or under the
form of imbedded
masses, as garnet-rock,
magnetic iron ore
(Sweden, Lapland),
cobalt-glance (Tunna-
berg), &c.

Great masses of Weiss-
tein, or Whitestone.
These form the passage
from the gneiss tex-
ture to that of the gra-
nitic, by the igneous
way.

UNSTRATIFIED CRYSTALLINE OR
IGNEOUS ROCKS.

Granitic rocks, in dome-like or imbedded masses (Kaolin, Bavaria; topaz rock of Saxony; lepidolite-granite of Moravia, &c.); short beds or bed-like veins (Scotland, Bohmerwaldgebirge); veins (Finland; with beryl and tourmaline, Bavaria); and small veins (Scotland, Pyrenees, and central France).

Sienitic rocks, in dome-like or imbedded masses (Bohemia); short beds or bed-like veins, veins, and small veins (Scotland).

Greenstone or Diabase, especially as short beds or bed-like veins, and as veins (Scotland, Norw.)

Serpentinous rocks, in imbedded or cylindrical masses, or bed-like veins (Moravia, Western Bohmerwaldgebirge). Probably of an age not far from that of the Greywacke forma-
tion.

The preceding deposits are posterior in formation to the stratified primitive rocks.

Porphyritic veins, or dikes of transition or secondary age (Western Bohmerwaldgebirge, Erzgebirge, &c.)

Basaltic rocks, in veins of a date more recent than the chalk (Scotland, &c.).

* * Network of metalliferous veins in the stratified and unstratified rocks, of a recent age; many of the age of secondary porphyry (Erzgebirge), or nearly contemporaneous with that of the containing rock, as in granite, &c. titanite, gadolinite, cerite, &c.

Short
beds, {
Hornblende rocks.
Limestones, ...granular.
Quartz rock, ...granular.
Gypsum,granular (summit of Mount
Cenis).

These rocks are intimately connected with the following formation, by innumerable and well known transitions, (Alps, Pyrenees, Scotland, Germany).

CLASS II.—TRANSITION ROCKS.

STRATIFIED OR NEPTUNIAN ROCKS.

FORMATION OF TALCOSC AND QUARTZOSE ROCKS, AND OF CLAY-SLATE.—
Ex.: Alps, Pyrenees, Ardennes, Brittany, Bohemia, Scotland, &c.

Chief rocks, different varieties of	Mica-slate, Talc-slate, quartziferous, Chlorite-slate	{ some crystalline mi- nerals, magnetic iron- ore, &c.
	Quartz { granular, rock, { compact, common, { densely arenaceous or frag- mentary.	
	Gneiss, { talcose, { granitic, Clay-slate,	{ some crystalline mi- nerals, hollow-spar, iron-pyrites, dipyre.
	Whet-slate, Flinty-slate, Alum-slate.	
	Slate with black chalk or anthracite.— N. B. Here first trace of coaly ma- ter.	
Subordi- nate, or short beds of	Calcareous clay-slate (Alps). { granular (Pyrenees, Ap- penines, Alps), subgranular (Scotland) compact, with small sparry veins, . . . brecciated (Alps, Ap- penines).	{ some crystalline mi- nerals, hornblende, au- gite, garnet, &c. some crystalline mi- nerals, feldspar (Coldu Bonhomme).
	Limestone, { granular, compact	{ some crystalline mi- nerals, tremolite, ve- suviian, &c.
	Dolomite, { granular, compact	
	Gypsum (Alps of Savoy, { granular, Pyrenees, Tarascon), { compact.	
	This formation passes into the following.	

Fossils very scarce.

Zoophyte, Orthocera-
tites, Crustacea, Tri-
lobites (Brittany, La
Manche, Alps), Mo-
nocotyledonous vege-
tables.

Short beds of rocks
impregnated with
hornblende, actino-
lite-slate.

Iron-glauco-slate (Bra-
zil and Bavaria)

Granitic rock, with
iron-glance (Scot-
land, Vicentin).

Mica-slate, mixed with
serpentine (Alps).
Potstone.

UNSTRATIFIED CRYSTALLINE OR IGNEOUS ROCKS.

Granite—porphyritic { dome-like masses, bed- rarely with
and sometimes { like veins, veins, and { tertiary basalt
cellular, { small veins (Erzgeb.) } veins (Arran).
graphitic. N. B. Imbedded and
with pinites. changed slaty rock.

Sienite—imbedded masses, bed-like veins, large and small veins.
or bed-like veins, and veins.
Diabase (Ophite of the Pyrenees), especially in short beds
globular imbedded masses (Island of Corsica).

Hyperstenic sienite or slagite—dome-like or imbedded
masses, (Scotland, England, Germany), and veins (Scot.).
Diallage rock or Euphotide,—dome-like or imbedded masses
(Appennines).

Serpentine,—dome-like or { many minerals imbedded, as
imbedded masses, and { hornblende, augite, chloromate of
bed-like veins, { iron, and chrysoprase.

Augite rock,—dome-like or { N. B. A breccia composed of gra-
cylindrical masses, and { nular limestone and augite acco-
veins (Pyren. Piedmont), paints this rock (Port de L'herz).

Porphyries (Syn { bed-like veins, and veins } N. B. Sometimes
of the age of recent grey- { slate altered at
Elvan, Corn- { wacke (Vendée, Erzgeb. { the contact (Tre-
wall), { Cornwall.) { bischthal).

N. B. Lierrite, axinite, octahedrite, in veins in the slaty
rocks.

* Network of metalliferous veins in the slaty and un-
stratified rocks, many nearly contemporaneous with the
containing unstratified rocks, others in the slaty
rocks of the age of the greywacke or the secondary
porphyries;—gold, native copper, red copper-ore,
arsenate of iron, platina.—Uppermost limit of uran-
ore and of tantalite.

STRATIFIED OR NEPTUNIAN ROCKS.

GREYWACKE FORMATION.—Ex.: Hartz, Scotland, England, Gessenke Vosges, &c.

Trimeristrial Monocotyledonous vegetables.

(Conglomerate.
Clay-slate.
Flinty-slate (Leadhills).
Alum-slate (Moffat).
Andraciferous-slate (Vosges, Alps, Britany)
(granular (Framont, Vosges).
subgranular (Scotland).
compact, with { ore (Styria),
small spar- } in part con-
ly veins } verted into
(Hartz). } brown iron-
stone.
Limestone,
Dolomite, . . . compact, with Encrinurites.

Subordi-
nate or
short
beds of

(Old red sandstone of England,
Scotland, and the United
States, (red sandstone of
Scotland and Norway; con-
glomerate of the Alps, the
Pyrenees, and Scotland).
Mountain limestone of England,
Scotland, and the United
States (Picardy, Marquise,
Belgium, Hartz). N.B. Car-
bonate of barites only here in
metalliferous veins.

Recent Greywacke,
or
Transition Red
Sandstone,

The short beds of anthracite and impure coal,
with vegetable impressions, explain the inti-
mate connexion of this formation and the
Coal Measures.

*Pseudo-
volcanic
Rocks.*

UNSTRATIFIED CRYSTALLINE OR
IGNEOUS ROCKS.

(Granite,
porphyritic { dome-like masses, bed-like veins (Scotland), and small
metalliferous (Zinnwald), dome-like, imbedded, or cylindrical masses,
N. B. Uppermost limit of the Topaz.
Sienite, { dome-like or imbedded masses (Scotland), veins and
porphyritic { small veins (Scotland, Norway).
zirconiferous, Norway, Scotland.
Diabase or greenstone.
Hypersteneic sienite or selagite . . . Kidney-shaped masses.
Euphotide, { dome-like or kidney-shaped masses or veins (Scotland, Py-
Varolite, { renees, Hartz).
Serpentine, {
Porphyry, { dome-like or im- } N. B. Greywacke altered where in con-
globular, { bedded masses, } tact with porphyry, and sometimes
glandular, { short beds, bed- } imbedded in porphyry (Vorospatak,
earthy, { like veins (Eng- } Lapos Banya in Transylvania); grey-
land), and veins. } wacke with bituminous wood and
auriferous-pyrites, Vorospatak).
Trap rocks,
amygdaloidal, with epidote, quartz, and { short beds (Prague), and
calcareous-spar, { veins (England).
Blatterstein (Uhenau, Westphalia),
augitic.
Porphyry-breccia, { short beds united with the porphyry or trap
Trap-breccia, { masses, or short true Neptunian beds in the slaty
rocks, and then passing into these (England,
Vosges), and sometimes shelly (Vosges).
* * Network of metalliferous veins, in stratified and unstratified
rocks; in these last, partly of contemporaneous forma-
tion;—red manganese-ore, tellurium.—Last limit of native
gold, tin, bismuth, antimony, selcdellum, arsenic ores, pharma-
colite, and auriferous-pyrites.

Fishes.

CLASS III.—SECONDARY OR FLETZ ROCKS.

STRATIFIED OR NEPTUNIAN ROCKS.

I. FIRST FLETZ SANDSTONE FORMATION.

1. *Coal-Measures, or Coal Sandstone Deposit*.—Ex.: Northern Germany, Tharandt, Plauen, Wettin, Bohemia, Moravia, Funfkirchen, Oravitz (Bannat), Galicia, Silesia, St. Etienne, Auvergne, Bretagne, Belgium, England, Scotland, the United States, South America, New Holland, China, &c.

Chief rocks different varieties of { Sandstone
feldspathic, &c., sometime reddish
(Bohemia).

{ Slate-clay,
Bituminous-slate,
Carbonate of iron,
Coal,

Subordinate rocks { Calcareous marl,
Compact limestone,
feld (W. borders of Rhine).

It is the only deposit which contains the true slate and pitch caking coal in great abundance.

2. *Secondary Red Sandstone Deposit or Tufflengendes.*

Ex.: Northern Germany, Hall, Tharandt, Bohemia, Forez, Moulins, Bretagne, England, Southern Alps, Northern Alps, (Tyrol), &c.

{ Red sandstone (inferior red conglomerate of the Vosges and Black Forest, of the Thuringerwald): it does not exist on the north side of the Pyrenees. New Red Sandstone of Buckland.

Many whitish sandstone (Weissliegende); (Chessy copper sandstone? some geologists place it among the red marl); Russian copper sandstone; chrome oxide.

The Weissliegende establish in Northern Germany a transition between the sandstone and the zechstein (Wettin).

UNSTRATIFIED CRYSTALLINE OR IGNEOUS ROCKS.

Porphyry, { claystone-porphry, compact or clinkstone-porphry, semi-vitreous porphyry, pitchstone-porphry, Trap, augitic, feldspathic, earthy, } { dome-like masses (Saxony), imbedded masses or short beds (Scotland, Silesia), veins and bed-like veins (Scotland), bed-like veins, and veins (Arran), and imbedded masses (Trebeschthal), dome-like masses (Edinburgh, the Palatinate), imbedded masses—N. B. Upper limit of the Peridot and Limbilité } short beds, bed-like veins, and veins, } semi-vitreous, imbedded masses or short beds (Palatinate of the Rhine).

Porphyry-breccia, { short beds united with the porphyry, or short true or Neptunian beds in the sandstone, and then passing into these or trap masses, and containing sometimes vegetable impressions (Upper Saxony). }
Trap-breccia,

N. B. Great deposit of agates, and some few zeolites, as stilbite, and mesotype.

* Network of metalliferous veins, and small veins; mercury, &c.—Last limit of cobalt-ore, and crystallised gray manganese-ore.

CLASS III.—SECONDARY OR FLOETZ ROCKS,—Continued.

STRATIFIED OR NEPTUNIAN ROCKS.

III. FIRST FLÆTZ LIMESTONE FORMATION.—Synon. Zechstein, Calcaire alpin; a part of the Hochbirge Kalk of Escher; the Hochgebirge Kalk of Uttinger.

UNSTRATIFIED CRYSTALLINE OR
IGNEOUS ROCKS,

Marine Fossils pretty rare.—*Amphibious Animals, Insects, Algalcites.*—*Upper limit of Productus.*

GERMANY.	SILESIA AND POLAND.	FRANCE.	PYRENEES.	ENGLAND.	NORTHERN ALPS.	SOUTHERN ALPS.	TRAP ROCKS,—cylindrical masses (Allgau), of what age?
Bituminous marl-slate, with copper-slate, with fishes, insects, and carapaces.	Zechstein, metatalliferous.	Bituminous marl-slate (Autun and Villefranche), with fishes and fruits.	Arenaceous grayish-black limestone, with vegetable impressions? Compact, darkish limestone?	slaty, compact, with productus and fishes. globular or botryoidal.	Magnesian limestone more or less & without petrifications. small granular compact & cracked.	Compact Zechstein, without shells, (Recco). Calcareous blackish marls (Vicentin). Limestone or Dolomite.	
Zechstein, with bituminous (Mellierie, near Autun).		Zechstein, with bituminous (Mellierie, near Autun).					
Gypsum.							

Connected with the red marl by alternations and passages.

Terrestrial monocotyledons and dicotyledons, many marine plants. Mollusca, or Zoophyte only in the upper part (Wieliczka, Soultz in Alsace).

III. SECOND FLINT SANDSTONE FORMATION, OR VARIEGATED OR SALIFEROUS SANDSTONE.—Syn. Grieshouiller, Beud., and of Boué's Mem. sur l'Allemagne; (Grawwacke of Alps of many geologists; Old Molasse in part, in vicinity of Alps.

GERMANY.	POLAND AND CARPATHIANS.	FRANCE.	SPAIN.	ENGLAND AND IRELAND.	N. ALPS, CARPATHIANS, AND APENNINES.	
Variegated sandstone (Bunter Sandstein).	Marly sandstone.	Red small-grained sandstone of the Vosges, of the Aveyron, and Nor-mandy.	Variegated marl, with gypsum and salt (St. Gison, Arrazon, Castile, and Cordona).	Red marl, with gypsum and salt-beds.	{ Marly coarse sandstone, like (Austria, Allgau, Trieste, Florence, Vironis). Marls, with marine plants (syn. Pietra serena and forte of Tuscany (Alsace)). Compact grayish limestone, like blackish limestone, compact yellowish ruiniform limestone, Arenaceous limestone.	{ Southern Alps. Variegated sandstone. Variegated indurated marl, with gypsum. Calcareous marl. Compact marl. Compact limestone. Shelly marly sandstone. Greywacke-like sandstone or conglomerate (Agor-dio), sometimes calcareous.
Variegated marl, with gyp-sar. N. B. Uppermost limit of Anhy-drite.	{ Calcareous marl. Compact marl. Globular limestone (Kog-genstein), Salzsee, in part magnesian. Compact magnesian limestone (Coburg).	{ Compact marl. Globular limestone. Compact magnesian limestone (Vic.)	{ Compact (Dax) limestone, in the Globular upper limestone, part.	{ Compact grayish limestone, like blackish limestone, compact yellowish ruiniform limestone, Arenaceous limestone.	{ Compact grayish limestone, like blackish limestone, compact yellowish ruiniform limestone, Arenaceous limestone.	{ Compact grayish limestone, like blackish limestone, compact yellowish ruiniform limestone, Arenaceous limestone.
{ Argillaceous li-thate of iron ore.	{ Micaceous iron-ore.	{ Lignite, with ferns (Vic, Soultz, Alsace).	{ Micaceous iron-ore (Bastenes), in gypsum.	{ Very coarse conglomerate, sometimes calcareous (All-gau, Montserrat).	{ Very coarse conglomerate, sometimes calcareous (All-gau, Montserrat).	{ Very coarse conglomerate, sometimes calcareous (All-gau, Montserrat).
{ Crystals of iron-pyrites.	{ Crystals of boracite, in gypsum.	{ Gypsum of Decize, of the Saintonge, &c.	{ Crystals of Iron-pyrites. Iron-pyrites. (Bastenes).	{ Marls with gypsum and salt (Hasselgebirge of Salz-burg, Tyrol, Transylvania; with galena, iron-pyrites, and micaceous iron-ore, and realgar, Tyrol).	{ Marls with gypsum and salt (Hasselgebirge of Salz-burg, Tyrol, Transylvania; with galena, iron-pyrites, and micaceous iron-ore, and realgar, Tyrol).	{ Marls with gypsum and salt (Hasselgebirge of Salz-burg, Tyrol, Transylvania; with galena, iron-pyrites, and micaceous iron-ore, and realgar, Tyrol).
{ Crystals of iron-pyrites.	{ Crystals of iron-pyrites.	{ Crystals of iron-pyrites.	{ Crystals of iron-pyrites.	{ Lignite in the salt and sand-stones (Transylvania).	{ Lignite in the salt and sand-stones (Transylvania).	{ Lignite in the salt and sand-stones (Transylvania).
{ Crystals of iron-pyrites.	{ Crystals of iron-pyrites.	{ Crystals of iron-pyrites.	{ Crystals of iron-pyrites.	{ Crystals of iron-pyrites.	{ Crystals of iron-pyrites.	{ Crystals of iron-pyrites.
{ Crystals of iron-pyrites.	{ Crystals of iron-pyrites.	{ Crystals of iron-pyrites.	{ Crystals of iron-pyrites.	{ Crystals of iron-pyrites.	{ Crystals of iron-pyrites.	{ Crystals of iron-pyrites.

In all these different countries, the upper sandstones are connected with the following formation of Muschelkalk, excepting in England. This formation occurs in Calabria, Sicily, Persia, and in North and South America.

CLASS III.—SECONDARY OR FLOETZ ROCKS.

UNSTRATIFIED CRYSTALLINE, OR
IGNEOUS ROCKS.

STRATIFIED OR NEPTUNIAN ROCKS.

IV. SECOND FLOETZ LIMESTONE FORMATION, SHELL LIMESTONE, OR MUSCHELKALK.—Syn. Rauchgrauerkalk of Merian; Zechstein of the S.W. of Germany, and in part of many authors; part of the Calcaire alpin of the French; Calcaire à encrines of Beud.

A good many Fossils. Cetaceæ, Plesiosaurus. First appearance of Belemnites and Echinites.

GERMANY.	NORTH-EASTERN FRANCE.	PYRENEES.	ENGLAND.	N. ALPS, CARPATHIANS AND APENNINES?	SOUTHERN ALPS.	Tertiary Basal salts, Hessia, Vicentin.	(cuneiform masses and veins, Augit-porphyr, N. B. Shell limestone indurated when in contact with, and imbedded in, basalt (Warrburg, Vicentin); Calcaire altere de Conzocchi.
Globular limestone, in part magnesian (under part). Limestone, compact grayish (Wurtzburg), with encrinites. blackish and fetid. magnesian, grayish (Coburg), yellowish. cellular. with hornstone, (Coburg).	Globular limestone (Aric). Compact limestone, grayish (around the Vosges). With encrinites perhaps around the granitic plateau of Burgundy. magnesian, cellular (Saverne). with hornstone (Saverne). marly. Perhaps also existing in the Arveiron, Lot, and Var, but wanting in the whole western France.	Compact grayish limestone, sometimes cracked (St. Girard). Perhaps also in the Arveiron, near Figeac.	It does not exist here.	Compact well stratified limestone (Salzburg, Savoy, Dotis in Hungary). Granular whitish limestone (Hall in Tyrol). The compact limestone is grayish (with encrinites, Salzburg). whitish (Salzburg). yellowish. brownish (Ischel mines). reddish (Hallein, Dotis). with hornstone (Carpathians, Salzburg). blackish (Bex, Montmelian).	Compact grayish limestone. Compact limestone, with vegetable impressions (Recoaro). Marly grayish limestone. Marly blackish limestone, near Idrria. with nodules of galena, calamine and manganeseiferous epidot (Vicentin).	Augit-porphyr, N. B. Shell limestone indurated when in contact with, and imbedded in, basalt (Warrburg, Vicentin); Calcaire altere de Conzocchi.	
marly, { (with nodules of lead-glance, (Wirttemberg) with quartz crystals (Pyrmont), } very compact, alternating with the quadersandstone marls and sandstones (Pyrmont).							

V. THIRD TERTIARY SANDSTONE FORMATION, OR QUADERSENSTONEN, OR WHITE SANDSTONE.—Syn. Arthosen of Brongniart and Bonnard.

Marine Fossils, and Monocotyledonous and Dicotyledonous Vegetables, rarely Ferns.

GERMANY.	SILESIA.	NORTH-EASTERN FRANCE.	PYRENEES.	ENGLAND.	NORTHERN ALPS.	SOUTHERN ALPS.
Pretty fine quartose sandstone, whitish, Bohemia, Hartz. yellowish, Luxembourg. ferruginous. with lignite. shelly, Coburg, Stadfeldstein. Coarse sandstone. Conglomerate, Freyberg. Pottery clay, } in the upper part. Smectic clay, } per part. Clay-marl, } Gypsum, grayish, Durrheim. Lignite, Coburg; or mixed in the sandstone, Westphalia. Silicified marl, with vegetables and seeds, Amberg.	Pretty fine sandstone, Glatz county.	Yellowish or whitish sandstone, Vic. Siliceous sandstone. Coarse feldspathic sandstone. shelly, Bonnard; around the granitic plateau of Burgundy, Autun, Avallon. Conglomerate, Metz. Sandstone with particles of lignite, Vigny, near Metz.	Fine-grained sandstone, whitish, Navarrens. yellowish. gray and marly, Nalzon. ferruginous, shelly. with vegetable impressions, Ogenes, or with lignite, Fossil resin? Orthes.	It does exist here as a separate formation. The same is the case in the north-western part of France.	Sandstones with a shelly, cement, Conglomerate, united rate, with lias between Piesting and Planingbach in Austria. The sandstone and lignite deposit of Anthracites; if not, it is green sand!	Marly fine-grained sandstone, reddish, yellowish, Vicentin, Southern Tyrol.
Subordinate beds of						Tertiary basaltic, Bohemia.
Nests of	Fibrous malachite. Phosphate of lead, Vilsack, Bavaria. Lead-glance, Bleyberg, Rhénane, Prussia. The Scania coal sandstone belongs perhaps to it.—Vide Steffens's description.	Sulphate of barites, } Burgundy. Phosphate of Lime, } Lead-glance, } Some part of the metalliciferous rock of the Départements de la Vienne and de la Charente belongs also to it; see Bull. Soc. Phil. April. 1823.	Quartz, } coarse sandstone, } fine, whitish, yellowish, ferruginous, Iron-hydrate Wavellite.		Brasils. } Quarz, } coarse sandstone, } fine, whitish, yellowish, ferruginous, Iron-hydrate Wavellite.	North America. White quartz sandstone, Lake Superior. See Schoolecraft's Narrative, 1820.
						N. B. Indurated sandstones near basalt, Bohemia.
						Upper limit of copper carbonate.

This formation is connected with the following by alternations: (Amberg, Westphalia).

CLASS III.—SECONDARY OR FLÖTZ ROCKS.—Continued.

STRATIFIED OR NEPTUNIAN ROCKS.

UNSTRATIFIED CRYSTALLINE OR IGNEOUS ROCKS.

VI. THIRD FLÖTZ LIMESTONE FORMATION, OR JURA LIMESTONE.

Many marine Fossils, especially accumulated in particular spots or layers. First Nummulate deposits. Crawfishes, Terrestrial Mammalia, Birds, Insects.

GERMANY (S. W. part, and N. of the Harz, and N. W. part).	POLAND.	N. N. W. and S. E. FRANCE and SWITZERLAND.	PYRENEES.	ENGLAND, IRELAND, and SCOTLAND.	NORTHERN ALPS.	S. ALPS, APPENINNES, IONIAN ISLES, and SICILY, N. W.
DIVISIONS, { Arenaceous limestone, Clay-marl, —Phosphorite nodules, Amberg, Marls, aluminous, selenite, sulphate of strontian. Sandstones, with hy-wavellite, of Amberg phosphate of iron. Compact lime-stone, with yellowish Um, Regens-burg; grayish part of Dolomite, leuconkalk of Friesleben. Oolitic and compact limestone, Hildesheim. Slaty limestone, with fishes and crawfishes, Solenhofen. Clay-marl, with iron pea-ore, Bavaria.	Marly lime-stone. Compact lime-stone. Clay-marl with iron-ore?	{ Arenaceous limestone. Clay-marl. Marls, aluminous, sulphate of strontian, —lignite, & fossil resin. Sandstones, with hydrate of iron. Compact limestone, with Magnesian limestone. Oolitic and compact lime-stone. Madreporal limestone, or Calcaire à polypiers, Normandy, Saintonge.	Marly blackish gryphite limestone, rare, St. Girond. Compact lime-stone with magnesian limestone, abundant. Lignite masses, Nalzen. Iron-ore. Oolitic and compact limestone.	{ Arenaceous limestone. clay-marls, aluminous, Sky, &c. Oolitic and compact limestones. Coral rag and Stonefield, slate, &c.	{ arenaceous limestone. marly limestone. marly sandstone. shelly. Sandstones, lignite beds, fossil resin. May not some magnesian limestones of Salzburg belong to it? Magnesian limestone of Pest.	Magnes. limestone, Tyrol, Appennines, Sicily. Oolitic and compact limestone, Belluno, Trieste, Dalmatia, Appennines, Nummulate limestone of Istria, with lignite marls, pyrites Istria.

Granitic rocks, schorl, there, super-incumbent masses, Tyrol, Vienna, and here and coúles. { veins, dome-like masses, dome-like masses, Wittenberg. } Basaltic rocks, tuff, { veins, dome-like masses, Tyrol, Vienna, and here and coúles. } Tertiary Augit-porphyr, metalliferous, { veins, dome-like masses, even granitic. } N. B. Irish has converted into Jasper rock, Portland, Sky. Jura limestone become granular limestone, Pre-dazzo.

These last marls connect this formation with the following.—The lias and the Jura limestone exist in South America, in the great Mississippi basin, and perhaps the compact limestone with silex of Brasil belongs also to it, or to the chalk.

A good many Fossils, Monoclylellonous and Dicotyledonous Vegetables, Fossil Resin.

VII. IRON AND GREEN SAND.—Syn. Alpine variegated Sandstone of Utinger; Variegated Sandstone of Pest of Beudant; Nagelfluh of C. Prevost; part of the Quadersandstone of the Germans.

GERMANY	RUSSIA, POLAND, GALICIA.	FRANCE AND SWITZERLAND.	PYRENEES.	ENGLAND AND IRELAND.	NORTHERN ALPS.	SOUTHERN ALPS.
Ferruginous sandstone, or sand with clay and iron-ore, Blausko.	Ferruginous sandstone, or sand, with iron-ore, there present.	Fine sandstone, coarse, with iron-ore, Perigord. siliceous wood.	Iron-sand, or sandstone.	Iron-sand.	Iron sandstone, Sonthofen. Nummulite compact limestone, Allgau, Switzerland.	Basalt, short bed, Basaltic tuff, Monte Costalta, Vicentin; Mado-centini; Madonna de San Orso, S.E. Sicily (Dutbeny). Tertiary veins, Basalt, bed-like Basaltic like tuff, Vicentin.
Green sand or sandstone, often marly, Regensburg, Banzhau. fossil resin, in nests, Oboza, Moravia.	Green sand or sandstone, with masses of marls, lignite with fucus, Isle d'Aix. fossil, resin, ditto.	Green sand, or sandstone, Depart. des Landes, St. Severe. Lignite.	Green sand, or sandstone, Depart. des Landes, St. Severe. Lignite.	Green sand, or sandstone, Depart. des Landes, St. Severe. Lignite.	Green marly sandstone. Shelly, Belluno.	Green marly sandstone. Shelly, Belluno.

Intimately connected with the chloritose chalk.—Exists also in the Atlantic part of the United States.

VIII. CHALK FORMATION.—Synon. Calcaire à nummulites; a great part of Beudant's Hungarian Jura limestone; white Jura limestone of Hausmann.

GERMANY AND SILESIA.	POLAND AND SOUTHERN RUSSIA.	FRANCE.	PYRENEES.	ENGLAND AND IRELAND.	NORTHERN ALPS.	Mastolon, Roebuck or Sheep, Vienna. Uppermost limit of Belemnites.
Chloritic chalk, syn. part of the Plankkalk, Bole-mia, Regensburg, Hartz, Westphalia. siliceous, Blansko, Moravia. Chalk, marl, syn. Plankkalk, Bohemia, Hartz. compact white limestone, Paderborn. Earthy chalk, Luneburg, with flints.	Compact white limestone, Austria, Hungary, and Transylvania. Chloritic chalk marl, rare, Krapina, Croatia. Coral and nummulite limestone, Leitha-gebirge. compact white limestone, Paderborn. Earthy chalk, Luneburg, with flints.	Chloritic chalk, Le Mans, Saumur, Menshould. siliceous. Chalk marl, with hornstone, near Dax.	Chloritic chalk, Depart. des Landes. Chalk marl and nummulite coarse limestone, Bastarnes, near Dax.	Chloritic chalk, syn. Mullatto stone. Chalk marl with hornstone. Earthy chalk with flint.	Chloritic chalk, Neukirchen, Diablerets, Servos. Compact nummulite limestone. whitish. reddish. Sonthofen, Teisendorf. Schwytz Canton. Chalk marl, Neukirchen, Hausruck.	Tertiary veins, of which Augit-porphry overles the chalk. Basalt, bed-like veins, Vicentin, near Schio. N. B. Chalk altered and cracked near augit-porphry, Schio; indurated and like marl near basalt, Bel-fast. * Network of metallic-rous veins, argenteriferous galena, &c., in the augit-porphry; uppermost limit of galea.

Divisions,

Chalk marl is found in Scania, and in some Danish islands, Moen, &c., and in Rugen Island, &c.

CLASS IV.—TERTIARY ROCKS.

STRATIFIED OR NEPTUNIAN ROCKS.

I. FIRST TERTIARY SANDSTONE FORMATION.—Syn.
Molasse Formation; Plastic Clay Formation.

PARISIAN BASIN.	LONDON AND IS, WIGHT BASIN.	NICE, PIGN. FRANCE B.	S. E. OF FRANCE BASIN.	DANISH, N. GERMANY, AND RUSSIAN BASIN.	RHINE BASIN.	SWISS AND BAVARIAN BASINS.	AUSTRIAN MORAVIAN, HUNGAR. & TRANSYLV. BASINS.	ITALIAN & SICILIAN BASINS.

* * * Few agates; great deposit of zeolites; opal, haüyne; uppermost limit of arragonite; undermost limit of nepheline and leucite.

II. FIRST TERTIARY LIMESTONE, OR TERTIARY COARSE LIMESTONE FORMATION.

Best marked shelly limestone.

Pseudo-volcanic Rocks.—Porcellanite, Earthy Slag, Tripoli.

PARISIAN BASIN.	LONDON AND NICE, PERPIGNAN, S. W. OF FRANCE BASIN.	S. E. OF FRANCE BASIN.	DANISH, NORTH GERMAN, AND RUSSIAN BASIN.	RHINE BASIN.	SWISS AND BAVARIAN BASIN.	AUSTRIAN, MORAVIAN, & TRANSYLVANIAN BASIN.	ITALIAN AND SICILIAN BASINS.
Chloritic coarse limest. shelly.	Compact limest. Bourdeaux, with shelly.	Compact limest. Bourdeaux, with shelly.	Chloritic limest. Leing, Cassel.	Sandy limest. fresh with salt water shells, syn. limest.	A kind of shelly coarse limest. Lichtensteig, and perhaps the shelly molasse of St. Gallen, &c.	Blue clay (syn. Teged). shelly. In the upper part melange opside.	Blue clay. shelly, Basano, Genoa, and Subappennines.
Coarse sandy limest. stone.	Legnan, iron, Nice, Dax.	Common coarse limest. Dep. Bouches du Rhone, Perpignan	Coarse limest. Gallia, rare occurrence.	Coarse limest. stone, Frankfurt, Turkheim.		Fragments of lignite, especially in Austria, Slavonia, &c.	Basaltic rocks, coulees, Vicen-tin, Sicily.
Coarse limest. Floute of lime.	Limestone with fresh water shells, or with fresh and salt water shells in the superior sandy part, Dax, Saucats.		It exists in some of the Danish islands, in Scandinavia, and in Mecklenburg.				Basaltic beds or conglomerate, tin.
Clay with lignite and fresh salt water shells, Sandstone, with shells, } Montrouge.							Basaltic beds or conglomerate, tin.
Marls and marly limest. Undermost limit of floor.						Not present in Transylvania.	Trachytic conglomerate, Pumice conglomerate, Hungary.

Connected by alternations with the siliceous limestone.

III. First Local Fresh-water, or Brackish-water Deposit.

Sometimes Bones of great terrestrial Mammalia or extinct species.

N. B. Uppermost limit of Sulphate of Barytes and Strontian.

PARISIAN BASIN.	LONDON AND ISLE WIGHT B.	NICE, PERPIGNAN, S. W. OF FRANCE BASIN.	S. E. OF FRANCE BASIN.	RHINE BASIN.	AUSTRIAN, MORAVIAN, HUNG. & TRANS. B.	PUY EN VELAY AND CLERMONT BASINS.
Siliceous limest. Marls.	Compact limest. sometimes concretionary, always without shells.	Compact limest. Marls.	Compact limest. stone.	Limestone. Marls, with fresh water shells, and bones, Buxweiler.	Marls and sand, with marine and fresh Marls.	Conglomerate.
Gypsum. Menilite, &c.	with fresh water shells and bones, Agen.	Gypsum, with bones, Aix.	Gypsum, with bones, Aix.		water shells, Melanopsid, Vienna; Arapatak, Transylvania; Gaya, Moravia.	Gypsum. Bitumen.
calcareous with bones.	Buhrstone, Damazan.	Magnesite, Dep. du Gard.		Perhaps belonging to first tertiary sandstone.		

Connected by alternations with the following formation.

Basalt, { in coulees, Can-tal, Auvergne.
ne. } in beds, Auvergne.
Basaltic { as short beds and conglom-merate, imbedded masses, Auvergne, Aurillac.

CLASS IV.—TERTIARY ROCKS,—*Continued.*

STRATIFIED OR NEPTUNIAN ROCKS.

IV. SECOND TERTIARY ARENACEOUS AND CALCAREOUS FORMATION.

Sometimes Marine Fossils.

PARISIAN BASIN.	LONDON AND WIGHT BASIN.	L.	NICE, PERPIGNAN, S. W. FRANCE B.	S. E. OF FRANCE, BASIN.	DANISH, N. GER. MANY & RUSS. B.	SWISS AND BAVARIAN BASIN.	AUSTR. MORAV. HUNG. TRA. BAS.	ITALIAN AND SICILIAN BASIN.

iron-hydrate nodules.			Sand, Landes.			Nagelfluh.	with shells, Pest, Vienna, Hatzeck Valley in Transylvania.	
			Lenzinite, St. Severe.					
			Iron-hydrate nodules.					

Uppermost limit of the Oxide of Manganese.

V. *Last Fresh-water Deposit.*

Local Fresh-water deposits, formed by springs or basins of fresh-water at very different periods of time.

PARISIAN BASIN.	LONDON AND WIGHT BASIN.	L.	NICE, PERPIGNAN, S. W. FRANCE B.	S. E. OF FRANCE, BASIN.	SWISS AND BAVARIAN BASIN.	AUSTR. MORAV. HUNG. & TRANS. BAS.	ITALIAN AND SICILIAN BASIN.
Meulière or Buhr-lime-stone.	Marls, Lime-stone, } Isle of Wight.		Marls with selenite.	Marls.	Marls, Heidenheim.	Marly limestone, Offen.	Limestone, in many places.
Marls.			shelly, Ostrea, Aguilleon.	Sand and sandstone.	Rolled masses and stones.	S. O. Switzerland.	Sand.
Limestone.			Sand, Landes.	with shells, Dep. Bouches du Rhone.	Iron-hydrate nodules.	Rolled masses.	Sandy limestone.
			Lenzinite, St. Severe.			Nagelfluh.	with shells, Pest, Vienna, Hatzeck Valley in Transylvania.
			Iron-hydrate nodules.				

N. B. Tertiary rocks exist in the steppes of Asia, in India, in Africa, in the Canaries, Island of Madeira, and the West Indian Islands (Guadaloupe, Barbadoes, &c.), in Columbia, and in the Atlantic United States.

CLASS V.—ALLUVIAL ROCKS.

OLD ALLUVIAL FORMATION.

Lake or fluviatile marls, resulting from ancient lakes, or the greater height of existing rivers.
Old alluvium of rivers, consisting of rolled stones, sand, &c.

Sandy and marly shelly marine deposit. Local deposits above the sea level.

Shelly marls, in Scandinavia;—shelly sand, near Nice;—shelly marl, with oysters, near La Rochelle;—sand and marl, with shells and bones of cetacea, in Scotland, &c.

Old alluvium of sea,—consisting of rolled stones, sand, and decayed vegetables, &c.

NEW ALLUVIAL FORMATION.

New alluvium of rivers,—consisting of rolled stones, sand, clay, &c.

New alluvium of sea,—consisting of rolled stones, sand, clay, &c.

Local deposits, produced by the sinking down of rocky masses.

Deposits from water,—pisolithes, sulphur (Baden, Austria), bog iron-ore, calcareous tuff of Baden (calcaire d'eau douce of Prevost), of the natron lakes of Hungary and Transylvania, &c., calcareous tuff with rhinoceros bones, &c., in Germany.

Peat-bogs,—phosphate of iron.

EXTINCT AND BURNING VOLCANOES.

Modern } stoney, Lavas, } vitreous,	<div> <div> <div>augitic,</div> <div>basaltic</div> </div> <div> <div>coulées&veins,</div> <div>lava,</div> </div> <div> <div>feldspathic,</div> <div>obsidian,</div> <div>pumice,</div> </div> </div>	
Meionite, wollastonite, melinite, &c.		
Modern } volcanic conglomerate,	<div> <div> <div>augitic,</div> <div>basaltic tufa,</div> </div> <div> <div>feldspathic,</div> <div>pumice tufa,</div> </div> </div>	
Lapilli and ashes,	<div> <div> <div>augitic,</div> <div>titaniferous</div> </div> <div> <div>iron,</div> <div>feldspathic,</div> </div> </div>	<div> <div>or</div> <div>local deposit</div> <div>short beds.</div> </div>

The various substances produced by sublimation in the volcanoes burning at the open air, and in those burning under water. (The effects of both kinds of volcanoes must not be quite the same).

The various substances produced by the solfatras on the continent (Buodeshegy in Transylvania), and by those under the sea (Island of St. Michael).

IV. After taking a view of the structure and arrangement of the crust of the earth, it is almost impossible to avoid forming some *theory* to explain the mode by which it was brought to its present habitable condition. Almost every appearance it presents informs us that it has undergone mighty revolutions: the regularly formed horizontal strata of some formations are similar to the arrangements of those mechanical deposits from water which at present come under our observation; and the crystalline structure of others forces us to infer a liquidity, by which only, according to the present laws of nature, that structure could be produced. The globular form of the earth is a sufficient proof that it was once liquid, because the liquid condition only could have allowed it to assume such a shape. The occurrence of petrified sea-shells, and of the petrified remains of fishes on high mountains, is also a certain evidence that the waters must at one time have risen beyond their present level, and that these eminences were of posterior formation to the animals whose exuvie they enclose. When petrified bones and horns of land animals are found in fossils, the same inference may legitimately be made. The immense quantities of mineral coal found in the bowels of the earth, and the connexion that may be traced between it and moss, or the remains of plants decaying under our observation, carry us back to a luxuriant vegetation before the period when our present soil was formed, or perhaps before the crust was arranged that supports it.

It is needless to multiply examples where general appearances are so striking, or to engage in abstruse reasoning where inferences are so easily drawn. Indeed, without any induction of facts, but what a very superficial experience affords, every one almost is compelled, from existing phenomena, to form some hypothesis; and that hypothesis will be more or less rational, according as it is suggested by a greater or smaller number of observations, and explains consistently a greater or smaller number of facts. There can be no presumption in tracing the laws of Nature through her most magnificent operations, any more than through her most minute, provided we strictly adhere to the course she points out, and do not twist her language to support our own preconceived notions. The power of gravitation, by which a stone is brought to the earth, retains the planets in their orbits; and the principle of electricity which, when excited in a piece of glass or of wax, only enables it to attract a pith-ball or the fibres of a feather, produces, when collected in the sky, all the terrifying effects of a thunder-storm. There surely can be no good reason why we should not investigate the circumstances in these two classes of facts, and why, after due investigation, we should not refer them to the same law, though the scale on which we trace its operations be so extremely different. In the same manner, no prejudice should exist against the theories of the geologist, though he should apply those mechanical and chemical principles, which he can trace in the formation of a minute crystal or a stalactite, or in the arrangement of the bottom of a river, to account for the present appearances of the habitable world.

How far this class of philosophers have adhered to well ascertained principles, in their geological investigations and reasoning, is a different question. All that we mean to claim for them is, that there is no natural presumption against a theory; that their object is legitimate when they endeavour to form one; and that there are not wanting appearances which may render one plausible. Of late years two principal theories have been proposed to account for geological phenomena, which have attracted such interest as to cause a complete oblivion of every previous hypothesis. Though diametrically opposite in many of their principles, each has men of science and ability for its supporters, and each explains a certain class of facts to the satisfaction of its friends. The one which ranges the greatest number of mineralogists and chemists among its adherents, is called, as we have already stated, the Neptunian or Wernerian, from Werner the great mineralogist of Freyberg, who gave it first the form of a theory founded on observation. The other is denominated the Plutonic system, from its employing the agency of subterranean fire, in accounting for actual appearances, or Huttonian, from the name of the late Dr. Hutton, who gave that particular modification of it which is now considered the most consistent and philosophical; and which Mr. Playfair and Sir James Hall have so ably advocated and illustrated. Both these systems, it will easily be perceived, agree in assuming a state of fluidity as necessary to explain the texture of particular fossils, and the general structure of the mineral kingdom; but they start in direct opposition with regard to its cause, and of course give a different account of every subsequent event, the Wernerian attributing that fluidity to solution in water, the Huttonian to igneous fusion. The products of a mass held fluid, by one of those agents, is in many cases so different from those which would be formed by the other, that the geologist need not despair of being ultimately able to discriminate between them, and to determine what kind of agency has principally been employed. In the mean time we shall state the opinion entertained of the manner in which each is supposed to have operated, by those who make use of it in their respective systems.

The Wernerian supposes that the surface of our globe presented at first a chaotic mass, in which the materials that compose its solid strata were held in solution by water. In that mixed and confused state, certain changes in the relative situation of the principles took place by motions among them, and the particles were thus placed in a condition favorable for the exertion of chemical affinities. The operation of these chemical attractions was to bring the materials on which they acted into the crystalline shape, which would be more or less perfect in proportion to the freedom in which they were formed, or the interruptions to which in their formation they were subject. An aggregated mass of crystals was thus formed, consolidated and precipitated in the same manner as at present the crystals of salts are deposited from their solution in water. This first precipitation from the chaotic fluid constituted the rocks of the primitive class, so called from this inferred priority

of formation. In support of the conclusion on which this name is grounded, the nature and position of these rocks are appealed to. They are evidently in a highly crystalline condition, and they are found nearer the centre of the earth than any other strata of the mineral kingdom. From the nature of the mass before this primitive subsidence, neither animals nor vegetables could exist; at least there have been found in these rocks none of their remains. After these precipitates were separated that compose the primitive class, a nucleus was formed on which subsequent depositions might rest; and the waters; from a cause which it may be difficult to explain, seem to have subsided and left a part of the solid aggregate nearly dry. There is nothing in this theory, however, which requires us to pronounce upon the question of the time which it might take for these crystallisations and subsidences to take place: or how rapidly or slowly (as we should term it) they might be effected by the Divine Power.

Still in the fluid the materials of the other strata existed, and these, from similar attractions, had their tendencies to precipitation and arrangement. Precipitates, accordingly, were formed, and arranged on the solid mass already existing. These, however, are found to differ considerably from the primitive class, in having a less perfect crystalline structure, and in containing mixtures like mechanical depositions. From these circumstances they are classified apart under the name of the transition series, and their formation is accounted for by supposing, that, as the chaotic fluid was now diminished in depth, its waves would descend still lower, and come into more immediate contact with that part of the earth's crust already consolidated, and by their agitation, might detach portions of it to mix with the materials still in solution, but gradually depositing; and thus might disturb their formation. In addition to this constant wearing action of the waves, those parts that were gradually elevated above the subsiding waters would be exposed to other causes of attraction from the elements.

The waters continued to subside, and new strata began to make their appearance, forming rocks of the secondary class; but as the action of the elements now extended over a greater surface, and the force of the chaotic waves increased, we find greater supplies of mechanical deposits. These rocks, therefore, having been partly composed of the debris, or disintegrated fragments of the two former classes, have less of the crystalline structure, and are arranged more generally in parallel layers, somewhat like successive mechanical deposits from a fluid. They occupy a lower level than the mountain masses, from the detrition of which they appear partly to have been formed, and rest upon the more crystallised strata as their basis. They often exhibit striking characters of their origin and mode of formation, as may be seen in some kinds of sandstone, puddingstone, and breccia.

When the waters had retired so much as to permit the formation of this class of rocks, and had ceased to cover them, the crust of the earth was prepared for supporting animal and vegetable life, and received from the hand of nature families of both in abundance. Accordingly, we find

that organic remains, no vestige of which can be found in rocks of the primitive class, and which can be but sparingly discovered in the transition series, increase in quantity and variety as we ascend from the old red sandstone, the earliest of the secondary strata.

The earth, however, if now arranged in the form which it at present assumes, was destined to undergo a mighty catastrophe. The waters which had subsided and left the dry land for the support of animals and vegetables, from inscrutable causes, again rose, resumed their former bed, and a second time a chaotic fluid invested the crust of the earth. This fluid must have ascended and almost covered the highest mountains, and in the words of Thomson,

'A shoreless ocean tumbled round the globe.'

This rise of the waters, Werner finds necessary to account for the position and structure of the secondary trap formations, so strangely alternating with or overlying the other secondary strata. This kind of formation he supposes must once have surrounded the earth, and formed almost a continuous crust, enclosing within it the other strata; but, by the sudden recession of the waters, that crust was broken, and, the greatest portion of it being carried away, there were only left those 'shreds and patches' of it that appear in the shape of detached mountains, columnar eminences, or confused masses of tufa. To the same period may be referred the origin of the coal formation; and to the same causes are its arrangements to be attributed. It is evidently and confessedly a substance of vegetable product, and presupposes the existence of a most luxuriant vegetation, before the organic kingdoms were involved in destruction by waters of the ocean.

After this great catastrophe, the waters again retired from off the face of the earth, and left the dry land for the plants and animals which now cover its surface. As they subsided, the exposed parts were acted upon by the influence of the ocean and the elements. Fragments were broken off from the solid rock, the softer portions were separated from those more indurated, successive layers of the surface were rendered friable and worn away. The debris thus formed was washed from the higher to the less elevated ground, from mountainous country and precipitous eminences, to plains and valleys; and being accumulated on the lower levels, and mixed with decayed animal and vegetable substances, composes the different species of alluvial rocks, and all the varieties of fertile soil.

The only other portion of the crust of the earth for which it would be necessary to account, and for which the theory under consideration can afford no explanation on its peculiar principle, are those formed of the products of volcanic fire. This class of rocks is so inconceivable when compared with the extent of the stratified masses, and apparently so unconnected with them, that any explanation that may be adopted concerning it will not much affect a geological hypothesis, calculated to apply to the state of the more universal formations. The foregoing is the general outline of the Wernerian system, but there is an observation or two still necessary to complete it.

The formation of the beds or strata, by a successive deposition from water, would lead us to expect that the separate layers should be disposed horizontally, or that they should, in their whole extent, be arranged at right angles to the force of gravity; that they should be continuous or without fissures; and that they should have no elevations or depressions. The reverse of this, however, is the fact. Instead of universal horizontality, we frequently find them almost in a vertical position; instead of a continuous surface, like the coats of an onion, we see wide irregular rents and fissures; and, instead of a uniformly level appearance, we find mountains and alpine chains shooting up many thousand feet above their surrounding regions. In a system that lays claim to consistency, some explanation must be provided for reconciling these apparent anomalies with its general principles, and many suppositions may obviously be resorted to. The greatest inequalities of the earth's surface must have originated in the manner in which the primitive strata assumed the crystalline appearance, and the circumstances under which chemical affinities acted upon the materials of the chaotic fluid. The irregularities of the subsequent depositions may be partly owing to the kind of surface or bed on which they were arranged, and partly to an unequal subsidence in the contiguous parts deposited at the same time. Many rents, fissures, and dislocations, must have originated in the different degrees of solidity in the contiguous strata, in the unequal weight which crystallisation imposed upon them, in the withdrawing of the water sooner or later from different portions, and in several other causes, which it is unnecessary, in this short sketch, to enumerate. Many of these rents and fissures were made while the strata were still immersed in the waters, and, being filled up with precipitates of a more crystalline kind, constitute what are demineralised veins, those repositories of mineral wealth. The structure of veins, narrowing in diameter as we descend, and the more regular disposition of their contents, according to laws of chemical attraction, are offered as decided proofs, both of their being filled by infiltration from above, and of their consolidation taking place in circumstances where the mass suffered no disturbance.

After this statement of the Wernerian theory, it might be proper to adduce some of the arguments that tend to confirm it, and some of the objections to which it has been thought liable; but both these will be more duly appreciated, after we have drawn a similar outline of the rival system to which it is opposed.

Dr. Hutton does not go back to chaos to lay the foundation of his habitable world, nor does he borrow much assistance in constructing his fabric from chemical attractions. He rests upon a pre-existing continent, out of the ruins of which our present dry land was formed and arranged principally by mechanical means. The portion of the globe which we now possess was, according to his hypothesis, the bottom of the sea when the older continent was decaying to form it; this older continent was then, of course, immersed; and, lest we should be alarmed at the recurrence of a similar catastrophe to this scene of our inter-

rests, we are told that it will be followed by a similar renovation. Thus, as one continent descends another rises, like the opposite scales of a balance; and, in the resources of the system, that order of organic nature is supposed to be traced by which the continued existence of the different races is secured, not by the perpetuity of the individual, but by the successive re-production of the kind. Our present world is thus one in an indefinite series of worlds which have existed in times past, and which are destined in future to appear; and all the less obvious or more striking changes which we witness are steps in the progress of mighty revolutions, to which the imagination can set no limits, either with regard to duration or magnitude.

He lays down as a certain position, that the solid parts of our earth are suffering decay from the action of the elements; that the portions detached from the more elevated ground are carried by the operation of water to the lower levels, and ultimately deposited in the basin of the ocean. He conceives, that tides and currents there arrange what is carried within their influence in layers along the bottom of the sea. This operation must proceed very slowly, but Dr. Hutton is not limited with respect to time, and can make as large a use of it as his system demands. Every river, every brook, every stream of water that we see, descends towards the ocean, charged with some portions of the surface over which it flows. All the soil and softer parts on which our plants are produced, have been confessedly loosened by water, and may be ultimately transported by it to the lowest levels of the same element. The strata of our dry land have all been thus carried from a pre-existing one, and arranged by the ocean which then covered it.

For their consolidation and other appearances, a new principle is assumed by the Huttonian geologists, which forms the chief characteristic of their system. They conceive that there perpetually exists in the heart of the mineral kingdom an immense force of heat that has been sufficient to fuse or to soften the various strata of which its crust is composed. The greater or less degree of liquidity which it thus produced, allowed the substances on which it acted to be consolidated upon cooling, either into crystalline fossils, or into less regular masses. The strata that were arranged at the bottom of the ocean, from the debris of a former world, were thus brought from their soft state of simple mechanical aggregation, to assume the compact structure of mountain rocks. To this powerful agent of internal heat, is not only assigned the office of first softening and finally indurating the strata, but that likewise of elevating them from the bottom of the sea, and converting them into dry land. The strata at the bottom of the ocean, being arranged by water, must, it is conceived, have been arranged in a horizontal direction, though now their appearance is extremely different. Their present fragmented and shattered surface, their deep chasms, their apparently ruinous contortions and dislocations, the vertical position of some of them, and the considerable declination of almost all, are also accounted for by the operation of internal fire.

The volatile ingredients of many bodies are

easily dissipated by caloric, and some compounds are discovered in the mineral kingdom, which must have been exposed, upon this hypothesis, to such an intensity of heat as would have effected a dissolution among their parts. To obviate objections of this kind, the modification of the effects of heat from the pressure under which it acts, is illustrated and applied with great ingenuity. This modification of heat, by pressure, is a very important fact to the Plutonian theory.

With regard to the order of time, or the succession in which the different rocks were formed that compose the crust of our earth, the Huttonian differs as much from the Wernerian as in the agent he principally employs. It will be remembered that Werner calls granite the earliest of the primitive rocks, from the supposition that it was separated from the chaos by crystalline precipitation, prior to the existence of any other mineral. Dr. Hutton, on the contrary, in his chronology of the fossil kingdom, places granite among its last formed products, and brings forward its appearance as a triumphant proof of the truth of his system. He conceives it in a state of fusion to have burst the superior strata with which it was enveloped, aided by the expansive power of his central fire, and to have issued forth from its confined furnace somewhat in the manner of a stream of lava from a volcano. The greatest heights of our globe, and the most extensive mountain ranges, are thus nothing else but the consolidated torrents of mighty eruptions, the matter of which had been rendered liquid by a subterranean fire, which still exists for the future accomplishment of similar effects, and gives proofs of present activity in the phenomena of the volcano. To its complete fusion is ascribed its perfect crystalline texture, its want of stratification, and its perfect freedom from organic remains.

A similar account is given by this system of the formation of veins, and of the fossils which generally fill them. They are rents caused by a force acting from beneath, and filled with matters injected into them from the same quarter in a state of fusion. Their contents are thus different from the materials of the strata which they traverse, and almost always present a highly crystalline structure.

Such is the outline of the Huttonian theory of the earth, as far as regards the manner in which its crust was stratified in the bottom of the ocean, consolidated into a compact mass, elevated into islands and continents, separated into distinct portions by veins and beds, and deranged in its horizontal appearances by an eruptive force. It is needless to mention the account which the supporters of this geological system give of volcanoes. They accord with their opinions, or perhaps suggested them; and the Wernerian leaves them in full possession of such ground without reluctance, satisfied that the central heat, which raised continents, is not necessary to explain their phenomena.

After giving a very imperfect account of these two theories, it may be necessary to say a few words with regard to their merits, the consistency of their parts, and their agreement with the phenomena which they profess to explain.

The Huttonian geologist commences with the

history of the formation of the strata, as in his system the strata were deposited and arranged prior to the operation of fire upon them, and prior likewise to the existence of the more crystallised masses formed by fusion. With the mode of forming the stratified structure he therefore begins his system; and here likewise begin the objections to which it has been thought liable.

He supposes that the materials of all the strata are the debris of a pre-existing world; that they have been detached from it by the operation of the elements; carried, by the agency of water, to the ocean; and there spread in regular order over its bottom by the same power. Thus all the rocks that exhibit the stratified structure, are nothing but mechanical deposits, and rivers have been the great agents in conveying them to their present situation. Now it cannot fail to strike every one, that effects are here attributed to those streams that mark the surface of our globe, which they seem inadequate to produce. It is true that most rivers flow towards the ocean, charged with a part of the soil or softer rock which border their channels; but it is not so true that they carry this burden to their ultimate destination. A great part of it is deposited on their banks, or in the hollows of their courses, and much of what reaches the sea goes to form bars, or, being driven back to the shore, makes an addition to the sea-coast. It is evident that a small portion only can reach the ocean, and 'if the disintegration be so slow as is admitted,' observes Mr. Murray; 'if, as Dr. Hutton himself observes, the description which Polybius has given of the Pontus Euxinus, with the two opposite Bosphori, the Maëotis, the Propontis, and the port of Byzantium, is as applicable to the present state of things as it was at the writing of that history; if the Isthmus of Corinth is apparently the same at present as it was 2000 or 3000 years ago; if Scylla and Charybdis remain now as they were in ancient times, rocks hazardous for coasting vessels; if the port of Syracuse, with the island which forms the greater and less, and the fountain of Arethusa, the water of which the ancients divided from the sea with a wall, do not seem to be altered; and if, on the coast of Egypt, we find the rock on which was formerly built the famous tower of Pharos; and, at the eastern extremity of the port Eunoste, the sea-bath cut in the solid rock on the shore, to all appearance the same at this day as they were in ancient times: if such be the extreme slowness of the disintegration, the reflection is obvious, that, admitting it, a duration will be allowed to the world infinitely beyond our conception, and adequate to any purpose which we can conceive it designed to serve; and there is at least no necessity pointed out for supposing an arrangement by which it is to be perpetuated or restored.'

'Neither are the facts conclusive which are stated by Dr. Hutton and Mr. Playfair, to prove that all our strata have originated from the waste of a former world, for they are equally well accounted for by the Wernerian system. It is stated, that many rocks are found which contain fragments of others, or which are connected with collections of gravel loose or consolidated. Such fragments and gravel necessarily suppose the existence of former strata, from the waste of which

they had originated. It is also observed, that, in many of the most extensive strata of the earth, remains or impressions of organic substances are found, both animal and vegetable, and of course these must have existed prior to the formation of such strata.

‘These facts are considered by the Huttonian geologist as sufficient proof of the existence of a habitable world, from the decay of which ours has been formed. They are, however, equally well accounted for by the Neptunist, without admitting such a supposition. It is supposed that the existence of marine animals commenced after the crystallisation of the great primary strata; and that after that period, too, the waters of the ocean began to diminish in height, so as to leave elevated land, on which vegetation commenced. The retreat of the ocean continued to be gradual for many ages, and during this time the secondary strata were formed. It is obvious, therefore, that the fragments of rock, the sand and gravel which these often contain, or with which they are associated, or which even in many cases compose the greatest part of their mass, might originate from the disintegration of the primary strata above the level of the sea; a disintegration to which, in this early period of their consolidation, they might even be more liable than they are now. And the origin of the remains of marine animals, and even of vegetables, found in the secondary rocks, it is obvious, are equally well accounted for on this theory, since the existence of these may have begun previous to the existence of these strata. The facts, therefore, do not prove the hypothesis of Dr. Hutton, since, on a different hypothesis, they are explained with equal facility.

‘It has been affirmed, however, that the same appearances of sand and gravel, and of marine impressions, are occasionally to be met with in the primitive strata, and that of course the Wernerian explanation is defective; for marine animals are not supposed to have existed at their formation; and it is obvious that the presence of sand and gravel are true indications of strata having existed before them.

‘But it is asserted, on the other hand, by Neptunian geologists, that such appearances are not to be met with in strata truly primitive; but that when they do occur in strata, not of the secondary class, it is in those of the intermediate kind, or what Werner terms the rocks of transition. These, it will be recollected, are supposed to be posterior in their formation to the primary, but prior to their secondary strata, and to have been formed at that period when the existence of marine animals, or at least of some species of them, had commenced; and of course they may occasionally be found with impressions or remains of these beings. This supposition is liable to no difficulties, and seems to follow justly from the facts. Since certain rocks, having peculiar characters, and composing the most elevated parts of the globe, are found destitute of organic remains, while in others they are in abundance, doth not this afford a presumption, that the former had been produced prior to the period when these beings began to exist? and if rocks are found intermediate in their character between

these, connected principally with the primary, but in general less elevated, and sometimes, though rarely, containing vestiges of sea animals, is it not reasonable to believe that these have been intermediate in their formation, and that at least the few species of those animals, whose remains are found in them, had begun to exist at the time they were formed.’

The Huttonian theory gives a solution of these phenomena, according to its own peculiar principles, which is pressed with greater difficulties than any which its adherents have been able to raise against its rival system. As all strata, according to it, are arrangements from the wrecks of a former world, they ought all to have their proportion of animal remains and fragmented fossils assigned them. No reason can be given for their existence in one situation which would not lead us likewise to expect their occurrence in another. Gneiss, mica-slate, and clay-slate are stratified rocks, and should have these proofs of their prior history inscribed upon them as legibly as slate-clay, sandstone, and the calcareous fossils. In the former class, however, they are seldom or never found; in the latter they are met with in abundance. The Huttonians endeavour to remove this inconsistency, by answering, that the gneiss and mica-slate are in a higher degree of crystallisation than the other kinds of rock in which petrifications occur, and that, in the fusion which enabled them to assume that state, the traces of animal exuviae may have been destroyed. This statement would obviate the objection, if it accorded with the fact; but unfortunately it has not that recommendation. We need only refer to that species of marble in which organic remains occur in abundance, to show that a higher perfection of the crystalline structure than is by this hypothesis consistent with their appearance in gneiss, actually admits of their existence in the carbonate of lime. Without allowing, with the Wernerian, a priority in the arrangement of these different kinds of rocks how shall we account for such phenomena? and by allowing such successive formations, how easily are they explained! Nor does the Huttonian theory labor with greater success, to reconcile the occurrence of fragments in some peculiar situations with its general principle of stratification. There frequently occurs between the strata, or what Werner calls the primitive and fletz formations, a bed of conglomerated fragments of rolled pieces. This appearance, for instance, occurs placed upon a basis of clay-slate, and covered with a stratum of sandstone, and is easily accounted for on the Wernerian doctrine of the prior existence of granite, from the rocks of which such debris might be detached as formed these beds, while the waters of the chaos still covered the gneiss and the somewhat lower levels of the globe. Let us hear the Huttonian explanation of this fact, as detailed by Mr. Murray.

‘The explanation, according to the Huttonian hypothesis, involves a supposition so extraordinary as to furnish a singular contrast with that of the Neptunian. It is supposed that the schistus had been formed in beds nearly horizontal, and that, by an expansive power exerted from beneath, these had been elevated to the surface, and

placed in a vertical position. In this situation, the bed of gravel, from which the breccia is formed, had been deposited on the summit of the vertical schistus. To admit of the formation of the horizontal strata of sandstone, it is further supposed, that the schistus, with this superincumbent breccia, had again sunk in the ocean, and remained depressed for ages, till the materials of the sandstone were deposited on it. These materials are supposed to have been then consolidated by the central fire operating on them, even with the intervention of the deep strata of schistus on which they are incumbent; and, lastly, we are told that the whole, when thus prepared, were again elevated by a new exertion of heat. It may surely be affirmed, without farther reasoning, that suppositions so extravagant and improbable can never be real interpretations of the operations of nature.'

The second class of operations in the order of succession, according to the Huttonian theory, is the process of consolidating, deranging, and elevating the earth's crust, formed, as above described, at the bottom of the sea; and the second great principle it assumes is the agency of internal heat for accomplishing these purposes. By employing this agent, and assigning it so important functions, the Huttonians have exposed their system to objections evident to those least acquainted with geological speculations, and which the most able Huttonian cannot satisfactorily obviate. The first thing that strikes us as a difficulty, in the conception of this theory, is the immense volume and intense force of that heat which could melt or sotten masses so gigantic in their bulk, and so infusible in their nature, as those that compose the habitable world.

This, however, is an objection founded rather upon a comparison of the great operations of nature, with the limited scale on which we conduct our own, than upon any natural inconsistency in the theory against which it was alleged.

There are objections to the principle of the Huttonian theory of a different kind, and not so easily answered. What is the nature and source of this central heat? and what are the laws by which it is regulated? These are questions, in the answers to which the supporters of the Plutonic system are certain to involve themselves in difficulties, if not in contradictions. Does this heat arise from combustion? No; for combustion requires conditions for its existence which are not to be found in the circumstances under which this central heat is supposed to act. Where could such a quantity of combustible matter be found, as could fuse and eject those mighty chains of mountains which extend so far and rise so high? If combustible substances should be found in the magazines of nature, whence could come that gas which is necessary for this operation? The circumstances of compression under which the central heat is supposed to act, and the consequent exclusion from oxygen or atmospheric air, are sufficient to destroy every idea of combustion.

But even though we should admit the possibility of ordinary burning, in the instance before us, are the stores, both of the combustible materials and the supporters of combustion, inex-

haustible? and will there always be sufficient quantities of them available for the purposes of making worlds when the old are worn out? or, in other words, for answering the ends of the theory in the renovation of nature? We all know that a substance which has undergone combustion, forms products which are not capable of undergoing a second time the same process.

It should be observed, however, that the ablest adherents of the Huttonian hypothesis have entirely renounced the use of fuel in the production of the central heat, and have resorted to other means of exciting and supporting it. Most of them also have given up the solar rays, friction, and condensation: indeed the supposition on which Mr. Playfair, the ablest supporter of the system, finally rests, seems little else than the old doctrine of occult qualities. If his hypothesis has any meaning, it implies, that an immense heat was originally stored in the lower parts of the earth, and that it is there preserved by the mutual action and reaction of the bodies in which it resides upon each other.

But its preservation in the same volume and intensity, without any fresh supply, is contrary to all the laws by which the action of heat is regulated. The only condition on which the hypothesis of its accumulation would be conceivable, would be a state in the bodies that contained it, so completely insulated that they could diffuse no more of it than what they received; or, in other words, a state in which no new distribution could take place, because the most perfect equilibrium of temperature was established among all the bodies which could, by their vicinity, partake of it, either by radiation or through the medium of conducting substances. Now it will not surely be pretended that there is, in the bowels of the earth, any region so insulated. Indeed the simple idea, that the central fire has softened the strata which were formerly cold mechanical deposits, presupposes a new distribution of its influence, with a consequent decrease of intensity in its original repository; and thus the very purpose for which its operation is assumed cannot be accomplished, without destroying the necessary conditions of its existence.

The other phenomena exhibited by veins, beds, and individual fossils, are more hostile to the hypothesis that employs fire in producing them, than even those which we have stated. But we cannot at present enter farther into the subject. We need only add that Dr. Boué seems to have adopted from the Huttonian theory some valuable suggestions, and that the commendation of M. Necker, with respect to the habits of Saussure as a geologist, seems well worthy the attention of all students of this science.

'In proportion to the avidity with which he sought for facts, was the care with which he avoided vain speculations. If he sometimes advances a hypothesis, it is with a reserve justly admired, although rarely imitated, and only when the facts seem imperiously to command it. When new facts come in opposition to his former opinions, he abandons or modifies them without regret.'

arts, and sciences, to the sweet content and capacity
of the reader! In arithmetick, *geometry*, perspective,
opticks, astronomy, architecture, sculpturâ, picturâ, of
which so many and such elaborate treatises are of late
written. *Barton. Anat. Mel.*

He that shall but see that *geometrical* tower of Ga-
reganda at Bologna in Italy, the steeple and the clock
at Strasburgh, will admire the effects of art, or that
engine of Archimedes to remove the earth itself, if he
had but a place to fasten his instrument. *Id.*

'Tis possible *geometrically* to contrive such an arti-
ficial motion as shall be of greater swiftness than the
revolutions of the heavens. *Wilkin's Math.*

For he by *geometrick* scale
Could take the size of pots of ale. *Hudibras.*

Although there be a certain truth, *geometricians*
would not receive satisfaction without demonstration
thereof. *Broune.*

Must men take the measure of God just by the
same *geometrical* proportions that he did that gathered
the height and bigness of Hercules by his foot?
Stillington.

Him also for my censor I disdain,
Who thinks all science, as all virtue, vain;
Who counts *geometry* and numbers toys,
And with his foot the sacred dust destroys.

Dryden.

All the bones, muscles, and vessels of the body are
contrived most *geometrically*, according to the strictest
rules of mechanicks. *Ray.*

Does not this wise philosopher assert,
That the vast orb, which casts so fair his beams,
Is such, or not much bigger than he seems?
That the dimensions of his glorious face
Two *geometrick* feet do scarce surpass? *Blackmore.*

He became one of the chief *geometers* of his age.
Watts.

How easily does an expert *geometrician*, with one
glance of his eye, take in a complicated diagram, made
up of many lines and circles! *Id.*

DEFINITIONS OF THE SCIENCE.

GEOMETRY, *Gr. γεωμετρία*, *Fr. geometrie*, ori-
ginally signified the art of measuring the earth,
or any distances or dimensions on or within it;
but it is now used for the science of quantity, ex-
tension, or magnitude, abstractedly considered,
without any regard to matter. Geometry is
usually divided into speculative and practical;
the former of which contemplates and treats of
the properties of continued quantity abstractedly;
and the latter applies these speculations and
theorems to use and practice.

The word *geometry* literally signifies measur-
ing of the earth, as it was the necessity of mea-
suring the land that first gave occasion to study
the principles and rules of this science, which
has since been extended to numberless other
speculations. Some define it the science of en-
quiring, inventing, and demonstrating all the af-
fections of magnitude. Proclus styles it the
knowledge of magnitudes and figures, with their
limitations; as also of their ratios, affections,
positions, and motions of every kind.

In a word, *geometry*, together with arithmetic,
now forms the chief foundation of all the mathe-
matics.

HISTORY OF GEOMETRY.

The invention of *geometry* is generally ascribed
to the Egyptians. Herodotus, Diodorus, Strabo,
and Proclus, all agree that the annual inunda-
tions of the Nile gave rise to it, by carrying away
the land-marks and boundaries of estates and
farms; and covering the surface of the ground
with mud, which effaced every trace of their for-
mer limits. Hence the Egyptians were obliged
every year to distinguish and lay out their lands
by the consideration of their figure and quantity,
that every person might have his own property:
and thus, by repeated experience and practice,
in drawing figures, lines, and schemes, for this
purpose, they gradually formed an art which,
from its origin, in measuring of lands, the Greeks
at last named *γεωμετρία*, *geometry*. By farther
contemplation on the draughts of figures, their

wonderful properties were more and more discovered, and the art continually gained ground and improved, by the discoveries of succeeding mathematicians.

This appears to be the most probable origin of this science; though Josephus seems to ascribe the invention to the Hebrews; while others of the ancients make Mercury the inventor. Polyd. Virg. de Inv. Rer. l. 1, c. 13.

Thales is said to have introduced this science from Egypt into Greece; where it was greatly cultivated and improved by himself, as well as by Pythagoras, Anaxagoras of Clazomenæ, Hippocrates of Chios, and Plato; who testified his conviction of the necessity and importance of geometry to the successful study of philosophy, by inscribing over the door of his academy, Let no one ignorant of geometry enter here. Plato thought the word geometry too mean a name for this science; and substituted instead of it the more extensive name of mensuration; and after him others gave it the title of pantometry. But even these are now become too confined in their import fully to comprehend its extent: for it not only enquires into, and demonstrates, the quantities of magnitudes, but also their qualities, as the species, figures, ratios, positions, transformations, descriptions, divisions, the finding of their centres, diameters, tangents, asymptotes, curvatures, &c.

About fifty years after Plato, Euclid collected together all these theorems, which had been invented by his predecessors in Egypt and Greece, and digested them into fifteen books, entitled the Elements of Geometry: demonstrating and arranging the whole in a very accurate and perfect manner.

The next to Euclid, of those ancient authors whose works are extant, is Apollonius Pergæus, who flourished in the reign of Ptolemy Euergetes, about A. A. C. 230, and 100 years after Euclid. He was author of the first and principal work on Conic Sections; on account of which, and his other accurate and ingenious geometrical works, he acquired from his patron the emphatic appellation of the Great Geometrician.

Contemporary with Apollonius, or perhaps a few years before him, flourished Archimedes, celebrated for his extraordinary mechanical inventions during the siege of Syracuse, and no less so for his many ingenious geometrical compositions. Eudoxus of Chidus, Archytas of Tarentum, Philolaus, Eratosthenes, Aristarchus of Samos, Dmostratus the inventor of the quadratrix, Menechmus his brother and the disciple of Plato, the two Aristauses, Conon, Thraedius, Nicoteles, Leon, Theudius, Hermotimus, Hero, and Nicomedes, the inventor of the conchoid, besides many other ancient geometricians, have contributed to the improvement of geometry.

The Greeks continued their attention to it, even after they were subdued by the Romans; whereas the Romans themselves were so little acquainted with it, even in the most flourishing time of their republic, that Tacitus informs us they gave the name of mathematicians to those who pursued the chimeras of divination and judicial astrology. Nor does it appear they were

disposed to cultivate geometry during the decline, and after the fall of the Roman empire. But the case was different with the Greeks; among whom are found many excellent geometricians since the commencement of the Christian era, and after the translation of the Roman empire. Ptolemy lived under Marcus Aurelius; and we have still extant the works of Pappus of Alexandria, who lived in the time of Theodosius; the commentary of Eutocius, the Ascalonite, who lived about A. D. 540, on Archimedes's mensuration of the circle; and the commentary on Euclid by Proclus, who lived under the empire of Anastasius.

The subsequent inundation of ignorance and barbarism was unfavorable to geometry, as well as to the other sciences; and the few who applied themselves to this science were calumniated as magicians. But, in those times of European darkness, the Arabians were distinguished as the guardians and promoters of science; and from the ninth to the fourteenth century they produced many astronomers, geometricians, geographers, &c.; from whom the mathematical sciences were again received into Spain, Italy and the rest of Europe, somewhat before the year 1400.

Some of the earliest writers, after this period, are Leonardus Pisanus, Lucas Pacciolus or de Bargo, and others between 1400 and 1500. And after this appeared many editions of Euclid, or commentaries upon him: thus Orontius Finaus, in 1520, published a commentary on the first six books; as did James Peletarius in 1556; and about the same time Nicholas Tartaglia published a commentary on the whole fifteen books. There have been also various other editions, or commentaries; but the completest edition of all the works of Euclid is that of Dr. Gregory, printed at Oxford in 1703, in Greek and Latin. The edition of Euclid by Dr. Robert Simpson, of Glasgow, containing the first six books, with the eleventh and twelfth, is much esteemed for its correctness; and Playfair's edition of the first six books, with two additional ones on solids, the intersection of planes, and the quadrature of the circle, is remarkable for the precision and taste which distinguished every thing that came from the pen of that accomplished philosopher.

Besides the different editions of Euclid, we have several other elementary treatises on geometry; the principal of which are those by Emerson, Simpson, Legendre and Leslie. All these are works of considerable merit and usefulness. Emerson's is quite a store-house of properties; Simpson's is distinguished by an elegant tract on geometrical maxima and minima, and by a copious collection of geometrical problems, with their solutions, exceedingly well adapted to improve the dexterity and to form the taste of the young student. Leslie's work contains the best introduction to geometrical analysis that is to be met with in the English language. Legendre's work, which has been recently translated into English, is, in many respects, exceedingly valuable; but there appears little reason to expect that it will supplant, in the English schools, the elements of Euclid, which, after all that has been done on the subject, is, for the purposes of tuition, still unrivalled.

Among those who have gone beyond Euclid, in the application of the elementary principles of geometry, may be named Apollonius, in his Conics, Plane Loci, Determinate Section, Tangencies, &c.; Archimedes, in his Treatises on the Sphere and Cylinder, the Dimensions of the Circle, of Conoids, Spheroids, Spirals, the Quadrature of the Parabola, &c.

Since the application of algebra to the geometry of curve-lines, this science has been greatly extended, and we may number, among those who have contributed to its improvement, almost every name of eminence connected with abstract science. The names of Descartes, Schooten, Leibnitz, Bernouilli, Maclaurin, Cotes, and Waring, are intimately associated with the history of this branch of the science. The most valuable work, however, on the algebraic geometry, is one recently published by Dr. Lardner, of Dublin.

On the subject of practical geometry, the writers may truly be said to be numberless; the chief are Beyer, Kepler, Ramus, Clavius, Mallet, Tacquet, Ozænam, Gregory, and Hulton.

On the whole, the history of geometry may be divided into four grand eras, viz. 1st, From its invention to its introduction into Greece by Thales; 2d, From that period to the time of Euclid; 3d, From Euclid and Archimedes to the application of algebra to the subject by Descartes; and 4th, From Descartes to Newton and to the present time, a period in which the invention of fluxions, and their application to this and other branches of science, has cast all previous discoveries into shade.

This science is usually divided into two parts, theoretical geometry, and practical geometry, the former showing the principles of the science, and the latter their application. For their application, however, to MENSTRUATION, TRIGONOMETRY, and NAVIGATION, we shall refer to the articles under those titles; and give in this article their application in the solution of practical problems in pure geometry.

PART I.

THEORETICAL GEOMETRY; OR GENERAL PRINCIPLES OF THE SCIENCE.

DEFINITIONS.

1. A POINT is that which has position but not magnitude.

2. A LINE is length without breadth or thickness; the extremities of a line are therefore points.

3. A RIGHT LINE, or STRAIGHT LINE, is that which lies evenly between its extreme points. Fig. 1, Plate X.

4. A SUPERFICIES is that which has only length and breadth; the extremities of a superficies are therefore lines, and the intersections of superficies with one another are also lines.

5. A PLANE SUPERFICIES is that in which any two points being taken, the straight line between them lies wholly in that superficies.

6. A PLANE RECTILINEAL ANGLE is the inclination of two straight lines to one another, which meet together, but are not in the same straight line. Fig. 2.

Note. When several angles are formed at the same point, as at B fig. 3, each particular angle is described by three letters, whereof the middle one shows the angular point, and the other two the lines that form the angle, thus C B D or D B C denotes the angle contained by the line C B and D B.

7. When a straight line standing on another straight line makes the adjacent angles equal to one another, each of the angles is called a RIGHT ANGLE, and the straight line which stands on the other is called a PERPENDICULAR. Fig. 4.

8. An OBTUSE ANGLE is that which is greater than a right angle. Fig. 5.

9. An ACUTE ANGLE is that which is less than a right angle. Fig. 6.

10. PARALLEL STRAIGHT LINES are such as are in the same plane, and which being produced ever so far both ways do not meet. Fig. 7.

11. A FIGURE is that which is enclosed by one or more boundaries.

12. RECTILINEAL FIGURES are those which are contained by straight lines.

13. Every plane figure bounded by three straight lines is called a TRIANGLE, of which the three straight lines are called the sides, that side upon which the triangle is conceived to stand is called the base, and the opposite angular point the vertex.

14. An EQUILATERAL TRIANGLE is that which has three equal sides. Fig. 8.

15. An ISOSCELES TRIANGLE is that which has only two equal sides. Fig. 9.

16. A SCALENE TRIANGLE is that which has all its sides unequal. Fig. 11.

17. A RIGHT-ANGLED TRIANGLE is that which has a right angle. Fig. 10.

18. An OBTUSE-ANGLED TRIANGLE is that which has an obtuse angle. Fig. 11.

19. An ACUTE-ANGLED TRIANGLE is that which has all its angles acute. Fig. 12.

20. Every plane figure bounded by four straight lines is called a QUADRILATERAL, and the right line joining the opposite angles is called a DIAGONAL.

21. A PARALLELOGRAM is a quadrilateral of which the opposite sides are parallel. Fig. 13.

22. A RECTANGLE is a parallelogram which has one right angle. Fig. 14.

23. A SQUARE is a rectangle which has all its sides equal. Fig. 15.

24. A RHOMBUS is a parallelogram which has all its sides equal. Fig. 17.

25. A TRAPEZIUM is a quadrilateral which has not its opposite sides parallel. Fig. 18.

26. A TRAPEZOID is a quadrilateral which has two of its opposite sides parallel. Fig. 19.

27. Plane figures bounded by more than four straight lines are called POLYGONS. Fig. 16.

28. A PENTAGON is a polygon of five sides, a HEXAGON has six sides, a HEPTAGON seven, an OCTAGON eight, a NONAGON nine, a DECAGON ten, an UNDECAGON eleven, and a DODECAGON twelve sides.

29. A REGULAR POLYGON has all its sides and all its angles equal; if they are not equal, the polygon is IRREGULAR.

30. A CIRCLE is a plane figure bounded by one

line called the circumference, which is such, that all straight lines drawn to it from a certain point within it called the centre are equal; and these straight lines are called the radii of the circle. The circumference itself is also often called a circle. Fig. 20.

31. The DIAMETER of a circle is a straight line passing through the centre, and terminated both ways by the circumference.

32. An ARC of a circle is any part of its circumference. Fig. 21.

33. A CHORD is a straight line joining the extremities of an arc. Fig. 21.

34. A SEGMENT is any part of a circle bounded by an arc and its chord. Fig. 21.

35. A SEMICIRCLE is half the circle, or a segment cut off by a diameter. The half circumference is also sometimes called a semicircle. Fig. 20.

36. A SECTOR is any part of a circle which is bounded by an arc and two radii drawn to its circumference. Fig. 22.

37. A QUADRANT, or quarter of a circle, is a sector having a quarter of a circle for its arc, and its two radii perpendicular to each other. A quarter of the circumference is also called a quadrant. Fig. 23.

38. The HEIGHT, or ALTITUDE, of a figure is a perpendicular let fall from an angle or its vertex to the opposite side or base. Fig. 24.

39. In a right-angled triangle the side opposite the right angle is called the HYPOTHEUSE, and the other two sides are called the LEGS, or sometimes the base and perpendicular. Fig. 10.

40. The circumference of every circle is supposed to be divided into 360 equal parts, called DEGREES, and each degree into sixty MINUTES, each minute into sixty SECONDS, and so on. Hence a semicircle contains 180 degrees, and a quadrant ninety degrees.

41. The MEASURE OF A RECTILINEAL ANGLE is an arc of any circle contained between the two lines which form that angle, the angular point being the centre, and it is estimated by the number of degrees in that arc. Fig. 25.

42. IDENTICAL FIGURES are such as have all the sides and all the angles of the one, respectively equal to all the sides and all the angles of the other, each to each, so that if the one figure were applied to, or laid upon the other, all the sides of the one would exactly fall upon and cover all the sides of the other, the two becoming, as it were, but one and the same figure.

43. The DISTANCE OF A POINT FROM A LINE is the straight line drawn from that point perpendicular to, and terminating in that line.

44. An ARC IN A SEGMENT OF A CIRCLE is that which is contained by two lines drawn from any point in the arc of the segment to the extremities of that arc. Fig. 26.

45. An ANGLE ON A SEGMENT, OR AN ARC, is that which is contained by two lines drawn from any point in the opposite, or supplemental part of the circumference, to the extremities of the arc, and containing the arc between them. Fig. 26.

46. An ANGLE AT THE CIRCUMFERENCE is that whose angular point is any where in the circumference; and an angle at the centre is that whose angular point is at the centre. Fig. 26.

47. A TANGENT TO A CIRCLE is a straight line that meets the circle at one point, and every where else falls without it. Fig. 27.

48. A SECANT is a straight line that cuts the circle; lying partly within and partly without it. Fig. 27.

49. A RIGHT-LINED FIGURE is inscribed in a circle; or the circle circumscribes it, when all the angular points of the figure are in the circumference of the circle. Fig. 28.

50. A RIGHT-LINED FIGURE circumscribes a circle; or the circle is inscribed in it, when all the sides of the figure touch the circumference of the circle. Fig. 28.

51. ONE RIGHT-LINED FIGURE is inscribed in another; or the latter circumscribes the former, when all the angular points of the former are placed in the sides of the latter. Fig. 28.

52. SIMILAR FIGURES are those that have all the angles of the one equal to all the angles of the other, each to each, and the sides about these angles proportional.

53. The PERIMETER OF A FIGURE is the sum of all its sides taken together.

Note. When the word line occurs, without the addition of either straight or curved, a straight line is always meant.

AXIOMS.

1. Things which are equal to the same thing are equal to one another.

2. When equals are added to equals, the wholes are equal.

3. When equals are taken from equals, the remainders are equal.

4. When equals are added to unequals, the wholes are unequal.

5. When equals are taken from unequals, the remainders are unequal.

6. Things which are like multiples of the same thing are equal to one another.

7. Things which are like parts of the same thing are equal.

8. The whole is equal to all its parts taken together.

9. Things which coincide, or fill the same space, are identical, or mutually equal in their parts.

10. All right angles are equal to one another.

11. A line which meets one of two parallel lines will if produced meet the other.

12. If two straight lines intersect each other, they cannot both be parallel to the same straight line.

PROPERTIES OF STRAIGHT LINES, AND PLANE RECTILINEAL FIGURES.

THEOREM I.—In any two triangles, as ABC , DEF (fig. 30 p. 1), if two sides, as AB , AC , in the one, be respectively equal to two sides, as DE , DF , in the other, and the angle A , included by the sides AB , AC , be equal to the angle D , included by the sides DE , DF ; then the triangles are equal in all respects, and have the angles equal which are opposite the equal sides.

For, conceive the point A to be laid on the point D , and the line AB on the line DE , then, as these lines are equal, the point B will fall on the point E . And as AB coincides with DE

and the angle A is equal to the angle D , the side AC will fall on the side DF ; and, these sides being equal, the point C will fall on the point F ; and, consequently, the line BC will coincide with the line EF . Hence, the two triangles are identical, having all the parts in the one equal to the corresponding parts in the other, viz. the side BC to the side EF , the angle B to the angle E , the angle C to the angle F , and the whole triangle ABC to the triangle DEF .

THEOREM II.—If two triangles, as ABC , DEF (fig. 30, p. 1.), have two angles as B and C in the one, respectively equal to two angles, as E and F in the other, and the sides BC , and EF , adjacent to these angles also equal, the triangles are equal in all respects, and have those sides equal which are opposite the equal angles.

For, conceive the point B to be laid on the point E , and the line BC on the line EF , then, because these lines are equal, the point C will fall on the point F . And, as BC coincides with EF , and the angle B is equal to the angle E , the side BA will fall on the side ED ; and, for a like reason, AC will fall on DF , and the points A and D will consequently coincide; the triangles are, therefore, identical, having the parts in one respectively equal to the corresponding parts in the other.

THEOREM III.—In any isosceles triangle, as ABC (fig. 31, p. 1.), the angles B and C , opposite the equal sides AB and AC , are equal.

For, conceive the angle BAC to be bisected by the line AD , then, as the two triangles ABD , ACD , have AC equal to AB , AD , common, and the angles BAD and DAC equal, they are identical (Theorem I.), and have therefore the angles B and C equal.

Cor. 1. The line which bisects the angle included between the equal sides of an isosceles triangle, bisects the third side also, and is perpendicular to it.

Cor. 2. An equilateral triangle is also an equiangular one.

THEOREM IV.—If a triangle, as ABC (fig. 32, p. 1.), have two equal angles, as A and B , the sides AC and BC , opposite those angles, are also equal.

For, if AC and BC are not equal, suppose one of them, as AC , to be longer than the other, and conceive AD to be the part of AC which is equal to BC , and join BD . Then, as AD is equal to BC , AB common to both, and the angles CAB and CBA equal, the triangles ABD and ABC are themselves equal (Theorem I.), the less equal to the greater which is impossible. AC and BC are, therefore, not unequal, that is, they are equal.

Cor. An equiangular triangle is also an equilateral one.

THEOREM V.—If two triangles, as ABC , DEF (fig. 33 p. 1.), have the sides AC and DF , AB and DE , and BC and EF , respectively equal, the triangles are identical, and have the angles equal, which are opposite the equal sides.

For let the point A be laid on D , and the line AB on the line DE ; then, as these lines are equal, the points B and E will coincide. Let

the point C fall at G , and join FG . Then, as DF and DG are equal, the angles DFG and DGF are equal (Theorem III.); and in the same way may the angles EFG and EGF be shown to be equal. Hence the angles DFE , and DGE , or ACB , are equal; and, consequently (Theorem I.), the triangles ABC , and DEF , are identical, and have the angles BAC , and EDF , equal, and the angles BAC , and EDF , also equal.

THEOREM VI.—The angles DBA , DBC (fig. 34, p. 1.), which one straight line, DB , makes with another, AC , on the same side of it, are either two right angles, or, together, they are equal to two right angles.

For, if BD is perpendicular to AC , each of the angles ABD and DBC is a right angle. If BD is not perpendicular to AC , let BE be perpendicular to A ; then ABD exceeds the right angle ABE by the right angle EBD , and DBC is less than the right angle EBC by the same angle EBD ; the angles ABD and DBC are, together, equal to two right angles.

Cor. All the angles that can be made at a point, as B , by any number of lines drawn on the same side of a line, as AC , are, together, equal to two right angles; and, as all the angles that can be made at the same point by lines drawn on the other side of AC are also together equal to two right angles, we may infer that all the angles that can be made in the same plane about any point, are, together, equal to two right angles.

THEOREM VII.—If two straight lines, as AB , DE (fig. 35 p. 1.), intersect each other, any two vertical or opposite angles, as ACD , BCE , are equal.

For, as AC meets DE , the angles ACD and ACE are, together, equal to two right angles (Theorem VI.); and, as EC meets AD , the angles ACE and ECB are also, together, equal to two right angles. Hence the sum of the angles ACD and ACE is equal to the sum of the angles ACE and ECB , and, if the common angle ACE be omitted from each sum, the remaining angles, ACD and ECB , are equal.

THEOREM VIII.—If any side, as AB (fig. 36, p. 1.), be produced, as to D , the outward angle CBD is greater than either of the inward and opposite angles A and C .

For bisect BC in E , join AE , and produce it till EF is equal to AE , and join BF . Then as AE is equal to EF , BE to EC , and the angles AEC and BEF are also equal (Theorem VII.), the triangles AEC and BEF are identical (Theorem I.), and the angle EBF is equal to the angle ACE ; consequently the whole angle CBD is greater than the angle C .

By producing CB as to C , it may be shown in the same way that the angle ABG , which is equal to CBD is greater than BAC .

THEOREM IX.—In any triangle, as ABC (fig. 37, p. 1.), if a side AB be greater than another side AC , the angle ACB , opposite the greater side AB , is greater than the angle ABC , opposite the less side AC .

For let AD be the part of AB which is equal to AC , and join CD . Then the angles ACD and ADC are equal (Theorem III.); but the

angle ADC is greater than the angle B (Theorem VIII.); therefore the angle ACD is also greater than B , and consequently the angle ACB is much greater than B .

THEOREM X.—In any triangle, as ABC (fig. 37, p. 1.), the greater angle, as C , has the side AB opposite to it, greater than the side AC , opposite the less angle B .

For, if AB were equal to AC , the angles B and C would be equal (Theorem III.); and, if AB were less than AC , the angle C would be less than the angle B , both of which conclusions are inconsistent with the hypothesis that the angle C is greater than the angle B ; hence the side AB must be greater than the side AC .

THEOREM XI.—If two triangles, as ABC , DEF (fig. 38 p. 1.), have two sides AB , BC , of the one, respectively equal to two sides DE , EF , of the other, but the angle ABC greater than the angle DEF ; then the side AC will be greater than the side DF .

Let ABG be the part of the angle ABC which is equal to DEF , and let BG be equal to EF or EC . Then (Theorem I.) the triangles ABG and DEF are identical, and have the sides AG and DF equal. And, as BG and BC are equal, the angles BGC and BCG are equal; hence BGC is greater than ACG , and much more is AGC greater than ACG ; hence (Theorem X.) AC is greater than AG , or than its equal DF .

THEOREM XII.—If two triangles, as ABC , DEF (fig. 39, p. 1.), have two sides AB , BC , of the one respectively equal to DE , EF , two sides of the other; but the third side AC of the one greater than the third side DF of the other, the angle ABC will be greater than the angle DEF .

For, if ABC and DEF were equal, AC and DF would be equal (Theorem I.), which, by hypothesis, they are not; and, if ABC were less than DEF , AC would be less than DF (Theorem XI.), which it is not. Hence, as ABC is neither equal to nor less than DEF , it must be greater.

THEOREM XIII.—In any triangle, as ABC , (fig. 39, p. 1.), the sum of any two of its sides, as AC and CB , is greater than the third side AB .

Produce AC till CD is equal to CB , and join DB ; then (Theorem III.) the angles D and DBC are equal, therefore the angle ABD is greater than the angle D , and hence (Theorem X.) AD , or the sum of AC and CB , is greater than AB .

THEOREM XIV.—In any triangle, as ABC (fig. 39, p. 1.), the difference of any two of its sides, as AC and AB , is less than the third side BC .

For let AE be the part of AB the greater, which is equal to AC the less; then, as AC and CB (Theorem XIII.) are together greater than AE and EB ; if the equal parts, AC and AE , be taken from each, EB , the difference of AC and AB , will remain less than CB .

THEOREM XV.—If a line, EF (fig. 40, p. 1.), intersect two parallel lines, AB and CD , the alternate angles BEF , CFE will be equal to each other.

If they are unequal, suppose BEF to be the greater, and that DEF is the part of it which is

equal to CFE . Then, as AB is parallel to CD , ED is not parallel to CD , it will, therefore, meet it in some point, as D ; and in the triangle, EDF , the outward angle $EF C$, is greater than the angle DEF (Theorem VIII.), which was supposed equal to it, which is impossible. The angles CFE , and BEF , are therefore equal.

THEOREM XVI.—If the alternate angles BEF and CFE (fig. 40, p. 1.) are equal, AB and CD are parallel.

For, if AB is not parallel to CD , let ED drawn from E be parallel to it. Then the angle CFE equal to the alternate angle FED (Theorem XV.), and also by hypothesis equal to the $FE B$, the angles FED and $FE B$ must be equal, which is impossible. Hence no line drawn through, except EB , can be parallel to CD .

THEOREM XVII.—If AB , CD (fig. 40, p. 1.), two parallel lines, be cut by another line EF , any outward angle, as AEG , is equal to the inward and opposite one CFE on the same side of EH , and any two inward angles, as AEF and $EF C$, are together equal to two right angles.

For the angle BEF being equal to the angle AEG (Theorem VII.), and also equal to the angle CFE (Theorem XV.), the angles AEG and CFE are equal. And as the angles AEF and BEF , together, are equal to two right angles (Theorem VI.), and the angle BEF is equal to the angle CFE , the angles AEF and CFE are together equal to two right angles.

THEOREM XVIII.—If two lines, as AB , EF (fig. 41 p. 1.), be each parallel to another line as CD , AB and EF are parallel to each other.

Let the lines be cut by the line $GHIKL$; then as the angle HIC is equal to BHI (Theorem XV.), and also equal to IKE (Theorem XVII.), the angles BHI and IKE are equal, and consequently (Theorem XVI.) the lines AB and EF are parallel.

THEOREM XIX.—If any side, as AB (fig. 42, p. 1.) of a triangle ABC be produced, the outward angle CBD , is equal to both the inward and opposite angles A and C .

Let BE be a line parallel to AC : then (Theorem XV.) the angles ACB and CBE are equal; and (Theorem XVII.) the angles CAB and EBD are equal; hence the angle CBD is equal to the sum of the angles A and C .

Cor. 1. As the angles CBD and CBA are together equal to two right angles (Theorem VI.) and the angle CBD is equal to the sum of the angles A and C , the three interior angles of any triangle are equal to two right angles.

Cor. 2. Either of the angles C or A is the difference between the other and the outward angle $CB E$.

THEOREM XX.—All the interior angles of any rectilinear figure, $ABCDE$ (fig. 43, p. 1.), are together equal to twice as many right angles as the figure has sides wanting four right angles.

For from any point, as F , within the figure, let lines be drawn to its angular points, dividing the figure into as many triangles as it has sides; then the interior angles of each triangle being equal to two right angles, the interior angles of all the triangles (which are the interior angles of the figure, and the angles about the point F , or the interior angles of the figure and four right angles), are equal to twice as

many right angles as the figure has sides. Hence the interior angles of the figure are equal to twice as many right angles as the figure has sides wanting four right angles.

Cor. 1. All the interior angles of a quadrilateral figure are together equal to four right angles.

Cor. 2. If the sides of the figure be produced the sum of the outward angles will be four right angles.—For, each interior with its corresponding exterior angle being equal to two right angles (Theorem VI.), all the interior and exterior angles will be equal to twice as many right angles as the figure has sides, or equal to the interior angles and four right angles; therefore the exterior angles are equal to four right angles.

THEOREM XXI.—In any parallelogram, as $ABCD$ (fig. 44, p. 1.), the opposite sides are equal to each other, and so are also the opposite angles, and the diagonal BD divides it into two equal triangles.

For AB and CD being parallel, and AD and CB also parallel, the angle ABD is equal to the angle CDB and the angle ADB to the angle CBD (Theorem XV.); and, as DB is common to both triangles, the triangles are (Theorem II.) identical, having AB equal to CD , AD to BC , and the angle A to the angle C , and as the two parts of the angle ADC are equal to the two parts of the angle ABC , the angles ADC and ABC are also equal.

Cor. If a parallelogram have one right angle, all its angles are right angles, and consequently all the angles of a rectangle are right angles.

THEOREM XXII.—Any quadrilateral, as $ABCD$ (fig. 44, p. 1.), whose opposite sides are respectively equal is a parallelogram.

For, DB being joined, the triangles ABD and CDB are (Theorem V.) identical, having the angles CDB and ABD equal, and the angles ADB and CBD equal. Hence (Theorem XVI.) AB and CD are parallel, and AD and BC are parallel; and consequently (Def. XXI.) the figure $ABCD$ is a parallelogram.

Cor. Hence a square is a parallelogram.

THEOREM XXIII.—The lines AC and BD (fig. 44, p. 1.) which join the corresponding extremities of equal and parallel lines, as AB and CD , are themselves equal and parallel.

For, BC being joined, the angles ABC and DCB are equal (Theorem XV.) and consequently (Theorem I.) the triangles ABC and DCB are identical, and have AC equal to BD , and the angles ACB and DBC equal, when AC and BD are parallel (Theorem XVI.).

THEOREM XXIV.—If two parallelograms, as $ABCD$, $ABEF$ (fig. 45, p. 1.), be on the same base AB , and between the same parallels AB , and FC , those parallelograms are equal to each other.

For, (Theorem XXI.) FE and DC are each equal to AB , they are therefore equal to each other, and if ED be added to each, FD and EC will be equal; and as AF is equal to BE , and AD to BC , the triangles ADF , and BCE , are equal (Theorem V.). If therefore each of these equal triangles be taken from the whole figure $ABCF$, the remainders, or the parallelograms $ABCF$ and $ABCD$ are equal.

Cor. If the diagonals AE and DB be drawn, the triangles AEB and ADB , halves of equal parallelograms, are equal.

THEOREM XXV.—Parallelograms, as $ABCD$, $EFGH$ (fig. 46, p. 1.), on equal bases AB and EF , and between the same parallels AF and DG , are equal to each other. For HG being equal and parallel to EF (Theorem XXI.) is equal and parallel to AB , hence (Theorem XXIII.) AH is equal and parallel to BG , therefore $AHGB$ is a parallelogram; and each of the parallelograms AC and EG being equal to the parallelogram AG , they are equal to each other.

Cor. 1. If BD and EG be joined, the triangles ABD and EFG , the halves of the equal parallelograms AC and EG are equal.

Cor. 2. If a parallelogram and a triangle be on the same or on equal bases, and between the same parallels, the parallelogram will be double the triangle.

THEOREM XXVI.—Equal triangles, as ABC , ADB (fig. 47, p. 1.) on the same base AB , are between the same parallels.

For if DC is not parallel to AB , let DE meeting AC in E be parallel to AB , and join BE . Then the triangles ABD and ABE are equal (*Cor.* Theorem XXIV.); and the triangles ABD and ABC are equal, by hypothesis; hence the triangles ABC and ABE are equal, the less to the greater, which is impossible. No line therefore, drawn through D , except DC , can be parallel to AB , and DC and AB are therefore parallel.

THEOREM XXVII.—If AB (fig. 48, p. 1.) be a line, and BC another divided into any number of parts, as BD , DE , EC , the rectangle contained by AB and BC is equal to the rectangles contained by AB and BD , AB and DE , and AB and EC .

For let AC be the rectangle contained by AB and BC , and let DF and EG be drawn parallel to AB ; then the rectangle AC is the sum of the rectangles AD , FE , and EC . Now AD is contained by AB and BD , FE by FD and DE , and GC by GE and EC ; and, as DE and EG are each equal to AB , their rectangles are equal to rectangles contained by AB and BD , AB and DE , and AB and EC .

Cor. 1. If AB be equal to BD , AD will be a square on BD , and DH will be a rectangle under BD and DC ; therefore the rectangle under a line, and a part of itself, is equal to the square of that part, and the rectangle of the two parts.

Cor. 2. If BA be equal to BC , BH will be a square on BC ; hence the rectangles under a line, and the several parts of itself, are equal to the square of that line.

THEOREM XXVIII.—The square of the sum of two lines, as AF and FB (fig. 49, p. 1.), is equal to the square of each line, and twice the rectangle contained by these lines.

Let AC be the square on AB , and FI the square on FB , and produce FG and IG till they meet DC and AD in E and H ; then HI and EF are equal, being equal to AB and BC , sides of the same square; if from these equals, the equal parts GI and FG be taken, the

maining parts GE and GH will be equal. But HG is equal to DE , and GE to HD , and the angle D being a right angle, HE is a square on HG , or it is equal to the square of AB . But the parallelograms AC and GC are rectangles, each equal to the rectangle contained by AF and FB ; for FG and GI are each equal to FB , and IC is equal to AF . Hence the square of AB , or the square of the sum of AF and FB , is equal to the squares of AF and FB , and twice the rectangle of AF and FB .

Cor. The square of any line is four times the square of half that line.

THEOREM XXIX.—The square of AC , the difference of two lines AB and BC (fig. 50, p. I.), is equal to the sum of the squares of those lines, all but twice the rectangle contained by them.

For let AD be the square on the difference AC , AF the square on the greater AB , and CI the square on the less BC ; and produce ED to meet FC in H . Then GH and HK are the excess of the two squares AF and CI above the square AD . Now as AB is equal to AG , and AC to AE , EG is equal to BC ; and, AB being equal to GF , GH is equal to a rectangle under AB and BC . Again, as AC is equal to CD , and CB to CK , AB is equal to DK ; and, CB being equal to KI , HK is equal to a rectangle under AB and BC ; hence the square of the difference of AB and BC is equal to the square of each of those lines, diminished by twice their rectangle.

THEOREM XXX.—The difference of the squares of any two unequal lines, as AB , AC (fig. 51, p. I.), is equal to a rectangle under their sum and difference.

For let AD be the square on AB , and AF the square on AC ; produce BD till BK is equal to AC ; draw IK parallel to AB , and produce FC till it meet IK , and ED in I and H . Then the rectangles IF and CD together form the difference of the two squares AD and AF . But the rectangles EF and BI are equal; for GF and BK are each equal to AC , and GI is equal to BC , as they are each equal to the difference of AB and AC , or of their equals AE and AG . The rectangles EF and CD are therefore together equal to the rectangles BI and CD , or to the whole rectangle DI , which is therefore equal to the difference of the squares AD and AF . But DI is a rectangle contained under DK the sum, and BC the difference of AB and AC ; hence the difference of the squares of AB and AC is equal to the rectangle under their sum and difference.

THEOREM XXXI.—If two parallelograms AG , CE (fig. 52, p. II.), be described on AB , BC , two sides of a triangle ABC , and the outward sides FG , DE ; if the parallelograms be produced till they meet in H ; and if HB be joined, and produced to meet the base AC in K ; and AL , CM be drawn parallel to HK , meeting FH and HD in L and M ; then, if LM be joined, AM will be a parallelogram, and equal to the parallelograms AG and CE .

For, as AH and HC are parallelograms, AL and CM are, each equal and parallel to BH

(Theorem XXI.), they are equal and parallel to each other (Theorem XXIII.), therefore AC and LM are also equal and parallel, and hence AM is a parallelogram.

Now (Theorem XXIV.) the parallelograms AG and AH are equal, for they are on the same base AB , and between the same parallels AB and CH . But the parallelogram AH is equal to the parallelogram AN , for they are on the same base AL , and between the same parallels AL and KH ; hence the parallelograms AG and AN , being each equal to AH , are equal to each other. Similarly the parallelograms CE and CN may be shown to be equal; and consequently the two parallelograms AG and CE are equal to the whole parallelogram AM .

Cor. If the parallelograms AG and CE be squares, and the angle ABC a right angle, then the parallelogram AM will also be a square, and equal to the two squares AG and CE .

THEOREM XXXII.—In any triangle as ABC (fig. 53, p. II.), obtuse angled at A , if a perpendicular CD be drawn from C on the base produced, then $BC^2 = BA^2 + AC^2 + 2 BA \cdot AD$.

For (Theorem XXXI., *Cor.*) $BC^2 = BD^2 + DC^2$; but (Theorem XXVIII.) $BD^2 = BA^2 + AD^2 + 2 BA \cdot AD$; therefore $BC^2 = BA^2 + AD^2 + DC^2 + 2 BA \cdot AD$. But (Theorem XXXI. *Cor.*) $AD^2 + DC^2 = AC^2$, hence $BC^2 = BA^2 + AC^2 + 2 BA \cdot AD$.

THEOREM XXXIII.—In any triangle, as ABC (fig. 54, p. II.), if CD be a perpendicular, drawn from C on the opposite side AB , then $BC^2 = BA^2 + AC^2 - 2 BA \cdot AD$.

For (Theorem XXXI. *Cor.*) $AC^2 = AD^2 + DC^2$, and (Theorem XXVIII.) $AB^2 = AD^2 + DB^2 + 2 BD \cdot AD$; hence $AB^2 + AC^2 = BD^2 + DC^2 + 2 AD^2 + 2 BD \cdot AD$. But (Theorem XXXI. *Cor.*) $BD^2 + DC^2 = BC^2$, and (Theorem XXVII. *Cor.* 1.) $2 AD^2 + 2 BD \cdot AD = 2 BA \cdot AD$; therefore $AB^2 + AC^2 = BC^2 + 2 BA \cdot AD$, or $BC^2 = AB^2 + AC^2 - 2 BA \cdot AD$.

THEOREM XXXIV.—In any triangle as ABC (figs. 53 & 54, p. II.) the rectangle under the sum and difference of two sides, as BC and AC is equal to the rectangle of the segments, AD and BD , of the third side, made by a perpendicular from the angle C .

For $BC^2 = BD^2 + DC^2$, and $AC^2 = AD^2 + DC^2$, (Theorem XXXI. *Cor.*); hence $BC^2 - AC^2 = (BD^2 + DC^2) - (AD^2 + DC^2) = BD^2 - AD^2$. But (Theorem XXX.) $BC^2 - AC^2 = BC + AC \cdot BC - AC$; and $BD^2 - AD^2 = BD + AD \cdot BD - AD$; therefore $BC + AC \cdot BC - AC = BD + AD \cdot BD - AD$.

THEOREM XXXV.—If the base AB of a triangle, as ABC (fig. 55, p. II.), be bisected in D , then $AC^2 + BC^2 = 2 AD^2 + 2 DC^2$.

For let CE be a perpendicular from C on AB ; then (Theorem XXXII.) $AC^2 = AD^2 + DC^2 + 2 AD \cdot DE$; and (Theorem XXXIII.) $BC^2 = BD^2 + DC^2 - 2 BD \cdot DE = AD^2 + DC^2 - 2 AD \cdot DE$; hence $AC^2 + BC^2 = 2 AD^2 + 2 DC^2$.

PROPERTIES OF CIRCLES.

THEOREM XXXVI.—If any point D (fig. 56, p. II.), be taken in ACB, the diameter of a circle DB, that part of the diameter which passes through the centre, C, is greater than any other line, as DE, that can be drawn from D to the circumference of the circle; and DE is greater than any other line DF drawn from D to the circumference; but at a greater distance from D B.

For, join CE and CF, then as CE is equal to CB, DC and CE together are equal to DB; and, as the sum of DC and CE is greater than DE (Theorem XIII.), DB is greater than DE. Again as DC and CE are respectively equal to DC and CF, but the angle DCE is greater than the angle DCF, DE (Theorem XI.) is greater than DF.

THEOREM XXXVII.—An angle ACB (fig. 57, p. II.) at the centre of a circle is double the angle ADB at the circumference, when they both stand on the same arc AB.

For join DC, and produce it as to E; then (Theorem XIX.) the angle ACE is equal to the sum of the angles CAD, and CDA; but, as CA is equal to CD, the angles CAD and CDA are equal; the angle ACE is therefore double the angle ADC. For a like reason the angle BCE is double the angle BDC, consequently the angle ACB is double the angle ADB.

Cor. 1. As the angle ACB, at the centre, is measured by the arc AB on which it stands, the angle ADB at the circumference is measured by half the arc AB, on which it stands.

Cor. 2. All angles in the same segment of a circle, or standing on the same arc, are equal to each other.

Cor. 3. The angle in a semicircle is a right angle; for, when AC and CB become one straight line, the angle ACB becomes equal to two right angles, and the angle ADB, which is in that case an angle in a semicircle, is a right angle.

THEOREM XXXVIII.—The sum of any two opposite angles BAD, BCD, of a quadrilateral inscribed in a circle, is two right angles (fig. 58, p. II.)

For the three angles of the triangle ADB are together equal to two right angles (Theorem XIX. Cor. 1). But (Theorem XXXVII. Cor. 2), the angle ADB is equal to the angle ACB, and the angle ABD to the angle ACD, hence the angles BAD and BDC are together equal to two right angles.

Cor. If AB be produced, as to E, then (Theorem VI.) the angles DAB and DAE, together, make two right angles; hence the angle DAE is equal to the inward and opposite one BCD.

THEOREM XXXIX.—In any circle as ABCD (fig. 59, p. II.) parallel chords as AB, CD, intercept equal ones, AC and BD.

For, BC being joined, the angles ABC and BCD are equal (Theorem XV.), and hence (Theorem XXXVII. Cor. 1) half the arc AC is equal to half the arc BD, or the whole arc AC, to the arc BD.

Cor. If AB be conceived to move parallel to itself till it coincide with the tangent EGF, then the arcs CG and G D intercepted by a tangent and a chord parallel to it will appear to be equal.

THEOREM XL.—If AB (fig. 60, p. II.) be a tangent to a circle, and AC a chord drawn from the point of contact A, the angle DAC is equal to any angle in the alternate segment ADC.

For from C draw the chord DC parallel to AB, and join AD. Then, as the arcs AC and AD are equal (Theorem XXXIX. Cor.), the angles ACD and ADC are equal (Theorem XXXVII. Cor. 2). But (Theorem XV.) the angles ACD and BAC are equal; therefore the angles BAC and ADC are equal; and, as ADC is equal to any angle in the same segment, BAC is also equal to any angle in that segment.

THEOREM XLI.—The angle EAC (fig. 61, p. II.), formed by two lines cutting a circle, is measured by half the sum or half the difference of the intercepted arcs EC and BD, according as the point A is within or without the circle.

For join EB; then when A is within the circle, the angle EAC is the sum of the angles CBE and DEB; but when A is without the circle, the angle EAC is the difference of the angles CBE and DEB (Theorem XIX. Cors. 1 and 2). But (Theorem XXXI. Cor. 1) CBE is measured by half EC, and the angle DEB by half BD; hence the truth of the proposition is manifest.

THEOREM XLII.—If AB (fig. 62, p. II.), any chord of a circle, be bisected by a line CD drawn to the centre, CD will be perpendicular to AB; or if CD, drawn from the centre, be perpendicular to AB, AB will be bisected in D.

Draw the radii CA, CB, then AB is bisected in D, the triangles ACD and BCD will be identical (Theorem V.), and have the angles ADC and BDC, opposite to the equal sides AC and BC, equal to each other, and CD is therefore perpendicular to AB. Or again, if CD is perpendicular to AB, the angles CDA and CDB will be equal, and, because of the equal sides AC and CB, the angles CAD and CBD will be equal (Theorem III.); hence the angles ACD and BCD will also be equal, and as CD is common to both triangles, the side AD will be equal to the side BD (Theorem II.), or AB is bisected in D.

Cor. The angles ACD and BCD are equal, therefore the arcs AE and BE are equal.

THEOREM XLIII.—If on AB, CD (fig. 63, p. II.), two chords in a circle, the perpendiculars EG and GF be drawn; then if the perpendiculars are equal, the chords are equal; and if the chords are equal, the perpendiculars are equal.

For join AG and GC, then (Theorem XLII.) the chords AB and CD are bisected in E and F, if therefore AB is equal to CD, AE is equal to CF. But (Theorem XXXI. Cor.) $AG^2 = AE^2 + EG^2$; and GC^2 (or $AC^2 = CF^2 + GF^2$). Hence $AE^2 + EG^2 = CF^2 + GF^2$; and if from these equals the equal squares AE^2 and CF^2 be taken, we have $EG^2 = GF^2$, or $EG = GF$. In the same way it may be shown that, when $EG = CF$, $AE = CF$, and consequently $AB = CD$.

THEOREM XLIV.—A perpendicular as BC (fig. 64, p. II.), at the extremity B of the radius of a circle, is a tangent to the circle.

For from the centre A draw AC to any point C in the line BC; then as ABC is a right angle, ACB is less than a right angle; hence

(Theorem X.) AC is greater than AB , or the point C is without the circle. In the same way it may be shown that BC meets the circle in the point B only, and it is therefore a tangent to the circle.

OF PROPORTION.

Proportion is the numerical relation which one quantity bears to another. Quantities between which proportion can exist must be of the same kind, as a line and a line, a surface and a surface, a solid and a solid, an angle and an angle.

A greater quantity is said to be a multiple of a less, when it contains the less a certain number of times without any remainder; and quantities so related are said to have the same relation to each other that unity has to the number which indicates how often the less is contained in the greater.

If a quantity, as A (fig. 66, p. II.), be contained exactly a certain number of times in another quantity B , the quantity A is said to measure the quantity B ; and, if the same quantity A be contained exactly a certain number of times in another quantity C , A is also said to be a measure of C ; and it is called a common measure of the quantities B and C . The quantities B and C will evidently bear the same relation to each other, that the numbers do which represent the multiple that each quantity is of the common measure A .

Again, if a quantity, D , be contained as often in another quantity, E , as A is contained in B , and as often in another quantity F , as A is contained in C , then the proportion that E has to F will be the same that B has to C , and the quantities B, C, E , and F , are said to be proportional quantities, a relation which is commonly expressed thus $B : C :: E : F$.

THEOREM XLV.—Any two quantities as AB, CD (fig. 67, p. II.), have the same proportion that their like multiples have.

Let AB be to CD as any number (say 3) to any other number (say 4); or let AB contain three such equal parts as those of which CD contains 4; and let E, F, G, H , be any like multiples Aa, ab , and bB ; Cc, cd , de , and eD ; then EF is the same multiple of AB that GH is of CD ; and the same that each part of the one is of the corresponding part of the other. And, as the parts of AB and CD are equal, the like multiples of those parts which constitute the parts of EF and GH are also equal. Hence EF is to GH as 3 is to 4, the same proportion that AB has to CD . In the same way may the property be proved, whatever numerical relation AB may have to CD .

Cor. Quantities of the same kind are to each other as their like parts.

THEOREM XLVI.—In any four quantities AB, BC, DE , and EF (fig. 68, p. II.) of the same kind, if $AB : BC :: DE : EF$, then also alternately $AB : DE :: BC : EF$. If AB contain any number of such equal parts Aa (say 4), as those of which BC contains any other number (say 3), Bb , then DE also will contain four such equal parts Dd as those of which EF con-

tains three, *E.e.* Then (Theorem XLV. *Cor.*) AB will be to DE as Aa to Dd , and BC to EF as Bb to Ee ; or as Aa to Dd ; hence $AB : DE :: BC : EF$.

Cor. If $AB : BC :: DE : EF$; then $BC : AB :: FE : ED$.

THEOREM XLVII.—In any four quantities AB, BC, DE , and EF (fig. 68, p. II.), of the same kind, if $AB : BC :: DE : EF$; then $AB : AB \pm BC :: DE : DE \pm EF$.

For let $AB : BC$, or $DE : EF :: m : n$; then $AB : AB \pm BC$, or $DE : DE \pm EF :: m : m \pm n$. In the same way it may be shown that $AB \pm BC : AB \mp BC :: DE \pm EF : DE \mp EF$.

THEOREM XLVIII.—Triangles, as ABC, DEF (fig. 69, p. II.), between the same parallels AE, CF , or that have equal altitudes, are to each other as their bases, AB and DE .

For let AB be to DE as any number, (3, for example), to any other number, (as 4); that is, let AB contain three such equal parts, Aa, ab, bB , as those of which DE contains four, Dc, ce, ef, fE ; and join Ca, Cb, Fc, Fe , and Ff .

Then the triangles CAa, Cab, CbB, FDc, Fce , &c., are all (Theorem XXV. *Cor.* 1) equal; therefore the triangle ABC contains three such equal parts as those of which the triangle DEF contains four. Hence the triangle ABC is to the triangle DEF as the base AB is to the base DE .

Cor. Parallelograms and rectangles between the same parallels, or that have equal altitudes, are to each other as their bases; for the parallelograms are doubles of their respective triangles.

THEOREM XLIX.—If two triangles, as ABC, DEF (fig. 70, p. II.), stand on equal bases, AB, DE , the triangles are to each other as their altitudes CH, FI .

Let BP be perpendicular to AB and equal to CH ; in BP take BQ equal to FI , and join AP, AQ , and CP . Then the triangle APB is equal to the triangle ABC , and the triangle ABQ to the triangle DFE . But $ABP : ABQ :: BP : BQ$ (Theorem XLVIII.), therefore $ABC : DEF :: HC : FI$.

Cor. Parallelograms and rectangles on equal bases are to each other as their altitudes.

THEOREM L.—If four lines, as A, B, C, D (fig. 71, p. II.), be proportional, the rectangle under the extremes A and D will be equal to the rectangle under the means B and C .

For $A : D : B : C :: A : B$ (Theorem XLIX. *Cor.*), and $B : C : B : D :: C : D$; consequently as $A : B :: C : D$, $A : D : B : C :: B : C : BD$; and therefore $A \cdot D$ and $B \cdot C$ are equal because they bear the same proportion to BD .

Cor. If the means are equal, the rectangle of the extremes will be equal to the square of the mean.

THEOREM LI.—If of four lines, as A, B, C, D (fig. 71, p. II.), the rectangle $A \cdot D$ of two of them, be equal to the rectangle $B \cdot C$ of the other two, then the sides of those rectangles will be inversely proportional; viz. $A : B :: C : D$; or $B : A :: D : C$, or $A : C :: B : D$, &c.

For as $A \cdot D = B \cdot C$, $AD : BD :: BC : BD$; but (Theorem XLIX. *Cor.*) $AD : BD :: A : B$, and $BC : BD :: C : D$; hence $A : B :: C : D$.

THEOREM LII.—If a line, as BE (fig. 72, p. II.), be drawn parallel to CD , one of the sides of a triangle ACD , it divides the other two sides, AC and AD , in the same proportion, or so that $AB : BC :: AE : ED$.

For let CE and BD be joined, then the triangle BCE and BDE are equal (Theorem XXIV. Cor.), and therefore the triangle ABE bears the same proportion to BCE that it does to BDE . But (Theorem XLVIII.) $ABE : BCE :: AB : BC$; and $ABE : BDE :: AE : ED$; hence $AB : BC :: AE : ED$.

Cor. $AB : AB + BC$, or $AC :: AE : AE + ED$ or AD (Theorem XLVIII.); or alternately $AB : AE :: AC : AD$; and the triangles ABE , ACD , being equiangular or similar, we may hence infer that similar triangles have the sides about their like angles in the same proportion, the homologous sides being opposite to the equal angles.

THEOREM LIII.—If two triangles as ABC , DEF (fig. 74, p. II.), have one angle, as A , in the one, equal to an angle, as E , in the other, then if $AB : BC :: DE : EF$, the triangles are similar.

For, if they are not, make the angle EDG equal to the angle BAC , then the angle AGB is also equal to the angle DGE , and the triangles ABC and DEG are consequently similar. Hence $AB : BC :: DE : EG$ (Theorem I. Cor.); but $AB : BC :: DE : EF$; therefore EF and EG are equal, which is impossible. The triangle ABC and DEF are therefore similar.

THEOREM LIV.—If CD (fig. 73, p. II.), be a perpendicular from C , the right angle of a right-angled triangle ABC , on the hypotenuse AB ; then $AD : AC :: AC : AB$; $BD : BC :: BC : AB$, and $AD : DC :: DC : DB$.

For the triangles ABC , ADC , having the common angle A , and the right angles ADC , and ACB , right angles, are similar; and for a like reason ACB , and DCB , are similar, as also are ADC and DCB . Hence (Theorem I. Cor.) $AB : AC :: AC : AD$, $AB : BC :: BC : BD$ and $AD : DC :: DC : DB$.

Cor. 1. $AB \cdot AD = AC^2$, $AB \cdot BD = BC^2$ and $AD \cdot DB = DC^2$.

Cor. 2. $AB \cdot AD + AB \cdot BD = AC^2 + BC^2$. But (Theorem XXXVII. Cor. 2), $AB \cdot AD + AB \cdot BD = AB^2$; hence $AB^2 = AC^2 + BC^2$, another demonstration of the important property deduced at Theorem XXXI. Cor.

THEOREM LV.—If an angle C , of a triangle ABC (fig. 75 p. I.), be bisected by CD , meeting the base in D , then $AC : CB :: AD : DB$.

Let BE , parallel to CD , meet AC produced in E ; then the angles DCB and CBE are equal (Theorem XV.), and the angles ACD and CEB are equal (Theorem XVII.); hence, as ACB and DCB are equal, CBE and CEB are equal, and therefore (Theorem IV.), CE is equal to CB . But (Theorem LI., Cor.), $AC : CE :: AD : DB$; hence $AC : CB :: AD : DB$.

THEOREM LVI.—If two chords, CE and DB , intersect each other in any point A , within a circle $DCDE$ (fig. 76, p. II.), the rectangle $CA \cdot AE$, of the segments of the one, is equal to

the rectangle, $BA \cdot AD$, the segments of the other.

For join C, B , and D, E , then (Theorem XXXVII., Cor. 2), the angles BCE , BDE , standing on the same arc BE , are equal, and the angles CBA and DEA are equal for a like reason, and the vertical angles BAC and DAE being equal, the triangles ABC and AED are similar, and consequently (Theorem LII., Cor.), $AD : AE :: AC : AB$; therefore (Theorem L.), $AD \cdot AB = AE \cdot AC$.

In like manner, if, as in fig. 77, the chords CE and BD meet when produced without the circle, the rectangles $AC \cdot AE$ and $AB \cdot AD$ are equal. For the angles ABC and AED are equal, as are also the angles ACB and ADE (Theorem XXXVIII., Cor.); and, the angle A being common to both the triangles ABC and AED , those triangles are similar, and therefore (Theorem LII., Cor.), $AC : AB :: AD : AE$; whence (Theorem L.) $AD \cdot AB = AE \cdot AC$.

Cor. If AB (fig. 77, p. II.) revolve round A till the points B and D meet, then the rectangle $AC \cdot AE$ will be equal to the square of the tangent drawn from A ; and hence all tangents drawn to the same circle from the same point are equal.

THEOREM LVII.—If in a triangle as ACB (fig. 78, p. II.) the vertical angle be bisected, as by CD , then $AC \cdot CB = AE \cdot EB + EC^2$.

For let CE produced meet the circumscribing circle in D , and join DB , then, as the angles ACE and DCB are equal, and the angles CAE and CDB are equal (Theorem XXXVII., Cor. 2), the angles AEC and DBC are equal; whence the triangles ACE and DCB are similar, and consequently (Theorem LII., Cor.) $AC : CE :: DC : CB$; whence (Theorem L.) $AC \cdot CB = CE \cdot CD$. But (Theorem XXVI. Cor.), $CE \cdot CD = CE^2 + CE \cdot ED$; and (Theorem LVI.) $CE \cdot ED = AE \cdot EB$; therefore $AC \cdot CB = AE \cdot EB + EC^2$.

THEOREM LVIII.—If $ABCD$ (fig. 79, p. II.) be a quadrilateral inscribed in a circle, the rectangle $AC \cdot BD$ is equal to the sum of the two rectangles $AD \cdot BC$ and $AB \cdot CD$.

From C draw CE , making the angle DCE equal to the angle ACB ; then, as the angles CDE , CAB , are equal (Theorem XXXVII., Cor. 2), the remaining angles DEC and ABC are equal, and the triangles ABC and DEC are similar; therefore $AB : AC :: DE : DC$ (Theorem LII. Cor.); whence (Theorem L.) $AB \cdot DC = AD \cdot DE$. Again, if from the equal angles DCE and ACB , the common angle ACE be taken, the remaining angles DCA and ECB will be equal; and, as the angles DAC and $EB C$ are equal (Theorem XXXVII., Cor. 2), the remaining angles ADC and BEC are equal; whence the triangles ADC and BEC are similar; and therefore $AD : AC :: BE : BC$; or $AD \cdot BC = AC \cdot EB$. Hence $AB \cdot DC + AD \cdot BC = AC \cdot DE + AC \cdot EB$, or $= AC \cdot BD$ (Theorem XXVII.).

THEOREM LIX.—If $AB CDE$ (fig. 80, p. II.) be an equilateral polygon inscribed in a circle whose centre is M , and $F G H I K$ an equilateral polygon of the same number of sides in-

scribed in a circle whose centre is L, the circumference of the polygon $ABCDE$ is to the circumference of the polygon $FGHIK$ as the radius AM to the radius FL .

For join M and L to the angles of the polygons, then the triangles AMB , BMC , &c., being mutually identical, and the triangles FLG , GLH , &c., being also mutually identical (Theorem V), the angles AMB , FLG , are equal, being like parts of four right angles; and therefore, as the triangles are isosceles, they are similar. Hence $AM : FL :: AB : FC$ (Theorem LII, Cor.); or $::$ perimeter $ABCDEA$: perimeter $FGHIKF$ (Theorem XLV), since the perimeters are like multiples of AB and FC .

Cor. If we conceive the sides of the polygons to be equal in number, and indefinitely small, their sides will coincide with the circumferences of the circumscribing circles. Hence the circumferences of circles are to each other as their radii.

THEOREM LX.—Similar triangles, as ABC , DEF (fig. 81, p. II.), are to each other as the squares of their like sides.

For let AK , DM , be squares on the like sides AB and DE , BI and EL , the diagonals of these squares, and CG , FB , perpendiculars from C and F upon AB and DE . Then as the angles CAG and FDH are equal, and the right angles AGC and DHF are also equal, the triangles ACG and DHF , as well as the triangles ABC , DFE , are similar. Hence (Theorem LII, Cor.), $AC : DF :: CG : FH$, and $AC : DF :: AB : DE$ or $:: AI : DL$; therefore $CG : FE :: AI : DI$; or $CG : AI :: FH : DI$ (Theorem XLVI.). But (Theorem XLIX.) the triangle ABC is to the triangle ABI as CG is to AI ; and the triangle DEF is to the triangle DLE as FH is to DL , therefore the triangle ABC is to the triangle ABI as the triangle DFE is to the triangle DLE ; or the triangle ABC is to the triangle DFE as twice the triangle ABI is to twice the triangle DLE ; or as AK to DM ; that is as the square of AB is to the square of DE .

THEOREM LXI.—All similar rectilineal figures, as $ABCDE$, $FGHIK$ (fig. 81, p. II.), are to each other as the squares of their like sides.

For draw BE , BD , GK , GI ; then the two figures being similar they are equiangular, and have their like sides proportional. Hence, as the angles A and F are equal, the triangles AEB and KFG are similar (Theorem LIV.); and for a like reason the triangles DBC and ICH are similar. And if from the equal angles AED and KFI the equal angles AEB and FKG be taken, the remaining angles EDB and IKC are equal; similarly the angles EDB and KIG are equal; therefore the triangles EBD and KIG are similar. Hence the triangles AEB and KFG are to each other as AE^2 to KF^2 and EBD to KGI as ED^2 to KI^2 and DBC to ICH as DC^2 to IH^2 ; but the corresponding sides of the polygons, and consequently their squares, are proportional; therefore, each of the triangles that compose $ABCDE$ is to the corresponding one in $FGHIK$, as the square of a side of the former is to a square of a like side of the latter, and consequently the whole polygons are to each other in the same proportion.

Cor. The areas of circles are to each other as the squares of their radii; for (fig. 80, p. II.) $AB : CF :: AM : FL$; or $AB^2 : CF^2 :: AM^2 : FL^2$; but the areas of the polygons are by this theorem as $AB^2 : GF^2$; and therefore also $AM^2 : FL^2$; which, when the polygons coincide with their circumscribing circles, is the proportion that those circles have to each other.

OF PLANES, AND THEIR INTERSECTIONS. DEFINITIONS.

1. A straight line is perpendicular to a plane when it is at right angles with every line which it meets in that plane.

2. If two planes cut each other, and, from any point in the line of their common section, two straight lines be drawn at right angles to that line, one in the one plane and the other in the other plane, the angle contained by these two lines is the angle made by the planes.

3. Two planes are perpendicular to each other when any straight line, drawn in one of the planes perpendicular to their line of common section, is perpendicular to the other plane.

4. A straight line is parallel to a plane, when it does not meet the plane, though produced ever so far.

5. Planes are parallel to each other when they do not meet, though produced ever so far.

6. A solid angle is formed by the meeting, in one point, of three or more plane angles, which are not in the same plane with each other.

THEOREM LXII.—Any three lines as AB , CD , CB (fig. 82, p. II.), which meet each other, not in the same point, are in the same plane.

For conceive a plane, passing through the line AB , to revolve round that line till it passes through the point C , then as the points E and C are in that plane, the line CD is in it; and for a similar reason the line CB is in the same plane; therefore all the three lines are in the same plane.

THEOREM LXIII.—If two planes as AB , BC (fig. 83, p. II.), cut each other, their common section BD is a straight line.

For join B , D , by a straight line; then, as the points B and D are in both the planes, the straight line BD , which joins them, is in both the planes; and A , therefore, is their line of common section.

THEOREM LXIV.—If a line, as AB (fig. 84, p. II.), be at right angles to each of two other straight lines, AD and AC , at A , their point of meeting; AB is also at right angles to the plane passing through AC and AD .

For through A , in the plane passing through AC and AD , draw any line AE ; and through any point E in that line draw EF parallel to AD , meeting AC in F . In AF produced take FC equal to AF ; join C , E and produce A to D . Then (Theorem LII.) $AF : FC :: DE : EC$; and consequently as AF is equal to FC , DE is equal to EC . Hence (Theorem XXXV.) $AD^2 + AC^2 = 2 DE^2 + 2 AE^2$; and therefore, by adding $2 AB^2$ to each of these equals, we have $AB^2 + AD^2 + AB^2 + AC^2 = 2 AB^2 + 2 AE^2 + 2 ED^2$; or $BD^2 + BC^2 = 2 AB^2 + 2 AC^2$.

$E^2 + 2 E D^2$. But (Theorem XXXV.) $B D^2 + B C^2 = 2 D E^2 + 2 B F^2$, and consequently $2 D E^2 + 2 B E^2 = 2 A B^2 + 2 A E^2 + 2 E D^2$; or, by omitting $2 D E^2$ from each, $2 B E^2 = 2 A B^2 + 2 A E^2$; or $B E^2 = A B^2 + A E^2$; and therefore the angle BAE is a right angle. AB is therefore at right angles to any line which it meets on the plane of AC , and AD , and it is consequently at right angles to that plane.

THEOREM LXV.—If a straight line as AB (fig. 85, p. II.) be at right angles to each of three straight lines, as BC , BD , BE , at B , their point of meeting, then these straight lines are all in one plane.

If they are not, let the plane passing through BE and BD meet the plane passing through BA and BC in the line BF ; then BA (Theorem LXIV.) being perpendicular to the plane, BDE is perpendicular to BF , which it meets in that plane; hence the angles ABC and ABF in the same plane are equal, the less to the greater, which is impossible. Hence BC cannot be out of the plane in which BE and ED are, and the three lines are consequently in the same plane.

THEOREM LXVI.—If two straight lines as AB , CD (fig. 86, p. II.), be at right angles to the same plane, as BDE , they are parallel to each other.

In the plane BDE draw DE at right angles to BD ; take any point E in it, and join EA , EB , and AD . Then (Theorem LIV. Cor. 2) $AE^2 = AB^2 + BE^2 = AB^2 + BD^2 + DE^2 = AD^2 + DE^2$; therefore the angle ADC is a right angle; and, as the angles $BD C$ and CDA are right angles, the lines CD , and AD , and BD , are in the same plane (Theorem LXIV.). But (Theorem LXII.) AB is in the plane of AD and BD ; hence AB and CD are in the same plane, and, as the angles ABD and CDB are right angles, the lines AB and CD are parallel.

THEOREM LXVII.—If AB and CD (fig. 87, p. II.) are parallel, and one of them, as AB , is perpendicular to a plane, as EF , the other, CD , is perpendicular to the same plane.

For if CD is not perpendicular to the plane EF , let DC , drawn through G , be perpendicular to A . Then (Theorem LXVI.) AB and DG are parallel; consequently DC and DG which cut each other, are both parallel to CD , which is impossible. Therefore no line drawn through D , except DC , is perpendicular to the plane EF ; and DC is consequently perpendicular to A .

THEOREM LXVIII.—If two lines, as AB , CD (fig. 88, p. II.), be each parallel to another line, as EF , though not in the same plane with it, these two lines are parallel to each other.

From any point G , in EF , draw GH , in the plane of $A B$ and $F F$, and perpendicular to EF ; and from the same point G , but in the plane of CD and EF , draw GK perpendicular to EF . Then (Theorem LXIV.) EG is perpendicular to the plane KGH , and therefore (Theorem LXVII.) AB and CO are both perpendicular to the same plane; and consequently (Theorem LXVI.) they are parallel to each other.

THEOREM LXIX.—If two straight lines meeting each other, as AB , BC , (fig. 89, p. II.), are parallel to two other straight lines, as DE , EF ,

which also meet each other, but are not in the same plane with AB and BC , the angles ABC and DEF are equal.

For take AB equal to DE , BC to EC , and join AC , DF , AD , BE , and CF . Then AB being equal and parallel to DE , AD and BE are equal and parallel (Theorem XXIX.), and for the latter reason BE and CF are parallel. Hence AD and CF are equal and parallel, and therefore AC and DF are equal and parallel; consequently (Theorem V.) the angles ABC and DEF are equal.

THEOREM LXX.—If two planes as AB , CD (fig. 90, p. III.) be cut by a third plane, $E H$, the sections EF and GH are parallel.

For in the plane $E H$ let EF and GH be drawn parallel to each other, and let $E I$ and $F K$ be perpendicular from E and F on the plane CD ; then (Theorem LXVI.) EL and FK are parallels; and consequently (Theorem LXIX.) the angles $H F K$ and $G E I$ are equal, and the right angles $E I G$ and $F H K$ being equal, as well as $F K$ and $E L$, the distance of the parallel planes; the triangles $F H K$ and $E G I$ are identical, and have $F H$ equal to $E G$; but their lines are also parallel, therefore the lines EF and $H G$, which join them, are parallel (Theorem XXIII.).

THEOREM LXXI.—If a straight line, as AB (fig. 91, p. III.), be perpendicular to a plane, as CK , any plane $D E$, passing through AB , is at right angles to the plane CK .

For from any point F , in CE , the common section of the two planes, draw FG , in the plane $D E$, perpendicular to CE . Then AB , being perpendicular to CK , is perpendicular to CE , which it meets in that plane, and it is therefore parallel to FG ; and consequently (Theorem LXVIII.) FG is perpendicular to the plane CK . Hence (Def. 3, PLANES), the plane $C H$ is perpendicular to the plane CK .

THEOREM LXXII.—If each of two planes, as AB , BC (fig. 92, p. III.), be perpendicular to another plane, as ADC , the common section, $B D$, of the first two planes, is perpendicular to the third plane.

For from D , in the plane ADC , draw DE perpendicular to AD , and DF to DC . Then as DE is perpendicular to DA , the common section of the planes AB and ADC , and those planes are at right angles to each other, ED is at right angles to AB , and consequently at right angles to DB , which it meets in that plane. For the same reason, DF is at right angles to DB , and hence, as BD is at right angles to DF and DE , it is at right angles to the plane ADC , in which those lines are (Theorem LXIV.).

THEOREM LXXIII.—If a solid angle, as A (fig. 93, p. III.) be contained by three plane angles as CAB , CAD , DAB , any two of these angles together are greater than the third.

If the angles are all equal, the proposition is manifest.—If they are not equal, let BAC be the greatest, and, in the plane BAC , draw AE , making the angle BAE equal to the angle BAD ; make AE equal to AD , and through E draw any straight line BEC , cutting AB and AC in B and C , and join BD , CD . Then (Theorem I.) the triangles BAE and BAD are

identical, and have BD and BE equal, and consequently EC is the difference of BC and BD , and (Theorem XIV.) EC is less than DC . Now as AE is equal to AD , AC common to both the triangles ACE and ACD , but EC less than DC , it follows (Theorem XII.) that the angle EAC is less than the angle CAD . Hence the angles BAE and EAC together, or the whole angle BAC , is less than the sum of the angles BAD and CAD .

THEOREM LXXIV.—If a solid angle as A (fig. 94, p. III.) be contained by any number of plane angles, as BAC , CAD , DAB , EAB , these plane angles together are less than four right angles.

Let the planes which contain the solid angle, A , be cut by another plane $BCDE$. Then the solid angles at B , C , D , and E , being each contained by three plane angles, ABE and ABC are less than CBE , ACB , ACD are less than BCD , ADC and ADE are less than CDE , and AEB and AED are less than BED . Hence the angles at the bases of the triangles which have their common vertex at A are greater than the interior angles of the rectilinear figure $BCDE$. But all the angles of the triangles BAC , CAD , DAE and BAE , are equal to twice as many angles as there are sides in the figure $BCDE$; and the interior angles of that figure, together with four right angles, being also equal to twice as many right angles as the figure has sides (Theorem XX.), the angles of the triangles are equal to the interior angles of the plane figure and four right angles. And, as all the angles at the bases of the triangles are greater than all the interior angles of the figure; the remaining angles of the triangles, or those which contain the solid angle A , are less than four right angles.

ON THE COMPARISON OF SOLIDS. DEFINITIONS.

1. Similar solids, contained by plane figures have their corresponding solid angles equal, and are bounded by the same number of similar planes, alike placed.

2. A prism is a solid whose ends are parallel, equal, and similar plane figures, and its sides, connecting those ends, are parallelograms.

3. An upright prism is one having the planes of its sides perpendicular to the planes of its ends.

4. A parallelopiped, or parallelopipedon, is a prism bounded by six parallelograms, every opposite two of which are equal, similar, and parallel.

5. A rectangular parallelopipedon is one whose bounding planes are rectangles, perpendicular to each other.

6. A cube is a rectangular parallelopipedon, whose sides are all equal.

7. A cylinder is a prism whose ends are circles; and its axis is the right line joining the centres of the parallel circles which form its ends.

8. A pyramid is a solid whose base is any rectilinear plane figure, and its sides triangles whose vertices meet in a point above the base, called the vertex of the pyramid.

9. A cone is a pyramid having a circle for its

base; and the axis of a cone is the line joining the vertex to the centre of the circle which forms the base.

10. Similar cones, and cylinders, are those that have their altitudes in the same proportions as the diameters of their bases.

11. A sphere is a solid bounded by a curve surface, every point of which is at the same distance from a point within, called the centre.

12. The diameter of a sphere is any right line passing through the centre and terminated both ways by the surface.

13. The altitude of a solid is the perpendicular drawn from the vertex to the opposite side or base.

THEOREM LXXV.—A section of any pyramid as $ABCD$ (fig. 95, p. III.), parallel to the base $BCDE$, is similar to the base; and these two planes are to each other as the squares of their distance from the vertex, or as AH^2 to AI^2 , AII being a perpendicular from A on the two parallel planes.

For join CH , FI . Then (Theorem LXX.) BC and EF are parallel, and CD and FG are parallel, and consequently (Theorem LXVIII.) the angles EFG and BCD are equal. In the same way it may be shown that each angle in the plane EFG is equal to the corresponding angle in the plane BCD , and consequently these planes are equiangular.

Again the triangles ABC and AEF being equiangular, as are also the triangles ACD and AFG , we have (Theorem LII. Cor.) $AC : AF :: BC : EF :: CD : FG$. In the same way it may be shown that all the sides of the plane of EG are proportional to the corresponding ones in BD , hence (Def. 52) the figures $BCDE$ and $EFGO$ are similar.

But (Theorem LXI.) the plane BD is to the plane EG as $BC^2 : EF^2$, or as $AC^2 : AF^2$; or as $AH^2 : AI^2$; because the triangles AHC , AIF , having the angles H and I right angles, and the angle A common, are similar, and therefore $AC : AF :: AH : AI$, or $AC^2 : AF^2 :: AH^2 : AI^2$, whence the plane BD is to the plane EG as $AH^2 : AI^2$.

Cor.—If the point A be conceived to be infinitely distant from the base, the pyramid will become a prism; and the ratio of AH to AI , as well as that of AH^2 to AI^2 , will be that of equality. Hence in any prism a section by a plane parallel to the base will be equal and similar to the base.

THEOREM LXXVI.—In any cone as $ABCD$ (fig. 96, p. III.), if GHI be a section parallel to the base, then GHI is a circle; and BCD , GHI are to each other as the squares of their distances from the vertex.

For let ALF be perpendicular to the parallel planes, and let the planes ACE , ADE , pass through the axis AKE of the cone, meeting the section in the points H , I , K .

Then (Theorem LXX.) HK and EC are parallel, as well as KI and ED , and by similar triangles $KHI : EC :: AK : AE :: KL : ED$; but EC is equal to ED , therefore KI is equal to KH ; and, as the same may be shown of any other lines drawn from K to the circumference of the section GHI , that section is a circle.

Again, by similar triangles $AL : AF :: AK : AE :: KI : ED$, whence $AL^2 : AF^2 :: KI^2 : ED^2 :: \text{circle } GHI : \text{circle } DCD$ (Theorem LXI. Cor.). Hence $AL^2 : AF^2 :: \text{circle } GHI : \text{circle } BCD$.

Cor. If the point A be conceived to be infinitely distant from the base, the cone will become a cylinder, and the ratio of AL to AF , as well as that of AL^2 to AF^2 , will be that of equality. Hence in any cylinder, the sections parallel to the base are circles equal to the base.

THEOREM LXXVII.—All pyramids and cones of equal bases and altitudes are equal to each other.

Let the pyramid $ABCDI$ (fig. 95, p. III.), and the cone $ABCD$ (fig. 96, p. III.) have equal bases and altitudes, and parallel to these bases, and at equal distances, AI and AL , conceive the planes EG and $GKHI$ to be drawn. Then (Theorem LXXV. and LXXVI.) $AI^2 : AI^2 :: EG : BD$; and $AL^2 : AF^2 :: GKHI : BCD$; and as AI^2, AI^2 , are equal to AL^2, AF^2 , therefore $EG : BD :: GKHI : BCD$; and, as BD is equal to BCD , EG is equal to $GKHI$. In this manner may all ratios in each figure at the same distance from the vertex be shown to be equal, and consequently, as the heights are equal, the solids which are composed of these sections are equal.

Cor. All prisms and cylinders whose bases and altitudes are equal, are equal to each other; and prisms and cylinders are equal to a rectangular parallelepipedon of the same base and altitude.

THEOREM LXXVIII.—A pyramid whose base is triangular, as $BDEF$ (fig. 97, p. III.), is the third part of a prism having the same base and altitude.

For let $ABCDEF$ be a prism on the same triangular base DEF , and, on the three rectangular sides of the prism, draw the diagonals BF, BD, CD . Then the planes BDF, BCD , divide the whole prism into three pyramids, $BDEF, DABC, DBCF$, which may be thus proved equal to each other.

The bases ABC and DEF being equal (Def. 2, SOLIDS), the pyramids $ABC D$ and $DEFB$ are equal (Theorem LXXVII.); and the bases BEF and BCF being equal (Theorem XXI.) the pyramids $DEFB$ and $BCFD$ are equal (Theorem LXX.). Hence all the three pyramids which compose the prism are equal, and the pyramid is the third part of the prism, or the prism is three times the pyramid.

Cor. 1. Every pyramid, whatever may be its figure, is the third part of a prism having the same base and altitude, since the base of the prism may be divided into triangles, and the whole solid into triangular prisms and pyramids.

Cor. 2. A cone is the third part of a cylinder, or of a prism having the same base and altitude; for it has been proved that a cylinder is equal to a prism, and a cone equal to a pyramid of equal base and altitude.

THEOREM LXXIX.—If AC and EG (fig. 98, p. III.) be two rectangular parallelepipedons having equal altitudes, AD, FH , then AC is to EG as the base AB to the base EF .

For, let the base AB be to the base EF as any number (say 3) is to any other number

(as 2); and conceive AB to be divided into three equal rectangles, AI, LK , and MB ; and EF into two equal rectangles, EO and PF ; and through the lines of division let the planes LR, MS, PV , pass, parallel to AQ , and ET . Then the parallelepipedons AR, LS, MC, EV , and PQ , having equal bases and altitudes, are all equal (Theorem LXXVII.). Hence the solids are to each other in the same proportion as their bases.

Cor. 1. From this theorem, (and Theorem LXXVII. Cor.) it appears that all prisms and cylinders of equal altitudes are to each other as their bases; and from this, combined with Theorem XLV. Cor., and Theorem LXXVIII., it appears that pyramids and cones of equal altitudes are to each other as their bases.

Cor. 2. By considering AQ and TE as the equal bases of the parallelepipedon AC, EG , those parallelepipedons will be to each other as their altitudes AN, EW . Hence prisms and cylinders of equal bases are to each other as their altitudes, and consequently pyramids and cones of equal bases are also to each other as their altitudes.

Cor. 3. As prisms and cylinders are as their altitudes when their bases are equal, and as their bases when their altitudes are equal, therefore, when neither are equal, they are in the compound ratio of their bases and altitudes.

THEOREM LXXX.—Similar prisms and cylinders are to each other as the cubes of their like linear dimensions.

For the bases are as the squares of their like sides, and the altitudes are as those sides; and the solidities being in the compound ratio of the bases and altitudes (Theorem LXXIX., Cor. 2) are as the cubes of those like sides.

Cor. Similar pyramids and similar cones, being the third parts of their corresponding prisms and cylinders, are to each other as the cubes of their like linear dimensions; and all similar solids whatever, being composed of similar pyramids, are to each other as the cubes of their like linear dimensions.

THEOREM LXXXI.—Every section of a sphere by a plane, as $CDEGF$ (fig. 99, p. III.), is a circle.

If the plane pass through the centre, then, as every point in the surface of the sphere is equidistant from its centre, the section is a plane figure, every point of whose periphery is equidistant from a certain point within it, and the figure is therefore a circle.

But if the plane do not pass through the centre, from the centre A , let AB be a perpendicular to the plane; take any two points, C, D , in the circumference of the section, and join AC, AD, BC , and BD . Then, as AB is perpendicular to the plane $CDEGF$, it is perpendicular to the lines CB and BD , which it meets in that plane; therefore $AC^2 = AB^2 + BC^2$, and $AD^2 = AB^2 + BD^2$; hence, as $AC = AD$, $AB^2 + BC^2 = AB^2 + BD^2$, and consequently $BC^2 = BD^2$, or $BC = BD$. Hence all lines drawn from B in the plane $CDEGF$, to the periphery of that plane, are equal, and the figure is therefore a circle.

THEOREM LXXXII.—A sphere is two-thirds of its circumscribing cylinder.

For, let AC (fig. 100, p. III.) be a section of

the sphere and cylinder; through the centre I , join AI, BI . Let $FIII$ be parallel to AD or BC , EIG and KL parallel to AB or DC , the base of the cylinder; KL meeting BI in M , and the circular section of the sphere in N .

Then, if the plane $HFBC$ be conceived to revolve round the line HF as an axis, the square FG will describe the cylinder AG , the quadrant IFG will describe the hemisphere EFG , and the triangle IFB will describe the cone AIB ; and, in the rotation, KL, KN , and KM , will describe corresponding sections of those solids, all of which have the common altitude FI .

Now, as IF is equal to FB , by similar triangles KI is equal to KM , and IN is equal to IG or KL , and (Theorem XXXI., Cor.) $IN^2 = IK^2 + KN^2$; or $KI^2 = KM^2 + KN^2$; or the square of the longest radius of these circular sections is equal to the sum of the squares of the two others. And as circles are to each other as the squares of their radii (Theorem LXI., Cor.), the circle whose radius is KL is equal to the sum of those whose radii are respectively KM and KN ; or the section of the cylinder is equal to the sum of the corresponding sections of the sphere and cone; and hence, as the altitudes are the same, the cylinder is equal to the sphere and cone together. But (Theorem LXXVIII., Cor. 2) the cone is one-third of the cylinder having the same base and altitude; therefore a sphere is two-thirds of the cylinder whose base and altitude respectively are equal to the diameter of the sphere.

Cor. 1. Spheres are to each other as the cubes of their diameters, for they are like parts of their circumscribing cylinders.

PART II.

SPHERICAL GEOMETRY.

DEFINITIONS.

1. The circles of a sphere whose planes pass through the centre are called *great circles*; and those whose planes do not pass through the centre are called *less circles* of the sphere.

2. The pole of a circle, is a point on the surface of the sphere equidistant from every point in the circumference of the circle.

3. A spherical angle is an angle formed by the surface of a sphere by the arcs of two great circles which intersect each other, and it is the same as the inclination of the planes of the circles, or as the angle formed by the tangents of the arcs at the point of intersection.

4. A spherical triangle is a figure formed on the surface of a sphere by the intersection of three planes which meet in the centre of the sphere.

THEOREM LXXXIII.—Any two great circles as ADC, ABC (fig. 101, p. III.), mutually bisect each other.

For the centre of the sphere being in the plane of each circle, is in their line of common section, which line, being a straight line (Theorem LXIII.), is therefore a diameter; and hence ADC , and ABC , are semicircles.

THEOREM LXXXIV.—The distance of a great circle, ABC from its pole, D (fig. 101, p. III.), is a quadrant.

For ADC is a semicircle (Theorem LXXXIII.), and (Def. 2, SPHERICAL GEOMETRY) D is equidistant from every part of ABC ; A is therefore equidistant from the points A and C , and consequently AD and DC are quadrants.

THEOREM LXXXV.—If two great circles, as BA, CA (fig. 102, p. III.), intersect each other in A , on the surface of a sphere whose centre is D ; and if BC be an arc of a great circle whose pole is A , then BC is the measure of the spherical angle ABC .

For, join AD, BD , and CD , then as A is the pole of BC , AB and AC are quadrants, and the angles ADB and ADC are right angles, and consequently (PLANE Def. 3) the plane angle BDC is the angle made by the planes ADB and ADC , or A is equal to the spherical angle ABC (SPHERICAL GEOMETRY Def. 3). But the angle BDC is measured by the arc BC , hence the equal angle BAC is measured by the same arc BC .

Cor. 1. As AD is perpendicular to BD and DC , it is perpendicular to the plane BDC (Theorem LXIV.), therefore the planes ADB and ADC , which pass through AD , are also perpendicular to the plane BDC . Hence the spherical angles ABC and ACB are right angles.

Cor. 2. Great circles whose planes are at right angles to the plane of another great circle, meet in the poles of that circle.

Cor. 3. Great circles which are at right angles to each other, pass each through the poles of the other; and if one circle pass through the pole of another, it cuts that great circle at right angles.

THEOREM LXXXVI.—Any two sides, as AB and BC , of a triangle as ABC (fig. 103, p. III.) are together greater than the third side AC .

For if D be the centre of the sphere, then the solid angle D is contained by three plane angles ADB, BDC , and ADC , any two of which are greater than the third (Theorem LXXIII). But these angles are measured respectively by the arcs AB, BC , and AC , hence any two of these arcs as AB and BC are together greater than the third arc AC .

THEOREM LXXXVII.—The three sides of a spherical triangle, as ABC (fig. 103, p. III.), are together less than a circle.

For the plane angles which form the solid angle D are altogether less than four right angles (Theorem LXXIV.), therefore the arcs AB, BC , and AC , which measure those plane angles are altogether less than a circle.

THEOREM LXXXVIII.—In isosceles spherical triangles, the angles opposite the equal sides are equal; and if two angles of a spherical triangle are equal, the sides which are opposite those angles are equal.

Let ABC (fig. 104, p. III.) be a spherical triangle, having two sides AB and BC equal, and let D be the centre of the sphere. Let BE and EC be tangents to AB and AC , and BF, CF two tangents drawn from B and C in the plane DBC , and intersecting each other in F , and join FE . Then the angles DBE and DCE being right angles (Theorem XLIV.), and the angles EDB and EDC measured by the equal arcs AB and AC being also equal, and the adjacent sides DB and DC , radii of the same

sphere being equal, the triangles EDB and EDC are identical (Theorem II.) and have EB and BC equal; and BF being equal to FC (Theorem LVI. Cor.), and EF common to the two triangles EFB and EFC , those triangles are identical (Theorem V.) and have the angles EBF and ECF (which are equal to the spherical angles ABC and ACD) equal to each other.

Again, the same construction being made, suppose the spherical angles ABC and ACB , or the plane angles EBF and ECF , to be equal; then as D is at right angles to BE and BF , A is at right angles to the plane BEF (Theorem LXIV.); and therefore the plane DBC , which passes through D , is at right angles to the plane BEF (Theorem LXXI.). For a like reason the plane DBC is at right angles to the plane ECF , and consequently (Theorem LXXII.) FE , the common section of the planes EBF , ECF , is at right angles to the plane DBC . Hence EFB and EFC are right angles, and therefore as the angles EBF and ECF are equal, and the side BF equal to the side FC , the triangles EBF and ECF are identical (Theorem II). Whence BE is equal to EC , and as DB is equal to DC , and the angles DBC and DCE are equal, the angle EDB is equal to the EDC (Theorem I.); or the arc AB is equal to the arc AC .

THEOREM LXXXIX.—In any spherical triangle as ABC (fig. 105, p. III.) the greater side is opposite the greater angle, and the greater angle opposite the greater side.

If ABC be greater than A , let ABD , a part of ABC , be equal to A ; then (Theorem LXXXVIII.) AD is equal to DB , and consequently BD and DC are equal to AD and DC , but BD and DC are greater than BC (Theorem LXXXVI.) therefore AD and DC (or AC) are greater than BC .

Again if AC is greater than BC , then if the angle B is not greater than A , it must be equal to it, or less. If it were equal then AC and BC would be equal (Theorem LXXXVIII.), and if it were less then by the preceding part of the proposition AC would be less than BC ; both of which conclusions are inconsistent with the given condition that AC is greater than BC . Hence the angle B must be greater than the angle A .

THEOREM XC.—If A , B , C , the angles of the spherical triangle ABC (fig. 106, p. III.), be the poles of three great circles DE , EF , and FD , then D , E , and F , the points where these circles intersect will be the poles of AC , AB , and BC , respectively; and the sides DE , EF , and FD , will be respectively the supplements of the measures of the angles A , B , and C ; and the sides AB , BC , and AC , will also respectively be the supplements of the measures of the angles E , F , and D .

For let AB , AC , and BC , be produced both ways, till they meet DE , EF , and FD , in G , H , I , K , L , and M . Then GH is the measure of the angle BAC , KI the measure of ABC , and ML the measure of ACB (Theorem LXXXV.). And as A is the pole of DE , the angle AHD is a right angle (Theorem LXXXV. Cor. 1), and for a like reason the angle CLD is a right angle;

hence (Theorem LXXXV. Cor. 2) D is the pole of LH . In the same way it may be shown that E is the pole of GK , and F the pole of MI ; therefore LH is the measure of D , GK the measure of E , and MI the measure of F .

Now as D is the pole of LH , DH is a quadrant, and as E is the pole of GK , EG is a quadrant (Theorem LXXXIV.); therefore EG and DH , or ED and GH , together are a semicircle. Hence DE is the supplement of GH , the measure of the angle BAC . In a similar way it may be shown that EF is the supplement of the measure ABC , and that DF is the supplement of the measure of ACB .

Again, because A is the pole of DE , AG is a quadrant, and, because B is the pole of E , F is a quadrant. Hence AG and BK , or AB and KG , together are equal to a semicircle; or AB is the supplement of GK , the measure of the angle E . And in the same way it may be shown that AC is the supplement of the measure of D , and BC the supplement of the measure of F .

THEOREM XCI.—The sum of the interior angles of a spherical triangle is greater than two, and less than six right angles.

For (fig. 106, p. III.) the measures of the angles A , B , C , together with the sides of the supplemental triangle DEF are equal to three semicircles; and as (Theorem LXXXVII.) the three sides of the triangle DEF , are less than four semicircles, the measures of the angles A , B , and C , are greater than two semicircles; or those angles are greater than two right angles.

And, as the interior and exterior angles of any triangle are equal to six right angles, the interior angles alone must be less than six right angles.

THEOREM XCII.—If $AGFB$ (fig. 107, p. III.) be the circumference of a great circle, of which D is the pole, and C any other point on the surface of the sphere, the greatest arc of a circle that can be drawn from C to the circle $AGFB$ is that passing through D , and those which are nearer ADC are greater than those which are more remote.

For, as CA passes through the pole of AFB , the planes ACB and AFB are at right angles; therefore CE drawn in the plane ACB , perpendicular to AB the common section of the two planes, is perpendicular to AE , GE , and FE , which it meets in the plane AFB ; and (Theorem XXXVI.) AE is greater than GE , and GE greater than FE ; and the right-angled triangles AEC , GEC , FEC , having EC common, the hypotenuse AC is greater than GC , and GC greater than FC . Hence the arc AC is greater than the arc GC , and the arc GC greater than the arc FC .

THEOREM XCIII.—In any right-angled spherical triangle, the sides containing the right angle are of the same affection as their opposite angles; that is, if the sides are greater or less than quadrants, the opposite angles are greater or less than right angles; and, conversely, if the angles are greater or less than right angles, the opposite sides are greater or less than quadrants.

Let ABC (fig. 108, p. III.) be a spherical triangle, right-angled at A ; produce AC , AB , till

they meet in G , and bisect the semicircles ABG and ACG in E and F . Then F will be the pole of ABG and E the pole of AFG ; join CE , then CE will be a quadrant (Theorem LXXXIV.) and ECA will be a right angle (Theorem LXXXV. Cor. 3.). Hence when AB is less than AE , or less than a quadrant, the opposite angle ACB is less than a right angle.

Again, let ADC be a spherical triangle, right angled at A , having AD greater than a quadrant, then the angle DCA is greater than the angle ECA , or greater than a right angle.

The converse may be demonstrated in a similar manner.

THEOREM XCIV.—In the right-angled spherical triangle, if the sides which contain the right angle are of the same affection, the hypotenuse, or the side opposite the right angle, is acute; but if they be of different affections, the hypotenuse is obtuse.

For when AC and AB (fig. 108, p. III.) are each less than a quadrant, CB being farther from CFG than CE , is less than CE (Theorem XCII.), and therefore less than a quadrant. But if AD be greater, and AC less than a quadrant, then CD , being nearer CFG than CE , is greater than CE , or greater than a quadrant.

Again, in the right-angled triangle CGB , where CG and GB are each greater than a quadrant, CB being farther from CFG than CE is less than a quadrant.

Cor. 1. Hence, conversely, if the hypotenuse of a right-angled spherical triangle is greater than a quadrant, the sides about the right angle are of different affections; and, if the hypotenuse is less than a quadrant, the sides are of the same affection.

THEOREM XCV.—In any spherical triangle, as ABC (fig. 109, p. III.), if the perpendicular BD fall within the triangle, the angles A and C are of the same affection; but, if the perpendicular fall without the triangle, the angles at the base are of different affections.

For when BD falls within the triangle, the angles A and C of the right-angled triangles ADB and BDC , being each of the same affection with BD (Theorem XCIII.), are of the same affection with each other.

But, when the perpendicular falls without the triangle, the angles DAB and DCB , being each of the same affection with BD , are of the same affection with each other; hence BAC and BCA are of different affections.

PART III.

PRACTICAL GEOMETRY.

PROBLEM I.—To bisect a straight line, as AB (fig. 110, p. III.).

From the points A and B , as centres, with any radius greater than half AB , describe arcs cutting each other in n and m ; join n , m , and AB will be bisected in C , the point in which A is cut by m .

For join A , n , A , m , B , n , and B , m ; then because A , n , and A , m , are respectively equal to B , n and B , m , and n , m is common to both triangles Anm and Bnm , the angles Anm and Bnm are equal. And hence, as An and Bn are equal, n , C is common to both triangles, and the angle

AnC equal to the angle BnC , the remaining sides AC and BC are equal (Theorem I.), or AB is bisected in C .

PROBLEM II.—To bisect a given angle, as ABC (fig. 111, p. III.).

From the angular point B with any radius describe the arc AC , and from the points A and C , with the same or any other radius, describe arcs intersecting in n . Join B , n , and A will bisect the angle ABC .

For An and Cn being joined, then (Theorem V.) the triangles ABn and nBC are equal in every respect, and therefore the corresponding angles ABn and CBn are equal, or the angle ABC intersected by the line Bn .

PROBLEM III.—From a given point C in a given line as AB (figs. 112 and 113, p. III.) to draw a perpendicular.

1. When the point C is near the middle of the line (fig. 112, p. III.) On each side of C take any two equal distances Cn , Cm ; and from n and m , with any radius greater than Cn or Cm , describe arcs cutting each other in s . Join s , C , then that line will be the required perpendicular.

For (Theorem V.) the angles ACs , and BCs , are equal, and therefore (Def. 7.) Cs is perpendicular to AB .

2. When the point C is near the end of the line (fig. 113, p. III.). Take any point, o , as a centre, and with the radius oC describe an arc cutting AB in m and C . Through m and o , draw the line mo , cutting the arc in n . Join n , C , and it will be the perpendicular required.

For the angle mCn , being in a semicircle, is a right angle (Prop. 37, Cor. 3.) therefore nC is perpendicular to AB .

Or from any scale of equal parts take Cm equal to four parts, and with C as a centre and radius equal to two or three parts, describe an arc; and with m as a centre, and radius equal to five of the same equal parts, describe an arc, cutting the preceding one in n , join n , C , which will be perpendicular to AB .

For $5^2 = 4^2 + 3^2$; hence (Theorem LIV. Cor. 2), ACn is a right angle.

PROBLEM IV.—From a given point C , out of a given line AB , to draw a line perpendicular to AB (figs. 114 & 115, p. III.).

1. When the given point is nearly opposite the middle of the line, as in fig. 114. Take any point o , on the other side of AB , and from the centre C , with the radius Co , describe an arc, cutting AB in m and n ; bisect n in G , and join CG ; then CG is perpendicular to AB . For Cn and Cm are equal, and Gn and Gm are equal, and GC common to the triangles CnG and CmG , therefore the angles CnG and CmG are equal (Theorem V.), or CG is perpendicular to AB .

2. When the point is nearly opposite the end of the line, as in fig. 115. Draw any line Cm , from C to AB ; bisect Cm in n , and with centre n and radius Cn or mn describe a circle, cutting AB in G ; then, if CG be joined, the line will be perpendicular to AB . For the angle CGm being in a semicircle is a right angle.

PROBLEM V.—At a given point D , in a given line DE , to make an angle equal to a given angle ABC (fig. 116, p. III.).

From B as a centre with any radius, describe the arc nm , cutting BA, BC, in the points m, n ; and from D as a centre, with the same radius, describe the arc rs ; take the distance mn , and apply it to the arc rs , from r to s . Draw DF through D and s , then the angle EDF will be equal to the angle ABC, as is evident from Theorem V.

PROBLEM VI.—Through a given point C (fig. 117, p. III.) to draw a line parallel to AB.

From C to AB draw any line CD; then through C draw CE, making the angle ECD equal to the alternate angle CDA, then (Theorem XVI.) CE is parallel to AB.

PROBLEM VII.—To draw a line, as FC (fig. 118, p. III.), parallel to another line AB, and at the distance of CD from A.

At any point E in AB, draw EF perpendicular to AB, and equal to CD, and through F draw FG parallel to AB, and A will, as is evident, be the required line.

PROBLEM VIII.—To divide a line as AB (fig. 119, p. III.) into n equal parts.

Through one extremity A, draw any line AC, and on it take $n + 1$ equal parts, D being the termination of the $n + 1^{\text{th}}$ part, I that of the n^{th} part, and F that of the $n - 1^{\text{th}}$ part. Join DB, and produce it till BE is equal to BD, and join EF, cutting AB in P, then BP is the n^{th} part of AB. For FI being equal to IB, and EB to BD, FE and IB are parallel, therefore $AB : BP :: AL : IF :: 1 : n$; therefore BP is the n^{th} part of AB.

PROBLEM IX.—To find the centre of a circle AD BC (fig. 120, p. III.)

Draw any chord AB, and A, bisect it with the perpendicular CD; bisect CD in O, and O will be the centre of the circle.

For if the centre is in CD, it must be in O, the middle of it. If it is not in CD let it be at F, and join FE, FA, and FB; then AF will be equal to FB, AE to EB, and EF common to the two triangles AFE and BFE, which (Theorem V.) are therefore identical, and consequently the angles AEF and BEF, being equal, will be right angles, and each equal therefore to the angle BEC, which is impossible. Hence the centre is in CD, and consequently it is in the point O.

PROBLEM X.—To describe the circumference of a circle through three given points, A, B, C, (fig. 121, p. III.)

Join AC, BC, and bisect these lines with the perpendiculars DO and EO, and from the point O, with the distance OA, OB, or OC, describe the circle ABC, and it will be the circle required.

For as AD and DO are respectively equal to CD and DO, and the included angles ADO, and CDO, are equal, AO and CO are equal; and for a like reason BO is equal to CO.

Hence O is the centre of a circle passing through A, B, and C.

Note. By this problem a circle may be described about a triangle.

PROBLEM XI.—To inscribe a circle in a triangle, as ABC (fig. 122, p. III.) Bisect any two of the angles as A and B, and the bisecting lines AD and BD will meet in the centre of the circle.

For from D draw DE, DF, and DG, perpendicular to the sides. Then as the angles DAG and DAE are equal, and the right angles DEA and DGA are equal, the angles ADE and ADG are equal; and consequently, as AD is common to both triangles, GD and DE are equal.

In the same way it may be shown that DE and DF are equal; and as the angles E, F, and G, are right angles, a circle described from D as a centre, with any of these equal lines as a radius, will touch the sides in E, F, and G, and it will consequently be inscribed in the triangle.

PROBLEM XII.—To make a triangle equal to any rectilineal figure, as ABCDE (fig. 123, p. III.)

Draw AD, and parallel to it draw EF, meeting AB produced in F, then the triangles ADE and AFD are equal (Theorem XXIV. Cor.) Proceed similarly with DB and CG, and the triangle FDG will obviously be equal to the figures ABCDE.

In the same way the figure may be reduced to a triangle whatever be the number of sides.

PROBLEM XIII.—To make a rectangle equal to a given triangle, ABC (fig. 125, p. III.)

Bisect AB in D with the perpendicular DE meeting CF, drawn parallel to AB in E; and draw BF parallel to DE. Then the rectangle DF will be equal to the triangle ABC (Theorem XXV. Cor. 3).

PROBLEM XIV.—To find BD, the side of a square whose area is equal to a rectangle contained by AB and BC (fig. 125, p. III.)

Upon AC, the sum of AB and BC, describe a semicircle, and draw the perpendicular BD, which will be the side of the square. For the rectangle of AB and BC is equal to the rectangle of BD, and the other segment of the chord, of which BD is a part (Theorem LVI.); but (Theorem XLII.) that segment is equal to BD; therefore the rectangle $AB \cdot BC$ is equal to the square of BD.

PROBLEM XV.—On a straight line AB (fig. 126, p. III.) to describe the segment of a circle, to contain an angle equal to a given angle.

Make BAC equal to the given angle, bisect AB with the perpendicular DE, meeting AE, a perpendicular to AC in E, then with E as a centre, and EA or EB as a radius, describe the circle AFBG; then (Theorem XI.) the angle BAC is equal to any angle in the segment AGB.

GEORGE II. See GREAT BRITAIN and HANOVER.

GEORGE III. See GREAT BRITAIN.

GEORGE (St.), a saint or hero, after whom several orders, both military and religious, are denominated. On some medals of the emperors John and Manuel Comneni, we have the figure of St. George armed, holding a sword or javelin in one hand, and in the other a buckler, with this inscription; an O, and therein

P

a little A, and ΓΕ—ΠΙΟC, making ΟΑΓΙΟΣ—

O

ΓΕΟΡΓΙΟΣ, *O holy George*. He is generally represented on horseback; and is highly venerated throughout Armenia, Muscovy, and all the countries which adhere to the Greek church; from the Greek, his worship has long been received into the Latin church; England and Portugal have both chosen him for their patron saint. Great difficulties have been raised about this saint or hero. His very existence has been called in question. Dr. Heylin supposed him only a symbolical device; and Dr. Pettingal asserted him to be a mere Basilidian symbol of victory. The following is Mr. Gibbon's account of this saint. He asserts him to have been an Arian bishop born at Epiphania in Cilicia, in a fuller's shop. From this obscure and servile origin, says this author, he raised himself by the talents of a parasite: and the patrons, whom he assiduously flattered, procured for their worthless dependent a lucrative commission, or contract, to supply the army with bacon. His employment was mean: he rendered it infamous. He accumulated wealth by the basest arts of fraud and corruption; but his malversations were so notorious, that George was compelled to escape from the pursuits of justice. After this disgrace, in which he appears to have saved his fortune at the expence of his honor, he embraced with real or affected zeal the profession of Arianism. From the love, or the ostentation, of learning, he collected a valuable library of history, rhetoric, philosophy, and theology; and the choice of the prevailing faction promoted George of Cappadocia to the throne of Athanasius. His conduct in this station is represented by our historian as polluted by cruelty and avarice, and his death is by him considered as a

just punishment for the enormities of his life. The occasion of his death, however, as narrated by ecclesiastical writers, will not add any stain to his memory. There was in Alexandria a place in which the priests used to offer human sacrifices. This place Constantius gave to the church of Alexandria, and George the bishop ordered it to be cleared, to build a Christian church on it. In doing this, they discovered a subterraneous cavern, in which the heathen mysteries had been performed, and in it were many human skulls. These, and other things which they found in the place, the Christians brought out and exposed to public ridicule. The heathens, provoked at this exhibition, took arms, and rushing upon the Christians killed many of them; they also seized the bishop in the church, and put him in prison. The next day they despatched him; and then, fastening his body to a camel, dragged it about the streets all day, and in the evening they burnt it and the camel together. This fate, according to Sozomen, the bishop owed in part to his haughtiness while he was in favor with Constantius; but he ascribes it chiefly to the inveteracy of the heathens, whose superstitions George had been very active in abolishing. But Mr. Gibbon gives a different turn to the affair of George's murder, and relates it with different circumstances. 'The Pagans,' says he, 'excited his devout avarice; and the rich temples of Alexandria were either pillaged or insulted by the haughty prelate, who exclaimed, in a loud and threatening tone, 'How long will these sepulchres be permitted to stand?' Under the reign of Constantius, he was expelled by the fury, or rather by the justice of the people; and it was not without a violent struggle that the civil and military powers of the state could restore his authority and gratify his revenge. The messenger who proclaimed at Alexandria the accession of Julian announced the downfall of the archbishop. George, with two of his obsequious ministers, count Diodorus and Dracontius master of the mint, was ignominiously dragged in chains to the public prison. At the end of twenty-four days the prison was forced open by the rage of a superstitious multitude, impatient of the tedious forms of judicial proceedings. The enemies of gods and men expired under their cruel insults; the lifeless bodies of the archbishop and his associates were carried in triumph through the streets on the back of a camel; and the inactivity of the Athanasian party was esteemed a shining example of evangelical patience. The remains of these guilty wretches were thrown into the sea; and the popular leaders of the tumult declared their resolution to disappoint the devotion of the Christians, and to intercept the future honors of these martyrs who had been punished, like their predecessors, by the enemies of their religion. The fears of the Pagans were just and their precautions ineffectual. The meritorious death of the archbishop obliterated the memory of his life. The rival of Athanasius was dear and sacred to the Arians, and the seeming conversion of these sectaries introduced his worship into the bosom of the Catholic church. The odious stranger, disguising every circumstance of time and place,

assumed the mask of a martyr, a saint, and a Christian hero; and the infamous George of Cappadocia has been transformed into the renowned St. George of England, the patron of arms, of chivalry, and of the garter.' *Hist.* vol. ii. p. 404.

GEORGE (St.), KNIGHTS OF. See **GARTER**. There have been various orders under this denomination, most of which are now extinct; particularly one founded by the emperor Frederik III. in 1470, to guard the frontiers of Bohemia and Hungary against the Turks; another called St. George of Alfama, founded by the kings of Arragon; a third and fourth in Austria and Carinthia; and a fifth in the republic of Genoa, &c.

GEORGE (St.), the largest of the Bermuda Isles, is about fifteen miles in length, and three in breadth; a reef of rocks, which extend some way into the sea, surrounds and greatly protects it. Ships, however, can only approach in two places without great hazard, and here the assistance of an experienced pilot is needful. It is divided into nine parishes, or districts. Long. $63^{\circ} 30' W.$, lat. $32^{\circ} 45' N.$

GEORGE (St.), a small island in the Pacific Ocean, near the coast of New Ireland, above a league north from Cape St. George.

GEORGE'S (St.), a large and deep bay on the west side of the island of Newfoundland. Lat. $48^{\circ} 12' N.$

GEORGE'S (St.), a river of the United States, in Maryland, which runs into the Potowmack, twelve miles south-west of Fort Cumberland.

GEORGE'S (St.), a river, or rather an arm of the sea, in the United States, about two leagues south-west of Penobscot Bay. It is navigable for brigs and ships of burden, up to what are called the Narrows, and from thence about four miles higher up, to nearly the head of the tide water, for sloops and schooners of eighty or ninety tons.

GEORGE'S (St.), a cape and island on the coast of East Florida, opposite to the mouth of the Appalachia. The cape is formed by the largest of the islands of this name, and is six leagues east of Cape Blaize, in N. lat. $29^{\circ} 38'$.

GEORGE'S (St.), the capital of the island of Grenada, once called Fort Royal, has one of the best harbours in the West Indies. It is divided into two parts, the Bay Town and the Carenage Town, by a remarkable ridge which terminates in the sea. The harbour is fortified, and there is a large old work of the French on a promontory above the town. On the ridge stands the church. The town is altogether pretty well occupied by the principal merchants residing in the Carenage division: in the Bay town, however, is a handsome square and market place.

GEORGE'S BAY (St.), a bay on the east coast of New Ireland, between Cape St. George and Cape Orford.

GEORGE, CAPE, a cape on the south coast of Kerguelen's Land. Long. $70^{\circ} 13' E.$, lat. $49^{\circ} 54' S.$ —It is also the name of a cape on the coast of Newfoundland. Long. $59^{\circ} 17' W.$, lat. $48^{\circ} 28' N.$, and of another on the coast of Peru. Lat. $23^{\circ} 50' S.$ —Also a cape on the north coast of the island of South Georgia. Long. $36^{\circ} 32' W.$, lat. $54^{\circ} 17' S.$

GEORGE'S CHANNEL (St.), that part of the Atlantic which runs between Ireland and Wales, or which opens from the Scilly Islands on the south, and the south-east point of Ireland on the north, and up northward between the two lands till it takes the name of the Irish sea. Ships that are bound up St. George's Channel will receive ample instructions, by attending to the rules laid down for avoiding the Scilly Islands, and ensuring a proper entrance into the English channel. Some confine the name of St. George's channel to begin only from the entrance of the narrow sea between the south-east point of Ireland and St. David's head on the coast of Wales, nearly to the east from it; in that case, all the sea to the northward of Scilly hither, is called the Bristol Channel, but in the former it is limited to the opening of the Severn Sea, between Hartland Point on the south and St. Gowan's Point on the north. In some charts the whole of the narrow sea between St. David's Head and the Mull of Galloway is all called St. George's Channel, or the Irish Sea, indifferently.

GEORGE'S CHANNEL (St.), is also a channel along the south-west coast of New Ireland, and extends from Cape St. George to Queen Charlotte's Foreland, and from thence about eight leagues to Portland's Island. This is about 100 leagues or 300 miles. In some part of this channel, near New Britain, the land seems to affect the needle, as the variation was considerably short of $5^{\circ} E.$

GEORGE, FORT, a strong and regular fortress of Scotland, in Inverness-shire. It has several handsome streets of barracks, and is seated on the point of Ardersier, a peninsula running into the frith of Murray. It completely commands the entrance into the harbour of Inverness, and lies opposite to Fortrose, ten miles north-east of Inverness.

GEORGE, FORT, (St.). See **MADRAS**.

GEORGE LAKE, a lake in the county of Washington, state of New York, about thirty-three miles long, and nearly two broad, discharges itself northward into Lake Champlain, at Ticonderoga. The entire north end is not more than two miles and a half from that lake, towards which the water is said to descend nearly 100 feet. Surrounded by high mountains, and remarkably clear, Lake George is no where excelled in scenery of romantic beauty. The water is also very deep, and the bottom so clean that neither winds or freshets render it turbid. It abounds with the finest fish. Here are also several small islands: Fort George at the north end, and the once famous Fort Ticonderoga, are both now in ruins.

GEORGE, LAKE, a lake of New York south-west of Lake Champlain, thirty-six miles long from north-east to south-west, and from one to seven broad. Its waters are 100 feet higher than those of lake Champlain.

GEORGE, LAKE, also called the Great Lake, in East Florida, is a division of the river St. John. It is about fifteen miles wide.

GEORGE'S TOWN (St.), the principal town of St. George's, one of the Bermudas Islands, in the North Atlantic Ocean, is in lat. $32^{\circ} 45' N.$, and long. $63^{\circ} 35' W.$ It has a good church, town-house and library, and is well fortified.

GEORGIA, a mountainous country of Asia, between the Black Sea and the Caspian, to the north of Armenia, and forming the frontier between Russia and Persia. The Caucasian ranges supply it to the south with fertilising streams, and it unites the products of both the tropical and temperate climates. Mr. Kenneir speaks of it as 'perhaps the most beautiful and highly favored region in the world. The face of the country is diversified with extensive plains, and watered by innumerable rivers; the hills are covered with forests of pine, oak, ash, beech, chestnuts, walnuts, and elms, entwined with vines, growing perfectly wild, and producing vast quantities of grapes. The plains are exceedingly fertile; cotton grows spontaneously, as well as the finest European fruit-trees; and rice, wheat, millet, hemp, and flax, are raised almost without culture. The rivers are full of the most delicious fish: poultry and game may be shot in the woods; and in the hills are to be found mines of gold, silver, and other minerals. Even the natives appear to more perfection than in any other country with which we are acquainted. The men are tall and elegantly formed, whilst the grace and beauty of a Georgian girl are proverbial throughout the East.'

Georgia originally included nearly the whole southern declivity of the Caucasus, and was regarded as extending from the Black Sea to the Caspian. But of late the name has been confined to that part of the region which was once subject to Persia; and which asserted its independence under its native prince, Heraclius, toward the close of the last century. For a short time it was a separate kingdom; but the colossal power of Russia, which was first favorable to its throwing off the yoke of servitude, finally crushed it. It is now a province of the Russian empire, and divided into the four provinces of Cartuel, Kaketi or Kacheti, Kisik called sometimes Somchet, and Georgian Armenia. It has been the seat of various wars between Russia and Persia. The capital is Tiflis.

The inhabitants, who are about 370,000, are generally of the Greek church, but there are many Mahomedans among them. Their dress nearly resembles that of the Cossacks; but men of rank frequently wear the habit of Persia. They usually dye their hair, beard, and nails, with red. The women, remarkable for their beauty and fine forms, employ the same color to stain the palms of their hands. On their heads they wear a cap, or fillet, under which their black hair falls on their forehead: behind, it is braided into tresses. Their eye-brows are painted with black, so as to form one entire line, and their faces are frequently coated with white and red. Their robe is often open to the girdle, and their general air and manner are said to be voluptuous. Being generally educated in convents, they can read and write; a qualification very unusual among the men even of some respectability. Girls are betrothed as soon as possible, often at three or four years of age. Travellers accuse the Georgians of drunkenness, superstition, cruelty, and sloth: and the mountains are the haunt of numerous banditti; they are certainly the most powerful body of mountaineers in this neigh-

bourhood. The nobility are numerous, and possess extensive private jurisdiction. See TIFLIS.

GEORGIA, one of the southern United States of America, bounded on the east by the Atlantic Ocean, on the south by East and West Florida, on the west by the Mississippi, and on the north-east and north by South Carolina and Tennessee. It is 270 miles long and 250 broad, containing 620,000 square miles: and is divided into Upper and Lower Georgia, which comprise the following counties and chief towns.

Counties.	Chief Towns.
Baldwin	Milledgeville
Bryan	C. H.
Bullock	Statesburgh
Burke	Waynesborough
Camden	St. Mary's
Chatham	Savannah
Clarke	Athens
Columbia	Applington
Effingham	Ebenezer
Elbert	Petersburg
Emanuel	
Franklin	Carnesville
Glynn	Brunswick
Greene	Greensborough
Hancock	Sparta
Jackson	Jeffersonston
Jasper	Monticello
Jefferson	Louisville
Jones	Clinton
Laurens	Dublin
Liberty	Riceborough
Lincoln	Lincolnton
Madison	Danielsville
McIntosh	Darien
Montgomery	C. H.
Morgan	Madison
Oglethorpe	Lexington
Pulaski	Hartford
Putnam	Eatonton
Richmond	Augusta
Savannah	Jacksonborough
Scribner	C. H.
Tattnal	C. H.
Telfair	Marion
Twiggs	
Walton	
Warren	Warrenton
Washington	Saundersville
Wayne	C. H.
Wilkes	Washington
Wilkinson	Irwinton.

This state is watered by the Savannah, separating it from South Carolina, the Ogeechee, Alabama, Satilla, Oakmulgee, Oconee, St. Mary's, Flint, Chatahoochee, Tallapoosa, and Coosa. The coast is bordered, for four or five miles inland, with salt marshes, generally uninhabited. In front of them is a chain of islands of a grey rich soil, covered in their natural state with pine, hickory, and live oak, and yielding on cultivation sea-island cotton. The principal of these are Wassaw, Ossabaw, St. Catharine's, Sapello, St. Simon's, Jekyll, and Cumberland. The east part of the state between the mountains, the ocean, and the Savannah and St. Mary's rivers, is an entirely level tract of 120 miles

long from north to south, and from forty to fifty broad, without a single hill or stone. About forty-five miles from the sea coast the lands begin to be uneven, ridges gradually rise into hills, and these into mountains, till they terminate in the Alleghany and Appalachian chains.

The rivers and creeks are generally bordered with marshes, in which are situated rice plantations, mingled with what are called the pine-barrens, which extend from sixty to eighty miles from the sea. Beyond these the country becomes uneven, diversified with hills and mountains, of a strong rich soil, producing cotton, tobacco, maize, wheat, and other grain. The north-western part of the state is mountainous, and abounds in sublime and picturesque scenery.

The soil of Georgia is various; but a large proportion is very productive. At a distance from the sea it changes from gray to red; in some places it is gravelly, but fertile; and farther back in the country its tint is gradually deepened, till it becomes what is called the mulatto soil, consisting of black mould and red earth. This sort of land is generally strong, and affords abundant crops of wheat, tobacco, corn, &c. It is succeeded in its turn by a soil that is nearly black, and very rich, on which are large quantities of black walnut and mulberry. The pine-barrens produce grapes of large size and good flavor. The forests abound in fine oak, pine, hickory, cedar, and mulberry trees. Of fruits are plentiful, figs, melons, oranges, pomegranates, olives, lemons, limes, citrons, pears, and peaches. The exports, which consist chiefly of cotton, rice, lumber, tobacco, canes, deer skins, and maize, amounted, in 1816, to 7,511,939 dollars.

The winters in Georgia are mild and pleasant; snow is seldom seen, nor is vegetation interrupted by severe frosts. There are several valuable mineral springs in this state; one near Washington; one in Jefferson county, twelve miles south-east of Louisville; and another in Madison county, five miles from Danielsville. A considerable part of the territory of this state is in the possession of the Creek and Cherokee Indians, the former inhabiting the south-west and west, and the latter the north-west parts. The seat of government is Milledgeville, but Savannah and Augusta are the largest towns. The other most considerable towns are Washington, Louisville, Darien, St. Mary's, Greensborough, Petersburg, and Sparta.

The legislature consists of a senate and a house of representatives, chosen annually by counties, each county sending one senator, and not less than one, nor more than four representatives. The governor is elected for two years, by a joint vote of both houses. The legislature meets on the second Tuesday in January. The constitution provides for a census of the state to be made once in seven years. Georgia sends six representatives to Congress.

The legislature has established a college at Athens, styled Franklin College, and has made provision for an academy in each county; the college and academies all to be united under the name of the university of Georgia. Great attention is paid to education throughout the state.

The settlement of a colony between the Savannah and Altamaha was first proposed in England in 1732, for the accommodation of poor emigrants from Great Britain and Ireland, and for the farther security of Carolina. Private compassion and public spirit conspired to promote the benevolent design, and George II. granted letters patent, dated June 9th, 1732, for legally carrying it into execution. The new province was called Georgia, in honor of the king who encouraged the plan. A corporation, consisting of twenty-one persons, was constituted by the name of the Trustees for Settling and Establishing the Colony of Georgia. In November, 1732, 116 settlers were conveyed thither free of expense, furnished with every thing requisite for building and for cultivating the soil. Mr. James Oglethorpe, one of the trustees, and an active promoter of the settlement, embarked as the head and director of these settlers. They arrived at Charlestown early in the following year, and soon began to build a small fort, on the site of the present Savannah, and a number of huts for their defence and accommodation. A treaty of friendship was concluded between the settlers and their neighbours the Creek Indians, and every thing wore the aspect of peace and future prosperity. Afterwards 570 adventurers, among whom were 130 Highlanders, and 170 Germans, were prevailed on to emigrate to Georgia. But the fundamental regulations established by the trustees of Georgia were ill adapted to the circumstances and situation of the settlers. Like other distant legislators, who framed their regulations upon principles of speculation, they were liable to many errors and mistakes; and however good their design, their rules were found impracticable. These, in fact, together with the wars in which they were involved with the Spaniards and Indians, and the frequent insurrections among themselves, threw the colonists into a state of confusion and wretchedness too great for human nature long to endure. Their oppressed situation was represented to the trustees by repeated complaints; till at length, finding that the province languished under their care, and weary with the complaints of the people, the trustees in 1752 surrendered their charter to the king, and it was made a royal government. From this time till the peace of Paris, in 1763, the colony struggled under many difficulties arising from the want of credit, and the frequent molestation of enemies. The good effects of the peace were sensibly felt. It now began to flourish under the care of governor Wright; and within ten years only, from 1763 to 1773, its exports arose from £27,021 to £121,676 sterling. During the American war, Georgia was over-run by the British, and the inhabitants were obliged to flee into the neighbouring states for safety. Since the period of the independence of the states, the population, agriculture, and commerce, have increased with astonishing rapidity, though they have been occasionally retarded by the hostile irruptions of the Indians. In 1789 the constitution was new-modelled upon a plan similar to that of the other states, and in 1790, a pretty firm treaty of peace was concluded between the United States

and the Indians. In 1817 the population was 309,440 of whom 133,459 were blacks.

GEORGIA, GULF OF, is a large gulf of the north Pacific Ocean, between the continent of North America and Quadra and Vancouver's Island. Captain Vancouver describes upwards of twenty ports in the gulf of Georgia, of which the easiest of access is Port de los Angeles, or Port Discovery, on the south shore. In the gulf are a number of islands, in general less rugged and barren than the main land, which for the most part is extremely desolate, the naked rocky mountains rising abruptly from the shores, and vast torrents from the melted snows tumbling down their sides. The entire gulf is about 120 miles long from north to south, and varying from six to twenty miles in breadth.

GEORGIA NEW OR SOUTH, ISLAND, was discovered by La Roche in 1675, but its extent was not ascertained until 1776, when Cook visited it. It presents nothing but mountains raising their heads to the clouds, and surmounted by glaciers, while the valleys are covered with perpetual snow. A strong bladed grass in tufts, and some small shrubs, is the only vegetation. The dung of an animal, supposed to be a fox, was the only indication of the existence of quadrupeds, and the only land bird seen was the lark. The atmosphere is enveloped in constant mist, which, together with the numerous detached islets and rocks, renders the navigation perilous. Sandwich Bay, near the middle of the land, is in 54° 42' S., 36° 12' W.

GEORGIC, *n.s. & adj.* Gr. $\gamma\eta$ and $\epsilon\rho\gamma\omicron\nu$, a work. A description of agricultural pursuits: applied particularly to poems of Hesiod and Virgil.

GEORGIO MAGGIORE (St.), an island of the Adriatic near Nancy, and containing one of the noblest Benedictine establishments in Italy. The church is particularly handsome, and contains the tombs of several of the Venetian doges.

GEORGIUM SIDUS, or the Georgian Planet, the name given by Herschel to the planet which he discovered. It is also sometimes called Uranus, but more generally Herschel, in compliment to its discoverer. See ASTROLOGY and HERSCHEL. Foreign astronomers have already named this planet Herschel, after its discoverer.

GEPIDÆ, GEPIDÆ, or GEPIDI, in ancient geography, according to Procopius, were a Gothic people, some of whom, in the migration of the Goths, settled in an island at the mouth of the Vistula, which they called Gepidos after their own name, which denotes lazy or slothful; others in Dacia, calling their settlement there Gepidia.

GERA, a town of Saxony, in the Vogtland and on the White Elster River. It is the capital of a district belonging to the counts of Reuss, and surrounded by walls. The streets are straight and regular, having been almost entirely rebuilt after a fire in 1780. It is a considerable manufacturing town in woollen and cotton cloths, and has a provincial school. Population 7500. Thirty miles S. S. W. of Leipsic, and sixty-eight west of Dresden.

GERANIUM, crane's bill, in botany, a genus of the decandria order, and monadelphia class of plants; natural order fourteenth, grui-

nales. Its characters are these:—the flower has a permanent empalement, composed of five small oval leaves, and five oval or heart-shaped petals, spreading open, which are in some species equal, and in others the two upper are much larger than the three lower. It has ten stamina, alternately longer than each other, but shorter than the petals, and terminated by oblong summits. In the bottom of the flower is situated a five-cornered germen, which is permanent. The flower is succeeded by five seeds, each being wrapped up in the husk of the beak, where they are twisted together at the point, so as to form the resemblance of a stork's beak. There are above forty species. The common wild sorts, and those which are brought from the colder climates, are hardy enough, and require little care; but the African species, and the others from hot countries which make so very beautiful a figure in our green houses, require great care in their culture and propagation. These may be propagated by seed, which should be sown towards the end of March in beds of light earth, carefully shading them from the sun, and giving them frequent, but gentle waterings, till they are well rooted. The mats with which these beds are covered are to be taken off in gentle showers, and always in the hot weather at nights, that the plants may have the benefit of the dew. They should remain about two months in this bed, by which time they will have taken root. Some pots of about seven inches wide should then be filled with light earth, and the plants taken up with as much as possible of their own earth about them, and planted severally in the middle of these pots; when they are to be set in a shady place, and watered at times till they have taken root. When well rooted, they should be set in a more exposed place to harden them, and should stand out till the middle of October; but, when the mornings begin to grow frosty, they must be removed into the green-house, and then placed as near the windows as possible, and the windows should be opened upon them till the weather is very cold. During the winter they must be often watered a little at a time, and their dead leaves should be pulled off. They must not stand under the shade of other plants, nor near any artificial heat. Those who wish that their plants should be large and flower soon, sow the seeds on a moderate hot-bed in the spring; when they are come up, they should not be drawn weak, and the pots into which they are transplanted should be plunged into another moderate hot-bed; shading them from the sun till they have taken root, and gradually inuring them to the open air, into which they should be removed in the beginning of June, and placed in a sheltered situation with other exotic plants. The shrubby African geraniums are commonly propagated by cuttings, which planted in a shady border, in June or July, will take good root in five or six weeks; and they may then be taken up and planted in separate pots, placing them in the shade till they have taken new root; after which they may be removed into a sheltered situation, and treated as the seedling plants.

GERAR, or GERARA, in ancient geography, the south boundary of Canaan near Bersaba;

situated between Cades and Zur: two deserts, the one facing Egypt and the other Arabia Petræa.

GERARD (Alexander), D.D., professor of divinity in King's College, Aberdeen, was born in 1728. He received the rudiments of his education at Foveran, and Aberdeen; and at twelve years of age entered student at Marischal College, and in four years afterwards was admitted A.M.: after which he studied theology at the universities of Aberdeen and Edinburgh. Having been licensed to preach, in 1748, he was chosen assistant to professor Dr. Fordyce in 1750, and was appointed his successor, in 1752. On the 5th of September, 1759, he was ordained a minister of the church of Scotland: on the 11th of June, 1760, he was appointed professor of divinity in the Marischal College, and minister of the Gray-friars church at Aberdeen; and about the same time he was created D.D. On the 18th June, 1771, he resigned both these offices, and was appointed professor of divinity in King's College; which situation he held till 1795, when, having just entered his sixty-eighth year, he died of a schirous tumor in his face. He was the author of, 1. *An Essay on Taste*: 8vo. 1759. 2. *Dissertations on subjects relating to the genius and Evidences of Christianity*, 8vo. 1766. 3. *An Essay on Genius*, 8vo. 1774. 4. *Several Sermons on various subjects*, published from 1760 to 1782; and, 5. *A part of his theological course, entitled The Pastoral Care*, published in 1799, by his son, Dr. Gilbert Gerard, who succeeded him in his professorship. His *Essay on Taste* gained the gold prize medal given by the Philosophical Society of Edinburgh in 1756. Dr. Gilbert Gerard also published 1. *On Indifference with respect to Religious Truths*, a sermon, 8vo. 2. *Institutes of Biblical Criticism*, 8vo., dedicated to Dr., now bishop, Herbert Marsh.

GERARD (Tung, or Tom), founder and first grand master of the knight's hospitalers of St. John, or knights of Malta, was born at Amalfi in Italy, in the eleventh century. In A.D. 1100 he assumed a religious habit, with a white cross on the breast, and, with many others, engaged in vows of chastity, poverty, and to relieve all Christians in distress, &c. He died in 1120, and was succeeded as grand master by Raymond du Puy. See MALTA.

GERARDE (John), an English surgeon and botanist, was born at Nantwich, in Cheshire, in 1545. He practised professionally as a surgeon in London, where also he became gardener to lord Burleigh; he himself had also a large botanic garden in Holborn, of which he published a catalogue in 1596. His great work is his *Herbal*, printed in 1597, and re-published by Dr. Thomas Johnson, in 1636, folio. Gerarde died in 1607.

GERARDIA, in botany, a genus of the angiospermia order, and didynamia class of plants; natural order fortieth, personatæ. CAL. quinquefid; cor. bilabiate; the under lip tripartite; the side lobes emarginated, and the middle one bipartite: caps. bilocular and gaping. Species one; a native of Africa.

GERBIER (Sir Balthazar), a painter of Ant-

werp, born in 1592, who distinguished himself by painting small figures in distemper. King Charles I. was so pleased with his performances that he invited him to court, where he was in great favor. He was knighted, and sent to Brussels, where he long resided as agent for that monarch.

GERBILLON (John Francis), one of the most celebrated of the Jesuit missionaries in China, was born in 1654. He was in great favor with the emperor, for whom he composed two books on geometry, printed at Pekin in the Chinese and Tartarian languages. He wrote also *Historical Observations on Great Tartary*, and an Account of some of his Travels, inserted in Du Halde's *History of China*. He died at Pekin, superior general of all the missions in China.

GERFALCON, *n. s.* Fr. *gerfault*. A bird of prey of the greatest strength next to the eagle.

GERFALCON. See FALCO.

GERGESA, in ancient geography, a Transjordan town, no otherwise known than by the Gergesenes of St. Matthew, Gergesæi of Moses; supposed to have stood in the neighbourhood of Gadara, and near the sea of Tiberias.

GERGESÆI, or GERGESENES, one of the seven ancient nations of Canaan, less frequently mentioned than the rest. They appear to have been less considerable and more obscure: their name is from Girgasi, one of Canaan's sons. See GIRGASHITES.

GERINA, or CERINA, a town on the northern coast of the island of Cyprus. The wall about half a mile in circumference, was formerly strong; but the greater part of it as well as the port is now in ruins. On the east side of the harbour stands a lofty castle, erected by the Venetians; and defended by four guns. The trade is inconsiderable, and the place does not contain above 1500 families. Sixteen miles N. N. W. of Nicosia.

GERISM, GERIZIM, or GARIZIM, in ancient geography, a mountain of Samaria, at the foot of which stood Shechem; famous for the temple built on it by Sanballat, in favor of his son-in-law Manasseh, by the permission of Alexander the Great; and destroyed 200 years after, by John Hyrcanus, son of Simon, the fourth in succession of the Asmoneans. *Josephus*.

GERMAIN, or St. GERMAIN, a town of France, in the department of the Seine and Oise, and ci-devant province of the Isle of France. It has a magnificent palace, embellished by Louis XIV., who was born in it, with a fine forest and elegant gardens, &c., long the asylum of king James II. Several kings of France were born here. It is seated on the Seine, twelve miles north-west of Paris.

GERMAINS (St.), a borough of England, in Cornwall, formerly the largest town in the county, and a bishop's see. Part of the old cathedral is used as the parish church, and the priory is still standing. It is ten miles west of Plymouth, and 224 west by south of London.

GERMAN, *n. s.* & *adj.* Fr. *germain*; Latin *germanus*. Brother; one approaching to a brother in proximity of blood: thus the children of brothers or sisters are called cousins german, the only sense in which the word is now used.

And to him said, go now, proud miscreant,
Thyself thy message do to *german* dear.

Spenser. Faerie Queene.

Wert thou a bear, thou wouldst be killed by the
Horse; wert thou a horse, thou wouldst be seized by
the leopard; wert thou a leopard, thou wert *german*
to the lion, and the spots of thy kindred were juries
on thy life. *Shakspeare. Timon.*

Not he alone shall suffer what wit can make heavy,
and vengeance make bitter; but those that are *german*
to him, though removed fifty times, shall come under
the hangman. *Shakspeare.*

You'll have your nephews neigh to you; you'll
have coursers for cousins, and genets for *germans*.

Id.

They knew it was their cousin *german*, the famous
Amphilalus. *Sidney.*

GERMAN OCEAN, otherwise called the North
Sea, an extensive branch of the Atlantic on the
north-west coast of Europe, bounded on the
south by the straits of Calais, and on the north
by the Orkney and Shetland Islands. The wa-
ters of this sea are saltier than those of the Baltic,
but less so than those of the main Ocean, and
they contain a large portion of unctuous matter,
and marine plants. The fisheries on the Dogger
Bank, as well as on the shores that bound this sea,
viz. those of Britain, Holland, Denmark, and
Norway, are extensive: they are still greater
northward i. e. in the direction of the Orkney
and Shetland Islands. This has accordingly been
the nursery for seamen in Europe. Throughout
its whole extent the tides prevail, but rise highest
on the coasts of Lower Saxony and Holland,
where the formation of the Zuyder Zee in the
thirteenth century, by a great eruption, and the
destruction of a whole island on the coast of
Sleswick in 1634, were awful proofs of their
power.

The German Ocean may be considered as di-
vided into two unequal parts by the Dogger
Bank, which traverses it in almost all its width,
and is traditionally said to have been formerly a
tract of dry land, joined to Jutland. The extent
of this sea from south to north, between the pa-
rallels of latitude quoted above, is reckoned by
Mr. Stevenson at 233 leagues, and its greatest
breadth from west to east, from St. Abb's-Head,
on the coast of Scotland, to Ring Klobing Froid,
on the opposite shore of Denmark, at 135 leagues.
The greatest depth of the water in this basin
seems to be upon the Norwegian side, where the
soundings give 190 fathoms; but the mean depth
of the whole may be stated at only about thirty-
one fathoms.

The water gradually deepens from south to
north, varying, after an irregular progression,
from 120 fathoms towards the northern extremity
to fifty-eight, thirty-eight, twenty-four and eigh-
teen fathoms, as we proceed southwards, to with-
in five miles of the shore, and the whole bottom
preserving the character of a great bay encum-
bered with numerous sand-banks. These great
accumulations of debris, especially in the middle
or central parts, and along the shores towards
what may be termed the apex of the bay, extend
from the river Thames along the shores of Hol-
land, &c., to the Baltic. One of these great cen-
tral banks, known to mariners as the Long For-
ties, tends north-east in the direction of the

ebb-tide from the entrance of the Frith of Forth
no less than 110 miles, while the Denmark and
Jutland banks may also be traced from the en-
trance of the Baltic, upwards of 105 miles in a
north-western direction. Besides these, we have
also that other great central range of banks
known under the common appellation of the
Dogger Bank, which is subdivided by the navi-
gator into the Long-Bank, the White-Bank, and
the Well-Bank, including an extent of upwards
of 354 miles from north to south. There are also
a vast number of shoals and sand-banks, lying
wholly to the southward of our section, between
Flamborough-Head and Heligoland. Altogeth-
er, therefore, the superficies of these extensive
banks is found to occupy no inconsiderable por-
tion of the whole area of the German Ocean;
the surface of which, in making these investiga-
tions, has been estimated to contain about
153,709 square miles, while the aggregate super-
ficial contents of the sand-banks alone amount to
no less than 27,443 square miles, or include an
area of about five and three quarters of the whole
surface of this Sea.

On the temperature of the German Ocean, the
following observations were made in 1821 by
Mr. John Murray:—

Temperature.

Feb. 22. Seven miles off Huntley Foot, Fahr.	
(River Tees), depth forty fa- thoms, at 10 ^h 30' A. M.	42°
Four miles off Red Cliff (to southward), depth, say thirty- five fathoms, at 10 o'clock P. M.	40·75
Three miles off Whitby, depth twenty-eight fathoms, at 4 ^h 22' A. M.	41
Feb. 23. Two miles off Kelsey, depth seven fathoms, at 8 o'clock A. M.	37·5
Two miles off Spurn Lights, depth 7·25 fathoms, at 9 ^h 22' A. M.	38
Three miles off Spurn Lamps, mouth of the Humber, depth seven fathoms, 10 o'clock P. M.	38
Feb. 24. In the Humber, three miles from Hull, at 9 o'clock A. M.	35·75

GERMANIA, in ancient geography, an exten-
sive country of Europe, bounded on the north by
the Baltic (Mare Suevium), on the east by the
Vistula, on the south by the Danube, and on the
west by the Rhine and the German Ocean. The
origin of the name has been much disputed, but
the most probable derivation is from 'ghar man'
(Celtic, a warlike man) from Teut. geier, or
guer, a sword, whence Span. guerra; Fr. guerre,
war. Many of the best authorities however de-
rive it from Lat. germanus, a relative, as having
been given by the Celts, who were probably
sprung from the same stock, viz. the Gomerians.
The Romans divided Germania into two regions,
viz. Germania Superior, and Germania Inferior,
which were separated only by the Rhine.

Germania Superior, or Upper Germany, com-
prised the whole country between the Rhine and

the Danube. Between the Rhine and Elbe were the following nations:—1. The Chauci, Upper and Lower, who were divided from each other by the river Visurgis, now the Weser. Their country contained what is now called Bremen, Lunenburg, Friesland, and Groningen. The Upper Chauci had the Cherusci, and the Lower the Chamavi on the south-east, and the German Ocean on the north-west. 2. The Frisii, Upper and Lower, were divided from the Lower Chauci by the river Amisia, now the Ems; and from one another by an arm of the Rhine. Their country still retains the name of Friesland. 3. Beyond the Isela (now the Yssel), which bounded the country of the Frisii, were situated the Bructeri, who inhabited that tract now called Broecmorland; and the Marsi, about the river Luppe. On the other side of that river were the Uspipii, or Uspites; but these were famed for often changing their territories, and therefore found in other places. 4. Next to these were the Juones, or inhabitants of Juliers, between the Maese and the Rhine. 5. The Catti, another ancient and warlike nation, inhabited Hesse and Thuringia, from the Hartz Mountains to the Rhine and Weser; among whom were comprehended the Mattiaci, whose capital is by some thought to be Marpurg, by others Baden. 6. Next to these were the Seducii, bordering upon Suabia; Narisci, or the ancient inhabitants of Northgow, whose capital was Nuremberg; and the Marcomanni, whose country anciently reached from the Rhine to the head of the Danube, and to the Neckar. The Marcomanni afterwards settled in Bohemia and Moravia, under their general or king Maroboduus, and some of them in Gaul, whence they drove the Boii, who had seated themselves there. 7. On the other side of the Danube, and between the Rhine and that river, were the Hermunduri, who possessed the country now called Misnia in Upper Saxony; though some make their territories to have extended much further, and to have reached to, or even beyond, Bohemia, then the seat of the Boii, whence its name. 8. Beyond them, on the north of the Danube, was another seat of the Marcomanni, along the river Albis, or Elbe. 9. Next to Bohemia were situated the Quadi, whose territories extended from the Danube to Moravia, and the northern part of Austria. These are comprehended under the ancient name of Suevi; part of whom at length forced their way into Spain, and settled a kingdom there. 10. Eastward of the Quadi were situated the Bastarnæ, and parted from them by the Granna, now Gran, a river that falls into the Danube; and by the Carpathian Mountains, from them called Alpes Bastarnicæ. The country of the Bastarnæ indeed made part of the European Sarmatia, and was therefore without the limits of Germany, properly so called; but we find these people so often in league with the German nations, and joining them for the destruction of the Romans, that we cannot but account them as one people. Between those nations, seated along the other side of the Danube and the Hercynian forest, were several others whose exact situation is uncertain, viz. the Martigni, Burii, Borades, Lygii, or Logiones,

and some others, who are placed by geographers along the forest above-mentioned, between the Danube and the Vistula.

On this side the Hercynian forest were the famed Rhatii (now Grisons), seated among the Alps. Their country, which was also called Western Illyricum, was divided into Rhatia Prima, or Propria, and Secunda; and was then of much larger extent, spreading itself towards Suabia, Bavaria, and Austria. On the other side of the Hercynian forest were, 1. The Suevi, who spread themselves from the Vistula to the river Elbe. 2. The Longobardi, so called, according to some, on account of their wearing long beards; but according to others, on account of their consisting of two nations, viz. the Bardi and Lingones. These dwelt along the river Elbe, and bordered southward on the Chauci above-mentioned. 3. The Burgundi, possessing a part of Poland. 4. The Semnones, who, about the time of Tiberius, were seated on the river Elbe. 5. The Angles, Saxons, and Goths, were probably the descendants of the Cimbri; and inhabited the countries of Denmark, along the Baltic Sea, and the peninsula of Scandinavia, containing Norway, Sweden, Lapland, and Finmark. 6. The Vandals were a Gothic nation, who, proceeding from Scandinavia, settled in the countries now called Mecklenburgh and Brandenburg. 7. Of the same race were the Dacians, who settled themselves in the neighbourhood of Palus Mæotis, and extended their territories along the banks of the Danube.

Germania Inferior, or Lower Germany, lay between the Seine and the Rhine; and in this we find a number of different nations, the most remarkable of which were the following:—1. The Ubii, whose territory lay between the Rhine and the Mosæ (or Maese), and whose capital was Cologne. 2. Next to them were the Tungri, supposed to be the same whom Cæsar calls Eburones and Condrusi; and whose metropolis, then called Attuatica, has since been named Tongres. 3. Higher up from them, and on the other side of the Moselle, were the Treviri, whose capital was Augusta Trevirorum, now Triers. 4. Next to them were the Tribosci, Nemotes, and Vangiones. The former dwelt in Alsace, and had Argentoratum, now Strasburg, for their capital: the others inhabited the cities of Worms, Spire, and Mentz. 5. The Mediomatrici were situated along the Moselle, about the city of Metz in Lorraine: and above them were situated another German nation, named Raurici, Rauraci, or Rauriaci, who inhabited that part of Helvetia above Basil. To the west and south of these were the Narvi, Suessones, Silvanectes, Leuci, Rhemi, Lingones, &c., who inhabited Belgic Gaul. Between the heads of the Rhine and Danube was seated the ancient kingdom of Vindelicia, whose capital was called Augusta Vindelicorum, now Augsburg. Below it, on the banks of the Danube, were the kingdoms of Noricum and Pannonia. The first of these was divided into Noricum Ripense and Mediteraneum. It contained a great part of the provinces of Austria, Styria, Carinthia, Tyrol, Bavaria, and some others of less note. The latter con-

tained the kingdom of Hungary, divided into Upper and Lower; and extending from Illyricum to the Danube, and the mountains Cætiæ in the neighbourhood of Vindebona, now Vienna.

The Germans did not begin to build towns of any consideration till after the arrival and settlement of the Romans, by whom the following towns were either built or enlarged, and received from them their names:—

Colonia Ubiorum, or Agrip- pina, now called	Cologne.
Colonia Ulpriana	Cleves.
Argentoratum	Strasburg.
Vindobona	Vienna.
Regenopolis	Ratisbon.
Berolinum	Berlin.
Herbipolis	Wurzburg.
Bonna Julia	Bonne.
Confluentes	Coblentz.
Augusta Vindelicorum . .	Augsburgh.
Colonia Trevirorum . . .	Triers, or Treves.
Moguntiacum	Mentz.
Neroberga, &c. . . .	Nurenberg, &c.

The following are the rivers, &c., known to the ancients as well as the moderns:—

Lacus Brigantinus . . .	Lake of Constance.
Sinus Codanus	The Baltic.
Ister vel Danubius . . .	The Danube, or Ister.
Rhenus	The Rhine.
Vistula	The Weichsel, or Vistula.
Nicer	The Neckar.
Albis	The Elbe.
Amisia	The Ems.
Visurgis	The Weser.
Dravus, vel Drabus . . .	The Drave.
Mœnus	The Maine.
Luppia, &c. . . .	The Lippe, &c.

The principal mountains and forests mentioned by the ancients are,

Jugum Hercynæum . . .	The Bohemian Forest.
Bacenis, vel Semana Sylva	The Harz.
Martiana Sylva	The Black Forest.
Sæsia Sylva	The Odenwald.
Abnoba	Abenow.
Mons Rhaeticus	The Sieben-bergen.
Taunus, &c. . . .	The Hayrich, &c.

The ancient history of the Germans is altogether wrapped in obscurity; nor do we, for many ages, know any thing more of them than what we learn from the history of their wars with the Romans. The first time they are mentioned by the Roman historians is about A. A. C. 211, when Marcellus subdued Insubria and Liguria, and defeated the Gasatae, a German nation, situated on the banks of the Rhine. From this time history is silent with regard to all these northern nations, till the eruption of the Cimbri and Teutones, who inhabited the most northerly parts of Germany. See Rome. We also find mention made of the Scordisci, a Thracian nation, who afterwards settled on the banks of the Danube. About A. A. C. 113 they ravaged Macedon, and cut off a whole Roman army sent against them; the general, M. Porcius Cato, grandson to Cato the censor, being the only person who escaped. After this they ravaged all Thessaly, and advanced to the coasts of the

Adriatic, into which, because it stopped their further progress, they discharged a shower of darts. By another Roman general however they were driven back into their own country with great slaughter; and, soon after, Metellus so weakened them by repeated defeats, that they were incapable, for some time, of making any more attempts on the Roman provinces. At last, in the consulship of M. Livius Drusus and L. Calpurnius Piso, the former prevailed on them to pass the Danube, which thenceforth became the boundary between the Romans and them. Notwithstanding this, in the time of the Jugurthine war, the Scordisci repassed the Danube on the ice every winter, and being joined by the Triballi, a people of Lower Masia, and the Daci of Upper Masia, penetrated as far as Macedon, committing every where dreadful ravages. Till the time of Julius Cæsar, however, we hear nothing more concerning the Germans.

About A. A. C. 58 Cæsar undertook his expedition into Gaul, during which his assistance was implored by the Ædui against Ariovistus, a German prince, who oppressed them. Cæsar, pleased with this opportunity of increasing his power, invited Ariovistus to an interview; but, this being declined, he next sent deputies, desiring him to restore the hostages he had taken from the Ædui, and to bring no more troops over the Rhine into Gaul. To this a haughty answer was returned; and a battle soon after ensued, in which Ariovistus was entirely defeated, and with great difficulty made his escape. In A. A. C. 55, Cæsar having subdued the Suessones, Belloci, Ambiani, Nervii, and other nations of Belgic Gaul, hastened to oppose the Usipetes and Tenceteri. These nations, having been driven out of their own country by the Suevi, had crossed the Rhine with a design to settle in Gaul. As soon as he appeared, the Germans sent him a deputation, offering to join him, provided he would assign them lands. Cæsar replied, that there was no room in Gaul for them; but he would desire the Ubii to give them leave to settle among them. Upon this, they desired time to treat with the Ubii; but in the mean time fell upon some Roman squadrons, which so provoked Cæsar, that he immediately marched against them, and, coming unexpectedly upon them, defeated them with great slaughter. They fled in the utmost confusion; but the Romans pursued them to the conflux of the Rhine and the Maese, where the slaughter was renewed with such fury, that about 400,000 of the Germans perished. After this, Cæsar, being resolved to spread the terror of the Roman name through Germany, built a bridge over the Rhine, and entered that country. In this expedition, however, which was his last in Germany, he performed no remarkable exploit.

Nothing further is recorded of the Germans till about A. A. C. 17, when the Tenceteri made an irruption into Gaul, and defeated M. Lollius, proconsul of that province. At last, however, they were repulsed, and forced to retire with great loss beyond the Rhine. Soon after this the Rhaetii invaded Italy, where they committed the greatest devastations, putting all the males they met to the sword, without distinction of age; and, when they happened to take women with

child, they consulted their augurs to know whether the child was a male or female; and if they pronounced it a male, the mother was immediately massacred. Against these barbarians was sent Drusus, the second son of Livia, a youth of extraordinary valor, and great accomplishments. He brought them to a battle, in which the Romans proved victorious, and cut in pieces great numbers of them with very little loss. Those who escaped the general slaughter, being joined by the Vindelici, took their rout towards Gaul, with a design to invade that province. But Augustus, upon the first notice of their march, despatched against them Tiberius, with several chosen legions. He was no less successful than Drusus had been; for having transported his troops over the lake Brigantium (now Constance) he fell unexpectedly on the enemy, gave them a total overthrow, took most of their strong holds, and obliged the whole nation to submit to his own terms. Tiberius, to keep the conquered countries in awe, planted two colonies in Vindelicia, and opened from thence a road into Rætia and Noricum. One of the cities which he built for the defence of his colonies he called, from his father Drusus, Drusomagus; the other by the name of Augustus, Augusta Vindelicorum. He next encountered the Pannonians, who had been subdued by Agrippa, but revolted on hearing the news of that great commander's death, which happened A. A. C. 11. Tiberius, however, with the assistance of the Scordisci, soon forced them to submit. They delivered up their arms, gave hostages, and put the Romans in possession of all their towns and strong holds. Tiberius spared their lives, but laid waste their fields, plundered their cities, and sent the finest of their youth into other countries. In the mean time Drusus, having prevented the Gauls from revolting, prepared to oppose the Germans who dwelt beyond the Rhine. They had collected the most numerous and formidable army that had ever been seen in those parts; with which they were advancing towards the Rhine, to invade Gaul. Drusus, however, defeated them, as they attempted to cross that river; and, pursuing his advantage, entered the country of the Usipetes, now Relinchusen, and thence advanced against the Sicambri, in the neighbourhood of the Lyppe and Yssel. Them he overthrew in a great battle, laid waste their country, burnt most of their cities, and, following the course of the Rhine, approached the German Ocean, reducing the Frisii and the Chauca between the Ems and the Elbe. In these marches the troops suffered extremely for want of provisions; and Drusus himself was often in great danger of being drowned, as the Romans who attended him were quite unacquainted with the flux and reflux of the tide. The Roman forces went into East Friesland for winter quarters; and next year (A. A. C. 10) Drusus marched against the Tencteri, whom he easily subdued. Afterwards, passing the Lupias (now the Lyppe), he reduced the Catti and Cherusci, extending his conquests to the banks of the Visurgis (or Weser); which he would have passed, had he not been in want of provisions, the enemy having laid waste the whole country. As he was retiring, the Germans

unexpectedly fell upon him in a narrow passage, and, having surrounded the Roman army, cut a great number of them in pieces. But Drusus having animated his men, after a bloody conflict, which lasted the whole day, the Germans were defeated with such slaughter, that the ground was strewn for several miles with dead bodies. Drusus found in their camp a great quantity of iron chains, which they had brought for the Romans; and so great was their confidence, that they had agreed before hand about the division of the booty. After this victory, Drusus built two forts to keep the conquered countries in awe; the one at the confluence of the Lyppe and the Aine, the other in the country of the Catti on the Rhine. He also made a famous canal, called in honor of him Fossa Drusiana, to convey the waters of the Rhine into the Sala. It extended eight miles, and was very convenient for conveying the Roman troops by water to the countries of the Frisii and Chauca. The following year (A. A. C. 9) Augustus, bent on subduing the whole of Germany, advanced to the banks of the Rhine, attended by Tiberius and Drusus. The former he sent against the Daci, who lived up to the south of the Danube; and the latter to complete the conquest he had so successfully begun in the western parts of Germany. The former easily overcame the Daci, and transplanted 40,000 of them into Gaul. The latter, having passed the Rhine, subdued all the nations from that river to the Elbe; but, having attempted in vain to cross this last, he set out for Rome: an end, however, was put to his conquests and his life by a violent fever, with which he was seized on his return.

After the death of Drusus, Tiberius again overran all those countries in which Drusus had spent the preceding summer; and struck some of the northern nations with such terror, that they sent deputies to sue for peace. This, however, they could not obtain upon any terms; the emperor declaring that he would not conclude a peace with one, unless they all desired it. But the Catti, or according to some the Sicambri, could not be prevailed upon to submit; so that the war was carried on, though in a languid manner, for about eighteen years. During this period, some of the German nations had quitted their forests, and began to live in a civilised manner under the protection of the Romans; but Quinctilius Varus being sent to command the Roman forces in that country, he so provoked the inhabitants by his extortions, that not only those who still held out refused to submit, but even the nations that had submitted were seized with an eager desire of throwing off the yoke. Among these was a young chieftain of extraordinary skill and valor, named Arminius. He was the son of Sigmur, one of the most powerful chiefs among the Catti, had served with great reputation in the Roman armies, and been honored by Augustus with the privileges of a Roman citizen, and the title of knight. But, his patriotism and ambition prevailing over his gratitude, he resolved to improve the general discontent among his countrymen, to deliver them from the Roman yoke. With this view he engaged the leading men of all the nations between

the Rhine and the Elbe, in a conspiracy against the Romans. To put Varus off his guard, he advised him to show himself to the inhabitants of the more distant provinces, administer justice among them, and accustom them to live after the Roman manner. Varus, being a man of a peaceable temper, readily consented to this insidious proposal; and, leaving the neighbourhood of the Rhine, marched into the country of the Cherusci. Having there spent some time in hearing causes, Arminius persuaded him to weaken his army, by sending out detachments to clear the country of robbers. This done, some distant nations of Germany rose up in arms by Arminius's directions; while those through which Varus was to pass in marching against them, pretended to be in a state of tranquillity, and ready to join the Romans against their enemies. On the first news of the revolt, Varus marched against the enemy with three legions and six cohorts; but, being attacked by the Germans as he passed through a wood, his army was almost totally cut off, while he himself and most of his officers fell by their own hands.

This terrible overthrow, though it raised a general consternation in Rome, did not, however, cause Augustus to abandon his enterprise. About two years after (A. D. 12) Tiberius and Germanicus were appointed to command in Germany. The death of Augustus, which happened soon after, prevented Tiberius from going on his expedition; and Germanicus was for some time hindered from proceeding in his, by a revolt of the legions, first in Pannonia, and then in Germany. About A. D. 15 Germanicus, having brought over the soldiers to their duty, laid a bridge across the Rhine, over which he marched 12,000 legionaries, twenty-six cohorts of the allies, and eight *alæ* (squadrons of 300 each) of horse. With these he first traversed the Cæsan forest (part of the Hercynian, supposed to lie partly in the duchy of Cleves, and partly in Westphalia). On his march he was informed, that the Marsi were celebrating a festival with great mirth and jollity. Upon this he advanced with such expedition, that he surprised them in the midst of their debauch; a terrible massacre ensued, and the country was destroyed with fire and sword for fifty miles round, without the loss of a single man on the part of the Romans. This general massacre roused the Brueteri, the Tubantes, and the Usipetes; who, besetting the passes through which the Roman army was to return, fell upon the rear, and put them into disorder; but the Romans soon recovered themselves, and defeated the Germans with considerable loss. The following year, (A. D. 16) Germanicus, taking advantage of some intestine broils which happened among the Catti, entered their country, where he put great numbers to the sword. Most of their youth, however, escaped by swimming over the Adrana (now the Eder), and attempted to prevent the Romans from laying a bridge over that river: but, being disappointed in this, some of them submitted to Germanicus, while the greater part, abandoning their villages, took refuge in the woods; so that the Romans, without opposition, set fire to all their towns and

villages; and, having burnt their capital, began their march back to the Rhine. Germanicus had scarcely reached his camp, when he received a message from Segestes, a German prince, in the interest of the Romans, acquainting him that he was besieged in his camp by Arminius. On this he instantly marched against the besiegers, entirely defeated them, and took a great number of prisoners; among whom was Thufeldis, the wife of Arminius, and daughter of Segestes, whom the former had carried off, and married against her father's will. Arminius enraged by the loss of his wife, whom he tenderly loved, stirred up all the neighbouring nations against the Romans. Germanicus, to avoid engaging such numerous forces at once, detached his lieutenant Cæcina, at the head of forty cohorts, into the territories of the Brueteri; his cavalry, under the command of Pedo, entered the country of the Frisii; while he himself embarked the remainder of his army, consisting of four legions, on a neighbouring lake; and transported them by rivers and canals to the place appointed on the Ems, where the three bodies met. In their march they found the sad remains of the legions conducted by Varus, which they buried with all the ceremony their circumstances could admit. After this they advanced against Arminius, who retired and posted himself advantageously close to a wood. The Roman general, coming up with him, ordered his cavalry to advance and attack the enemy. Arminius, at their first approach, pretended to fly; but suddenly wheeled about, and giving the signal to a body of troops, whom he had concealed in the wood, to rush out, obliged the cavalry to give ground. The cohorts then advanced to their relief; but they too were put into disorder, and would have been pushed into a morass, had not Germanicus himself advanced with the rest of the cavalry to their relief. Arminius did not think it prudent to engage these fresh troops, but retired in good order; upon which Germanicus also retired towards the Ems. Here he embarked with four legions, ordered Cæcina to reconduct the other four by land, and sent the cavalry to the sea-side, with orders to march along the shore to the Rhine. Though Cæcina was to return by roads well known, yet Germanicus advised him to pass, with all possible speed, a causeway, called the long bridges, which led across vast marshes, surrounded on all sides with woods and hills. But Arminius, having got notice of this, arrived at the long bridges before him, and filled the woods with his men; who, on the approach of the Romans, rushed out, and attacked them with great fury. The legions, unable to manage their arms in the marshy ground, were obliged to yield; and would have been entirely defeated, had not night put an end to the combat. The Germans, encouraged by their success, instead of sleeping spent the whole night in diverting the courses of the rivulets which rose in the neighbouring mountains; so that, before day, the camp of the Romans was laid under water, and their works were overturned. Cæcina at last resolved to attack the enemy by day-break, and, having driven them to their woods, to keep them there till the baggage and wounded men should pass

the causeway, and get out of the enemy's reach. But when his army was drawn up, the legions posted on the wings deserted their stations, and occupied a field beyond the marshes. Cæcina followed them, but the baggage stuck in the mire, as he attempted to cross the marshes, which greatly embarrassed the soldiers. Arminius, perceiving this, began the attack, and crying out, 'This is a second Varus, the same fate attends him and his legions,' fell on the Romans with inexpressible fury. As he had ordered his men to aim chiefly at the horses, great numbers of them were killed; and, the ground becoming slippery with their blood, the rest either fell or threw their riders, and galloping through the ranks, put them in disorder. Cæcina distinguished himself greatly, but his horse being killed he would have been taken prisoner, had not the first legion rescued him. The avarice of the enemy, however, saved the Romans from destruction; for just as the legions were quite spent, and on the point of yielding, the Germans suddenly abandoned them to seize the baggage. During this respite, the Romans struggled out of the marsh, and, having gained the dry fields, formed a camp with all possible speed. The Germans having thus lost the opportunity of destroying the Romans, contrary to the advice of Arminius, attacked their camp next morning, but were repulsed with great slaughter; after which they gave Cæcina no more molestation till he reached the banks of the Rhine.

Germanicus, in the mean time, having conveyed the legions he had with him down the Ems to the ocean, to return by sea to the Rhine, and finding his vessels overloaded, delivered the second and fourteenth legions to P. Vitellius, desiring him to conduct them by land. But this march proved fatal to great numbers, who were either buried in the quicksands, or swallowed up by the returning tide, to which they were as yet utter strangers. Those who escaped lost their arms, utensils, and provisions; and passed a melancholy night upon an eminence, which they had gained by wading up to the chin. The next morning at ebb, Vitellius, by a hasty march, reached the Usingis, by some thought to be the Hoerenster, on which the city of Groningen stands. There Germanicus, who had reached that river with his fleet, took the legions again on board, and conveyed them to the mouth of the Rhine, whence they all returned to Cologne, where it had been reported they were totally lost.

This expedition cost the Romans very dear, and procured very few advantages. Great numbers of men had perished; and the greatest part of those who had escaped so many dangers, returned without arms, utensils, horses, &c., half naked, lamed, and unfit for service. The next year, however, Germanicus, bent on the entire reduction of Germany, made vast preparations for another expedition. Having found that the Germans were chiefly indebted for their safety to their woods and marshes, their short summers and long winters; and that his troops suffered more from their tedious marches than from the enemy, he resolved to enter the country by sea, hoping thus to begin the campaign earlier, and

surprise the enemy. Having, therefore, built 1000 vessels, with great despatch, during winter, he ordered them early in the spring (A. D. 16), to fall down the Rhine; and appointed the island of the Batavians for the general rendezvous of his forces. When the fleet was sailing, he detached Silius, one of his lieutenants, with orders to make a sudden irruption into the country of the Catti; and in the mean time, he himself, hearing that a Roman fort on the Lupias was besieged, hastened with six legions to its relief. Silius was prevented, by sudden rains, from doing more than taking some booty, with the wife and daughter of Arpen, king of the Catti; neither did those who besieged the fort wait the arrival of Germanicus. In the mean time, the fleet arriving at the island of the Batavians, the provisions and warlike engines were put on board and sent forward; ships were assigned to the legions and allies; and, the whole army being embarked, the fleet entered the canal formerly cut by Drusus, and from his name called Fossa Drusiana. Hence he sailed prosperously to the mouth of the Ems; where, having landed his troops, he marched directly to the Weser, where he found Arminius encamped on the opposite bank, and determined to dispute his passage. The next day Arminius drew out his troops in order of battle; but Germanicus, not thinking it advisable to attack them, ordered the horse to ford over under the command of his lieutenants, Stertinius and Emilius; who, to divide the enemies' forces, crossed the river in two different places. At the same time Cariovalda, the leader of the Batavian auxiliaries, crossed the river where it was most rapid: but, being drawn into an ambuscade, he was killed, together with most of the Batavian nobility; and the rest would have been totally cut off, had not Stertinius and Emilius hastened to their assistance. Germanicus in the mean time passed the river without molestation. A battle soon after ensued; in which the Germans were defeated with so great a slaughter that the ground was covered with arms and dead bodies for more than ten miles round: and among the spoils taken on this occasion were found, as formerly, the chains with which the Germans had hoped to bind their captives.

In memory of this signal victory, Germanicus raised a mount, upon which he placed as trophies the arms of the enemy, and inscribed underneath the names of the conquered nations. This so provoked the Germans, though already vanquished and determined to abandon their country, that they attacked the Roman army unexpectedly on its march, and put them into some disorder. Being repulsed, they encamped between a river and a large forest surrounded by a marsh, except on one side, where it was enclosed by a broad rampart, formerly raised by the Angrivarii as a barrier between them and the Cherusci. Here another battle ensued; in which the Germans behaved with great bravery, but in the end were defeated with great slaughter. After this second defeat, the Angrivarii submitted, and were taken under the protection of the Romans, and Germanicus put an end to the campaign. Some of the legions he sent to their winter quarters by land, while he himself

embarked with the rest on the river Ems, in order to return by sea. The ocean proved at first very calm, and the wind favorable: but all of a sudden a storm arising, the fleet, consisting of 1000 vessels, was dispersed; some of them were swallowed up by the waves; others were dashed in pieces against the rocks, or driven upon remote and inhospitable islands, where the men either perished with famine, or lived upon the flesh of the dead horses with which the shores soon appeared strewn; for, in order to lighten their vessels, and disengage them from the shoals, they had been obliged to throw over-board their horses and beasts of burden, nay, even their arms and baggage. Most of the men, however, were saved, and even great part of the fleet recovered. Some of them were driven upon the coast of Britain; but the petty kings who reigned there generously sent them back. On the news of this misfortune, the Catti, taking new courage, ran to arms; but Caius Silius being detached against them with 30,000 foot, and 3000 horse, kept them in awe. Germanicus himself, at the head of a numerous body, made a sudden irruption into the territories of the Marsi, where he recovered one of Varus's eagles; and, having laid waste the country, he returned to the frontiers of Germany, and put his troops into winter quarters; whence he was soon recalled by Tiberius, and never suffered to return into Germany again. After the departure of Germanicus, the more northern nations of Germany were no more molested by the Romans. Arminius carried on a long and successful war with Maroboduus king of the Marcomanni, whom he at last expelled, and forced to apply to the Romans for assistance; but, excepting Germanicus, it seems they had at this time no other general capable of opposing Arminius, so that Maroboduus was never restored. After the final departure of the Romans, however, Arminius having attempted to enslave his country, fell by the treachery of his own kindred. The Germans held his memory in great veneration; and Tacitus informs us, that in his time they still celebrated him in their songs. Nothing remarkable occurs in the history of Germany from this time till the reign of Claudius I. A war indeed is said to have been carried on by Lucius Domitius the father of Nero. But of his exploits we know nothing more than that he penetrated beyond the river Elbe, and led his army farther into the country than any of the Romans had ever done. In the reign of Claudius, however, the German territories were invaded by Cn. Domitius Corbulo, one of the greatest generals of his age. But, when he was on the point of forcing them to submit to the Roman yoke, he was recalled by Claudius, who was jealous of the reputation he had required. In the reign of Vespasian, a terrible revolt happened among the Batavians and those German nations who had submitted to the Romans; an account of which will be found under the article **ROME**. The revolted were with difficulty subdued; but in the reign of Domitian the Dacians invaded the empire, and proved a more terrible enemy than any of the other German nations had been.

After repeated defeats, Domitian was at last obliged to consent to pay an annual tribute to Decebalus king of the Dacians; which continued

to the time of Trajan. But this warlike prince refused to pay tribute; alleging, when it was demanded of him, that 'he had never been conquered by Decebalus.' Upon this the Dacians passed the Danube, and began to commit hostilities in the Roman territories. Trajan, glad of this opportunity to humble an enemy whom he began to fear, drew together a great army, and marched with the utmost expedition to the banks of the Danube. As Decebalus was not apprised of his arrival, the emperor passed the river without opposition, and entering Dacia laid waste the country. At last he was met by Decebalus with a numerous army. A bloody engagement ensued, in which the Dacians were defeated; though the victory cost the Romans dear: the wounded were so numerous, that they wanted linen to bind up their wounds; and to supply the defect, the emperor devoted his own wardrobe. After the victory, he pursued Decebalus from place to place, and at last obliged him to consent to a peace on the following terms: 1. That he should surrender the territories which he had unjustly taken from the neighbouring nations. 2. That he should deliver up his arms, his warlike engines, with the artificers who made them, and all the Roman deserters. 3. That for the future he should entertain no deserters, nor take into his service the natives of any country subject to Rome. 4. That he should dismantle all his fortresses, castles, and strongholds. And, lastly, that he should have the same friends and foes with the Romans. This peace was of short duration. Four years after (A.D. 105) Decebalus began to raise men, provide arms, entertain deserters, fortify his castles, and invite the neighbouring nations to join him against the Romans as a common enemy. The Scythians hearkened to his solicitations; but the Jazyges, a neighbouring nation, refusing to bear arms against Rome, Decebalus invaded their country. Hereupon Trajan marched against him; but the Dacian, finding himself unable to withstand him by open force, had recourse to treachery, and attempted to get the emperor murdered. His design, however, proved abortive, and Trajan pursued his march into Dacia. That his troops might the more readily pass and repass the Danube, he built his celebrated bridge over that river. To guard the bridge, he ordered two castles to be built; one on each side the Danube. Trajan, however, as the season was far advanced, did not enter Dacia this year, but contented himself with making the necessary preparations. Early in the next spring (A.D. 106) Trajan set out for Dacia; and, having passed the Danube by the new bridge, reduced the whole country, and would have taken Decebalus himself had he not put an end to his own life, to avoid falling into the hands of the Romans.

After the death of Decebalus, Dacia was reduced to a Roman province; and several castles were built in it, and garrisons placed in them to keep the country in awe. From the death of Trajan, the Roman empire began to decline, and the northern nations to be daily more and more formidable. Dacia indeed was held by the Romans till the reign of Galienus; but Adrian, who succeeded Trajan, caused the arches of the bridge over the Danube to be broken down, lest the

barbarians should make themselves masters of it, and invade the Roman territories. In the time of Marcus Aurelius, the Marcomanni and Quadi invaded the empire, and gave the emperor a terrible overthrow. He continued the war, however, with better success afterwards, and invaded their country in his turn. In the end, the Marcomanni and Quadi were, by repeated defeats, brought to the verge of destruction; insomuch that their country would probably have been reduced to a Roman province, had not Marcus Aurelius been diverted from pursuing his conquests by the revolt of one of his generals.

After the death of Marcus Aurelius, the Germanic nations became every day more and more formidable to the Romans. Far from being able to invade and attempt the conquest of these northern countries, the Romans had the greatest difficulty to repress the incursions of their inhabitants. But for a particular account of their various invasions of the Roman empire, and its total destruction by them at last, see *ROME*. The immediate destroyers of the Roman empire were the Heruli; who, under their leader Odoacer, dethroned Augustulus the last Roman emperor, and proclaimed Odoacer king of Italy (A. D. 478). The Heruli were soon expelled by the Ostrogoths; and these in their turn were subdued by Justinian I., who re-annexed Italy to the eastern empire. But the popes found means to obtain the temporal as well as spiritual jurisdiction over a considerable part of the country, while the Lombards subdued the rest. These last proved very troublesome to the popes, and at length besieged Adrian I. in his capital. In this distress he applied to Charles the Great king of France; who conquered both Italy and Germany, and was crowned emperor of the west (A. D. 800). See *GERMANY*.

We have now to notice the peculiar *manners and customs* of these nations. They are described by the Roman historians as resembling the Gauls; and differing from other nations by their tall stature, ruddy complexion, blue eyes, yellow bushy hair, haughty and threatening looks, strong constitutions, and being proof against hunger, cold, and all kinds of hardships. Their native disposition appeared chiefly in their martial genius, and in their singular fidelity. The former they indeed carried to such an excess as came little short of downright ferocity: and as to the latter, they were greatly esteemed by other nations for it: insomuch that Augustus, and several of his successors, committed the guard of their persons to them, and other nations either courted their alliance, or hired them as auxiliaries: though it must be owned that their extreme love of liberty, and their hatred of tyranny and oppression, often hurried them to treachery and murder, especially when they thought themselves ill used by those who hired them; for in such cases they were easily provoked, and extremely vindictive. In other cases, Tacitus tells us, they were noble, magnanimous, and beneficent, without ambition to aggrandise their dominions, or invade those from whom they had received no injury; rather choosing to employ their strength and valor defensively than offensively; to preserve their own than to ravage those

of their neighbours. Their friendship and intercourse were rather a compound of honest bluntness and hospitality, than of wit, humor, or gallantry. All strangers were sure to meet with a kind reception from them to the utmost of their ability: even those who were not in a capacity to entertain them, reckoned it a duty to introduce them to those who could; and nothing was held more detestable than to refuse them either the one or the other. They do not seem, indeed, to have had a taste for elegant entertainments; they affected in every thing, in their houses, furniture, diet, &c., rather plainness and simplicity, than sumptuousness and luxury. If they learned of the Romans and Gauls the use of money, it was rather because they found it more convenient than their ancient way of bartering one commodity for another; and then they preferred those ancient coins which had been stamped during the times of the Roman liberty, especially such as were either milled or cut in the rims, because they could not be so easily cheated in them as in some others, which were frequently nothing but copper, or iron plated over with silver. This last metal they likewise preferred before gold, as more convenient for traffic; and, as they became more feared by the Romans, they learned how to draw enough of it from them to supply their whole country, besides what flowed from other nations. As to marriage, every man was contented with one wife, except some few of the nobles, who kept a plurality, more for show than pleasure; and both parties were so faithful to each other, and chaste, true, and disinterested, in their conjugal affection, that Tacitus prefers their manners in this respect to those of the Romans. The men sought not dowries from their wives, but bestowed them upon them. Their youth, in those cold climes, did not begin so soon to feel the warmth of love as those in hotter ones: it was common with them not to marry young; and those were most esteemed who continued longest in celibacy, because they reckoned it an effectual means to make them grow tall and strong. To marry, or be concerned with a woman, before they were full twenty years old, was accounted shameful wantonness. The women shared with their husbands not only the care of their families, and the education of their children, but even the hardships of war. They attended them in the field, cooked their victuals, dressed their wounds, excited their courage to fight against their enemies, and sometimes by their own bravery recovered a victory when it was upon the point of being lost. In a word, they looked upon such constant attendance on them, not as a servitude, like the Roman dames, but as a duty and an honor. Yet what appears to have been still a harder fate upon the ancient German ladies was, that their great Odin, or Woden, excluded all those from his valhalla, or paradise, who did not, by some violent death, follow their deceased husbands.

The authority of civil government was extremely limited among the Germans. In times of peace they had no common or fixed magistrate; but the chief men of every district dispensed justice and accommodated differences.

In the far greater part of Germany, the form of government was a democracy, tempered indeed, and controlled, not so much by general and positive laws, as by the occasional ascendancy of birth and valor, of eloquence and superstition. Some tribes, however, on the coast of the Baltic, acknowledged the right of kings; but their kings had not absolute or unbounded power; their authority consisted rather in the privilege of advising than in the power of commanding. Matters of small consequence were determined by the chief men; affairs of importance by the whole community.

On occasions of danger a general of the tribe was elected; and, in circumstances of pressing and extensive danger, several tribes concurred in the choice of the same general. The bravest warrior was named to lead his countrymen into the field, by his example rather than his commands. His power expired with the war, and in time of peace the German tribes acknowledged not any supreme chief. Princes were, however, appointed, in the general assembly, to administer justice, or rather to compose differences (minimant controversias, *Cæsar*) in their respective districts. In the choice of these magistrates birth was regarded as much as merit. To each was assigned, by the public, a guard, and a council of 100 persons; and the first of the princes appears to have enjoyed a pre-eminence of rank and honor, which sometimes tempted the Romans to compliment him with the regal title.

They considered it as a badge of servitude to be obliged to dwell in a city surrounded with walls. Each barbarian fixed his independent dwelling on the spot to which a plain, a wood, or a stream of fresh water had induced him to give the preference. Neither stone, nor brick, nor tiles, were employed in these slight habitations. They were, indeed, no more than low huts of a circular figure, built of rough timber thatched with straw, and pierced at the top to leave a free passage for the smoke. That they considered cities as places of confinement, rather than of security, appears from the following circumstance: when one of their tribes had shaken off the Roman yoke, their countrymen required of them, as an evidence of their having recovered liberty, to demolish the walls of the towns which the Romans had built in their country.

The military weapons of the cavalry among the Germans were shields and spears, which they used in common with the foot, but the latter had, besides their darts, bows and slings, and seldom had recourse to their pikes and swords. Their arms were esteemed their favorite furniture and chief ornament; so that they never appeared in public without them. The sword was so sacred, that the most solemn and obligatory oaths were those which they took upon a naked blade. Nor did they assist in any solemn rite, without their sword, shield, or spear. They even wore them at their familiar visits, banquets, and religious dances; and they were frequently to be burnt or buried with them, when they died.

There is scarcely any thing in which the Germans, though nearly allied in most of their other customs to the Gauls, were more opposite to them than in their funerals. Those of the latter

were performed with great pomp and profusion; those of the former with the same plainness and simplicity which they observed in all other things. The only grandeur they affected in them was, to burn the bodies of their great men with some peculiar kinds of wood; but the funeral pile was neither adorned with the clothes and other furniture of the deceased, nor perfumed with fragrant herbs and gums; each man's armour, that is, his sword, shield, and spear, were flung into it, and sometimes his riding-horse. The Danes, indeed, flung into the funeral pile of a prince, gold, silver, and other precious things, which the chief mourners, who walked in a gloomy guise round the fire, exhorted the bystanders to fling liberally into it in honor of the deceased. They afterwards deposited their ashes in urns, like the Gauls, Romans, &c., as plainly appears from the vast numbers which have been dug up all over the country, and illustrated by dissertations written upon them, by several learned moderns of that nation. And the sacrifices they offered for their dead, the presents they made to them at their funerals, and all the other superstitious rites performed at them, were done in consequence of those notions, which their ancient religion had taught them, as to the immortality of the soul, and the bliss or misery of a future life. At these funerals, as well as in all their other feasts, they were famed for drinking to excess; and one may say of them, above all the other descendants of the ancient Celtes, that their hospitality, banquets, &c., consisted much more in the quantity of strong liquors, than in the elegance of eating. Beer and strong mead, their natural drink, were reckoned the chief promoters of health, strength, fertility, and bravery; upon which account, they indulged themselves to the utmost in them, not only in their feasts, and before battle, but even in their common meals.

As the ancient Germans did not commit any thing to writing, and as none of the ancient writers have given us any account of it, it is impossible to guess how soon the belief of their great Woden, and his paradise, was received among them. It may have been much older than the times of Tacitus, and he have known nothing of it, from their care in concealing their religion from strangers; but as they conveyed their doctrines to posterity in songs and poems, and most of their northern poets tell us that they have drawn their intelligence from those very poems which were preserved amongst them, we may justly suppose that whatever doctrines are contained in them were formerly professed by the generality of the nation, especially as we find their ancient practice conformable to it. Thus, as the surest road to this paradise was to excel in martial deeds, and to die intrepidly in the field of battle; and as none were excluded from it but base cowards, and betrayers of their country, it is natural to think that the signal and excessive bravery of the Germans flowed from this ancient belief of theirs: and if their females were so brave and faithful as not only to share with their husbands all the dangers and fatigues of war, but at length to follow them by a voluntary death into the other world, it can hardly be

attributed to any thing else but a strong persuasion of their being admitted to live with them in that place of bliss. This belief therefore, whether received originally from the ancient Celtes, or afterwards taught them by the since deified Woden, seems, from their general practice, to have been universally received by all the Germans, though they might differ from one another in their notions of that future life. The notion of a future happiness obtained by martial exploits, especially by dying, sword in hand, made them bewail the fate of those who lived to old age, as dishonorable here and hopeless hereafter: upon which account they had a barbarous way of sending them into the other world, willing or not willing. And this custom is said to have lasted several ages even after their receiving Christianity, especially among the Prussians and Veneti. These murders were preceded by a fast and followed by a feast.

GERMAN'DER, *n. s.* } French *germandrée* ;
 GERME, *n. s.* } Lat. *germen*. A plant;
 GERMIN, *n. s.* } sprout; shoot; a
 GERMINATE, *v. n.* } sprouting seed: to
 GERMINATION, *n. s.* } bud; increase; or
 grow: used in a literal and figurative sense.

Though palaces and pyramids do slope
 Their heads to their foundations; though the treasure
 Of nature's *germins* tumble all together,
 Even 'till destruction sicken: answer me
 To what I ask you. *Shakspeare. Macbeth.*

Thou all-shaking thunder,
 Strike flat the thick rotundity of the world;
 Crack nature's mould, all *germins* spill at once
 That make ungrateful man. *Id. King Lear.*

For acceleration of *germination*, we shall handle
 the subject of plants generally. *Bacon.*

This action is furthered by the chalcites, which
 hath within a spirit that will put forth and *germinate*,
 as we see in chymical trials. *Bacon's Nat. History.*

Whether it be not made out of the *germe*, or trea-
 dle of the egg, doth seem of lesser doubt. *Browne.*

The seeds of all kinds of vegetables being planted
 near the surface of the earth, in a convenient soil,
 amongst matter proper for the formation of vegeta-
 bles, would *germinate*, grow up, and replenish the
 face of the earth. *Woodward.*

Suppose the earth should be carried to the great
 distance of Saturn; there the whole globe would be
 one frigid zone; there would be no life, no *germina-*
tion. *Bentley's Sermons.*

GERMANDER, in botany. See TEUCRIUM.

GERMANDER, ROCK. See VERONICA.

GERMANICUS CÆSAR (Claudius), the son
 of Drusus, and nephew to the emperor Tiberius,
 who adopted him. He was much renowned as
 a general, and took the title of Germanicus from
 his conquests in Germany; but though he re-
 fused the empire, offered to him by his army,
 Tiberius, jealous of his success and popularity,
 caused him to be poisoned, A. D. 29, aged thirty-
 four. He was a protector of learning; and com-
 posed some Greek comedies and Latin poems,
 some of which are still extant. Many medals
 of this commander were struck by his son Cali-

gula among which are figs. 1 and 2. In the first
 he is represented in his triumphal chariot, his
 right hand being elevated and bearing the eagle
 in his left which he had recovered in a battle with
 the Germans; inscription GERMANICUS CÆSAR. In
 the second the eagle also is preserved and the
 inscription bears reference to its capture.

Fig. 1.

Fig. 2.

GERMANO (St.) is a town of Naples, in the
 Terra di Lavoro, at the foot of the hill on which
 stands the Benedictine abbey of Monte Cassino.
 The passage of the mountain is hazardous, either
 on mules or on foot. In 1734 it was taken by
 the Spaniards; and on the 16th March, 1815, the
 Austrians defeated Murat here. Near this are
 the ruins of Cassinum, an ancient town destroyed
 by Theodoric, king of the Goths. Inhabitants
 5000. Seventeen miles south-east of Sora, and
 forty-eight N. N. W. of Naples.

GERMANTOWN, a town of New York,
 in Columbia county, containing 516 citizens in
 1796.

GERMANTOWN, the name of two towns in
 North Carolina: 1. in Hyde county, Newbern
 district; 2. the capital of Stokes county, on a
 branch of the Dan, 528 miles south-west by
 south of Philadelphia.

GERMANTOWN, a town of Pennsylvania, in
 Philadelphia county, chiefly inhabited by Ger-
 mans. It has one principal street, mostly of stone
 buildings, two miles long, with Lutheran and
 Calvinist churches, Quaker meeting-house, &c.
 Stockings are manufactured to a great extent,
 and there are several tanneries. It is seven miles
 north of Philadelphia.

GERMANY, as a modern empire, is in strict
 propriety no longer existent; the repeated victories
 of the French in the late continental wars having,
 as we have shown in a preceding part of this
 work, induced the emperor of AUSTRIA (see that
 article) to relinquish his ancient title of emperor
 of Germany, and that prince having no other
 preponderance in the general Germanic con-
 federation, settled by the congress of Vienna,
 than that which arises from the extent of his do-
 minions. See DIET and ELECTOR.

Yet, as the new confederation maintains the
 old system so far as to combine the Germanic
 states in a diet, we may here notice some of the
 greater geographical and statistical features com-
 mon to those states, referring to each of them as
 distinctly treated in their respective places of our
 alphabet for more minute particulars.

The following is a list of the states, with the
 number of votes, and the revenue and population
 of each, according to the official returns in 1818:—

Members of the Diet.	Number of Votes.	Population from the official return in 1818.	Revenue computed in Pounds sterling.	Members of the Diet.	Number of Votes.	Population from the official return in 1818.	Revenue computed in Pounds sterling.
			£				£
Austria (exclusive of Hungary, Galicia, and other states out of the empire)	4	9,482,227	6,370,000	Brought over	50	29,019,205	17,756,000
Prussia (exclusive of other Polish territories)	4	7,923,439	4,300,000	Mecklenburg - Strelitz, grand duchy	1	71,769	50,000
Saxony, kingdom	4	1,200,000	850,000	Oldenburg, gr. duchy	1	217,769	150,000
Bavaria	4	3,560,000	1,800,000	Anhalt-Dessau, duchy	1	52,947	60,000
Hanover	4	1,305,351	900,000	Anhalt-Bernburg	1	37,046	30,000
Wurtemberg	4	1,395,463	1,000,000	Anhalt-Köthen	1	32,454	23,000
Baden, grand duchy	3	1,000,000	550,000	Schwartzburg-Sondershausen, principality	1	45,117	25,000
Hesse-Cassel, electorate	3	540,000	380,000	Schwartzburg - Rudolstadt	1	53,937	22,000
Hesse-Darmstadt, grand duchy	3	619,500	370,000	Hohenzollern - Hechingen	1	14,500	80,000
Holstein and Lauenburg, duchies	3	360,000	200,000	Lichtenstein	1	5,546	3,000
Luxemburg, grand duchy	3	214,058	120,000	Hohenzollern - Sigmaringen	1	35,360	30,000
Brunswick, duchy	2	209,600	130,000	Waldeck, county	1	51,877	40,000
Mecklenburg-Schwerin, grand duchy	2	358,000	150,000	Reuss (Elder Branch), principality	1	22,255	13,000
Nassau, duchy	2	302,767	176,000	Reuss (Younger Br.)	1	52,205	29,000
Saxe-Weimar, grand duchy	1	201,000	150,000	Hesse-Homburg	1	20,000	17,000
Saxe-Gotha, duchy	1	185,682	150,000	Schaumburg-Lippe	1	24,000	18,000
Saxe-Cobourg	1	80,012	55,000	Lippe-Detmold	1	69,062	50,000
Saxe-Meiningen	1	54,400	35,000	The free town of Lübeck	1	40,650	30,000
Saxe-Hildburghausen	1	27,706	20,000	Do. of Frankfort	1	47,850	60,000
				Do. of Bremen	1	48,500	40,000
				Do. of Hamburg	1	129,800	120,000
Carry over	50	29,019,205	17,756,000		69	30,091,849	18,646,000

The entire number of votes therefore in the Germanic diet is, according to this table, sixty-nine; but, as it would be evidently improper to give the smaller states an equal voice with the larger, a repartition of votes has been agreed on, in the manner we have more particularly stated in the article DIET.

Germany, thus defined, is bounded on the north by Denmark and the Baltic; on the east by Poland; on the south by Hungary, Italy, and Switzerland; and on the west by France and the Netherlands. It is more extensive than either France or Spain, being about 650 miles from north to south, and 600 from east to west; and embraces a surface of 220,000 square miles, with a population of more than 30,000,000 of inhabitants, or about 136 individuals to each square mile.

It is physically divided into two principal portions by the Sudetic chain of mountains, which beginning with the Westerwald in Westphalia, and traversing Hesse-Cassel, the south of Saxony, and Silesia, end in the Carpathians, on the frontier of Poland and Hungary. Almost all the country to the north of this range is flat, and the rivers hold a northerly course, without meeting any formidable impediment, until they reach the level of the German Ocean or the Baltic. Southward of this chain Germany is much more di-

versified, consisting in part of extensive plains, but traversed also by vast ranges of mountains, as the Alps, extending from Switzerland on the west to Hungary on the east. In its central part is a great ridge running north-west from the Brisgau to Egra, and forming afterwards, by a semi-circular curve, the southern half of the barrier that separates Bohemia from the adjacent countries. The course of the rivers also in southern Germany is less uniform than in the north: the Inn and the other great streams proceeding from the Alps run northward, and are absorbed in the Danube; while other rivers, less both in number and magnitude, flow into the Danube by a southerly course, from Franconia and Moravia; and the Neckar and the Maine convey their waters westward to the Rhine. The inhabitants therefore with great propriety call the southern half Upper, the northern Lower Germany; and for the same reason apply the terms Upper and Lower Saxony, and Upper and Lower Rhine.

Sixty navigable *rivers* are said to penetrate this part of Europe, among which are the DANUBE, the RHINE, the MAINE, the WESER, the ELBE, and the ODER. See those articles.

The oldest canal is said to have been begun by Charlemagne in 793, to join the Rednitz and Altmühl: it is not yet complete. The principal

are, the canal of Kiel, which joins the Baltic to the North Sea. That of Trarermunde, which goes from Lubeck to Hamburg; and a few of considerable importance, but not of great length, in the Prussian states. Inland navigation is particularly wanted in Southern Germany. The congress of Vienna enacted that, in the case of navigable rivers running through the states of different powers, commissioners should be named by these powers to regulate all that regarded the navigation, on the principle that such rivers ought to be open to all the nations interested, and that every thing should be done to diminish the obstacles to free intercourse. Other waters are not numerous in Germany; there are a few small lakes in Bavaria, Austria, Pomerania, and Brandenburg; but the principal are in the duchy of Mecklenburg. The lake of Constance belongs partly to Germany and partly to Switzerland. Germany on the other hand contains upwards of 1000 mineral springs and baths, of which the most celebrated are at Carlsbad in Bohemia, at Toplitz in Austria, at Seltzer on the Upper Rhine, at Pyrmont in Westphalia, and at Aix-la-Chapelle.

Germany, in point of *climate*, is as various as in her other great geographical features. It is colder in the north, than in Britain; but the summer, even there, is on the whole warmer than ours. The range of latitude is from 46° to 54° N., and the air is almost every where salubrious. But Vienna and some other northern districts are considered unhealthy, from their marshy position. Sandy plains and barren heaths abound in the north-east, swamps and marshes in the north-west; but many of the interior and south-west parts are very fertile. A large proportion of the Prussian states is of a sandy and unproductive character: Bavaria, Wirtemberg, and the hereditary states of Austria, much diversified; while Saxony is in general fertile.

Germany grows wheat, barley, oats, and all our kinds of corn: flax, rapeseed, madder, and hops: but agriculture as a science, particularly in the south, is in a backward state. Valuable tracts lie uncultivated and there are throughout a number of extensive forests, in which wolves, wild boars, lynxes, &c., still hold dominion. The finest pastures are in the north-west, particularly in East Friesland, Oldenburg, Mecklenburg, and some parts of Hanover and Holstein. Here also are found excellent cattle and some good breeds of horses. Sheep are general throughout Germany, and the Merino breed, introduced a century ago into Saxony, is said to be equal to the finest of Spain. Our corn laws prohibiting, in fact, the German farmers to export that commodity to Great Britain, have been the means even in the last year (1826) of turning a more decided attention to the improvement of the German wools.

The *wines* made along the banks of the Rhine have long been celebrated. Next to these are the wines of the Moselle, and of particular districts in the Austrian provinces. In the latter only, and in a few other parts of the south of Germany, silk is cultivated; and while some of the rivers, particularly the Danube and the Elbe, afford

small particles of gold, they hardly repay the expense of washing. The mountains are rich in iron, copper, lead, tin, silver, cobalt, and bismuth, particularly the Erzgebirge chain in Saxony, and the Hartz Mountains, and those of Carinthia and Styria. Bavaria, as well as the duchy of Salzburg, is also rich in salt mines. The mines of Idria, in Carniola, yield annually 5000 cwt. of quicksilver. Fullers' earth and porcelain clay are found near Dresden, and form the basis of extensive manufactures. Marble is found in various parts; and coal is wrought in Westphalia, Saxony, and other provinces. In the south the great majority of the coal mines is said to be unwrought. The manufactures of Germany are not confined to any particular districts, as in England. The stock of wool being equal only to the home consumption, and the sheep of Germany which hardly exceed in number those of England (a country of not one-third the extent), being scattered over the country, the woollen manufactures are in like manner diffused on a small scale throughout various towns. But flax being produced in great abundance, and of the best quality, in Northern Germany; the linen made there has been famous for several centuries. It is manufactured in Silesia, Saxony, and Westphalia, not only for home consumption, but also for export. Cotton manufactures are of recent origin here; and a great competition has been introduced between their manufactures and ours. Cheapness of labor is a decided advantage possessed here, but the machinery is inferior and their fuel dearer than ours.

In the important branch of hardware the Germans are also inferior to our manufactures, but they excel us perhaps in articles of wood, ivory, toys, &c.

The imports of Germany are colonial produce from the East Indies, and America; wine from France and Spain; cottons and hardware from England. The chief commercial cities are Vienna, Hamburg, Lubeck, Bremen, Frankfurt on the Maine, Breslau, Leipsic, Augsburg, Nuremberg; to these are to be added in the second class Stralsund and Stettin on the Baltic, and in the interior Magdeburg, Ulm, and Naumburg. The pride of the educated ranks has proved a great impediment to the extension of commercial undertakings in Germany, the gentry preferring to educate their sons for the army, and allowing commerce to be confined to the inhabitants of the free towns. Navigation and the fisheries are both very limited pursuits, being confined to the shores of the Baltic and North Seas.

Several of the southern German states are still Catholic, but toleration prevails in most of them. The Lutheran and Calvinistic churches are chiefly in the north. Under the former constitution, several of the Catholic dignitaries were princes of the empire; but they have happily lost their temporal power, and most of the Catholic bishops receive salaries from the state. Many of the abbeys and monasteries were secularised by the treaty of Lunéville, and the chief of those remaining are in Austria. In some of the northern parts of Germany, the Lutherans and Calvinists have agreed to relinquish their distinguishing appellations, and unite in one body,

as the professors of the Evangelical Faith. Jews are numerous in most parts of Germany; their political condition varying in different states. A few Greek Christians are likewise found in some of the south-eastern provinces.

Germany, in its language and literature, presents wide fields of interesting research and attainment. The former embraces a vast number of dialects, and is altogether a barbarous mixture of the Northern and Latin tongues of all ages: the Latin has been very successfully cultivated of late by the learned, and what is called High German, spoken by the superior and educated classes, is a copious and tolerably harmonious language. But the Low German of the North is dreadfully harsh to a foreign ear. German literature presents a large and useful mass of *materials*; and in the history of literature her writers excel; as indeed in every kind of historical research. But they are abstract in metaphysics; young in politics, and the true doctrine of political liberty; verbal as critics; and sceptical in theology, particularly her modern Protestant divines. Poetry has been said to date in Germany no further back than the middle of the eighteenth century; of course it is undisciplined by taste, and chiefly lyrical. Studying with a view to publish is often the settled object of life here: copyright being unlimited in duration; and authorship considered a source of regular income. The libraries at the chief universities are on a very useful plan, containing an ample supply of recent publications; and booksellers have long acted on a plan of exchanging all new publications among each other. All this, however, leads in Germany to the publication of much of that knowledge which in other countries is not consigned to the press; and often not to paper. In the fine arts the Germans are not backward: engraving is carried in some cities to a pitch of considerable excellence; and painting, particularly of late, has been successfully cultivated; perhaps, however, their greatest progress is in music. In medicine, particularly in surgery, they are deficient, wanting almost every where hospital practice.

We must add, however, that in the mathematics and mechanics, in astronomy, geography, and chemistry, few countries can boast so long a list of able writers.

There are twenty-one universities in Germany (formerly thirty in number), of which thirteen are Protestant, viz.

Berlin	
Göttingen	in Hanover.
Leipsic	} in Saxony.
Jena	
Halle	
Heidelberg	in Baden.
Tübingen	in Württemberg.
Erlangen	in Franconia.
Marburg	in Hesse-Cassel.
Giessen	in Hesse-Darmstadt.
Kiel	in Holstein.
Rostock	in Mecklenburg-Schwerin.
Greifswalde	in Pomerania.
Six Catholic, viz.	
Vienna	
Prague	

Paderborn . . . in Prussian Westphalia.
Landshut . . . in Bavaria.
Würzburg . . . in Franconia.
Freiburg . . . in Baden,
and two partly Catholic and partly Protestant, viz. Breslau in Silesia, and Bonn on the Rhine; the latter was created in 1818. Wittenberg, Erfurt, Olmutz, and several others, have ceased to be universities. The total number of students at these seminaries is between 8000 and 9000; Göttingen is the most numerous attended, having above a tenth of the whole. Schools, literary societies, and museums, are every where increasing.

We now advert to the *history* of this mighty aggregate of nations in modern times. The extensive empire erected by Charles the Great, which he himself imprudently began to divide among his sons during his own lifetime, was not long enjoyed by his posterity. In France the Carlovingian race continued to reign for 183 years after his death; but in Germany it continued only seventy-four years; producing, within that period, six emperors, viz. Louis I. his son, Lothair I. and Louis II. his grandsons; Charles II., his great grandson; Louis III., son of Charles II., and Charles III., who was deposed in 888. On the deposition of Charles III. the German princes resumed their ancient independence; and, rejecting the Carlovingian race (according to some), elected Arnulph, king of Bohemia. Others, however, say, this Arnulph was the son of Carloman, a descendant of Charlemagne. Be that as it may, he reigned twelve years, and conquered his rival Guido, or Guy, who had been set up in opposition to him, and crowned king of Germany, by pope Formosus in 892; who also, upon the death of Guy, next year, crowned his son Lambert. Arnulph, however, reigned till 899, when he died, and was succeeded by his son Louis IV., whom some style the last of the male line of Charlemagne. Upon his death, in 911, the nobles elected Otho, duke of Saxony, but he, being old, recommended Conrad, duke of Franconia, whom they elected accordingly in 912. Conrad, dying in 920, recommended to their election Henry I., surnamed the Fowler, the son of Otho. Henry conquered the Danes, Huns, Vandals, and Bohemians; and was succeeded, in 937, by his son Otho I., surnamed the Great; who, after reigning twenty-six years as king of Germany, was crowned emperor in 962. After this he reigned other ten years; and, in 973, was succeeded by his son Otho II., who, dying in 983, was succeeded by his son Otho III., a boy of ten years of age. The reigns of most of these monarchs contain little remarkable, except their contests with the popes. What more immediately merits attention is the progress of government in Germany, which was in a great measure opposite to that of the other kingdoms of Europe. When the empire, erected by Charlemagne, fell asunder, all the independent princes assumed the right of election; and those now distinguished by the name of electors had no legal or peculiar right to appoint a successor to the imperial throne. They were only the officers of the emperor's or king's household, his secretary, steward, chaplain, marshal, or

master of horse, &c. By degrees, however, as they lived near his person, and had independent territories of their own, they increased their influence and authority; and in the election of Otho III., A.D. 984, acquired the sole right of electing the emperor. Thus, while in the other kingdoms of Europe the dignity of the great lords, who were all originally allodial or independent barons, was diminished by the power of the king, as in France, and by the influence of the people, as in Great Britain; in Germany, on the other hand, the power of the electors was raised upon the ruins of the emperor's supremacy, and of the people's jurisdiction.

Upon the death of Otho III., in 1001, an interregnum of four months ensued; after which the princes elected Henry II., surnamed the *Lame*, the grandson of Henry I., who reigned twenty-three years. Of this emperor's successors, till the accession of the house of Austria, it is only necessary here to give a brief chronological list. Conrad II., surnamed *Salicus*, the son of Herman, duke of Franconia, was elected in 1024; and after reigning nearly fifteen years, was succeeded, in 1039, by his son Henry III.; who, in 1056, was succeeded by his son Henry IV., though not without opposition from Rodolph of Suabia, and Herman of Luxemburg. Henry IV., after having reigned no less than fifty years, was deposed, in 1106, by his unnatural son Henry V.; on whose death, in 1125, Lothaire II., duke of Saxony, was elected. He died in 1137, and next year the diet chose Conrad III., duke of Franconia, the son of Frederick, duke of Suabia. He was succeeded, in 1152, by his brother, Frederick I., surnamed *Barbarossa*, who having embarked against the infidels, and taken Iconium, was drowned in Syria, in 1190. He was succeeded by his son Henry VI., who behaved so villanously to Richard I. of England, and who was at last poisoned by his wife Constance, and succeeded by his son Otho IV., in 1197. But a party of the princes having chosen Philip, duke of Suabia, Henry's brother, a civil war ensued, which ended in favor of Otho, Philip being assassinated in 1208. But four years after Otho was deposed, and Frederick II., his younger brother, then king of Sicily, was elected emperor, and crowned by pope Honorius III. in 1220. Having afterwards offended pope Gregory IX., by making peace with the sultan of Babylon, Frederick was excommunicated, which gave rise to the factions of the *Guelphs* and *Gibelines*, who, by their inveterate virulence against each other, disturbed the empire for several ages. Conrad IV. was elected emperor on the death of his father Frederick II., in 1250. See *CONRAD IV.* He died four years after, and was supposed to have been poisoned. His son was still more unfortunate. After an interregnum of two years, Richard, duke of Cornwall, brother to Henry III. king of England, was elected emperor in 1257; but, that prince residing mostly in England, Alphonso X., king of Castile, was elected in opposition to him. At last Rodolph I., count Hapsburg, was elected emperor in 1273. He conquered and killed Ottocar, king of Bohemia, and laid the foundation of the future gran-

deur of the house of Austria, though upon his death, in 1291, Adolphus of Nassau was chosen emperor; but had not reigned seven years, when he was defeated and slain by Albert of Austria, the son of Rodolph, who was crowned emperor in 1298.

Albert I. was equally ambitious and rapacious, but having seized upon the paternal estates of his nephew, John of Suabia, he was assassinated by that prince in 1308. Henry VII. of Luxemburg was then elected, upon whose death, in 1313, an interregnum of a year took place, when Louis V. the son of Louis duke of Bavaria, by Matilda, daughter of Rodolph I., was chosen by one party of the electors, and Frederick, the son of Albert I., by another. But Frederick, being taken prisoner, was obliged to renounce his dignity; and Louis, being killed by a fall from his horse in 1347, was succeeded by his other competitor, Charles IV., the son of John king of Bohemia, and grandson of Henry VII. This prince was a great encourager of learning, and in his reign the golden bull, establishing the Germanic constitution, was given by pope Innocent VI. in 1356. Charles, dying in 1378, was succeeded by his son Wenceslaus, who was twice imprisoned by the Bohemians, and at last deposed in 1400, when Rupert, Prince Palatine, was elected. Rupert was succeeded, in 1410, by Jodocus Margrave of Moravia, who, in 1411, was displaced by Sigismund, king of Hungary and Bohemia, the son of Charles IV. Albert II., duke of Austria, having married this monarch's daughter, succeeded him in all his dominions in 1437, but reigned only two years. His son Frederick III., archduke of Austria, &c. was elected emperor in 1440; and, from this period, the imperial dignity continued in the male line of that family for 300 years. His successor Maximilian I. married the heiress of Charles, duke of Burgundy; whereby Burgundy and the seventeen provinces of the Netherlands were annexed to the house of Austria. Charles V., grandson of Maximilian, and heir to the kingdom of Spain, was elected emperor, A.D. 1519. Under him Mexico and Peru were conquered by the Spaniards; and in his reign happened the reformation in several parts of Germany; which, however, was not confirmed by authority till 1648, by the treaty of Westphalia.

The reign of Charles V. was continually disturbed by his wars with the German princes and the French king, Francis I. Though successful in the beginning of his reign, his good fortune, towards the conclusion of it, forsook him; which, with other causes, occasioned his abdication of the crown. His brother Ferdinand I., who succeeded him in 1558, proved a moderate prince with regard to religion. He caused his son, Maximilian, to be elected king of the Romans in his own lifetime, and died in 1564, having ordered, by his last will, that if either his own male issue, or that of his brother Charles, should fail, his Austrian estates should revert to his second daughter Anne, wife to the elector of Bavaria, and her issue. This gave rise to the opposition afterwards made by the house of Bavaria to the Pragmatic sanction, in favor of the empress queen of Hungary on the death of her father. The

reign of Maximilian II. was disturbed with internal commotions, and an invasion from the Turks; but he died in peace in 1576. He was succeeded by his son Rodolph II., who was involved in wars with the Hungarians, and in differences with his brother Matthias, to whom he ceded Hungary and Austria in his lifetime, and by whom he was succeeded in the empire. Under Matthias the Lutherans and Calvinists were so much divided, as to threaten the empire with a civil war. His ambition, however, at last tended to reconcile them; but the Bohemians revolted, and threw the imperial commissaries out of a window at Prague. This gave rise to a ruinous war, which lasted thirty years. Matthias expected to have exterminated both parties; but they formed a confederacy, called the Evangelic League, which was counterbalanced by a Catholic League. Matthias, dying in 1618, was succeeded by his cousin Ferdinand II.; but the Bohemians offered their crown to Frederick, the elector Palatine, the most powerful Protestant prince in Germany, and son-in-law to king James I. That prince was so imprudent as to accept of the crown; but he lost it, being entirely defeated by the duke of Bavaria and the imperial generals at the battle of Prague; and he was even deprived of his electorate, the best part of which was given to the duke of Bavaria. The Protestant princes in Germany, however, had among them, at this time, many able commanders, who were at the head of armies, and continued the war with wonderful obstinacy. Among these were the margrave of Baden Durlach, Christian duke of Brunswick, and count Mansfield. Christian IV., king of Denmark, declared for them; and Richelieu, the French minister, was not fond of seeing the house of Austria aggrandised. The emperor, on the other hand, had excellent generals; and Christian, having put himself at the head of the Evangelic League, was defeated by Tilly, an Imperialist of great military reputation. The Protestants formed a fresh confederacy at Leipsic, of which the celebrated Gustavus Adolphus, king of Sweden, was the head. An account of his victories will be found under the article SWEDEN. At last he was killed at the battle of Lutzen in 1632. But the Protestant cause did not die with him. He had brought up a set of heroes, such as the duke of Saxe-Weimar, Torstenson, Banier, and others, who shook the Austrian power; till, under the mediation of Sweden, a general peace was concluded among all the belligerent powers, at Munster, in 1648: which formed the basis of the subsequent political system of Europe.

Ferdinand III. succeeded his father; but died in 1657, and was succeeded by his son Leopold I., a severe, unamiable, and not very fortunate prince. He had two great powers to contend with, France and the Turks, and was a loser in his wars with both. Louis XIV. had the two celebrated generals, Condé and Turenne, in his service. The latter had already distinguished himself by great exploits against the Spaniards; and, on the accession of Leopold, the court of France had taken the opportunity of confirming the treaty of Munster, and attaching to her interest several independent princes of

Germany. The tranquillity which now too place, however, was not established upon any permanent basis. War with Spain was resumed in 1668; and the great successes of Turenne in the Netherlands excited the ambition of the prince of Condé to attempt the conquest of Franche Comté, then under the protection of the house of Austria. This was accomplished in three weeks: but the rapid success of Louis had awakened the jealousy of his neighbours to such a degree, that a league was formed against him by England, Holland, and Sweden; and the French monarch, dreading to enter the lists with such formidable enemies, consented to the treaty of Aix-la-Chapelle; by which, among other articles, Franche Comté was restored.

The flames of war were soon renewed by the insatiable ambition of Louis XIV., who, having entered into an alliance with Charles II. of England, aimed at the total overthrow of the Dutch republic. The events of that war will be found related under the article UNITED PROVINCES. The misfortunes of the Dutch excited the compassion of the emperor and king of Spain, who openly declared themselves their allies. Turenne was opposed by the prince of Orange and the celebrated general Montecuculi, whose artful conduct eluded even the penetrating eye of Turenne, and he sat down suddenly before Bonne. Here he was joined by the prince of Orange, who had likewise eluded the vigilance of the French generals. Bonne soon surrendered, and several other places in Cologne fell into the hands of the allies; who likewise cut off the communication between France and the United Provinces; so that Louis was soon obliged to recal his armies, and abandon all his conquests with greater rapidity than they had been made. In 1674 he was deserted by his ally Charles II. of England, and the bishop of Munster and elector of Cologne were compelled to renounce their allegiance to him; but, notwithstanding these misfortunes, he continued every where to make head against his enemies, and even meditated new conquests. With a powerful army he again invaded Franche Comté in person, and, in six weeks, reduced the whole province. In Alsace, Turenne defeated the imperial general at Sinsheim, and ravaged the palatinate, surprised 70,000 Germans, cut in pieces a considerable detachment at Mulhausen, routed the elector of Brandenburg, who had been entrusted with the chief command, near Colmar; gave a third body a similar fate at Turkheim; and obliged the whole German forces at last to evacuate the province, and repass the Rhine. In consequence of these disasters, Montecuculi was recalled to act against Turenne. The military skill of the two commanders seemed to be nearly equal; but, before the superiority could be adjudged to either, Turenne was killed by a cannon ball, in reconnoitring a situation for erecting a battery. By his death the Imperialists obtained a decided superiority. Montecuculi penetrated into Alsace; and the French, under de Lorges, nephew to the deceased general, were happy in being able to avoid a defeat. Part of the German army now sat down before Treves, where they were opposed by Mareschal Crequi; but his negligence exposed

him to such a dreadful defeat, that he was obliged to fly into the city with only four attendants. Here he endeavoured in vain to animate the people to a vigorous defence. The garrison mutinied; and, when he refused to sign the capitulation they made, delivered him up prisoner to the enemy. Louis, in the mean time, had taken the field in person against the prince of Orange; but the disastrous state of affairs in Germany induced him to recall the prince of Condé to make head against Montecuculi. In this campaign the prince seemed to have the advantage. He compelled the Germans to raise the sieges of Hagenau and Saverne; and at last to repossess the Rhine, without having been able to force him to a battle. This was the last campaign made by these celebrated commanders; both of whom now retired from the field to spend the remainder of their days in peace. The excellent discipline, however, which the two great French generals had introduced into their armies, still continued to make them very formidable. In Germany the duke of Lorraine, who had recovered Philipsburg, was repeatedly defeated by Mareschal Crequi, who had been ransomed. In Flanders the prince of Orange was overmatched by the duke of Orleans and Marshal Luxembourg. A peace was at length concluded at Nimeguen in 1679, by which Louis secured Franche Comté, with many cities in the Netherlands; while the king of Sweden was reinstated in those places of which he had been stripped by the Danes and Germans. This tranquillity, however, was of short duration. Louis prepared for new contests: possessed himself of Strasburg by treachery; and dispossessed the elector palatine and the elector of Treves of the lordships of Falkenburg, Germansheim, and Valdentz. On the most frivolous pretences he had demanded Alost from the Spaniards; and, on their refusal, seized upon Luxembourg. His conduct, in short, was so intolerable, that the prince of Orange, his inveterate enemy, found means to unite the whole empire in a league against him. Spain and Holland became parties in the same cause; and Sweden and Denmark seemed also inclined to accede to the general confederacy. Notwithstanding this formidable combination, Louis seemed still to have the advantage. He made himself master of Philipsburg, Manheim, Frankendal, Spire, Worms, and Oppenheim; the palatinate was ravaged dreadfully; the towns were reduced to ashes; and the people, driven from their habitations, were left to perish through the inclemency of the weather and the want of provisions. By this cruelty his enemies were rather exasperated than vanquished: the Imperialists, under the duke of Lorraine, resumed their courage, and put a stop to the French conquests. At length all parties, weary of a destructive war, consented to the treaty of Ryswick in 1697.

By the treaty of Ryswick, Louis XIV. gave up to the empire Fribourg, Brisac, Kehl, and Philipsburg; and consented to destroy the fortifications of Strasburg. Fort Louis and Traerbach, the works of which had exhausted the skill of the great Vauban, with Lorraine, Treves, and the palatinate, were resigned to their respective

princes; inasmuch that the terms to which he now consented, after so many victories, were such as could scarcely have been expected under the pressure of the greatest misfortunes. The views of Louis, however, in consenting to this apparently humiliating treaty, were beyond the views of ordinary politicians. The health of the king of Spain was in such a declining way, that his death appeared to be at hand; and Louis now resolved to renew his pretensions to that kingdom, which he had formerly, by a treaty, solemnly renounced. But his designs, in this respect, could not be concealed from the vigilance of William III. of England; of which Louis being sensible, and knowing that the emperor had claims of the same nature on Spain, he entered into a very extraordinary treaty with William. This was no less than the partition of the whole Spanish dominions in the following manner:—To the young prince of Bavaria were to be assigned Spain and the East Indies; the dauphin, son to Louis, was to have Naples, Sicily, and the province of Guipuscoa; while the archduke Charles, son to Leopold, was to have only the duchy of Milan. By this scandalous treaty, the indignation of Charles was roused, so that he bequeathed the whole of his dominions to the prince of Bavaria. This scheme, however, was disconcerted by the sudden death of the prince; upon which a new treaty of partition was concluded between Louis and William. By this the kingdom of Spain, with the East India territories, were to be bestowed on the archduke Charles, and the Duchy of Milan upon the duke of Lorraine. The last moments of the Spanish monarch were disturbed by the intrigues of the rival houses of Austria and Bourbon; but the haughtiness of the Austrian ministers so disgusted those of Spain, that they prevailed upon their dying monarch to make a new will. By this the whole of his dominions were bequeathed to Philip, duke of Anjou, grandson to Louis, who, prompted by his ambition, accepted the kingdom bequeathed to his grandson, excusing himself to his allies in the best manner he could for departing from his engagements. For this, however, he was made to pay dear. His insatiable ambition and his former successes had alarmed all Europe. The emperor, the Dutch, and the king of England, entered into a new confederacy against him; and a bloody war ensued, which threatened to overthrow the French monarchy entirely. While this war was carried on with such success, the emperor Leopold died in 1705. He was succeeded by his son, Joseph I., who put the electors of Cologne and Bavaria to the ban of the empire; but being ill served by Prince Louis of Baden, general of the empire, the French partly recovered their affairs, notwithstanding their repeated defeats. The duke of Marlborough had not all the success he expected or deserved. Joseph himself was suspected of a design to subvert the Germanic liberties; and it was plain, by his conduct, that he expected England should take the laboring oar in the war, which was to be entirely carried on for his benefit. The English were disgusted at his slowness and selfishness: but he died, in 1711, before he had reduced the Hungarians; and, leaving no

male issue, was succeeded by his brother Charles VI., whom the allies were endeavouring to place on the throne of Spain, in opposition to Philip, duke of Anjou, grandson to Louis XIV.

When the peace of Utrecht took place, in 1713, Charles at first conducted himself as if he would continue the war, but found himself unable, being forsaken by the British. He therefore was obliged to conclude a peace with France at Baden in 1714, that he might attend the progress of the Turks in Hungary; where they received a total defeat from prince Eugene at the battle of Peterwaradin. They received another of equal importance from the same general in 1717, before Belgrade, which fell into the hands of the Imperialists; and, next year, the peace of Passarowitz, between them and the Turks, was concluded. Charles employed his leisure in making arrangements for increasing and preserving his hereditary dominions in Italy and the Mediterranean. Happily for him, the crown of Britain devolved to the house of Hanover; an event which gave him a very decisive weight in Europe, by the connexions between George I. and II. and the empire. Charles was sensible of this, and became, in consequence, so haughty, that, about A.D. 1724 and 1725, a breach ensued between him and George I., and so unsteady was the system of affairs all over Europe at that time, that the capital powers often changed their old alliances, and concluded new ones contradictory to their interest. It is sufficient to observe here that the safety of Hanover, and its aggrandisement, was the main object of the British court; as that of the emperor was the establishment of the Pragmatic sanction in favor of his daughter the late empress queen, he having no male issue. Mutual concessions upon these great points restored a good understanding between George II. and Charles VI.; and the elector of Saxony, flattered with the view of gaining the throne of Poland, relinquished his claims upon the Austrian succession. The emperor, after this, had very bad success in a war with the Turks, which he had undertaken chiefly to indemnify himself for the great sacrifices he had made in Italy to the house of Bourbon. Prince Eugene was then dead, and he had no general to supply his place. The system of France, however, under cardinal Fleury, happened to be pacific; and she obtained for him, from the Turks, a better peace than he had reason to expect. Charles, to keep the German and other powers contented, had, before his death, given his eldest daughter, Maria Theresa, afterwards empress-queen, in marriage to the duke of Lorraine, a prince who could bring no accession of power to the Austrian family. He died in 1740.

Charles VI. was no sooner in the grave than all he had so long labored for must have been overthrown, had it not been for the firmness of George II. The young king of Prussia entered and conquered Silesia, which he said had been wrongfully dismembered from his family. The king of Spain and elector of Bavaria set up claims directly incompatible with the Pragmatic sanction, and in this they were joined by France; though all these powers had solemnly guaranteed it. The imperial throne, after a con-

siderable vacancy, was filled up by the elector of Bavaria, who took the title of Charles VII. in January 1742. The French at this time poured their armies into Bohemia, where they took Prague; and the queen of Hungary, to divert the king of Prussia, ceded to that prince the most valuable part of the duchy of Silesia by a formal treaty. Her youth, her beauty, and her sufferings, together with the fortitude with which she bore them, touched the hearts of the Hungarians, into whose arms she threw herself and her young son; and, though they had been long remarkable for their disaffection to the house of Austria, they declared unanimously in her favor. Her generals drove the French out of Bohemia; and George II., at the head of an English and Hanoverian army, gained the battle of Dettingen, in 1743. Charles VII. was at this time miserable on the imperial throne, and would have given the queen of Hungary almost her own terms; but she haughtily and impolitically rejected all accommodation, though advised to it by his Britannic majesty, her best and indeed only friend. This obstinacy gave a color to the king of Prussia to invade Bohemia, under pretence of supporting the imperial dignity; but though he took Prague, and subdued the greatest part of the kingdom, he was not supported by the French; upon which he abandoned all his conquests and retired into Silesia. This event confirmed the obstinacy of the queen of Hungary; who came to an accommodation with the emperor that she might recover Silesia. He died soon after in 1745, and Francis I., duke of Lorraine, then grand duke of Tuscany, consort to the queen of Hungary, after surmounting some difficulties, was chosen emperor.

The bad success of the allies against the French and Bavarians in the Low Countries, and the loss of the battle of Fontenoy, retarded the operations of the empress-queen against the king of Prussia. The latter beat the emperor's brother, prince Charles of Lorraine, who had before driven the Prussians out of Bohemia; and the conduct of the empress-queen was such, that his Britannic majesty thought proper to guarantee to him the possession of Silesia, as ceded by treaty. Soon after, the king of Prussia, alleging that he had discovered a secret convention between the empress-queen, the empress of Russia, and the king of Poland, to strip him of his dominions and to divide them among themselves, suddenly drove the king of Poland out of Saxony, defeated his troops, and took possession of Dresden; which he held till a treaty was made under the mediation of king George II., by which the king of Prussia acknowledged Francis I. for emperor. The war, however, continued in the Low Countries, to the disadvantage and discredit of the Austrians and Dutch, till it was finished by the treaty of Aix-la-Chapelle, in April 1740. By that treaty Silesia was once more guaranteed to the king of Prussia. It was not long before that monarch's jealousies were renewed and verified; and the empress of Russia's views falling in with those of the empress-queen and the king of Poland, who were unnaturally supported by France in their new schemes, a fresh war was kindled. The king of

Prussia declared against the admission of the Russians into Germany, and his Britannic majesty against that of the French. Upon these two principles all former differences between these two monarchs were forgotten, and the British parliament agreed to pay an annual subsidy of £670,000 to Frederick during the war. The flames of war therefore now broke out in Germany with more violence than ever. The armies of his Prussian majesty, like an irresistible torrent, burst into Saxony; totally defeated the imperial general Brown at the battle of Lowositz; forced the Saxons to lay down their arms, though almost impregnablely fortified at Pirna; and the elector of Saxony to flee to his regal dominions in Poland. After this, the king of Prussia was put to the ban of the empire; and the French poured, by one quarter, their armies, as the Russians did by another, into the empire. The conduct of Frederick on this occasion was most determined and most creditable to his fortitude. See PRUSSIA. At last, however, the taking of Colberg by the Russians, and of Schweidnitz by the Austrians, was on the point of completing his ruin, when his most formidable enemy, the empress of Russia, died January 5th, 1762. George II., his only ally, died on the 25th of October 1760. The deaths of these illustrious personages were followed by great consequences. The British ministry of George III. sought to finish the war with honor, and the successor of Catharine, recalled his armies. Frederick the Great was, notwithstanding, so much reduced, that the empress-queen, probably, would have completed his destruction, had it not been for the wise backwardness of other German princes, to annihilate the house of Brandenburg. At first the empress-queen rejected all terms proposed to her, and ordered 30,000 men to be added to her armies. The visible backwardness of her generals to execute her orders, and the new successes obtained by the king of Prussia, at last prevailed on her, however, to agree to an armistice, which was soon followed by the treaty of Hubertsburgh, which secured to Frederick the possession of Silesia. Upon the death of her husband, in 1765, her son Joseph II. who had been crowned king of the Romans in 1764, succeeded him.

This prince showed an active and restless disposition, much inclined to extend his territories by conquest, and to make reformation in the internal policy of his dominions; but he took few proper methods for accomplishing his purposes. Hence he was almost always disappointed; and at last is said to have written for himself the following epitaph: 'Here lies Joseph, unfortunate in all his undertakings.' In 1788 a war commenced betwixt him and the king of Prussia; in which, notwithstanding the impetuous valor of that monarch, Joseph acted with such caution, that his adversary could gain no advantage over him; and an accommodation took place without any remarkable exploit on either side. In 1781 he took the opportunity of the quarrel betwixt Britain and the United Provinces, to deprive the latter of the barrier towns which had been secured to them by the treaty of Utrecht. These indeed had often been

of great use to the house of Austria in its state of weakness; but Joseph, conscious of his own strength, looked upon it as derogatory to his honor to allow so many of his cities to remain in the hands of foreigners, and to be garrisoned at his expense. As the Dutch were unable to resist, the imperial orders for evacuating the barrier towns were instantly complied with; nor did the court of France, though then in friendship with Holland, offer to interpose. Encouraged by this success, Joseph next demanded the free navigation of the Scheldt; but, as this would have been very detrimental to the commercial interests of Holland, a flat refusal was given to this requisition. In this the emperor was much disappointed; having flattered himself that the Dutch, intimidated by his power, would yield the navigation of the river as easily as they had done the barrier. Great preparations were made by the emperor, which the Dutch seemed prepared to resist. But, while he appeared so much determined on this acquisition, he suddenly abandoned the project, and proposed exchanging the Netherlands for the duchy of Bavaria. This was opposed by the king of Prussia; and, by the interference of the court of France, the emperor found himself at last obliged also to abandon his other scheme of opening the navigation of the Scheldt. A treaty of peace was concluded, under the guarantee of Louis XVI. wherein the states acknowledged the emperor's sovereignty over the Scheldt from Antwerp to Sestinghen; agreed to demolish certain forts, and to pay a sum of money in lieu of some claims which the emperor had on Maestricht, and by way of indemnification for laying part of his territories under water. The treaty with the Dutch was no sooner concluded than a quarrel with the Turks took place, which terminated in an open war. It does not appear that the emperor had at this time any real provocation, but he seems to have acted merely in consequence of his engagements with Russia to reduce the dominions of the grand signior. These engagements, however, did not retard the progress of reformation, which he carried on throughout his dominions with unparalleled rapidity, and which at last produced the revolt of the Austrian Netherlands. In the course of this reform a complete code of laws was compiled. These were at first greatly commended for their humanity, as excluding almost entirely every species of capital punishment; yet, when narrowly considered, the commutations were found to be so exceedingly severe, that the most cruel death would, comparatively speaking, have been an act of mercy. Even for small crimes the punishments were severe beyond measure; but the greatest fault of all was, that the modes of trial were so defective, and the punishments so arbitrary, that the most innocent character lay at the mercy of a tyrannical judge. The innovations in ecclesiastical matters were, however, most offensive to his subjects, though some of them were not unreasonable; such as the introduction of the vernacular language instead of the Latin, in administering the sacraments; and the total abolition of the papal supremacy throughout the imperial dominions. Many favors were also

bestowed upon the Jews; and in 1786 the emperor wrote with his own hand to the different corporations in Vienna, requesting that their youths might be received as apprentices in that city. Severe laws against gaming were likewise enacted, and executed with rigor; and heavy restrictions were laid on all the societies of free masons in Germany, while those in the Netherlands were totally suppressed. But the innovations in religious matters were chiefly resented by the Belgians, who had long been remarkable for their attachment to the Romish religion in its most superstitious form. Indeed the alterations in the civil constitutions of the empire were so great, that, even those who were least bigoted in this respect began to fear that their liberties were in danger, and a universal dissatisfaction was excited. The emperor at first behaved very haughtily, and refused to yield the smallest point to his subjects. Finding, however, that a general revolt was ready to take place, and being unable, on account of the Turkish war, to spare such a force as would be necessary to reduce the provinces to obedience, he, in autumn 1787, promised a restoration of their ancient constitution and privileges. His promises, however, were so delusive, and his conduct was so arbitrary and capricious, that in the end of 1789 the states of all the provinces in the Austrian Netherlands came to a resolution of entirely throwing off the yoke. Articles of federal union were drawn up, and a new republic was formed under the title of the United Belgic Provinces. The situation of the emperor's affairs at that time did not allow him to take the measures necessary for preventing this revolt; to which perhaps his ill state of health also contributed; and, continuing daily to grow worse, he sunk under it on the 20th of February 1790, in the fortieth year of his age, and twenty-sixth of his reign.

The leaders of the Belgic revolution, however, soon became so unpopular that they were obliged to fly; and the congress, which had been established as the supreme legislative body, behaved with such tyranny that they became generally detested. Mean time, in 1790, the emperor Joseph was succeeded by his brother Leopold II., under whose administration matters soon took a more favorable turn. By his wisdom, moderation, and humanity, he in a considerable degree retrieved the bad consequences of his predecessor's conduct; having made peace with the Turks, and in some measure regained the allegiance of the Netherlands. But the death of Leopold II., in 1792, occasioned a new change of affairs. His son and successor, Francis II. having taken an early and active part in the war with France, the Belgians once more threw off their allegiance, and petitioned the convention to be united with the French republic. This, in consequence of the success of the republican arms, in 1793 and 1794, was accordingly done, and the *ci-devant* Austrian Netherlands formed into nine of the new departments of the French republic. That part of Germany which lies on the left or west bank of the Rhine, was also annexed to France. In the year 1801—1805, and 1810, in consequence of three bloody and ruinous wars, Francis II. was obliged to

make peace with France on terms more and more humiliating, till the German constitution became, as we have intimated, completely destroyed.

With large armies, maintained at the expense of the occupied countries, Germany remained completely under the power of France till 1813, when fairer prospects opened, and a memorable burst of patriotic zeal, taking advantage of the dawn of liberty in the Peninsula, liberated the German nations. The Confederation of the Rhine, which had stood the seven years' monument of French ambition, on the one hand, and of the self-interest and pusillanimity of some of its states on the other, was then as we have seen dissolved, and the Constitution of Germany was remodeled by the Congress at Vienna; since which its public affairs have remained without external disturbance.

GERME, among shipping, a kind of bark used in the shallows on the coast of Egypt, as drawing but little water. They are strong and well-built; but have no decks. They have one, two, or three masts, according to their sizes. The yards are fixed to the top of the masts, and, as well as the sails, are unmanageable from below. To effect the smallest change, the seaman must go aloft. The burden of these boats is five or six tons. They are chiefly used to convey goods from Alexandria to Rosetta.

GERMEN, the seed bud. See **BOTANY**. In assimilating the vegetable and animal kingdoms, Linnaeus denominates the germen, the ovarium or uterus of plants; and affirms its existence to be chiefly at the time of the dispersion of the male dust by the anther; as, after its impregnation, it becomes a seed-vessel. Germen, by Pliny and the ancient botanists, is used to signify a bud containing the rudiments of the leaves.

GERMERSHEIM, a strong town of the Bavarian circle of the Rhine, at the conflux of the Queich and the Rhine. It is surrounded partly by a wall, and partly by the Queich, the Rhine, and marshy grounds; the diet of Frankfurt, in 1819, fixed on it as one of the bulwarks of the empire, and appropriated no less than £600,000 sterling for additional works, particularly a double *tête de pont* on the Rhine. In January, 1794, the French took it, and in May following they were defeated at this place by the Austrians. Population 1500. Five miles south of Spire, and eight south of Mannheim.

GERMINATION, among botanists, also comprehends the precise time which the seeds take to rise, after they have been committed to the soil. The different species of seeds are longer or shorter, in rising, according to the degree of heat which is proper to each. Millet, wheat, and several of the grasses, rise in one day; blite, spinach, beans, mustard, kidney-beans, turnips, and rocket, in three days; lettuce and dill, in four; cucumber, gourd, melon, and cress, in five; radish and beet in six; barley in seven; orach in eight; purslane in nine; cabbage in ten; hyssop in thirty; parsley in forty or fifty days; peach, almond, walnut, chestnut, pæony, horned poppy, hypecoum, and ranunculus *falcatius*, in one year; rose-bush, cornel-tree, haw-

thorn, medlar, and hazel-nut in two. The seeds of some species of orchis, and of some lilaceous plants, never rise at all. Some seeds require to be sown almost as soon as they are ripe, otherwise they will not sprout or germinate. Of this kind are the seeds of coffee and fraxinella. Others, particularly those of the pea-bloom flowers, preserve their germinating faculty for a series of years. Mr. Adanson asserts, that the sensitive plant retains that virtue for thirty or forty years. Air and water are the agents of germination. The humidity of the air alone makes several seeds to rise that are exposed to it. Seeds too are observed to rise in water, without the intervention of earth; but water without air is insufficient. Mr. Hombert's experiments on this head are decisive. He put several seeds under the exhausted receiver of an air-pump, with a view to establish something certain on the causes of germination. Some of them did not rise at all; and the greatest part of those which did, made very weak and feeble productions. Thus it is for want of air, that seeds, which are buried at a very great depth in the earth, either thrive but indifferently, or do not rise at all. They frequently preserve, however, their germinating virtue for many years within the bowels of the earth; and it is not unusual, upon a piece of ground being newly dug to a considerable depth, to observe it soon after covered with several plants, which had not been seen there in the memory of man. Were this frequently repeated, it would doubtless be the means of recovering certain species of plants which are regarded as lost; or which perhaps have never come to the knowledge of botanists. Some seeds require a greater quantity of air than others. Thus purslane, which does not rise till after lettuce in the free air, rises before it in vacuo; and both prosper but little, or perish altogether, while cresses vegetate as freely as in the open air.

GERONA, GIRONA, or GIRONNA, an ancient town of Spain, in Catalonia, and a bishop's see. In 1694 it was taken by the French and restored at the peace of Ryswick. In 1705 it was taken by the Austrians, and again by the French in 1711, under the duke of Noailles. In the year 1809 this city endured one of the most extraordinary sieges recorded in history; but was at length, after the most vigorous and honorable defence, compelled to yield to the French. We regret we can only in this place refer to Dr. Southey's excellent narrative of this siege, 'Peninsular War,' vol. ii. p. 520.

Gerona is built in the form of a triangle, on the slope, and at the foot of a steep mountain; it is surrounded with good flanked walls, and covered by two forts erected on the mountain. Besides these, it has five fortified buildings. The streets are narrow and winding, but the houses respectable. There are thirteen monasteries in the place, and about 14,000 inhabitants. Here is also an academy on a large scale, with professors of Latin, rhetoric, philosophy, and divinity; the students are numerous, and form one of the chief supports of the place. Gerona stands near the Onhal, forty-four miles south of Perpignan, and forty-seven north-east of Barcelona.

GERONTES, from γερων, in antiquity, a kind of judges, or magistrates, in ancient Sparta, answering to what the Arcopagites were at Athens. See **ARLOPAGUS**. The senate of gerontes was called gerusia, i. e. the assembly or council of old men. They were originally instituted by Lycurgus; their number, according to some, was twenty-eight; and according to others thirty-two. They governed in conjunction with the king, whose authority they were intended to balance, and to watch over the interests of the people. Polybius defines their office in few words, when he says, per ipsos, et cum ipsis, omnia administrari. None were admitted into this office under sixty years of age, and they held it for life. They were succeeded by the ephori.

GEROPOGON, in botany, a genus of the polygamia equalis order, and syngenesia class of plants; natural order forty-ninth, compositæ. The receptacle is paleaceous, with the points of the paleæ sharp or bristly: **CAL.** simple: **SEEDS** in the disc have a feathered pappus, in the radius have a pappus of five awns. Species three; natives of Italy.

GERS, a department of France, bounded on the north by those of Landes, and Lot and Garonne; on the east by that of Upper Garonne; on the south by those of the Upper and Lower Pyrenees; and on the west by that of Landes. It includes the ci-devant provinces of Armagnac and Gascony; and is wholly inland, having a territorial extent of 2620 square miles, and 286,500 inhabitants. It is divided into the five arrondissements of Auch, Condom, Lectoure, Lombez, and Mirande. It is principally devoted to pasturage and the cultivation of the grape. Auch is the capital.

GERS, a river of France, which rises in the department of the Upper Pyrenees, crosses and gives name to that of the Gers, and falls into the Garonne, three miles south-east of Agen.

GERSAU, a town in the Swiss canton of Schweitz, on the lake of Lucern. It stands among mountains, and is accessible only by a single and hazardous path. It became, in 1315, independent, and is still the smallest free state known, its whole territory being only two leagues long, and half a league broad. Population 1500.

GERTRUYDENBERG, a small strong town of the Netherlands, situated on the Biesbosch, an arm of the sea, in North Brabant. It has about 1300 inhabitants, chiefly employed in salmon fishing, and, in 1709, it was the scene of a long negotiation between Louis XIV. and the allied powers, and was taken by the French, under Dumouriez, on 4th May, 1793; ten miles south-east of Dort, and seven north-east of Breda.

GERVAISE, or **GERVASE**, of Tilbury, a famous English writer of the thirteenth century; born at Tilbury on the Thames. He was nephew to Henry II., king of England; and was in great credit with Otto IV. emperor of Germany, to whom he dedicated a Description of the World, and a Chronicle. He also composed a History of England, a History of the Holy Land, and other works.

GERUMENHA, or **GERUMENI**, an ancient town of Portugal, in Alentejo, with a strong castle, seated on a hill, near the Guadiana. In 1662 it stood a siege of a month, before it surrendered to the Spaniards. It lies eighteen miles below Badajoz.

GERUND, *n. s.* Lat. *gerundium*. A kind of verbal noun, which governs cases like verbs, and in Latin ends in di, do, and dum.

GERYON, or **GERYONES**, in fabulous history, a king of Gades, in Iberia, who had three bodies, and fed his cattle with human flesh. This monster was slain by Hercules, who carried off his cattle. Hyginus makes him the son of Chrysaor, brother of the winged horse Pegasus, and the grandson of Neptune, by Medusa, one of the furies. The fable is supposed to mean that he was a king of three contiguous Spanish islands; or, as others think, there were three kings brethren, so united as to seem to have but one soul.

GESNER (Conrad), M. D., a celebrated physician and naturalist, born at Zurich in 1516. Having finished his studies in France, he travelled into Italy, and taught medicine and philosophy at Lausanne, with extraordinary reputation, and excelled so much in natural history, that he was surnamed the German Pliny. He died December 9th, 1565, leaving many works behind him, on botany, medicine, grammar, natural history, &c. Of these the principal are, 1. A History of Animals, Plants, and Fossils; 2. Bibliotheca Universalis; a Greek and Latin Lexicon. Boerhaave emphatically styled him *Monstrum Eruditionis*, 'a prodigy of learning.' 'Those indeed,' Mr. Coxe observes in his Letters on Switzerland, 'who are conversant with the works of this great naturalist, cannot repress their admiration at the amplitude of his knowledge in every species of erudition, and the variety of his discoveries in natural history. Their admiration is still further augmented, when they consider the gross ignorance of the age which he helped to enlighten, and the scanty succours he possessed to aid him in thus extending the bounds of knowledge; that he composed his works, and made those discoveries which would have done honor to the most enlightened period, under the complicated evils of poverty, sickness, and domestic uneasiness.' During his last twenty-four years, however, his salary, as a professor, enabled him to live in easy circumstances.

GESNER (John Matthew), an acute German critic, born at Neuburg, in 1691. After superintending the public school of Weinheim for eleven years, he removed to Anspach, and thence to Gottingen, where he was made professor of humanity, and public librarian, &c. He died at Gottingen in 1761. His most esteemed works are, an excellent Latin Dictionary, and his editions of the Classics.

GESNER (Solomon), the celebrated author of the Death of Abel, was born at Zurich in 1730. In his early years he showed no signs of superior abilities. When he arrived at a proper age, he chose his father's profession, viz. that of a printer. In 1752 he made a tour through Ger-

many; and when at Berlin was admitted into a literary society, of which Gleim and Lessing were members. Every member read in turn some pieces of his own composition, and Gesner was very desirous of submitting to these able critics a small work, which was his first attempt. The piece which he wished, but had not eventually the courage to show, was his poem, entitled Night, which he published on his return to Zurich in 1753. The success of this essay emboldened him to publish a pastoral romance, called Daphnis, in three cantos. The applause deservedly bestowed upon this performance, induced him to publish his Idylls, and other rural poems in imitation of Theocritus. Pastoral poetry, which was then little known in Germany but by translations, began to be preferred to every other kind. These Idylls were the favorite object of his pursuit, and that part of his work which acquired him the greatest reputation. His Death of Abel was first published in 1758. It is written, like the rest of his pieces, in poetical prose; and went through three editions in one year. The French edition was followed by others, in Italian, Dutch, Danish, and, lastly, two in English, one in prose and the other in verse. He next published his First Navigator, a poem in three cantos, which many consider as his master-piece. He produced, likewise, in the dramatic style, Evander and Alcimne in three acts; and Erastus in one act, which was represented with applause at Leipsic and Vienna. In 1765 he was called to the grand council, in 1767 to the less; in 1768 he was appointed bailiff of Eilibach; that of the four guards in 1776; and in 1781 superintendent of waters, which office in 1787 was continued to him for six years. He died of a paralytic attack in 1788, aged fifty-eight. As a pastoral poet, Gesner, if he has been equalled by any, has been excelled by none. His pastoral romance of Daphnis is not inferior, in natural simplicity, to the celebrated work of Longus; but it surpasses it far in variety of images and incident. Erastus and Evander are instructive and interesting poems, on account of the contrast between the world and nature which reigns throughout them; and his First Navigator unites the mildest philosophy with all the splendor and imagery of Fairy land. The late empress, Catharine II., presented him with a gold medal as a mark of her esteem. Travellers thought they had seen only the half of Switzerland, if they had not been in the company of Gesner, or procured some of his drawings.

GESNERIA, in botany, a genus of the angiospermia order, and didynamia class of plants; natural order fortieth, personate: *cal.* quinquefied, and placed on the germen: *cor.* incurvated and then recurvated: *caps.* inferior and bilocular. Species eleven; all South American shrubs.

GESSORIACUM, in ancient geography, a port and station for ships of the Morini in Gallia Belgica. In Caesar's time, according to Dio, there was no town; but Florus speaks of it as one; and the Gessoriacenses Muri, are mentioned by Eumenius in his Panegyric. The author of Tabula Theodosiana, commonly called Peutinger's map, says expressly, that Gessoriacum

was in his time called Bononia. It is now called Boulogne.

GEST, *n. s.*

GESTA'TION, *n. s.*

GESTICULATE, *v. n.*

GESTICULATION,

GES'TURE, *n. s. & v. a.*

a stage: to bear, as the parent its young in the womb: posture expressive of sentiment: to ridicule; to imitate.

And after that his dice turned on chaunces,

So was he either glad or saide, Alas,

And helde after his *gestes*, are his paas;

And after suche answers as he hadde,

So weren his daies sory other gladdes.

Chaucer. Troilus and Creseide.

Women full good, and trewe, and vertuous,

Witnesse on hem that dwelte in Cristes hous,

With martyrdom they preved hir constance.

The Romain *gestes* maken remembrance

Of many a very trewe wif also.

Chaucer. The Merchant's Tale.

Who fair them quites, as him besemeth best,

And goodly can discourse with many a noble *gest*.

Spenser.

Our attire disgraceth it, it is not orderly read, nor *gestured* as he semeth.

Hooker.

When we make profession of our faith, we stand; when we acknowledge our sins, or seek unto God for favour, we fall down; because the *gesture* of constancy becometh us best in the one, in the other the behaviour of humility.

Id.

I'll give you my commission,

To let him there a month, behind the *gest*,

Prefixed for's parting. *Shakspeare. Winter's Tale.*

To the dumbness of the *gesture*

One might interpret. *Id. Timon of Athens.*

He undertook so to *gesture* and muffle up himself in his hood, as the duke's manner was, that none should discern him.

Wotton.

Grace was in all her steps, heaven in her eye,

In every *gesture* dignity and love!

Milton's Paradise Lost.

He distinctly sets down the *gests* and progress thereof.

Browne.

Aristotle affirmeth the birth of the infant, or time of its *gestation*, extendeth sometimes unto the eleventh month; but Hippocrates avers that it exceedeth not the tenth.

Id.

Alh, my sister, if you had heard his words, or seen his *gestures*, when he made me know what and to whom his love was, you would have matched in yourself those two rarely matched together, pity and delight.

Sidney.

Why in viviparous animals, in the time of *gestation*, should the nourishment be carried to the embryo in womb, which at other times goeth not that way?

Ray on the Creation.

Every one will agree in this, that we ought either to lay aside all kinds of *gesture*, or at least to make use of such only as are graceful and expressive.

Addison's Spectator.

Their classical profiles, and glittering dresses,

Their large black eyes, and soft seraphic cheeks,

Crimson as cleft pomegranates, their long tresses,

The *gesture* which enchants, the eye that speaks,

The innocence which happy childhood blesses,

Made quite a picture of these little Greeks;

So that the philosophical beholder

Sighed for their sakes—that they should e'er grow older.

Byron. Don Juan.

GESTRICIA, a province of Sweden, in the government of Gefleborg, about 1240 square miles

in extent, and having a population of 27,000 North and west it is mountainous and barren, but in the south it has beautiful valleys and plains, producing corn, flax, hemp, hops, &c., but the inhabitants depend chiefly on their forests, iron mines, and iron works. The chief town is Gefle.

GET, *v. a. & v. n.*

GETTER, *n. s.*

GETTING.

Sax. *geatan*, *ge tan*;

Goth. *geta*; pret. I got,

anciently *gat*; part. pass.

got, or gotten. To obtain, whether by force or otherwise; to arrive at any state or posture: thus, to *get off* is to dispose of or escape; to *get over*, to conquer or suppress; to *get up*, to arise from repose or from a seat; to remove from one place to another; the act of acquisition or increase: sometimes used in the sense of *beget*. 'To *get*, in all its significations,' says Dr. Johnson, 'both active and neutral, implies the acquisition of something, or the arrival at some state or place by some means; except in the use of the preterite compound, which often implies mere possession: as, he has *got a good estate*, does not always mean that he has acquired, but barely that he possesses it. So we say, the *lady has got black eyes*, merely meaning that she has them.'

Wisdom is the principal thing, therefore *get* wisdom; and with all thy *getting*, *get* understanding.

Prov. iv. 7.

What hast thou to do with hir live,

Thy falsheid every man maie fele,

For thou ne canst no cattell *gete*,

But livest in londe as a lorell,

With glosing *gettest* thou thy mete.

Chaucer. The Plowmans Tale.

Have ye not seen sometime, a pale face

(Among a prees) of him that hath ben lad

Toward his deth; wher as he *geteth* no grace,

And swiche a colour in his face hath had,

Men mighten know him that was so bestad,

Amonges all the faces in that route;

So stant Custance, and loketh hire aboute.

Chaucer. The Man of Lawes Tale.

Yet being pregnant still with powerful grace,

And full of fruitful Love, that loves to *get*

Things like himselfe, and to enlarge his race,

His second brood, though not of powre so great,

Yet full of beauteie, next he did beget,

An infinite increase of angels bright,

All glistering glorious in their Maker's light.

Spenser's Hymnes.

Such losels and scatterlings cannot easily, by any constable, or other ordinary officer, be *gotten*, when they are challenged for any such fact.

Spenser.

Thine be the cosset, well hast thou it *got*.

Id.

You knew he walked o'er perils, on an edge

More likely to fall in than to *get over*.

Shakspeare. Henry IV.

Get on thy boots; we'll ride all night.

Shakspeare.

Take no repulse, whatever she doth say;

For *get* you gone, she doth not mean away.

Id.

Henry the sixth hath lost

All that which Henry the fifth had *gotten*.

Id.

Peace is a very lethargy, a *getter* of more bastard-children than war's a destroyer of men.

Id.

If they *get* ground and vantage of the king,

Then join you with them like a rib of steel.

Id.

Those boys are boys of ice; they'll none of her; sure they are bastards to the English, the French never *got* them.

Id.

Get you to bed on the instant; I will be returned forthwith.

Id. Othello.

The fox bragged what a number of shifts and devices he had to *get* from the hounds, and the cat said he had but one, which was to climb a tree.

Bacon.

Who hath a state to repair may not despise small things ; and it is less dishonourable to abridge a petty charge than to stoop to petty *gettings*.

Id.

Sheep will *get up* betimes in the morning to feed against rain.

Id. Nat. History.

Then forcing thee, by fire he made thee bright ;

Nay thou hast got the face of man.

Herbert.

They will *get over* the river A vonat Stratford, and *get* between the king and Worcester.

Clarendon.

Phalantus was entrapped, and saw round about him ; but could not *get out*.

Sidney.

Women with studied arts they vex :

Ye gods, destroy that impious sex :

And if there must be some to invoke

Your powers, and make your altars smoke,

Come down yourselves, and, in their place,

Get a more just and nobler race.

Waller.

Like jewels to advantage set,

Her beauty by the shade does *get*.

Id.

All things, but one, you can restore ;

The heart you *get* returns no more.

Id.

The roving fumes of quicksilver, in evaporating, would oftentimes fasten upon the gold in such plenty, as would put him to much trouble to *get* them off from his rings.

Boyle.

Most of these things might be more exactly tried by the Torricellian experiments, if we could *get* tubes so accurately blown that the cavity were perfectly cylindrical.

Id.

When an egg is made hard by boiling, since there is nothing that appears to *get in* at the shell, unless some little particles of the water, it is not easy to discover from whence else this change proceeds than from a change made in the texture of the parts.

Id.

Whatever thou dost, deliver not thy sword ; With that thou mayest *get off*, though odds oppose thee.

Dryden.

O heaven, in what a lab'rinth am I led !

I could *get out*, but she detains the thread.

Id.

The laughing sot, like all unthinking men, Bathes and *gets* drunk ; then bathes and drinks again.

Id.

If you'll take 'em as their fathers *got* 'em, so and well ; if not, you must stay 'till they *get* a better generation.

Id.

Having no mines, nor any other way of *getting* or keeping of riches but by trade, so much of our trade as is lost, so much of our riches must necessarily go with it.

Locke.

Lying is so cheap a cover for any miscarriage, and so much in fashion, that a child can scarce be kept from *getting* into it.

Id.

Though creditors will lose one-fifth of their principal and use, and landlords one-fifth of their income, yet the debtors and tenants will not *get it*.

Id.

Any tax laid on foreign commodities in England raises their price, and makes the importer *get* more for them ; but a tax laid on your home-made commodities lessens their price.

Id.

Two or three men of the town are *got* among them.

Tatler.

After having *got* out of you every thing you can spare, I scorn to trespass.

Guardian.

'Tis very pleasant to hear the lady propose her doubts, and to see the pains he is at to *get over* them.

Addison.

By the marriage of his grandson Ferdinand he *got* into his family the kingdoms of Bohemia and Hungary.

Id.

Imprisoned fires, in the close dungeons pent,
Roar to *get* loose, and struggle for a vent ;
Eating their way, and undermining all,
Till with a mighty burst whole mountains fall.

Id.

Though the king could not *get* him to engage in a life of business, he made him however his chief companion.

Id. Spectator.

The man who lives upon alms, *gets* him his set of admirers, and delights in superiority.

Addison.

Sphinx was a monster that would eat

Whatever stranger she could *get*,

Unless his ready wit disclosed

The subtle riddle she proposed.

Id. Whig Examiner.

Those that are eager to *get* abundance of this world, and solicitous to lay up what they have *gotten*, little consider what may become of it, and in how little a time it may be all taken from them.

Henry. Isaiah. xv. 7.

There is a sort of men who pretend to divest themselves of partiality on both sides, and to *get above* that imperfect idea of their subject which little writers fall into.

Pope on Homer.

A knot of ladies, got together by themselves, is a very school of impertinence.

Swift.

Wood, to *get* his halfpence *off*, offered an hundred pounds in his coin for seventy in silver.

Id.

This practice is to be used at first, in order to *get* a fixed habit of attention, and in some cases only.

Watts.

Get by heart the more common and useful words out of some judicious vocabulary.

Id.

Our studies will be for ever, in a very great degree, under the direction of chance ; like travellers we must take what we can *get*, and when we can *get it*.

Sir J. Reynolds.

Yes, I nursed thee

Because thou wert my firstborn, and I know not

If there would be another unlike thee,

That monstrous sport of nature. But *get* hence

And gather wood !

Byron. Deformed Transformed.

GETA (M. Septimius Antonius), the son of the emperor Severus, and brother to Caracalla. In the eighth year of his age he was moved with compassion at the fate of some of the partisans of Niger and Albinus, who were to be executed, and his father struck with his humanity retracted the sentence. After Severus's death, he reigned at Rome conjointly with his brother ; but Caracalla, who envied his virtues and was jealous of his popularity, ordered him to be poisoned ; and, this not being effected, he murdered him in the arms of his mother Julia, who, in attempting to defend him, received a wound in her arm, from the hand of her worthless son, A. D. 212. Geta had not reached the twenty-third year of his age, and the Romans lamented the death of so virtuous a prince, while they groaned under the cruelties and oppressions of Caracalla.

GETA, is a town of Sweden, on the north coast of the island of Aland. Long. 9° 50' E., lat. 60° 25' N.

GETÆ, an ancient nation of Thrace, who dwelt on both sides of the Ister, near Seythia, supposed to be the ancestors of the Dacians and Goths ; or, according to others, of the Walachians or Moldavians.

GETHESEMANE, in ancient geography, a village at the foot of Mount Olivet, whither our

Lord sometimes retired in the night-time. It was in a garden belonging to this village that he suffered his memorable agony in which he sweated blood; and was arrested by Judas and his band. The place is described by Maundrel as an even plot of ground, not above fifty-seven feet square, lying between the foot of Mount Olivet and the brook Cedron.

GETHYLLIS, in botany, a genus of the monogynia order, and dodecandria class of plants; natural order ninth, spathaceæ: cor. six-cleft, and the stamina are in six different directions: caps. is trilocular. Species five; all Cape herbs.

GEW'GAW, *n. s. & adj.* γεγαρ; Fr. *joyau*; à Lat. *gaudento*. That which is splendid or showy in appearance without sterling value; trifling.

That metal they exchanged for the meanest trifles and *gewgaws* which the others could not bring.

Abbot.

Let her love whom she will I scorn to woo her,
While she stays with me I'll be civil to her;
But if she offers once to move her wings
I'll fling her back all her vain *gewgaw* things.

Buckingham.

As children, when they throw one toy away,
Straight a more foolish *gewgaw* comes in play.

Dryden.

Prefer that which Providence has pronounced to be the staff of life, before a glittering *gewgaw* that has no other value than what vanity has set upon it.

L'Estrange.

When we load it (the head) with a pile of super-numerary ornaments, we destroy the symmetry of the human figure, and foolishly contrive to call off the eye from great and real beauties, to childish *gewgaws*, ribands, and bone-lace.

Addison.

The first images were fans, silks, ribands, laces, and many other *gewgaws*, which lay so thick that the whole heart was nothing else but a toynshop.

Id. Guardian.

Let him that would learn the happiness of religion,
see the poor *gewgaw* happiness of Felician.

Law's Serious Call.

——— Man,

Thou pendulum betwixt a smile and tear,
Ages and realms are crowded in this span,
This mountain whose obliterated plan
The pyramid of empires pinnacled
Of glory's *gewgaws* shining in the van,
Till the sun's rays with added flame were filled!
Where are its golden roofs? Where those who dared
to build?

Byron. Child Harold.

GEUM, avens, or herb bennet, a genus of the polygamia order, and icosandria class of plants; natural order thirty-fifth, scitoseæ: CAL. cleft into ten parts; petals five; and each SEED has a jointed awn. There are ten species; of which the two following, both natives of Britain, are the most remarkable:—

G. rivale, with a very thick, fleshy, and fibrous root, hairy leaves, and upright stalks, ten or twelve inches high, terminated by purple flowers nodding on one side. Of this there are varieties with red and with yellow flowers. The root powdered is said to be efficacious in curing the tertian ague; and it is daily used for this purpose by the Canadians and other inhabitants of North America. Sheep and goats eat the

plant; cows, horses, and swine, are not fond of it.

G. urbanum, with thick fibrous roots of an aromatic taste, rough serrated leaves, and upright, round, hairy stalks, terminated by large yellow flowers, succeeded by globular fruit. The roots, gathered in spring before the stem comes up, and infused in ale, give it a pleasant flavor, and prevent its growing sour. Infused in wine, they have a stomachic virtue. The taste is mildly austere and aromatic, especially when the plant grows in warm dry situations; but in moist shady places it hath little virtue. Both these species are easily propagated either by the root or seed.

GEX, a town in the south-east of France, in the department of the Ain, noted for watch-making. It stands near the foot of Mount Jura, and contains a population of 2500; ten miles west of Geneva.

GEZULA, or **GAZULA**, a country of Africa, south of Morocco, the inhabitants of which are allies of the emperor. They are numerous, and are reckoned the most ancient people of Africa. They have no towns, but live in camps and villages, and are hospitable to strangers. They have an annual fair, which lasts two months. The country abounds in corn, pasture, copper and iron.

GHASTFUL, *adj.*

GHAST'LY, *n. s.*

GHAST'LINESS, *n. s.*

GHAST'NESS, *n. s.*

GHOST, *n. s., v. n. & v. a.*

GHOST'INESS, *n. s.*

GHOST'LY, *adj.*

Sax. *gæst*, a ghost, and *fulle*; Belgic *gheest*; Teut. *geist*; Swed. *gast*. A spiritual appearance; a being as opposed to whatever is material.

The name of the third person in the Holy Trinity; the soul of man; and by use applicable to whatever has a character of death, or is horrid, pale, emaciated.

Save and defend us from our *ghostly* enemies.

Common Prayer.

There stood the temple of Mars Arripotent,
Wrought all of burned steel; of which the' entree
Was longe and streite, and *ghostly* for to see.

Chaucer. The Knightes Tale.

And thou shalt understand, that marchandise is in two maneres; that on is bodily, and that other is *ghostly*: that on is honest and leful, and that other is dishonest and unfeul.

Id. The Persones Tale.

Here will I dwell apart,
In *ghostly* grave, 'till my last sleep
Do close mine eyes;

Help me, ye baneful birds, whose shrieking sound
Is sign of dreary death.

Spenser's Pastorals.

And when my weary *ghost*, with griefe outworne,
By timely death shall winne her wished rest,
Then let this plaint unto his cares be borne,
That blame it is to him that armes prof st.

To let her die whom he might have redrest.

Id. Fierie Queene.

But, sudden catching hold, did her dismay
With quaking hands, and other signes of feare
Who, full of *ghostly* fright and cold affray,
Gan shut the door.

Id.

Our common necessities, and the lack which we all have, as well of *ghostly* as of earthly favours, is in each kind easily known; but the gifts of God, according to these degrees and times, which he in his secret wisdom seeth meet, are so diversly be-

M

stowed, that it seldom appeareth what all receive :
what all stand in need of seldom lieth hid. *Hooker.*

Often did I strive
To yield the *ghost* ; but still the envious flood
Kept in my soul. *Shakespeare. Richard III.*

Their shadows seem
A canopy most fatal, under which
Our army lies ready to give up the *ghost*.
Shakespeare.

Vex not his *ghost* : O, let him pass ! He hates him,
That would upon the rack of this rough world
Stretch him out longer. *Id. King Lear.*

Look you pale, mistress ?
Do you perceive the *ghostliness* of the eye ?
Shakespeare.

Julius Caesar
Who at Philippi the good Brutus *ghosted*,
There saw you labouring for him. *Id.*

Why looks your grace so heavily to-day ?
—O, I have past a miserable night ;
So full of ugly sights, of *ghostly* dreams,
So full of dismal terror was the time. *Id.*
The *ghostly* father now hath done his shrift. *Id.*

The *ghosts* and monster-spirits that did presume
A body's privilege to assume
Vanish again invisibly
And bodies gain again their visibility. *Cowley.*

— Marke what ugliness
Stares through the sightlesse eye-holes from within.
Note those leane craggs and with what *ghostliness*
That horrid countenance doth seeme to grin.
Geo. Withers.

Death
Grinned horrible a *ghostly* smile, to hear
His famine should be filled.
Milton's Paradise Lost.

To be less than gods
Disdained ; but meaner thoughts learned in their
fight,
Mangled with *ghostly* wounds through plate and mail.
Milton.
Let Cromwell's *ghost* smile with contempt to see
Old England struggling under slavery. *Marvell.*

He could reduce all things to acts,
And knew their natures by abstracts.
Where entity and quiddity,
The *ghosts* of defunct bodies fly ;
Where truth in person does appear
Like words congealed in northern air.
Hudibras.

Euryalus, taking leave of Lucretia, precipitated her
into such a love-fit, that within a few hours she
ghosted. *Sidney.*

Those departed friends, whom at our last separation
we saw disfigured by all the *ghostly* horrors of death,
we shall then see assisting about the majestick throne
of Christ, with their once vile bodies transfigured into
the likeness of his glorious body, mingling their glad
acclamations with the hallelujahs of thrones, principalities,
and powers. *Boyle.*

The mighty *ghosts* of our great Harry rose,
And armed Edwards looked with anxious eyes,
To see this fleet among unequal foes,
By which fate promised them their Charles should
rise. *Dryden.*

I did not for these *ghostly* visions send ;
Their sudden coming does some ill portend.
Id.

I, who make the triumph of to-day,
May of to-morrow's pomp one part appear,
Ghostly with wounds, and lifeless on the bier ?
Prior

What beckoning *ghost* along the moonlight shade
Invites my steps, and points to yonder glade. *Pope*

But in his private thoughts and busy brain,
Thousand thin forms and idle fancies flit ;
The three-shaped Sphinx ; and direful Harpy's train,
Which in the world had never being yet ;
Oft dreams of fire, and water ; loose delight ;
And oft arrested by some *ghostly* spright,
Nor can he think, nor speak, nor move, for great af-
fright. *Fletcher's Purple Island.*

There would he dream of graves and corse pale,
And *ghosts* that to the charnel-dungeon throng,
And drag a length of clanking chain, and wail,
Till silenced by the owl's terrific song ;
Or blast that shrieks by fits the shuddering aisles
along. *Beattie.*

' Besides, I hate to sleep alone,' quoth she,
The matron frowned. ' Why so ?'— ' For fear of
ghosts.'

Replied Katinka ; ' I am sure I see
A phantom upon each of the four posts.' *Byron.*

GHAUTS (Arab. maber, a pass) is a term
particularly applied to certain ranges of hills,
which run north and south, through the
Indian peninsula ; sometimes the highland is
called Bakaghaut (above the pass), and the bar
Pagaenghauts (below the pass).

GHAUTS, THE WESTERN, are the most elevated
of these ranges, and extend from Cape Comorin
to the Tuptee, or Surat River, where they do
not terminate in a point, or promontory ; but
bend eastward in a wavy line parallel to the
river, and are afterwards lost among the hills in
the neighbourhood of Boorhanpoor. Their
proper name, in the language of Hindostan, is
Sukheim, Purbut, or the hills of Sukheim. They
rise to an elevation of between 3000 and 4000
feet from the level of the sea. In its line along
the Tuptee this ridge forms several passes, or
ghauts, from which there is a descent into the
low country of Khandesh. In their whole ex-
tent the Western Ghauts, according to Mr. Ham-
ilton, include thirteen degrees of latitude, with
the exception of a break in the ridge, about six-
teen miles wide, in the latitude of Paniany,
through which the River Paniany takes its
course from the Coimbatore province. Their
distance from the sea coast is seldom more than
seventy miles, commonly about forty, and they
are frequently visible from the sea. Within one
short space betwixt Barcelore and Mirjaow they
approach within six miles of the sea. The alti-
tude of these hills is sufficiently great to prevent
the body of the clouds from passing over them,
and accordingly the alternate north-east and
south-west winds (called the monsoons) occasion
a rainy season on the windward side of the
mountains only. In the parallel of Surat this
cause ceases to operate, and here therefore
the south-west wind, no longer opposed by a
wall of mountains, carries its supply of moisture
without interruption over the surface of the
country. About the fifteenth degree of north
latitude the Western Ghauts, although steep and
stony, are by no means rugged, or broken with
rocks ; but the stones are buried in a rich mould,
and in many places are not seen without dig-
ging. Here therefore these fine mountains are
covered with stately forests. There are no bam-

boos that can be compared with those that grow in this part of them. They compose a great part of the forest, growing in detached clumps, with open spots between; and equal in height the most lofty palms. Near Cutaki, about half way up the Ghauts, the teak becomes common.

GHANTS, THE EASTERN, are commonly described as commencing in the south, about lat. $11^{\circ} 20' N.$, to the north of the Cavery, and extending with little interruption, in a straight line to the banks of the Khrisna in lat. $16^{\circ} N.$, separating the two Carnatics; the one is called the Carnatic Balaghaut, or above the Ghauts, the true Carnatic; the other the Carnatic Payceenghaut, or below the Ghauts, extending along the coast of Coromandel. About the latitude of Madras, the highest part of this ridge is estimated at 3000 feet; and Bangalore, which is within the chain, was found by barometrical observation to be 2901 feet above the level of the sea.

The component parts of these mountains are granite, composed of white felspar and quartz, with dark green mica in a small proportion. The particles are angular, and of moderate size. The rocks appear stratified, but the strata are broken and confused. The country above the Eastern Ghauts rises into swells like the land in many parts of England, and is overlooked by the high barren peaks which close the view to the east. The soil here is very poor, and covered with copse, having a few large trees intermixed; the whole of the copse land serving for inferior pasture. About two miles from Naiekan Eray a torrent in the rainy season brings down from the hills a quantity of iron ore in the form of black sand, which, in the dry season, is smelted, each forge paying a certain quantity of iron for permission to carry on the work.

GHEBERS, or GUEBERS, is the name by which the fire-worshippers of Persia are generally known. Those of this sect are dispersed through the country, and are the remains of the ancient Persians, or followers of Zoroaster. They have a suburb at Ispahan, called Gaurabad, or the town of the Gaurs, where they are employed in the meanest drudgery: some of them are dispersed through other parts of Persia; but they principally abound in Kerman, the most barren province in the whole country, where the Mahomedans allowed them liberty and the exercise of their religion. Several of them fled many ages ago into India, and settled about Surat, where their posterity still remain. They are ignorant, inoffensive people, extremely superstitious, zealous for their rites, rigorous in their morals, and honest in their dealings. They believe a resurrection and a future judgment, and worship only one God. Although they perform their worship before fire, and direct their devotion towards the rising sun, for which they have an extraordinary veneration, yet they strenuously maintain, that they worship neither; but that, as these are the most expressive symbols of the Deity, they turn towards them in their devotional services. Zoroaster, the founder of this sect, maintained that there were two principles, one the cause of all good, the other the cause of all evil: and, abominating the adoration of images, his followers worshipped God only by fire; which they looked

upon as the brightest and most glorious symbol of Oronasdes, or the good God; as darkness is the truest symbol of Armanius, or the evil god. Zoroaster taught his followers, that fire was the truest shechinah of the divine presence; that the sun being the most perfect fire, God had there the throne of his glory, and the residence of his divine presence in a peculiar manner; and next to this in our elementary fire: and, therefore, he ordered them to direct all their worship to God, first towards the sun, which they called Mithra, and next towards their sacred fires: and, when they came before these fires to worship, they always approached them on the west side, that having their faces towards them, and also towards the rising sun at the same time, they might direct their worship towards both.

GHEENT, or GAUNT, a city of the Netherlands, the capital of East Flanders. It is a bishop's see, and seated on four navigable rivers, the Scheldt, the Lys, the Lievre, and the More, which, with a great number of canals, run through it, and divide it into twenty-six little isles, over which there are upwards of 300 wooden bridges.

Ghent is surrounded with walls and other fortifications, but the ramparts are now chiefly used as promenades. The streets are large and well paved, the market-places spacious, and the houses built mostly of brick. The large market-place is remarkable for a statue of Charles V. That of Cortere has a fine walk, between several rows of trees. In 1737 an opera-house was built here, and a guard-house for the garrison. Near the town is a very high tower, with a handsome clock and chimes. The great bell weighs 11,000 pounds. The cathedral is remarkable both for its outward appearance, and the splendor and richness of its interior; and here is a subterraneous church. The Benedictine abbey of St. Peter is also well worth notice, the church and library being elegant, and the establishment richly endowed. Its paintings and tapestry are much admired. The inside of this and several of the eight churches in Ghent is of marble. Ghent was anciently the capital of the Nervii, and after them of the Vandals, who gave it the name of Wanda, or Vanda, whence Ganda and Ghent are supposed to have been derived. Odoacer of Flanders first surrounded it with walls; and in 1397 Philip, the twenty-fifth earl of Flanders, enlarged it. Prince John, the third son of Edward III., of England, was born in it, and hence named John of Gaunt; as was also the emperor Charles V.; but the inhabitants have no reason to venerate his memory; for, by his repeated oppressions, he provoked them to revolt in 1539; upon which he put to death twenty-six of the principal citizens, banished many others, and confiscated their estates; he at the same time deprived the city of its privileges, arms, and artillery; fined the citizens 12,000,000 of crowns, and ordered the magistrates to walk in procession with ropes about their necks. Ghent is famous for the pacification signed here, in 1576, for settling the tranquillity of the seventeen provinces. It was taken by Louis XIV., in 1678, but restored at the treaty of Nimeguen. The French took possession of it again after the death of Charles II. of Spain.

In 1706, it was taken by the duke of Marlborough; and by the French in 1708; but it was retaken the same year. The French also took it by surprise after the battle of Fontenoy; but at the peace of Aix-la-Chapelle it was returned. On the 14th of November, 1792, it was taken possession of by the French under General Labourdonna, who were welcomed by the inhabitants. In April, 1793, they evacuated it, upon the desertion of Dumouriez; but recovered it again in July 1794, when the Austrians under Clairfait retreated. It remained with the rest of the Netherlands in their hands for twenty years: and hither Louis XVIII. returned during the 100 days. Ghent is well seated for trade, on account of its rivers and canals. It carries on a great commerce in corn; and has linen, woollen, and silk manufactures. Hence it was, indeed, that England first received her woollen manufacture; and she now rivals us in that of cotton. In 1816 the college here received a great extension, being constituted one of the three universities of the kingdom of the Netherlands, the current language is Flemish, but all people of education are capable of speaking French fluently. The citadel, built by Charles V., is one of the largest in Europe, but not proportionally strong. The number of citizens is about 65,000, but its population is not proportionable to its extent: of which Charles V. thus boasted to Francis I.: 'I have a glove,' said he, alluding to its French name Gand, 'in which I could put your whole city of Paris.' Ghent lies twenty-six miles north-west of Brussels; thirty south-west of Antwerp, and thirty-five north of Lisle. Long. $3^{\circ} 49' E.$, lat. $51^{\circ} 4' N.$

GHERIAH, or **GHERIAN**, a town of Hindostan, in Concan, on the west or pirate coast. It was the capital of the pirate Angria, from whom it was taken by admiral Watson and colonel Clive, in 1756, when his fleet was destroyed, and his fort taken, by the British and Mahrattas. It lies eighty miles N. N. W. of Goa, and 205 south by east of Bombay. Long. $73^{\circ} 8' E.$, lat. $16^{\circ} 45' N.$

GHERIAH, a fortress situated on a promontory, on the south of India, a mile long, and a quarter of a mile broad. It is in the province of Concan. This promontory lies about a mile from the entrance of a capacious harbour, formed by the mouth of a river which descends from the Western Ghauts. In the year 1707 a Mahratta chief, named Conajee Angria, had established an independent sovereignty here, and possessed a numerous fleet. At a subsequent period, the depredations of these pirates drew on them an attack from the British by commodore James, when the whole of the enemy was either captured or destroyed. There was found (1765) in the fort 206 pieces of ordnance, and an immense quantity of ammunition and naval stores, beside £120,000 in specie or valuables. It now belongs to the Peshwa of the Mahrattas.

GHER'KIN, *n. s.* Germ. *gurcke*, a cucumber. A small pickled cucumber.

GHESS. See **GRESS**.

GHILAN, a province of Persia, on the south-west shore of the Caspian Sea, which it borders for upwards of 200 miles. It has no rivers of

importance, but the waters of the Kiziluvein, and numerous streams from its mountains, render it fertile in rice, wheat, and provisions. It is in fact, one vast narrow plain enclosed by mountains, through which there are only a few difficult passes. Silk is the staple produce, and Astrachan its chief market; but the town of Retch carries on a considerable trade. Population of the district 50,000.

GHINALA, a town and country of West Africa, on the north of the Rio Grande. The capital is situated about seventy miles up that river.

GHISLAIN (St.), or **St. GILLIAN**, a town of the Netherlands, in the ci-devant province of French Hainault, seated on the Haine, five miles west of Mons. It was taken by general La Fayette, in June 1792. Long. $3^{\circ} 53' E.$, lat. $50^{\circ} 28' N.$

GHIZNE, or **Zabul**, a level district of Afghanistan, between the 33° and 34° of N. lat., and the 58° and 60° E. long. It is but poorly cultivated; the inhabitants, who are of the Ghiljee tribe, preferring a pastoral life, and raising a great number of sheep. The climate is very cold. Its principal towns are Ghizne, Karabay, and Gardaiz.

GHIZNE, the capital of the above district, was once the chief town of a powerful empire, extending from the Ganges to the middle of Persia. It was then called Medineh, or The City, and Dar al Islam, the seat of the true faith; was strongly fortified and contained many sumptuous palaces. In the year 1783 it was visited by Mr. Foster, who says, it stands on a hill of a moderate height, at the foot of which runs a small river. Its existence is principally supported by some Hindoo families, who carry on a small traffic, and supply the wants of the few Mahomedan residents. At a short distance stands the tomb of sultan Mahmoud, to which pilgrims resort from distant places. The climate of Ghizne is so cold as to have become proverbial; and the Afghans told me, that the town has been more than once overwhelmed in snow. This city was in the year 960 taken possession of by Abistagy, a rebel governor of Khorassan, who threw off his allegiance to the Samonavian dynasty of Persia, and founded a new kingdom. He was succeeded by his son-in-law Subaetageen, who extended his dominions to the banks of the Indus. Mahmoud, the next in succession, invaded India several times, and accumulated greater wealth than was ever in possession of any other individual. It was he who raised the glory of the Ghiznean empire to its zenith, and first obtained from the caliph the title of sultan. He died in the year 1030, and was buried in a magnificent tomb seen by our traveller. The kingdom continued to flourish till the year 1116, when it was subdued by a Persian army. In the year 1150 it was again seized by Alhaddeen, the prince of Ghore, who, in revenge for an insult offered to his family by the inhabitants of this city, ordered a massacre of them for seven days, and destroyed all the public buildings but the tombs. The royal family upon this fled to Lahore, where the dynasty only languished through two more weak reigns.

GHORAGHAUT, or **Idrackpool**, is a district of Bengal, containing about 150 square miles. It formerly embraced great part of the district of Dinageepoor, and extended across the Brahmapootra River, including the district of Currybary. The greater portion of the inhabitants are now Mahomedans, and a quiet and tractable people; the zemindary is in the hands of a Hindoo family, promoted to that situation by the Shijaaddeen Khan, about the year 1727. It is included in the collectorship of Momen-sing.

GHORAGHAUT, also called **Nusserutabad** (the city of victory), the capital of the above district, is pleasantly situated on the west bank of the Curruttya, and formerly carried on a considerable trade with Bootan for Tangan horses, musk, &c.

GHORE, or **GHOOR**, a mountainous district of Afghaunistaun, situated between 35° and 37° of N. lat., and 67° and 69° of E. long. The climate is very cold. In the twelfth century its chiefs became independent, and, having overthrown the Ghiznean empire, carried their arms to the south-east as far as Benares; and one of their slaves, named Cuttub, founded about the year 1205 the Mahomedan kingdom of Dehly. This country in the thirteenth and fourteenth centuries was overrun by the armies of Jenghis Khan and Tamerlane, and is now in the possession of the Usbeck Tartars. The tribe, being of pastoral habits, have emigrated to the vicinity of Paishawur, and are now subdivided into three, called the Mehmund, Khulleel, and Daoudyze tribes. Its chief towns were Ghore and Firoz Koh.

GHORE, the capital of this district, once the residence of a long line of sovereigns, was taken from them by the king of Khuarizm, and subsequently sacked by the armies of Jenghis and Tamerlane, since which period it has not recovered.

GIAGH, in chronology, a cycle of twelve years, in use among the Turks and Cathayans. Each year of the giagh bears a name of some animal; the first that of a mouse; the second that of a bullock; the third a lynx or leopard; the fourth a hare; the fifth a crocodile; the sixth a serpent; the seventh a horse; the eighth a sheep; the ninth a monkey; the tenth a hen; the eleventh a dog; and the twelfth a hog. They also divide the day into twelve parts, called giaghs, and distinguish them by the names of animals. Each giagh contains two of our hours, and is divided into eight kehs; so that a keh is a quarter of our hour.

GIAMBEUX, *n. s.* Fr. *jambes*. Legs, or armour for legs, as greaves.

The mortal steel despoitously entailed,
Deep in their flesh, quoth through the iron walls
That a large purple stream adown their *giambeux*
falls. *Spenser.*

GIANNONI (Peter), an Italian author, born at Naples, in 1680. He wrote a History of Naples, which is admired for its purity of style, and vigor of sentiments. It gave such offence to the court of Rome that he was obliged to flee to Piedmont; where he died in 1748.

GIANT, *n. s.* Goth. *geant*; Ital. Span. *gigante*; and Port. *gigante*; Fr. *gigantlike*, *adj.* } *geant*; Lat. *gigas*: all probably of Gr. *γίγας*, earth-born; because the old fables declared that the early giants were literally born of the earth. A man or woman of extraordinary or unnatural size, with reference to height: *gigantic*; vast; lofty; strong.

Sire Kyng, quoth Merlin, though gif thou wolt here
caste
In the honour of men, a worke that ever schal ylaste,
To the hul of Kilar send into Yrlonde,
After the noble stones that ther habbet longe ystonde,
That was the trikke of *giandes* for a quoynte work
there is
Of stones all with art ymad in the world such non is.

Robert of Gloucester.

His mery men commandeth he
To maken him bothe game and gle;
For nedes must he fighte,
With a *geant* with hedes three,
For paramour and jolitee
Of on that shone ful brighte.

Chaucer. The Rime of Sire Thopas.

At last, by subtile sleights, she him betraid
Unto his foe, a *gyaunt* huge and tall.

Spenser. Faerie Queene.

Now does he feel his axle
Hang loose about him, like a *giant's* robe
Upon a dwarfish thief. *Shakspeare. Macbeth.*
Gates of monarchs
Are arch'd so high, that *giants* may get through,
And keep their impious turbans on, without
Good-morrow to the sun. *Id. Cymbeline.*

Woman's gentle brain
Could not drop forth such *giant* rude invention;
Such Ethiop words. *Id. As You Like It.*
I had rather be a *giantess*, and lie under mount
Pelion. *Shakspeare.*

Those *giants*, those mighty men, and men of renown,
far exceeded the proportion, nature, and
strength of those *giants* remembered by Moses of his
own time. *Raleigh's History.*

What though an apish pigmie in attire,
His dwarfish body *gyant-like* array,
Turr. brave, and get him stilts to seem the higher,
What would so doing handsome him I pray?
Now, surely such a mimick sight as that
Would with excessive laughter move your spleene,
Till you had made the little dandiprat,
To lye within some auger-hole unscene.

Geo. Withers.

Pierce faces threatening wars,
Giants of mighty bone, and bold emprise!

Milton.

His *giantship* is gone somewhat crest fallen,
Stalking with less unconscionable strides,
And lower looks. *Id. Agonistes.*
The *giant* brothers, in their camp, have found
I was not forced with ease to quit my ground.

Dryden.

Notwithstanding all their talk of reason and philosophy, which they are deplorably strangers to, and those unanswerable doubts and difficulties, which, over their cups, they pretend to have against Christianity; persuade but the covetous man not to deify his money, the proud man not to adore himself, and I dare undertake that all their *giantlike* objections against the Christian religion shall presently vanish and quit the field. *South.*

By weary steps and slow,
The groping *giant*, with a trunk of pine,
Explored his way. *Addison.*

Neptune, by prayer repentant rarely won,
Afflicts the chief to avenge his *giant* son,
Great Polyphemus of more than mortal might.

Pope.

Rocks, torrents, gulphs, and shapes of *giant* size,
And glittering cliffs on cliffs, and fiery ramparts rise.

Beattie.

Oh enviable Briareus! with thy hands
And heads, if thou hadst all things multiplied
In such proportion!—But my Muse withstands
The *giant* thought of being a Titan's bride,
Or travelling in Patagonian lands.

Byron.

—into life it came
And grew a *giant* tree: the mind may grow the same.

Id. Childs Harold.

GIANTS. The traditions of all ages have furnished us with so many extravagant accounts of giants of incredible bulk and strength, that the existence of such people is now generally disbelieved. It is commonly thought that the stature of man has been the same in all ages; and some have even pretended to demonstrate the impossibility of the existence of giants mathematically. Of these Mr. M'Laurin has been the most explicit. But his arguments and comparisons, drawn from the disproportion between the cohesion of parts in small models and large works, of human workmanship, are by no means conclusive; because, along with an increase of stature in any animal, we must always suppose a proportional increase in the cohesion of the parts of its body. Large works sometimes fail when constructed on the plan of models, because the cohesion of the materials whereof the model is made, and of the large work, are the same; but a difference in this respect will produce a very remarkable difference in the ultimate result. Thus, suppose a model is made of fir wood, the model may be firm and strong enough; but a large work made also of fir, when executed according to the plan of the model, may be so weak that it will fall to pieces from its own weight. If, however, we make use of iron for the large work instead of fir, the whole will be sufficiently strong, even though made exactly according to the plan of the model. The same may be said with regard to large and small animals. If we could find an animal whose bones exceeded in hardness and strength the bones of other animals as much as iron exceeds fir, such an animal might be of a monstrous size, and yet be exceedingly strong. In like manner, if we suppose the flesh and bones of a giant to be greatly superior, in hardness and strength, to those of other men, the great size of his body will be no objection at all to his strength. The whole controversy, therefore, concerning the existence of giants must rest upon the credibility of the accounts given by those who profess to have seen them, and not on any arguments drawn *a priori*. In the Scripture we are told of giants who were produced from the marriages of the sons of God with the daughters of men. See ANTE-DILUVIANS. This passage indeed has been differently interpreted, and it is very doubtful whether the word translated giants there implies any extraordinary stature. In other parts of Scripture, however, giants, with their dimensions, are mentioned in such a manner that we cannot possibly doubt their existence; as in the case of Og king

of Bashan, Goliath and his brethren. 1 Chron. xx. 4—8. The Rev. Mr. Gun, minister of Latheron in Caithness, mentions William Sutherland, the last proprietor of Berrydale Castle, who lived in the end of the fifteenth century, and measured nine feet five inches high.

M. Le Cat, in a memoir read before the Academy of Sciences at Rouen, gives the following account of giants that are said to have existed in different ages. 'Profane historians have given seven feet of height to Hercules their first hero; and in our days we have seen men eight feet high. The giant who was shown in Rouen, in 1735, measured eight feet six inches. The emperor Maximin was of that size; Shenkius and Platerus, physicians of the last century, saw several of that stature; and Goropius saw a girl who was ten feet high. The body of Orestes, according to the Greeks, was eleven feet and a half; the giant Galbara, brought from Arabia to Rome under Claudius Cæsar, was near ten feet; and the bones of Secondilla and Pusio, keepers of the gardens of Sallust, were but six inches shorter. Funnani a Scotchman, who lived in the time of Eugene II. king of Scotland, measured eleven feet and a half; and Jacob le Maire, in his voyage to the straits of Magellan, reports, that on the 17th of December, 1615, they found at Port Desire several graves covered with stones; and, having the curiosity to remove the stones, they discovered human skeletons of ten and eleven feet long. The chevalier Scory, in his voyage to the peak of Teneriffe, says, that they found in one of the sepulchral caverns of that mountain, the head of a Guanche which had eighty teeth, and that the body was not less than fifteen feet long. The giant Ferragus, slain by Orlando nephew of Charlemagne, was eighteen feet high. Rioland, a celebrated anatomist, who wrote in 1614, says, that some years before there was to be seen in the suburbs of St. Germain the tomb of the giant Isoret, who was twenty feet high. In Rouen, in 1509, in digging in the ditches near the Dominicans, they found a stone tomb containing a skeleton whose skull held a bushel of corn, and whose shin bone reached up to the girdle of the tallest man there, being about four feet long, and consequently the body must have been seventeen or eighteen feet high. Upon the tomb was a plate of copper, whereon was engraved, 'In this tomb lies the noble and puissant lord, the chevalier Ricon de Vallemont, and his bones.' Platerus, a famous physician, declares, that he saw at Lucerne, the true human bones of a subject which must have been at least nineteen feet high. Valence in Dauphiné boasts of possessing the bones of the giant Bucart, tyrant of the Vivarais, who was slain by an arrow by the count De Cabillon his vassal. The Dominicans had a part of the shin bone, with the articulation of the knee, and his figure painted in fresco, with an inscription, showing that this giant was twenty-two feet and a half high, and that his bones were found in 1705, near the banks of the Morderi, a little river at the foot of the mountain of Crussol, upon which (tradition says) the giant dwelt.' M. Le Cat adds, that skeletons have been discovered of giants, of a still more incredible height, viz. that of Theuto-

bochus king of the Teutones, found January 11th, 1613, twenty-five feet and a half high; of a giant near Mazarino, in Sicily in 1516, thirty feet; of another in 1548, near Palermo, thirty feet, &c. &c. But whether these accounts are credited or not, we are certain that the stature of the human body is by no means fixed. We are ourselves a kind of giants in comparison of the Laplanders; nor are these the most diminutive people to be found upon the earth. The abbé la Chappe, in his journey into Siberia to observe the transit of Venus, passed through a village inhabited by people called Wotiacks, who were not above four feet high.

GIANTS, REBELLIOUS, in ancient mythology, the sons of Cœlus and Terra. According to Hesiod they sprang from the blood of the wound which Cœlus received from his son Saturn. Hyginus calls them sons of Tartarus and Terra. They are represented as endued with strength proportioned to their gigantic size. Some of them, as Cottus, Briareus, and Gyges, had each fifty heads and 100 arms, and serpents instead of legs! They were of a terrible aspect, and their hair hung loose about their shoulders. Pallene and its neighbourhood was the place of their residence. The defeat of the Titans, to whom they were nearly related, incensed them against Jupiter, and they all conspired to dethrone him. Accordingly they reared Mount Ossa upon Pelion, and Olympus upon Ossa; and from thence attacked the gods with huge rocks, some of which fell into the sea and became islands, and others fell on the earth and formed mountains. Jupiter summoned a council of the gods; when being informed that it was necessary to obtain the assistance of some mortal, he by the advice of Pallas called up his son Hercules; and with the aid of this hero he exterminated the giants Enceladus, Polybates, Alcyon, Porphyryon, the two sons of Alœus, Ephialtes and Othlus, Eurytus, Clytius, Tythys, Pallas, Hippolitus, Agrius, Thoon, and Typhon, the last of whom it was more difficult to vanquish than all the rest. Jupiter, having thus gained a complete victory, cast the rebels down to Tartarus, where they were to receive the full punishment of their crimes; or, according to some of the poets, he buried them alive under Mount Ætna and different islands.

The GIANT'S CAUSEWAY is a natural pier or promontory, projecting 600 feet into the sea, on the north coast of the county of Antrim, Ireland. It is sometimes described as the south part of the promontory of Bengou, which is eight miles west of Fardhead. In describing this noble natural curiosity of Ireland, we shall avail ourselves of the published accounts of a gentleman (Rev. G. N. Wright) whose descriptive sketches of his native country have elsewhere enlivened our pages. He conducts us from Belfast by Glenarm and Ballycastle to Ballintoy and Bushmills, about one mile from the Causeway, where there is an inn called the Causeway Inn, being the nearest place of rest and refreshment.

'Approaching the shore at the Rock Heads' it becomes necessary to abandon all kinds of vehicles as well as our horses, and trust to pedestrian activity for the remainder of the path to the Causeway.

'A first object of curiosity in this direction is Port Coon Cave; this magnificent excavation is accessible both by sea and land. In the west side are two apertures by which it can be entered at all times, but the violence of the billows at its mouth sometimes forbids the most adventurous sailor to approach. The cave is of considerable length, and boats may row in 100 yards at least. The formation of the interior is very extraordinary, and extremely interesting to the mineralogical tourist: the roof and sides are composed of rounded stones, imbedded in a basaltic paste, of extreme hardness. These stones again are formed of concentric spheres, resembling the pellicles of an onion. The appearance of the cave, viewed from the innermost recess, is not unlike the side aisle of a gothic cathedral, the roof being a tolerably regular pointed arch: the sides appear greasy, and do actually feel so: one of the unbidden attendants, who takes the trouble to accompany the party, is generally provided with a loaded piece, upon the discharge of which, a tremendous reverberation of sound is produced: musical instruments also, when played with judicious management, i. e. by allowing a short pause between the succeeding notes, will be found to produce most agreeable echoes. Adjoining this cave is the little inlet called Port Coon, formed by a very remarkable whyndyke; which seems to have been composed of seven walls, and to have been separated from the dyke in front of the precipice, by some great convulsion. In this shock a small pyramidal basaltic rock was detached from the great mass, and stands now insulated in the centre of the small bay. The ruins of the whyndyke are attached to its eastern side, separated into a number of distinct walls, exhibiting their construction by horizontal prisms, and forming, altogether, a very curious object. Beyond the projecting excavated rock, of which Port Coon Cave is composed, is a second of these whyndykes, being one side of the little estuary of Port Nabau.

'On the west of Port Coon Cave and Dyke, in the dark perpendicular cliff, is a deep and lofty cave, accessible by water alone. The entrance assumes the appearance of a pointed arch, and is remarkably regular. The boatmen are very expert in entering these caves; they bring the boat's head right in front, and, watching the roll of the wave, quickly ship the oars, and sail in majestically upon the smooth rolling wave. The depth of Dunkerry Cave has not been ascertained, for the extremity is so constructed as to render the management of a boat there impracticable and dangerous; besides, from the greasy character of the sides of the cave, the hand cannot be serviceable in forwarding or retarding the boat. Along the sides is a bordering of marine plants, above the surface of the water, of considerable breadth. The roof and sides are clad over with green conferva, which gives a very rich and beautiful effect: and not the least curious circumstance connected with a visit to this subterranean apartment, is the swelling of the water within. It has been already frequently observed, that the swell of the sea upon this coast is at all times heavy; and, as

each successive wave rolls into the cave, the surface rises so slowly and awfully, that a nervous person would be apprehensive of a ceaseless increase in the elevation of the waters until they reached the summit of the cave. Of this, however, there is not the most distant cause of apprehension, the roof being sixty feet above the high water mark. The roaring of the waves in the interior is distinctly heard; but no probable conclusion can be arrived at from this as to the depth. It is said too, that the inhabitants of some cottages a mile removed from the shore, have their slumbers frequently interrupted in the winter's nights, by the subterranean sounds of Dunkerry Cavern. The entrance is very striking and grand, being twenty-six feet in breadth, and enclosed between two natural walls of dark basalt and the visitor will enjoy a much more perfect view of the natural architecture at the entrance, by sitting in the prow with his face to the stern as the boat returns.

‘Landing again, and returning to the Causeway road, pursue its windings beneath the wild and barren cliff for about a quarter of a mile, when the first view of the Causeway is afforded. The impression at first produced is that of the building of an extensive pier, for which the stones, blocked out, had many years ago been laid upon the beach; but from some great national calamity, or other unknown cause, the work was interrupted, and the laborers all dismissed. And so the natives believe, that the giants once commenced this colossal task of forming a causeway into Scotland, but that, being expelled by the ancient Irish heroes, they left the great work imperfect. It is not, however, the magnitude of the Causeway which surprises, nor the distant view which commands attention; the wonder and admiration of the tourist are to be reserved until he steps upon the very surface of this great work of nature, when the expectation of the most sanguine and the amazement of the most experienced traveller will indeed be fully realized. To the left are seen some bold projecting rocks, called the Stookins, forming a partition between Port-na-Baw and Port-na-Gange; and a little farther west, close to the shore, stands the insulated rock called Sea-Gull Isle; and between Port-na-Gange and Port-Naffer the Causeway runs out into the sea.

‘The Causeway consists of three piers or moles, projecting from the base of a stratified cliff, about 400 feet in height: the principal mole is visible for about 300 yards in extent at low water, the others not more than half that distance. It is composed of polygonal pillars, of dark colored basalt, so closely united, that it is difficult to insert more than a knife-blade between them; and the formation of a continuous surface at each point in the pavement, by polygons whose angles vary so much in value, would have surprised even Proclus, yet no artificial formation can exceed this in accuracy. Towards the centre of the whole mass the pillars ascend; and, from the peculiar appearance of the surface, this vertex is usually called the Honeycomb. The pillars are irregular prisms of an uncertain number of sides, varying from three to nine: there is one of three sides near the centre of the

Honeycomb, and several of nine have been detected, but the hexagonal form prevails most generally.

‘Each pillar is in itself a distinct piece of workmanship; it is separable from all the adjacent columns, and then is itself separable into distinct joints, whose articulation is as perfect as human exertion could have formed them, the extremities of each joint being concave or convex, which is determined by the terminations of the joint with which it was united; but there is no regularity as to the upper or lower extremity being concave, or convex; the only law on this point is, that the contiguous joints are the one concave, the other convex. In order to ensure stability to this piece of architecture, the angles of the inferior joints frequently overlap those of the superior so finely, that the force required to dislocate them frequently fractures the joints. If the concavity of any pillar be examined, it will be found to represent a circle inscribed in a polygon; the interval in each angle intercepted between the periphery of the circle, and the sides of the polygon being perfectly horizontal. To make this more intelligible—suppose the extremity of the pillar or joint had been originally in a soft state, but in a polygonal form, and that a heavy iron ball, whose diameter was equal to the shortest diameter of the polygon, was laid upon it, and, being removed again, left a basin-formed impression on the stone; this would give a perfect idea of the appearance which the concave ends exhibit: the convex, on the other hand, appears as if the ball was enclosed within the pillar still, and a portion of the sphere projected through the extremity of the column. This very mathematical appearance of the circle inscribed in an irregular polygon, has led some fanciful theorists to suppose, that these curious columns might have been formed by the compression of a number of liquid globules, which at first only touched at one point, but, when the pressure was increased indefinitely, were formed into angular masses.

‘Though the polygons are all irregular, yet the contiguous sides of the adjacent pillars are equal, so that the contact of the columns is complete. And we have already mentioned, that, notwithstanding the number and different values of the concurring angles in each point, yet their sum is found to be so precisely equal to four right angles, that there is not the smallest aperture or open space left over the whole arena of basaltic pavement. So close is the flooring of this natural quay, that, whenever any subsidence of the surface has occurred, water will be found to lodge, and remain for a length of time. And this suggests also a curious circumstance, to which the attention of the visitor will be called, upon his arrival at the Causeway; that, although the union of the columns has been just represented as impervious to a lodgment of water, yet on the west side of the Causeway is seen a spring of water bubbling up between the interstices of the columns through which the blade of a knife could, with much difficulty, be introduced. This is called, of course, the Giants Well, and the water found in it is extremely

pure. It may be observed also, that the pillars, between which the water issues, are not in the least worn, nor are their angles less accurate than those of any pillar in the Causeway. In the early ages of natural history, many ridiculous questions were proposed relative to this extraordinary piece of nature's architecture, which would degrade the naturalist of the present age; amongst the rest, it was seriously proposed, as a difficult and important question, to discover the depth which the Causeway pillars run perpendicularly into the ground, and in the *Encyclopædia Britannica* we find this solemn sentence: 'How deep they are fixed in the strand was never yet discovered.' But the modern geologist can assure these sage enquirers, that the mole or quay, called the Giants' Causeway, is only the continuation of a basaltic stratum, whose breadth may be measured in various parts of the range along the coast, and is ascertained to be forty-five feet in thickness or depth. The answer to the query, to what distance does it extend under water, is not so satisfactory in a nautical point of view; but it is supposed to obey the same law here as the stratum to which it belongs is found to do elsewhere.

The Causeway, which is entirely composed of basaltic pillars, is inclined to the horizon in a small angle, and may be traced up the cliff in an easterly direction, and culminates at the distance of one mile from the Causeway, where it attains the height of 250 feet above the level of the sea. It still proceeds towards the east, and ultimately immerses at Portmoe. This is not the grandest nor most magnificent stratum of basalt: the next stratum but one to this forms the noblest natural colonnade in the world, the columns being more perfect in their articulation than the great columns of Fair Head, and of more colossal dimensions than those of the Causeway.

An expert guide will afford much satisfaction to the tourist in pointing out the variety of form and position in the different columns around the Causeway; some are remarkable for the great length of their joints, others are seen in the lowest range of the precipice, lying in an horizontal position; but this is evidently attributable to external causes, as all the columns in these have a vertical position. In the face of the bold stratified cliff, east of the Causeway, some very perfect and regular colonnades of clustered pillars are seen, the most perfect of which are called the organs, from a very striking resemblance which the façade bears to the range of frontal tubes in a large church organ. And opposite these is another, called generally the Giants' Loom, but the term giant has lost its distinguishing power in this vicinity now, as every stone around derives an epithet or name from its relative situation amongst these great men's suppellectilia, their chairs, their well, &c.

The scenery east of the Causeway is truly sublime: the dark precipitous cliffs which rise regularly in gradually retiring strata, certainly suggest the idea of their having been deposited age after age, as Werner thought; and the extraordinary appearance of the various colonnades might, for a moment, seduce the fancy of the contemplating visitor, and lead him to imagine,

that here whole palaces have been overwhelmed in ruin. These successive capes, which are visible from the Causeway, are but a part of one great headland, called Bengore, the rival of Benmore or Fair Head, and similarly formed. On a lofty projecting cliff, east of the Causeway, stand a few shattered columns, usually known by the appellation of 'the chimney tops,' and said to have been mistaken by the crew of the vessels composing the invincible Armada of Spain, and fired upon as such.' Wright's Guide to the Giants' Causeway, 12mo. London, 1823.

GIBBE, *n. s.* Heb. גִּבְלָה, to end. Any old worn out animal.

For who, that's but a queen, fair, sober, wise,
Would from a paddock, from a bat, a *gibbe*,
Such dear concerns hide? *Shakspeare. Hamlet.*

GIBBER, *v. n.* } To speak indistinctly,
GIBBERISH, *n. s.* } or utter words without meaning; applied to the private language or cant terms of rogues and gipsies. According to Skinner from Fr. *gaber*, to cheat; see GIBE. By others conjectured to be formed by corruption from jabber. But, as it was anciently written giberish, Dr. Johnson thinks it probably derived from the chemical cant, and originally implied the jargon of 'Geber' and his tribe.

Some, if they happen to hear an old word, albeit very natural and significant, cry out straightway, that we speak no English, but *giberish*. *Spenser.*

The sheeted dead,

Did squeak and *gibber* in the Roman streets.

Shakspeare.

Some of both sexes writing down a number of letters, just as it came into their heads; upon reading this *giberish*, that which the men had wrote sounded like High Dutch, and the other by the women like Italian. *Swift.*

GIB'BET, *n. s. & v. n.* Fr. *gibet*; barb. Lat. *gabalus*, from Heb. גִּבְלָה, an end or boundary.—Minsheu. That on which malefactors are hanged or exposed; any transverse beam.

He shall come off and on swifter than he that *gibbets* on the brewer's bucket. *Shakspeare.*

When was there ever cursed atheist brought
Unto the *gibbet*, but he did adore
That blessed power which he had set at nought? *Davies.*

You scandal to the stock of verse, a race
Able to bring the *gibbet* in disgrace. *Cleaveland.*
I'll *gibbet* up his name. *Oldham.*

Hamam suffered death himself upon the very *gibbet* that he had provided for another. *L'Estrange.*

Papers lay such principles to the Tories, as if they were true, our next business should be to erect *gibbets* in every parish, and hang them out of the way. *Swift.*

One to destroy is murder by the law,
And *gibbets* keep the lifted hand in awe,
To murder thousands takes a specious name
War's glorious art, and gives immortal fame.

Young.

GIBBER, *n. s.* Fr. *Gamé*; wild fowl.

These imposts are laid on all butchers' meat, while, at the same time, the fowl and *gibber* are tax-free.

Addison on Italy.

GIBBON (Edward), Esq., a celebrated English historian, born at Putney in Surrey, April 27th, 1737. He was the eldest son of Edward

Gibbon, Esq., and Judith, daughter of — Porten, Esq. merchant, of London. His family was descended from John Gibbon, architect to Edward III., who possessed lands in Kent. His constitution till his fifteenth year was extremely feeble, as were those of his brethren and sisters, who all died in infancy: and he complains that ‘the chain of his education was broken, as often as he was called from the school of learning to the bed of sickness.’ To the care and attention of his maternal aunt he ascribes his preservation from a premature death. In 1745 he was sent to the grammar-school at Kingston; in January, 1749, to that of Westminster; and in April, 1752, to Oxford, where he matriculated in Magdalen College; the professors of which he blames greatly for their remissness and inattention to his moral conduct and principles. In consequence of this he became a convert to the Roman Catholic faith in his sixteenth year. To cure the young Catholic of his errors, and bring him back to the Protestant faith, his father, within three weeks after his conversion (June 30th, 1753) sent him to Switzerland, and entrusted him to the tutorage of Mr. Pavillard, a Calvinist minister at Lausanne, whom Mr. Gibbon mentions with gratitude, as a most excellent preceptor. Under his tuition he made rapid progress in the Latin, Greek, and French classics; in history, geography, logic, and metaphysics; and was also soon reclaimed from the errors of popery; so that on Christmas, 1754, he received the sacrament in the church of Lausanne. Thus had he communicated with three different churches before he was eighteen years old. These jarring opinions, however, successively adopted and rejected, and the repeated changes so rapidly made from the one to the other, perhaps contributed to weaken our author’s faith in revelation, and to lead to his final change to deism, as much as his perusal of M. Voltaire’s writings, or his conversation with that author, to whom he introduced himself in 1757. About this time Mr. Gibbon fell in love with Mad. Susan Churchod, daughter of the minister of Crassay, a lady whom he describes as possessed of every accomplishment, corporeal and mental, that can adorn a woman. But, though the consent of the young lady and her parents was easily obtained, yet his father’s tyrannical veto, to which, ‘after a painful struggle,’ he submitted, deprived him of this inestimable treasure, and of matrimonial felicity for life. The lady was afterwards married to the celebrated M. Neckar. In spring, 1758, he was recalled to England, and well received by his father; at whose house at Beriton, in Hampshire, he finished a work he had begun at Lausanne, entitled *Essai sur l’étude de la Littérature*, which he published in 1761, 12mo., with a dedication to his father. Previous to this period, he had been appointed a captain in the South Hampshire militia, in which he served two years, and which contributed to make him better acquainted with English manners, principles, and parties. At the peace in 1763 he went abroad; and after visiting Paris, where he was introduced to Messrs. D’Alembert and Diderot, returned to his favorite residence at Lausanne. Having spent some time

there, he made the tour of Italy; and at Rome on the 15th of October, 1764, while musing amidst the ruins of the capitol, the idea of his great work first started into his mind. Upon his return to Hampshire in June, 1765, he found his father involved in pecuniary difficulties, and, to relieve him, consented to the sale of part of the estate. After commencing a history of the revolutions of Switzerland, which he suppressed, he engaged in a journal entitled *Memoires Littéraires de la Grand Bretagne*, and published 2 vols. for 1767 and 1768; but his partner in this undertaking, a native of Switzerland, going abroad, when the third volume was nearly finished, the work was discontinued. Bishop Warburton having about this time published an Interpretation of the Sixth Book of Virgil’s *Æneid*, he criticised it with equal asperity and success. Of his *History of the Decline and Fall of the Roman Empire*, the 1st vol. was published in 1776, and met with extraordinary success; the 2d and 3d vols. appeared in 1781; and the 4th, 5th, and 6th, in 1787, established Mr. Gibbon’s fame as an historian. Encomiums were lavished on him from all quarters by Mr. Hume, Dr. Robertson, Dr. Watson, Zimmerman, &c. The last represents Mr. Gibbon as even excelling both those eminent historians in point of style. ‘All the dignity,’ he adds, ‘all the charms of historic style are united in Gibbon; his periods are melody itself, and all his thoughts have nerve and vigor.’ But others, while they give our author full credit for acuteness of penetration, fertility of genius, luxuriance of fancy, elegance of style, harmony of language, and beauty of epithets, &c., object that ‘the uniform stateliness of his diction sometimes imparts to his narrative a degree of obscurity, unless he descends to the miserable expedient of a note to explain the minuter circumstances,’ and that ‘his style on the whole is much too artificial; which gives a degree of monotony to his periods, that extends almost to the turn of his thoughts.’ But a more serious objection, it has been added, is his attack upon Christianity; the loose and disrespectful manner in which he mentions many points of morality, regarded as important on the principles of natural religion; and the indecent allusions and expressions which too often occur in the work. An argumentative attack upon Christianity will never, merely as such, be condemned or shunned by the Christian; on the other hand, the attack is never to be carried on in an insidious manner, and with improper weapons: indeed Christianity itself, so far from dreading, will invite every mode of fair and candid discussion. But our historian often makes, when he cannot readily find, an opportunity to insult the Christian religion. Such indeed is his eagerness in the cause, that he stoops to the most despicable pun, or to the most awkward perversion of language, for the pleasure of turning the Scripture into ribaldry, or calling Jesus an impostor. Yet of the Christian religion has Mr. Gibbon himself observed, that ‘it contains a pure, benevolent, and universal system of ethics, adapted to every duty and every condition of life.’ Various answers to Mr. Gibbon’s attack on Christianity were published by Dr. Chelsam, Dr. Randolph, lord Hailes, Dr. Watson, bishop

of Llandaff, Dr. White, Mr. Apthorpe, Mr. Davis, Mr. Taylor, Dr. Priestley, and others. To most of these our author made no reply, though his posthumous memoirs show that he felt the weight of some of them. Our author, however, was no friend to new opinions in politics. Being introduced into the house of commons as M. P. for Liskeard in 1774, he uniformly supported administration with his vote, during the American war; and upon the French revolution he adopted Mr. Burke's creed, in every thing but his reverence for church establishments. Soon after the downfall of lord North's administration, he returned to Lausanne; but his Swiss friend dying, and French politics prevailing in Berne, he left his Paradise, as he styled it, and returned to London in June, 1793. He did not however enjoy this retreat long. His constitution had suffered much from repeated attacks of the gout, and a swelling of his ankles; and, after having been often tapped for a hydrocele, he died at London, of the gout in his stomach, on the 16th of January, 1794, in the fifty-seventh year of his age.

GIBBONS (Grinling), a celebrated modern carver and statuary, was born in London of Dutch parents about the middle of the last century. He was patronised both by Charles II., and James II.; and gave to wood and coin, to marble and to bronze, the lightness of flowers. His principal remaining works are, the wooden throne at Canterbury, the monument of viscount Camden, at Exton in Rutlandshire, the font in St. James's Church, the statue of Charles II. at Charing Cross, and that of James II. in the Privy Garden. He died in 1721.

GIBBONS (Thomas), D. D., a dissenting minister of some popularity, was born in 1720 at Swaffham, Norfolk. He became in 1742 pastor of an Independent meeting-house in Silver-street, London; but the next year removed to Haberdasher's Hall. In 1754 he was one of the tutors of the Mile End Academy, and in 1764 received a diploma from the university of Aberdeen. He died in 1783; having published,—1. *Juvenilia*; or *Poems on Several Occasions*. 2. *Family Sermons*, 8vo. 3. *A System of Rhetoric*, 8vo. 4. *Female Worthies*; or the *Lives of Pious Women*, 2 vols., 8vo. 5. *Memoirs of Dr. Isaac Watts*, 8vo. After his death, three volumes of his sermons were published.

GIBBOSITY, *n.s.* } Fr. *gibbosité*; Latin
GIBBOSUS, *adj.* } *gibbus*. An astronomical
GIBBOUSNESS, *n. s.* } term implying convexity;
 inequality. Crookbacked; deformed; a prominence.

I demand how the camels of Bactria came to have two bunches on their back, whereas the camels of Arabia have but one? How oxen in some countries began and continue *gibbous* or hunch-backed?

Browne.

A pointed flinty rock, all bare and black,
 Grew *gibbous* from behind the mountain's back.

Dryden.

When ships, sailing contrary ways, lose the sight
 one of another, what should take away the sight of
 ships from each other, but the *gibbosity* of the interja-
 cent water?

Ray.

The bones will rise, and make a *gibbous* member.

Wiscman.

The sea, by this access and recess, shuffling the
 empty shells, wears them away, reducing those that
 are concave and *gibbous* to a flat.

Woodward's Natural History.

To make the convexity of the earth discernible,
 suppose a man lifted in the air, that he may have
 a spacious horizon; but then, because of the distance,
 the convexity and *gibbousness* would vanish away, and
 he would only see a great circular flat.

Bentley's Sermons.

GIBBOSITY, in surgery, denotes any protuberance, or convexity of the body, as in a person hump-backed. Infants are much more subject to gibbosity than adults, and it oftener proceeds from external than internal causes. A fall, blow, or the like, frequently thus distorts the tender bones of infants. When it proceeds from an internal cause, it is generally from a relaxation of the ligaments that sustain the spine, or a caries of its vertebrae; though the spine may be inflected forward, and the vertebrae thrown out, by a too strong and repeated action of the abdominal muscles. This, if not timely redressed, grows up and fixes as the bones harden, till in adults it is totally irretrievable: but when the disorder is recent, and the person young, there are hopes of a cure.

GIBBOUS, in astronomy, is used in respect to the enlightening parts of the moon, whilst she is moving from the first quarter to the full, and from the full to the last quarter: for all that time the dark part appears horned or falcated; and the light one hunched out, convex, or *gibbous*.

GIBBS (James), A. M., a celebrated Scottish architect, born at Aberdeen in 1674. His father was a merchant of that city, and parties running high about 1688, he named his two dogs Whig and Tory, in ridicule of both parties;—an offence for which the magistrates of Aberdeen summoned him before them, and condemned the two dogs to be hanged at the cross! Young Gibbs was educated at the Marischal College, where he took his degree of A. M. About 1694 he travelled into Holland, where he spent some years with an eminent architect; and where, in 1700, he was introduced to the earl of Mar, who generously assisted him with money and recommendatory letters, to enable him to complete himself under the best Italian masters. About 1710 he left Italy, and returned to England, where he found his noble patron in favor with the queen. An act being passed for building fifty new churches, Mr. Gibbs was employed, and gave a specimen of his abilities by planning and executing St. Martin's Church, St. Mary's in the Strand, and several others. Among many other beautiful edifices planned by him, and built by his direction, we shall only mention the Radcliffe Library at Oxford; the King's College, Royal Library, and Senate House at Cambridge; and the duke of Newcastle's monument. He died 5th of August, 1754, leaving a fortune of £15,000.

GIBBS (Vicary), an English lawyer and judge of no less celebrity, was born in 1752 at Exeter, in which city his father was a surgeon. He was educated at Eton and King's College Cambridge on the royal foundation. In 1772 he obtained

a Craven scholarship. After this, entering himself of Lincoln's Inn, he contracted an acquaintance with Mr Dunning, afterwards lord Ashburton, whose patronage became important to him. He succeeded Mr. Burke in the recordership of the city of Bristol, and was an able and eloquent pleader at the bar. His exertions on the trials of Tooke, Hardy, Thelwall, &c, in particular, ranked him high in his profession; and he proceeded rapidly through the situations of chief justice of Chester, solicitor, and attorney-general (on accepting which last office he was knighted), till, being raised to the bench, he was, in 1814, finally elevated to the dignity of lord chief justice of the common pleas. Sir Vicary only filled this last post about four years, when his infirmities compelled him to resign. He survived about two years, and died in the month of February, 1820.

GIBCAT, n. s. Gib and cat. An old worn-out cat.

I am as melancholy as a *gibeat*, or a lugged bear.

Shakspeare.

GIBE, v. n., v. a., & n. s.

GIBER, n. s.

GIBINGLY, adv.

Belg. *gabbirn*; Ital. *gabbare*.

Old French *ga-ber*; Goth. *gaber*, *gabba*, to mock; To reproach; ridicule; taunt; upbraid; or sneer.

When he saw her toy, and *gibe*, and geer,

And pass the bounds of modest merry make,
Her dalliance he despised.

Spenser.

They seem to imagine that we have erected of late a frame of some new religion, the furniture whereof we should not have borrowed from our enemies, lest they should afterwards laugh and *gibe* at our party.

Hooker.

Mark the fleers, the *gibes*, and notable scorns

That dwell in every region of his face.

Shakspeare.

You are well understood to be a more perfect *giber* of the table, than a necessary bencher of the capitol.

Id. Coriolanus.

Why, that's the way to choke a *gibing* spirit.

Whose influence is begot of that loose grace

Which shallow laughing hearers give to fools.

Shakspeare.

His present portance

Gibingly and unreasonably he did fashion
After the inveterate hate he bears to you.

Id.

He is a *giber*, and our present business

Is of more serious consequence.

Ben Jonson.

The good man was by nature gay

Could *gibe* and joke as well as pray.

Somerville.

The rich have still a *gibe* in store,

And will be monstrous witty on the poor.

Dryden.

If they would have from the bottom of their hearts,
their aversion would be too strong for little *gibes*
every moment.

Spectator.

Draw the beasts as I describe them,

From their features while I *gibe* them.

Swift.

Thus with talents well endued,

To be scurrilous and rude,

When you pertly raise your snout,

I'll *gibe*, and laugh and flout.

Id.

His society with frown severe

Scurrility with *gibing* air,

Id.

Till the tried jade, the wheel forgets to hurl,

Provoking envious *gibe* from each pedestrian churl.

Byron.

GIBEAH, a city of Benjamin, lying north of Jerusalem about twenty or thirty furlongs, and

built upon a hill as its name imports. This city gave birth to Saul, the first king of Israel, for which reason it is often called Gibeah of Saul.

GIBEON, a city seated on an eminence about forty furlongs north of Jerusalem, and not far from Gibeah. It was the capital of the Gibeonites.

GIBEONITES, an ancient nation of Canaan, who, hearing of Joshua's great conquests, saved their lives at the expense of their liberty, by a representation that they belonged to a very remote country, and desired to make an alliance with the Hebrews. See Joshua ix. 3—27. The Gibeonites were descended from the Hivites, and possessed four cities; viz. Chephirah, Beeroth, Kirjathjearim, and Gibeon; which were afterwards given to the Benjamites, except the last, which fell to the tribe of Judah. The Gibeonites continued subject to those burdens which Joshua had imposed on them, and were very faithful to the Israelites till the dispersion of that nation.

GIBLETS, n. s. Minshew says, from *gobbet*, a good mouthful; Mr. Thomson refers us to the Saxon *gibla*; M. Goth. *gibla*, a wing; according to Junius, more properly from Fr. *gibier*, game. The parts of a goose which are cut off before it is roasted.

'Tis holyday; provide me better cheer:

'Tis holyday; and shall be round the year:

Shall I my household gods and genius cheat,

To make him rich who grudges me my meat?

That he may loll at ease; and pampered high,

When I am laid, may feed on *giblet* pie?

Dryden.

GIBRALTAR, a promontory, and important fortress, in the south of Spain, at the entrance from the Atlantic into the Mediterranean. It is in fact a great rocky mountain, about three miles in length from north to south, from half to three-fourths of a mile in width, and from 1200 to 1400 feet in height. On the north side is an isthmus, about a mile and a half in length, and half as much in breadth, which connects this vast mass of rock with the continent. Its northern front is almost perpendicular; and the east side is full of precipices, while the south, being narrow and abrupt, presents hardly any possibility of approach even to an enemy in command of the sea. On none of these sides has this fortress ever been attacked; there remains only the western front, which is almost as abrupt as the others, but which may be approached in shipping from the bay, and on a level part of which the town is built.

The rock is in general calcareous; and, on blowing it up, fossil bones and teeth have been found, which at first were supposed to be human, but are now known to belong to quadrupeds. The rock has also several caverns, of which that of St. Michael on the west, is the largest; it is 1110 feet above the level of the sea. The rain water continually filtrates through, and forms stalactites, some of which extend from the roof to the bottom, forming columns two feet in diameter, and which continually increase in bulk. Excavations have been formed in the rock by blasting, capable of holding the entire garrison of 6000 men; and these subterranean barracks

communicate with all the batteries by passages of the same kind, all of which may be traversed on horseback. Eight bomb-proof cisterns, each containing 40,000 tons, are kept constantly full of water, by collecting all the little runs on the west side of the rock, and the water is allowed to deposit its sediment in immense troughs before it is let into the cisterns.

The bay of Gibraltar is nine miles long, and five broad, and forms a convenient and well-protected naval station. One side is formed by the promontory and isthmus; to the south is the sea; the other sides of the bay (the west and north) are formed by the main land of Spain, but the command of the whole depends on the possession of the promontory.

The town of Gibraltar consists of a principal street, from half to three-quarters of a mile long, and containing 12,000 inhabitants, English, Spaniards, and Jews; each religion being fully tolerated. It is surrounded by a strong wall, supported by bastions and other works, and was formerly under strict military regulations, no inhabitant being allowed to be out of his home after eleven o'clock, without express permission from the governor; and neither hawkers nor beggars were permitted in it. The abuses and vexations consequent to this species of government, induced the parliament to erect it into a body corporate, and the civil power is now lodged in its magistrates. Its chief protection is derived from the batteries on the neighbouring heights, which sweep both the isthmus and the approach to the town by water. In the last siege the town was almost entirely destroyed, but it was afterwards rebuilt on an improved and enlarged plan. The houses have flat roofs, and bow windows are used generally for shops; they are painted black, to blunt the dazzling rays of the sun, with a white stripe to mark each story or floor. Out of the main streets the inhabitants are much crowded, as was exemplified in the rapid spreading of a contagious fever, communicated from Cadiz in 1804, which swept off many thousand inhabitants; the military escaped only from the observance of the strictest precautions, and from their being lodged on higher ground. The climate of Gibraltar is qualified by the vicinity of the sea, and less hot than might be expected in the latitude of 36° .

Cottons, and other manufactures, are its imports from England; sugar, rum, and other produce, from the West Indies; tobacco, rice, and flour, from North America; while wine, fruits, silk, wax, and other Mediterranean articles, are brought in from the east. The port is formed by moles of considerable extent. The chief public buildings are the navy hospital, the victualling office, barracks, and governor's house. The places of worship an English church, Catholic chapel, and three synagogues; here is also a small but elegant playhouse, and a respectable garrison library.

This important fortress seems to have been first particularly noticed as a place of consequence in the year 712. At that time the general of the caliph Al Wahd landed with an army of 12,000 men on the isthmus between the general of the the continent; and, that he might secure an in-

tercourse with Africa, ordered a castle to be built on the face of the hill. Part of the building still remains: and, from an inscription discovered above the principal gate, appears to have been finished in 725. It continued in the possession of the Saracens till 1310, when it was taken by Perez de Guzman, under Ferdinand IV. king of Castile. In 1333, however, it was surrendered to the son of the emperor of Fez, who came to the assistance of the Moorish king of Granada. An attempt was made upon it in 1349 by Alphonso XI., king of Castile; but, when the fortress had been reduced to the last extremity, a pestilential fever broke out in the Spanish camp, which carried off the king himself, with great part of his army; after which the enterprise was abandoned. The fortress continued in the possession of the Saracens of Fez until 1410, when it was taken by Joseph III. king of Granada. A design of attacking it was formed by Henry de Guzman in 1435; but, the enterprise miscarried through his imprudence, and he was defeated and slain. However it was at length taken, after a gallant defence, by his son John de Guzman in 1462; since which time it has remained in the hands of Europeans.

In 1540 Gibraltar was surprised and pillaged by Piali Hamet, one of Barbarossa's corsairs; but the pirates, having fallen in with some Sicilian galleys, were by them defeated, and all either killed or taken. In the reign of Charles V. the fortifications of Gibraltar were modernised, and such additions made as to render them almost impregnable. But in 1704, in consequence of the resolution adopted by the court of Britain to assist the archduke Charles in his pretensions to the Spanish crown, Sir George Rooke was sent with a powerful fleet into the Mediterranean, and an attempt on Gibraltar was resolved upon. On the 21st of July, 1800 troops were landed upon the isthmus under the prince of Hesse Darmstadt; and, on the refusal of the governor to surrender, a cannonade was begun from the fleet on the 23d, and kept up so briskly that in five or six hours the Spaniards were driven from many of their guns, especially at the new mole-head. The admiral, perceiving that by gaining this part of the fortification the reduction of the rest would be facilitated, ordered out some armed boats to take possession of it. On their approach the Spaniards sprung a mine, which demolished part of the works, killed two lieutenants and forty men, wounding about sixty more. Notwithstanding this disaster the assailants kept possession of the work, and took a small bastion half way between the mole and the town. On this the governor capitulated, and the prince of Hesse took possession of the gates on the 24th. The garrison, consisting of 150 men, marched out with the honors of war; and the Spaniards who chose to remain were allowed the same privileges they had enjoyed under Charles II. The works were found very strong, and the place well provided with ammunition and military stores: yet the capture was held of little value by the British court.

This conquest was achieved with the loss of about sixty killed and 216 wounded on the part of the English. The prince of Hesse remained

governor, and eighteen men of war were left at Lisbon under the command of Sir John Leake, to succour the garrison if there should be occasion. The loss of such an important fortress, however, having alarmed both the courts of Madrid and Paris, orders were sent to the marquis de Villadarias a Spanish grandee, to lay siege to it. The prince of Hesse immediately applied to Sir John Leake for assistance; but, before the latter had time to comply with his request, a French fleet arrived, and debarked six battalions to assist the Spaniards; after which they proceeded to the westward, leaving only six frigates in the bay. The trenches were opened on the 11th of October, about which time Sir John arrived with twenty sail of English and Dutch ships; but, hearing that the French were about to attack him with a superior force, he returned to refit. Having left orders at Lisbon to make preparations for this purpose, he accomplished the work with such expedition that, on the 29th, he returned, and surprised in the bay three frigates, a fire ship, two English prizes, a tartan, and a store ship. After this he landed some reinforcements, supplied the garrison with six months' provisions, and sent on shore 500 sailors to assist in repairing the breaches. The Spaniards supposing that the garrison would now be off their guard, on account of the vicinity of their fleet, formed the rash design of attempting to surprise the place, though the British admiral was still before it. In this mad attempt 500 brave volunteers associated, taking the sacrament never to return unless they accomplished their purpose. They were conducted by a goat-herd to the south side of the rock near the cave-guard. This they mounted, and lodged themselves the first night in the cave of St. Michael: the next they scaled Charles V.'s wall; surprised and massacred the guard at Middle-hill; where afterwards, by ropes and ladders, several hundreds of the party designed to support them were hauled up; but, being discovered, they were attacked by a party of grenadiers, and all either killed or taken. Notwithstanding these misfortunes the Spaniards continued the siege, and fitted out a strong squadron from Cadiz, to intercept the provisions sent to the garrison; expecting that, on the arrival of their fleet, Sir John would be obliged to retire, and the garrison to surrender. They continued their fire therefore with additional fury, dismounted many of the cannon, and did essential injury to the works, in several different places. The prince of Hesse, however, excited his utmost to disappoint their expectations. As it was probable that they might attempt to storm the curtain, a curvette was dug in the ditch, which was filled by the tide, and a double row of palisades placed parallel to the works; and the chambers of the mine under the glacis were loaded; but on a sudden the Spaniards altered their design, and threatened an attack on the lines which the garrison had on the declivity of the hill to flank the glacis, and overlook their advanced works. While affairs were in this situation, part of the succours they had long expected arrived in the bay, Dec. 7th 1704; and in two days after, the remainder came in with nearly 2000 men, and a proportionable quantity of am-

munition and provisions. These had sailed from Cape Spartel, and were in danger of falling into the hands of the enemy, whose fleet they mistook for their own; but escaped by being becalmed. Sir John Leake, having thus powerfully reinforced the garrison, set sail for Lisbon, where he arrived about the end of the year. In the beginning of 1705 the Spaniards were reinforced by a considerable body of infantry, and on the 11th of January made an attack on the King's Lines, but were repulsed. The attack was renewed next day by 600 grenadiers, French and Walloons, supported by 1000 Spaniards, under lieutenant general Fuy. They showed an intention to storm a breach which had been made in the round tower at the extremity of the King's Lines, and another in the entrenchment on the hill. The retrenchment which covered the latter, with part of the entrenchment joining the precipice of the rock, was defended at night by a captain, three subalterns, and ninety men; but the captain usually withdrew, with two subalterns and sixty men, at day break. The round tower was defended by 180 men, commanded by a lieutenant colonel. The marquis, by deserters from the garrison, had obtained intelligence of the strength of these posts, and planned his attack accordingly. The detachment for the upper breach mounted the rock at midnight, and concealed themselves in the cliffs until the captain had withdrawn; after which, advancing to the point of the entrenchment, they threw grenades on the subaltern and his party, so that they were obliged to leave the place. At the same time 300 men stormed the round tower, where lieutenant colonel Bar made a vigorous defence, though the enemy annoyed them on the flanks with great stones and grenades. Observing, however, the Spaniards marching down to cut off his retreat from the town, he retired; and, by getting over the parapet of the king's lines, descended into the covered way, where the English guards were posted. Thus the garrison were alarmed; all the regiments were assembled at their proper posts; and captain Fisher endeavoured to stop the progress of the enemy with seventeen men, but they were repulsed, and himself taken prisoner. At last, however, the tower was retaken by lieutenant colonel Moncal at the head of 400 or 500 men, after it had been in the possession of the enemy upwards of an hour. The garrison were now farther reinforced by six companies of Dutch troops and 200 English soldiers, with provisions and stores. The assailants, however, were still determined to go on. The marquis de Villadarias was superseded by marischal Tesse, a Frenchman, with whom admiral Pointis was desired to co-operate in blocking up the place. The marischal joined the army with four fresh battalions, besides eight companies which had been sent before; the ordnance, which had been greatly injured, was exchanged, and the works put into the best repair. On the part of the English, a reinforcement was ordered under Sir Thomas Dilkes and Sir John Hardy, to join admiral Leake at Lisbon: which being effected, the whole fleet, consisting of twenty-eight English, four Dutch, and eight Portuguese men of war, having on board two

battalions of land forces, set sail from Lisbon. And happily for the besieged, the incessant rains and storms had retarded the operations of the land forces, and greatly distressed the enemy's fleet; eight of their ships having been forced from their anchors. At this critical period Sir John Leake, with the allied fleet, entered the straits, when the few remaining French ships put out to sea, and he immediately gave chase. Three men of war were taken; the admiral's ship and another were driven on shore, and burnt; and the rest made the best of their way to Toulon. The garrison was now so well supplied, that marischal Tesse withdrew his troops from the trenches, and formed a blockade, drawing an entrenchment across the isthmus to prevent the garrison from ravaging the country. The prince of Hesse remained for some time in the place, where he repaired the batteries, and made fortifications; after which he joined the archduke Charles at Lisbon. Major-general Rames was now appointed governor of Gibraltar, in which only two new battalions were left, as nothing was to be feared from the enemy. In the course of this siege the Spaniards lost 10,000 men, including those who died of sickness; while the garrison lost only 400. The new governor brought with him 400 men for the greater security of the place; but soon resigned his government to colonel Roger Elliot, during whose time Gibraltar was made a free port by a special order from queen Anne.

Colonel Elliot was succeeded by colonel Congreve before 1714, and he by colonel Cotton soon after. In 1720 the Spaniards threatened another attack, but the design was abandoned. At last, however, in the end of 1726, they assembled an army near Algesiras, encamping, on the 20th of January, 1727, on the plain below St. Roch, and erecting a battery on the beach to protect their camp. Though admiral Hopson was then at anchor in the Bay of Gibraltar, yet, as he had not heard of the commencement of hostilities between Britain and Spain, he allowed the boats of the latter to pass with provisions, arms, and ammunition, between Algesiras and the camp, at the same time that brigadier Kane, who had been a second time sent from Minorca, lay under similar embarrassments. The operations of the Spaniards, however, seemed so evidently to tend towards an attack, that the governor thought proper to order such of that nation as were in the town to leave it, and to forbid their galleys to anchor under his guns. The count de las Torres commanded the Spanish forces, amounting to nearly 20,000 men; and soon after forming his camp, he advanced within reach of the garrison. The brigadier then desired him to keep out of his reach, otherwise he should do his utmost to force him; but to this the Spanish commander replied, that he should obey his Catholic majesty's orders, and encroach as far as possible. Hostilities, however, were not commenced till the 20th of February 1727, when the Spaniards having brought materials for batteries to the old wind-mill on the neutral ground, it was determined in a council of war, that the Spanish general had commenced hostilities. Still, however, the governor sent to the count to know the reason of breaking ground before the

garrison; but received for answer, that 'he was in his master's territories, and was no answerable to any other person for his conduct.' On this the governor opened the batteries of the Old Mole and those of Willis upon the Spanish workmen; however, they persisted in carrying on their operations, and at night marched a party down to the Devil's Tower, where they began a communication with their other works. The governor was now informed by some deserters, that the enemy were forming a mine in a cave under Willis's Battery, with a design to blow it up; but, the plot being thus discovered, a party was immediately stationed to cut off the communication. On the 22d of February the Spaniards opened on the garrison with seventeen pieces of cannon besides mortars; and the day following brigadier Kane left Gibraltar to send a reinforcement from Minorca. On the third of March the enemy opened a new battery of twenty-two guns on the Old Mole, and on the 8th another of fifteen guns, bearing also upon the same Mole, the guns of which had annoyed the western flank of their approaches. All this time the garrison had kept up a constant and well directed fire from the batteries which bore upon the works of the enemy; but the ordnance being old frequently burst; by which they suffered more than from the fire of the besiegers. The latter were also greatly annoyed by the fleet under admiral Hopson and Sir Charles Wager, who, since the beginning of the siege, had intercepted their home-bound ships, and greatly benefited the garrison by bringing the prizes into the bay. But on the arrival of a reinforcement from Minorca, they sailed to the westward, leaving the garrison to defend themselves in the best way they could. The enemy continued to augment their batteries, and erect new ones, until they amounted at last to sixty cannon besides mortars; and, on the 3rd of May, the governor received intelligence that a general assault was intended. Hostilities, however, ceased on the 12th, when news arrived that the preliminaries of a general peace were signed. In the course of this siege the loss of the Spaniards was computed at nearly 3000 men, besides casualties, which could not be ascertained. That of the garrison amounted only to 300; a very small number, considering that during the siege seventy cannon and thirty mortars burst on the batteries.

For upwards of half a century, no farther attempts were made on Gibraltar; but the hostile manifesto, presented by the Spanish ambassador to the court of London, at the commencement of the American war, was soon followed by an interruption of communication betwixt Spain and Gibraltar. No direct intention of attacking it, however, was manifested till the 16th of July 1779, when the port was completely blocked up by a squadron of two seventy-four gun ships, several frigates, galleys, &c. Ten days after they began to form a camp on the plain below St. Roch, three miles from the fortress. The garrison at this time consisted of 5382 men, including officers, with a company of engineers and artificers; but the greatest expectations were formed from the abilities and valor of general

Elliott, the governor. See ELLIOTT. As soon as the breaking off the communication with Spain indicated approaching hostilities, the governor took every precaution that could be suggested by military wisdom; but though informed of the rupture betwixt the two courts, and though he beheld the hostile operations of the enemy, he used no means to interrupt them till the 12th September, when the batteries of Green's Lodge, Willis, and Queen Charlotte, were opened for a few hours, with a view to disturb the workmen. From this time to the beginning of 1780 the enemy continued the blockade both by sea and land, but without doing any damage to the works or garrison; and it was not until the 12th of January that a single person was wounded. This happened to be a woman, who, passing near one of the houses, was slightly hurt by a shot from the enemy. In the mean time, however, the usual supplies of provisions being cut off, the garrison began to feel all the horrors of famine. All the necessaries of life were very scarce, and to be procured only at most exorbitant prices. As the rock, however, is almost surrounded by the sea, it was natural to suppose, that in such a scarcity of other provisions great benefit would have been derived from the ocean; but the fishermen, being all foreigners, and under no regulation, took advantage of the scarcity in the garrison to exact a most exorbitant price for the fish. Had matters remained long in this state, the fortress must have fallen into the hands of the enemy. They were, however, effectually relieved in consequence of the repeated victories gained by admiral Rodney over the Spanish fleets, on the 8th and 16th of January 1780; which proved equally serviceable to the garrison and detrimental to the enemy, who were now in great want both of provisions and materials for shipping. The news of the last of these important victories arrived at Gibraltar on the evening of the 17th, and in two days more the garrison was completely relieved by the arrival of the fleet and convoy; when they were farther reinforced by a regiment of Highlanders, consisting of 1051 men, officers included. An opportunity was also taken of sending away with the fleet all the invalids and women in the garrison; with whom they set sail on the 10th of February, leaving in the bay only the Edgar and Panther, ships of the line, with two frigates.

On the departure of the British fleet the blockade was immediately resumed; and, notwithstanding the ample supplies lately received, the garrison soon began again to experience the want of fresh provisions. It had hitherto received these in abundance from the coast of Barbary; but the friendship of the emperor of Morocco was now transferred from Great Britain to Spain in a manner totally unprecedented. Thus the garrison became daily more and more distressed, from being obliged to make constant use of their salt provisions, and even this with the strictest economy. At the same time the defence of the garrison was so vigorous, that while it continued to be supplied even in this scanty manner, the Spaniards began to lose all hope of reducing it; for which reason they formed a project of burning all the British shipping in the

bay. The night fixed for executing this scheme was the 6th of June 1780, when ten fire ships, favored by an uncommon darkness, stood over from the Spanish to the British side of the bay. Their design was to set fire to the store-houses and shipping nearest the water side; but, having been too precipitate in firing their ships, they met with a very heavy cannonade, and the attempt was frustrated. On this occasion the skill and intrepidity of the British seamen were eminently displayed. Having manned their boats, they grappled with the fire-ships already in flames, and, notwithstanding the danger of their exploding, towed them clear of the vessels under the walls, and extinguished them. The failure of this project was a grievous disappointment to Don Barcelo the Spanish admiral, who lay ready with his squadron to intercept the British vessels that might attempt to escape; while the batteries on their lines were ready to bombard the town, if the fire-ships had succeeded in causing any conflagration on shore. The failure of this attempt was soon followed by other disasters. As soon as they had, with great labor, constructed new batteries, they were destroyed by the besieged; and their mortification on these occasions was the greater, as the governor allowed them to complete their works before he commenced his destructive operations. Thus the labor of many days was often lost in a few hours, and was again resumed with as little prospect of success as before. The garrison were now, however, considerably annoyed by the Spanish gun-boats, to which indeed the shipping were equally exposed. These were vessels from thirty to forty tons burden, constructed so that they lay low and comparatively secure in the water. They had fifteen oars on a side, carried forty or fifty men, with a twenty-six pounder on the prow; and, from the facility of managing them, two were deemed, in calm weather, to be a match for a frigate of moderate size. All their efforts, however, could only reduce the garrison to great straits for want of provisions; and to this dreadful inconvenience the British submitted with the most stoical resignation. From admiral Rodney's departure in February, 1780, to October, almost the only provisions in the garrison were such as tended to produce the scurvy; which accordingly raged in such a manner as to threaten the most fatal consequences. The allowance of salt provisions had hitherto continued undiminished; but now it was judged necessary to reduce the allowance of bread and meat, and to enforce the strictest economy with regard to food. Every thing of this kind that could be practised, however, seemed insufficient to preserve the garrison from want. In the beginning of 1781 provisions became exceedingly scarce, by the almost total expenditure of the public stores, and the vigilance of the enemy's cruisers. About the middle of February the bakers left off work for want of flour; many of the poorer sort wanted bread, and the price of fresh provisions again rose to a most enormous height; while the scarcity of fuel was such, that it was sometimes scarcely procurable in quantity sufficient to dress their victuals. The garrison had hitherto derived assistance occasionally from the gardens

on the neutral ground, though vast quantities of vegetables had been removed thence by the enemy. Towards the end of October 1780, however, the Spaniards expelled the British from these gardens; and from this time the supply of vegetables depended entirely upon cultivation; which, happily for the garrison, was attended with such success, that the produce came at last to be nearly equal to the demand. At last, on the 12th of April 1781, supplies were brought by the British fleet under admirals Darby, Digby, and Ross, though they could not be got in without great difficulty. This so irritated the court of Spain, that they determined to exert their utmost force rather than fail in obtaining their favorite object. The batteries of the besiegers were now mounted with 200 guns of the heaviest metal, and ten mortar-pieces of the largest size. In three weeks this prodigious mass of artillery consumed 100,000 lbs. of gunpowder, and threw into the town 4000 or 5000 shot and shells every day. By such an immense bombardment the town was almost totally laid in ruins. The inhabitants were at last all forced to leave the town, and take shelter under tents, with what accommodation could be provided for them in such scenes of horror and confusion. Numbers took the opportunity of retiring with the fleet; while many that remained were reduced from a state of opulence to the greatest distress. The conduct of the governor, however, was now admirable: he allowed such as chose it a free passage to England, and supplied them with provisions for the voyage. During this bombardment, not only the greatest part of the effects belonging to the inhabitants were destroyed, but the fortifications were in many places greatly injured; and the remainder was destroyed by the soldiers, who were often very insubordinate. Rigorous measures were, therefore, now, of necessity, adopted; and it was intimated, that any soldier convicted of being drunk or asleep upon his post, or found marauding, should be immediately executed.

By the beginning of June, 1781, the enemy had relaxed considerably in their firing, seldom exceeding 600 shot in a day; and they continued gradually to diminish this number so remarkably, that towards the end of August they seldom fired in the day, or above four times in the night. The batteries on land, however, were succeeded by the gun-boats; which renewed every day their attacks, keeping the garrison in continual alarm, and never failing to do more or less execution. To restrain them, a battery of guns, capable of throwing their shot to a great distance, was erected; and, as it reached the enemy's camp, it was determined to open it upon them as often as the gun-boats made their attacks. The besiegers continued still, however to improve their works, and for this purpose employed the best engineers both of France and Spain; so that by the end of November, 1781, they had brought them to such a state of perfection, as inspired both kingdoms with the most sanguine expectations of success. Governor Eliott was undismayed at these formidable preparations, and suffered them to proceed without molestation that he might at once destroy them. In the night of the 27th of November a

chosen party of 2000 men was detached to attack the enemies' works and batteries; and their success was equal to their most sanguine expectation. They marched out in great order and silence about 2 o'clock A.M. under brigadier-general Ross; and arrived with the utmost celerity at the enemy's works, which they stormed and overthrew; spiking all their guns. The artillery-men, artificers, and sailors, exerted themselves so vigorously, that in an hour the whole of the enemy fled; the magazines were blown up, the storehouses of arms, ammunition, and military implements, and all the works that had been constructed, were set on fire, and totally consumed: the whole damage done on this occasion being estimated at upwards of £2,000,000 sterling. In the beginning of December, a partial attempt was made by the Spaniards to repair their works: but it was evident, that if the place could be reduced at all, it must be by some means hitherto unattempted. The Spanish monarch seemed determined however on his object, and was willing to employ the whole strength of his empire. Among the various projects formed, that of the chevalier D'Arcon, a French engineer, was adopted on a larger scale. His plan was to construct such floating batteries as might neither be liable to be sunk or set on fire. Their bottoms were made of the thickest timber, and their sides of wood and cork long soaked in water with a layer of wet sand betwixt them. Their thickness was such, that they were impenetrable to cannon shot; and, to prevent the effects of red hot balls, a number of pipes were contrived to carry water through every part of the vessel, connected with pumps sufficient to furnish a constant supply. The people at the batteries were sheltered from the bombs by a rope-netting made sloping, that they might roll off; and spread with wet skins to prevent fire. Ten of these batteries were constructed out of the hulls of large vessels, of fifty or sixty guns, cut down for that purpose, and carrying from ten to twenty-eight guns each, with about half as many in reserve, in case of accident. Each gun was served by thirty-six artillery-men; and the whole were seconded by eighty large boats carrying guns and mortars of heavy metal; a great number of ships of force and frigates, with some hundreds of small craft, were to accompany them with troops, for the instant execution of what might be judged necessary.

On this occasion upwards of 1000 pieces of artillery, and 80,000 barrels of gunpowder, were provided. A body of 12,000, of the best troops of France were now added to the Spanish army before the place; the body of engineers was the best that both kingdoms could produce; and numbers of volunteers of the best families in both joined the attacking army. The command of it was committed to the duke of Crillon, who had distinguished himself by the conquest of Minorca; and two princes of the blood royal of France, the count of Artois and the duke of Bourbon, came to be witnesses of the meditated enterprise. The former politely transmitted a packet of letters for various individuals in the garrison, which had been intercepted and carried

to Madrid; and which he requested that he might be the means of conveying to those for whom they were designed. Both he and the duke of Bourbon signified to general Elliott, the high regard they had for his person and character; the duke of Crillon expressing the same sentiments. Such a prodigious armament raised the confidence of the besiegers so high, that they looked upon the conquest of the place as an absolute certainty; and the commander in chief was thought by far too modest, when he said, that the garrison might hold out a fortnight. 'It appeared,' says captain Drinkwater, 'that they meant, previous to their final efforts, to strike if possible a terror through their opponents, by displaying an armament more powerful than had probably ever been brought before any fortress. Forty-seven sail of the line, including three inferior two-deckers; ten battering ships, deemed perfect in design, and esteemed invincible, carrying 212 guns; innumerable frigates, xebecs, bomb-ketches, cutters, gun and mortar boats, and smaller craft for disembarking men, were assembled in the bay. On the land side were most stupendous and strong batteries and works, mounting 200 pieces of heavy ordnance, and protected by an army of 40,000 men, commanded by a victorious and active general. In their certainty of success, however, the enemy seemed entirely to have overlooked the nature of that force which was opposed to them; for though the garrison scarcely consisted of more than 7000 effective men, including the marine brigade, they forgot that they were now veterans in this service, had long been habituated to the effects of artillery, and were by degrees prepared for the arduous conflict that awaited them. We were at the same time commanded by officers of approved courage, prudence, and activity; eminent for all the accomplishments of their profession, and in whom we had unbounded confidence. Our spirits too were not a little elevated by the success attending the firing of red hot shot, which in this attack we hoped would enable us to bring our labors to a conclusion, and relieve us from the tedious cruelty of a vexatious blockade.' This was suggested by lieutenant-governor Boyd, and on the 8th September, 1782, their advanced works were almost destroyed by it.

As a prelude to the dreadful storm which was about to be poured forth on this garrison, the enemy on the 9th September opened a battery of sixty-four of their largest cannon, accompanied with a terrible fire from other batteries, and a great number of mortars. On this and the following day an attack was also made upon the batteries erected on Europa Point, which at that time were entirely under the management of captain Curtis of the Brilliant frigate. By these the fire of the Spaniards was so warmly returned, that they not only could make no impression, but were forced to retire, after being so much damaged that two of the principal ships were obliged to withdraw to the bay of Algeiras. On the 12th the enemy made preparations for their grand and decisive attack. Accordingly, on the morning of the 13th, the ten floating batteries came forward, under Don Buenventura de Moreno, a Spanish officer of great gallantry, who

had signalled himself at Minorca. Before ten o'clock they had all reached their proper stations, anchoring in a line about 1000 yards from the shore. They then began a heavy cannonade, and were seconded by all the cannon and mortars in the enemy's lines and approaches; at the same time that the garrison opened all its batteries both with hot and cold shot from the guns, and shells from the howitzers and mortars. This terrible fire continued on both sides without intermission until noon; when that of the Spaniards began to slacken, and the fire of the garrison to obtain a superiority. About two o'clock the principal battering ship, commanded by Don Moreno, was observed to emit smoke as if on fire, and some men were seen busy upon the roof, searching from whence it proceeded. The fire from the garrison was now kept up without the least intermission or diminution, while that from the floating batteries was perceived sensibly to decrease; so that about 7 P. M. they fired but few guns, and these only at intervals. At midnight the admiral's ship was on fire, and soon completely in flames. Eight more of these batteries took fire successively; and on the signals of distress made by them, the multitude of feluccas, launches, and boats, with which they were surrounded, all came to their assistance, and began to take the men out of the burning vessels. Captain Curtis, who lay ready with the gun boats to take advantage of any favourable circumstance, came upon them at two A. M., and, forming a line on the enemy's flank, advanced upon them with such expedition as to throw them into entire confusion; they now therefore fled precipitately with all their boats, totally abandoning the floating batteries and all who were in them to perish in the flames. This would undoubtedly have been their fate, had not captain Curtis extricated them at the imminent risk of his own life and that of his men. So zealous was he in this work of benevolence that while his boat was along-side of one of the largest batteries, it blew up, and some heavy pieces of timber pierced the bottom of his boat, killing one man and wounding several others. He himself escaped with difficulty out of this boat, which was sunk, as well as another by the accident. The floating batteries were all consumed; about 400 people being saved from them; many of whom were picked up floating on rafts and pieces of timber. Indeed the blowing up of the batteries as the flames reached their powder-rooms, and the discharge of the guns in succession as the metal became heated by the fire, rendered the attempt to rescue them very dangerous. This terrible catastrophe took place in sight of the combined fleets of France and Spain. It had been proposed that they should co-operate upon this important occasion, by attacking the garrison at Europa Point, and such places as appeared most exposed to an attempt by sea: but they remained inactive, assigning, as a reason for this, the want of wind.

A British fleet in the mean time had assembled at Portsmouth, consisting of thirty-five sail of the line, in excellent condition, and filled with the best officers and sailors in Europe. The command was given to lord Howe, accompanied by admirals Barrington, Milbank, Hood, Sir Richard

Hughes, and commodore Hotham. But the progress of this force to Gibraltar was delayed by contrary winds, and it was not until he had gained the southern coast of Portugal, that lord Howe received information of the defeat of the enemy's attempt on the 13th September. On the 11th October he entered the Straits, and several of the storeships destined for Gibraltar came safe to anchor under the cannon of the fort, without any molestation from the enemy. The combined fleet in the mean time had been much damaged by a storm; two ships of the line were driven ashore near Algeiras; two more were driven out of the bay into the Mediterranean; others lost their masts, and most of them suffered considerably. One in particular, a ship of seventy guns, was carried by the storm across the bay, and ran aground under the works of Gibraltar, where she was taken by the garrison, with her whole complement of men. The combined fleet, however, put to sea on the 13th, with a view to prevent the remaining store-ships that had overshot the bay to the east from making good their entrance; and at the same time to rejoin the two ships that had been separated from the main body. Having the advantage of the wind, they bore down upon the British fleet, which drew up in order of battle to receive them; but, notwithstanding their superiority, they declined coming to an engagement. On the wind becoming more favorable next day, lord Howe took the opportunity to bring in the storeships that were in company; and the day following the remainder were conveyed to Gibraltar, and the troops for the reinforcement of the garrison were landed with a large supply of powder, and provisions. This last relief proved entirely decisive; for though the blockade continued till news arrived of the preliminaries of peace being signed, in the beginning of February, 1783, no other attack was made.

Gibraltar is now a decidedly favorite possession of our government. In war it is a valuable place of rendezvous, and in peace a convenient mercantile depôt. Yet it has been of late questioned, whether all the advantages of this possession are not too dearly purchased, when we calculate the maintenance of a garrison not otherwise necessary, and the large disbursements made since the peace of 1783! It is said to cost annually little short of £400,000.

GIBRALTAR, STRAITS OF, are a narrow sea, which forms the communication between the Atlantic Ocean and the Mediterranean, thereby dividing Europe from Africa; and runs from west to east about thirteen leagues. In this strait there are three remarkable promontories, or capes, on the Spanish side, and as many opposite to them on the Barbary side. The first of these, on the side of Spain, is Cape Trafalgar, opposite to which is Cape Spartel; and, in the neighbourhood of this, stood the fortress of Tangier, once in the possession of the British. The next to the Spanish side is Tarisan, and over against it lies Malabata, near the town of Alcaassar, where the straits are about five leagues broad. Lastly, Gibraltar, facing the mountain of Abyla, near the fortress and town of Ceuta, which make the eastern entry of the straits.

GIBSON (Dr. Edmund), bishop of London, was born at Knipe in Westmoreland, in 1669.

He early displayed his knowledge in several writings and translations, which recommended him to the patronage of archbishop Tension, who appointed him his domestic chaplain; and soon after rector of Lambeth, and archdeacon of Surry. Becoming thus a member of the convocation, he defended his patron's rights, as president, in eleven pamphlets; he then completed his scheme of the legal duties and rights of the English clergy, under the title of *Codex Juris Ecclesiastici Anglicani*, in folio. Archbishop Tension dying in 1715, and Dr. Wake, bishop of Lincoln, being made archbishop of Canterbury, Dr. Gibson succeeded him in the see of Lincoln, and in 1720 was promoted to the bishopric of London. He spent the latter part of his life in publishing letters, charges, occasional sermons, and tracts against the prevailing immoralities of the age. His pastoral letters are justly esteemed masterly productions against infidelity and enthusiasm. His other publications are, 1. An edition of Drummond's *Polemio-Middinia*, and James V.'s *Cantilena Rustica*, with notes; 2. The *Chronicon Saxonum*, with a Latin translation, and notes; 3. *Reliquiæ Spelmanianæ*, the posthumous works of Sir Henry Spelman, relating to the laws and antiquities of England; 4. An edition of Quintilian de *Arte Oratoriâ*, with notes; 5. An English translation of Camden's *Britannia*, with additions, 2 vols. folio; and, 6. A number of small pieces, that have been collected and printed in 3 vols. folio. He died, aged seventy-nine, in September 1748.

GIBSON (Richard), an English painter, commonly called the Dwarf, was originally page to a lady at Mortlake; who, observing his genius for painting, generously had him instructed in that art. He devoted himself to Sir Peter Lely's style, and copied his pictures to admiration. His paintings in water colors were also esteemed. He was in great favor with Charles I., who made him his page of the back-stairs; and he had the honor to instruct in drawing queen Mary II., and queen Anne, when princesses. He married Anne Shepherd, who was also a dwarf; on which occasion king Charles I. honored their marriage with his presence, and gave away the bride. Waller wrote a poem on this occasion, entitled 'The Marriage of the Dwarfs.' Fenton, in his notes on this poem, observes, that he had seen this couple painted by Sir Peter Lely; and that they were of an equal stature, each being three feet ten inches high. However, they had nine children, five of whom arrived at maturity, well-proportioned, and of the usual standard of mankind. Mr. Gibson died in the seventy-fifth year of his age; and his wife, having survived him almost twenty years, died in 1709, aged eighty-nine.

GIBYLE, a sea-port town of Tripoli, on the river Jebilee, the ancient Byblos: it is in ruins, and thinly inhabited. It was repeatedly besieged by the Crusaders. Twelve miles S.S.W. of Tripoli.

GIDDILY, *adv.*

GID'DINESS, *n. s.*

GID'DY, *adj.*

GID'DY-BRAINED, *adj.*

GID'DY-HEADED,

GID'DY-FACED.

Sax *gidig*; Goth. *edga*, to agitate. Having a rotatory or circular motion or sensation. Inconstant; thoughtless; irregu-

lar, whether it relate to mind or body; intoxicated. This word is supposed also, to come from gad, to wander; to be in motion.

The parts that fortune hath bestowed upon her,
Tell her, I hold as *giddily* as fortune. *Shakspeare.*

More than light airs, and recollected terms,
Of these most brisk and *giddypaced* times. *Id.*

As we have paced along
Upon the *giddy* footing of the hatches,
Methought that Glo'ster stumbled. *Id.*

Our fancies are more *giddy* and unfirm,
More leaping, wavering, sooner lost and won,
Than women's are. *Id. Twelfth Night.*

There be that delight in *giddiness*, and count it a
bondage to fix a belief. *Bacon.*

Megrimms and *giddiness* are rather when we rise after
long sitting, than while we sit. *Id.*

It may be gnats and flies have their imagination
more mutable and *giddy*, as small birds likewise have. *Id.*

To roam

Giddily, and be every where but at home,
Such freedom doth a banishment become. *Donne.*

And sooner may a gulling weather-spy,
By drawing forth heaven's scheme descry
What fashioned hats or ruffs, or suits, next year,
Our *giddy-headed* antick youth will wear. *Id.*

A sodaine north-wind fetcht,
With an extreame sea, quite about againe,
Our whole endeavours; and our course constrain
To *giddie* round. *Chapman.*

That men are so misaffected, melancholy, *giddy-headed*, hear the testimony of Solomon.

Burton on Melancholy.

Turn him out again, you unnecessary, useless,
giddybrained ass! *Ottway's Venice Preserved.*

The *giddy* vulgar, as their fancies guide,
With noise say nothing, and in parts divide. *Dryden's Æneid.*

Them revelling thus the Tentyrites invade,
By *giddy* heads and staggering legs betrayed. *Tate.*

The indignation of heaven rolling and turning us,
'till at length such a *giddiness* seized upon government,
that it fell into the very dregs of sectaries. *South.*

Too many *giddy* foolish hours are gone,
And in fantastic measures danced away. *Rowe.*

The frequent errors of the pathless wood,
The *giddy* precipice, and the dangerous flood. *Prior.*

As Ixion fixed, the wretch shall feel
The *giddy* motion of the whirling mill. *Pope.*

Intestine war no more our passions wage
And *giddy* factions tear away their rage. *Id.*

You are as *giddy* and volatile as ever, the reverse
of Pope; who hath always loved a domestic life. *Swift to Gay.*

GIDEON, Heb. גִּדְעֹן i. e. a destroyer, the son of Joash, a Manassite, who had a very extraordinary call to deliver the Israelites from the oppression of the Midianites. Having effected their deliverance by supernatural aid, he was chosen judge of Israel, A. M. 2759, and died in 2798. See Judges vi. vii. and viii.

GIENS, a town and arrondissement of the department of the Loire, in a neighbourhood very fertile in corn, wine, and saffron. The arrondissement contains forty-nine communes, and 38,550 inhabitants. In the town are brass-works and tanneries. Population of the town 5022. It is twenty-one miles south of Montargis, and thirty-three south-east of Orleans.

GIER-EAGLE, *n. s.* Sometimes it is written jer-eagle. An eagle of a particular kind. Bochart thinks the vulture is meant below.

These fowls shall not be eaten, the swan, and the pelican, and the *gier-eagle*. *Leviticus* xi. 18.

GIESSEN, a walled town of Hesse-Darmstadt, the seat of the civil and ecclesiastical courts of Upper Hesse, between the Lahn and the Wiesek. It has some woollen and cotton manufactures; but its trade is inconsiderable, and the arsenal of little military importance. A university was founded here in 1607. Population 7700. Six miles east of Wetzlar, and thirty-six north-east of Mentz.

GIFANIUS (Obertus, or Hubert), LL. D., a learned critic and civilian, born at Bueren in Guelderland, in 1534. He studied at Louvain and Paris, and erected the German library at Orleans; where he took his degree in 1567. He taught civil law and philosophy at Strasburg, Altdorf, and Ingoldstadt; and wrote several tracts, besides comments on ancient authors. Though bred a protestant, he turned Roman Catholic, and was made counsellor to the emperor Rodolph. He was very avaricious, and is accused of suppressing the MSS. of Fruterius, a youth of extraordinary genius, who died at Paris, aged twenty-five, and left them to his care. Gifanius died at Prague in 1604.

GIFFORD (Andrew), D. D., an eminent English dissenting divine and antiquarian, born August 17th, 1700. He was the son of Emanuel Gifford, minister of a Baptist church at Bristol, and was educated at Tewksbury, under the Rev. Mr. Jones, and the celebrated Dr. Ward. He joined his father's church, and was baptized in 1723; he preached to the church at Nottingham in 1725; and was ordained and settled at London, February 5th, 1730. In 1731 Sir Richard Ellys appointed him his chaplain. In 1754 the Marischal College of Aberdeen presented him with a diploma. He was also admitted a member of the Society of Antiquaries, and, in 1757, was appointed assistant librarian to the British Museum. He died 19th June, 1784, leaving his museum and library to the Baptist academy at Bristol.

GIFFORD (John), a modern political writer, whose real name is said to have been John Richard Green. He was born in 1758, and educated by his grandfather, who enabled him to enter as a gentleman commoner at St. John's College, Oxford. He adopted the legal profession; but dissipated his fortune, and, having involved himself in difficulties, travelled on the continent under the above assumed name. Returning to England, in 1783, he became a political writer and alarmist; a contributor to the British Critic and Antijacobin Review, &c. He was also the author of *The Reign of Louis XVI.*, and complete *History of the French Revolution*, 1794, 4to; *The History of France*, from the earliest Times to the End of the Revolution, 1795, 5 vols. 4to; *A Residence in France in the Years 1792, 1793, 1794, and 1795*, &c., 1797, 2 vols. 8vo; and *A History of the Political Life of the Right Honorable William Pitt*, 3 vols. 4to. Mr. Gifford received finally a pension from the government, and was made one of the police magistrates

of the metropolis. He died at Bromley, Kent, March 6th, 1818.

GIFFORD, a small river in East Lothian, remarkable for an extraordinary flood on the 4th October, 1755, which carried down many trees and most of the bridges in the parish of Yester, though no quantity of rain had previously fallen.

GIFT, *n. s.* } Saxon *giſt*; Gothic *giſt*.

GIFTED, *adj.* } See GIVE. Any thing bestowed or offered; a bribe; a power or faculty; an endowment. A gifted person is one who possesses extraordinary powers or talents.

Thou shalt not wrest judgement, thou shalt not respect persons, neither take a gift; for a gift doth blind the eyes of the wise. *Deut. xvi. 19.*

They presented unto him gifts, gold, and frankincense and myrrh. *Matt. ii. 11.*

Many nations shall come with gifts in their hands, even gifts to the king of heaven. *Tob. xiii. 11.*

Why then will ye fond Dame! attempted bee

Unto a stranger's love, so lightly placed

For guiftes of gold or any worldly glee,

To leave the love that ye before embraced

And let your fame with falsehood be defaced.

Spenser's Faerie Queene.

And if the boy have not a woman's gift,

To rain a shower of commanded tears,

An onion will do well for such a shift.

Shakespeare.

All his practice is deceit,

Every gift it is a bait. *Ben Jonson.*

No man has any antecedent right or claim to that which comes to him by free gift. *South.*

They cannot give;

For had the gift been theirs, it had not here

Thus grown. *Milton.*

Thence all things living gaze on, all things thine

By gift. *Id.*

Made of my enemies the scorn and gaze,

To grind in brazen fetters, under task,

With my heaven gifted strength. *Id. Agonistes.*

Creator bounteous, and benign,

Giver of all things good, but fairest this

Of all thy gifts, nor envyest. *Milton.*

Two of their gifted brotherhood, Hacket and Coppinger, got up into a pease-cart, and harangued the people to dispose them to an insurrection. *Dryden.*

Recall your gift, for I your power confess;

But first take back my life, a gift that's less. *Id.*

He who has the gift of ridicule, finds fault with any thing that gives him an opportunity of exerting his talent. *Addison.*

There is no talent so pernicious as eloquence, to those who have it not under command: women, who are so liberally gifted by nature in this particular, ought to study the rules of female oratory.

Id. Freeholder.

Oh man! creation's pride, Heaven's darling child,

Whom Nature's best divinest gifts adorn,

Why from thy home are truth and joy exiled,

And all thy favourite haunts with blood and tears defiled? *Beattie.*

—————And for this—

A being of the race thou dost despise,

The order which thine own would rise above,

Mingling with us and ours; thou dost forego

The gifts of our great knowledge, and shrinkest back

To recreant mortality—Away! *Byron's Manfred.*

GIFT, donum, in law, is a conveyance which passes either in lands or goods; and is of a larger extent than a grant, being applied to things moveable and immoveable; yet, as to things im-

moveable, when taken strictly, it is applicable only to lands and tenements given in tail; but gift and grant are too often confounded.

Gift, or grant, as a method of transferring personal property, answers in some measure to the conveyances of real estates. Gifts and grants are however thus to be distinguished from each other: gifts are always gratuitous; grants, on the contrary, are upon some consideration or equivalent; and, in respect to their subject matter, they may be divided into gifts or grants of chattels real, and gifts or grants of chattels personal. Under the former may be included all leases for years of land, assignments, and surrenders of these leases; and all the other methods of conveying an estate less than freehold; though these very seldom carry the outward appearance of a gift, however freely bestowed; being usually expressed to be made in consideration of blood, or natural affection, or of five or ten shillings nominally paid to the grantor; and, in case of leases, always reserving a rent, though it be but a pepper-corn:—any of which considerations will, in the eye of the law, convert the gift, if executed, into a grant; if not executed, into a contract.

In grants or gifts of chattels personal, one man renounces, and another man immediately acquires, all title and interest therein: which may be done either in writing or by word of mouth, attested by sufficient evidence, of which the delivery of possession is the strongest and the most essential. But this conveyance, when merely voluntary, is somewhat suspicious; and is usually construed to be fraudulent, if creditors or others become sufferers thereby. By stat. 3 Hen. VII., cap. 4, all deeds of gift of goods, made in trust to the use of the donor, shall be void; because, otherwise, persons might be tempted to commit treason or felony, without danger of forfeiture; and the creditors of the donor might also be defrauded of their right. And by 13 Eliz. cap. 5, every grant or gift of chattels, as well as lands, with an intent to defraud creditors or others, shall be void, as against such persons to whom such fraud would be prejudicial: but, as against the grantor himself, shall stand good and effectual; and all persons partakers in, or privy to, such fraudulent grants, shall forfeit the whole value of the goods, one moiety to the king, and another moiety to the party grieved; and also, upon conviction, shall suffer imprisonment for half a year. See FRAUD.

The conveyance of lands by gift, 'donatio,' is properly applied to the creation of an estate-tail, as feoffment is to an estate in fee, and lease to that of an estate for life or years. It differs in nothing from a feoffment, but in the nature of the estate passing by it; for the operative words of conveyance in this case are do or dedi (West. Symbol. 256); and gifts in tail are equally imperfect without livery of seisin, as feoffments in fee simple. (Litt. sect. 59.) This is the only distinction which Littleton seems to make, when he says (sect. 57), 'it is to be understood, that there is feoffor and feoffee, donor and donee, lessor and lessee;' viz., feoffor is applied to a feoffment in fee-simple, donor to a gift in tail, and lessor to a lease for life, or for years, or at will.

GIG, *n. s.* Fr. *gigue*; Goth. *ga, gega*, to go; Isl. *gigja*. A vehicle with two wheels; a sound

produced by wind; any thing that is whirled round in play; a fiddle (now out of use).

This house was al so full of *giggles*,
And al so full, eke, of chirkinges,
And of many other winkinges.

Chaucer. House of Fame.

Playthings, as tops, *gigs*, battledores, should be procured them.

Locke.

Thy coach of hackney, whiskey, one horse chair,
And humblest *gig*, through sundry suburbs whirl
To Hampstead, Harrow, Brentford, make repair.

Byron.

GIGANTIC, *adj.* Lat. *gigantes*. See **GIANT**. Suitable to a giant; big; bulky; enormous; likewise wicked; atrocious.

I dread him not, nor all his giant brood,
Though fame divulged him father of five sons,
All of *gigantick* size, Goliath chief.

Milton's Agonistes.

Others from the wall defend
With dart and javelin, stones, and sulphurous fire;
On each hand slaughter and *gigantick* deeds.

Milton.

The son of Hercules he justly seems,
By his broad shoulders and *gigantick* limbs.

Dryden.

The Cyclopean race in arms arose,
A lawless nation of *gigantic* foes.

Pope's Odyssey.

They were *gigantic* minds, and their steep aim
Was Titan-like, on daring doubts to pile
Thoughts which could call down thunder and the flame
Of heaven, again assailed, if heaven the while
On man and man's research could deign do more than smile.

Byron.

GIGGLE, *v. n.* } Sax. *geagl*; Dutch *gick*.
GI'GLER, *n. s.* } *gelen*. To laugh idly; to titler.

A sad wise valour is the brave complexion,
That leads the van, and swallows up the cities:
The *giggler* is a milk-maid, whom infection,
Or the fired beacon, frighteth from his ditties.

Herbert.

We shew our present joking, *giggling* race;
True joy consists in gravity and grace.

Garrick's Ep.

GIGHA, **GIGA**, or **GIGO**, one of the Hebrides; lying on the west coast of Kintyre, in Argyleshire, eleven miles E. S. E. of Hay; it is seven miles long from north-east to south-west, and two and a half broad. The greater part of it is arable. The west coast is high and rocky. On the east there are several dangerous sunk rocks. Shell-fish, particularly lobsters, crabs, cockles, and razor or spout-fish, abound on the shores. Large cod, weighing from six to sixteen lbs. each, with skate, ling, large haddock, &c., also abound. There is a regular ferry between Gigha and Kintyre. On the island are several caves and cairns; and it abounds with excellent spring water, though it has neither lakes nor rivers. Nothing can exceed the view from Gigha in variety and grandeur. The soil is mostly a rich loam, with a mixture, in some places, of sand, moss, or clay; vegetation is quick, and the air salubrious. Great improvements have been lately made in its agriculture, and particularly in the drainage; large portions of land, formerly lying waste, having been inclosed, and now producing excellent crops. Population about 1000. Long. 5° 43' W., lat. 55° 44' N.

GIGLET, *n. s.* Sax. *geagl*; Dut. *gegl*; Scot. *gillet*, is still retained. A wanton; a lascivious girl. Now out of use.

Young Talbot was not born

To be the pillage of a *giglet* wench.

Shakspeare.

Away with those *giglets* too, and with the other confederate companion. *Id. Measure for Measure.*

GIGLIO, **ISOLA DI**, a wine island on the coast of Tuscany, at fourteen or fifteen miles distance from the isthmus of Monte Argentaro, and seventeen west of Porto Ercale. It consists of hilly ground, covered with wood and vines, and containing caves of beautiful marble. It is inhabited by about 1200 persons, employed in agriculture and fishing, particularly for pilchards. Long. 10° 55' E., lat. 42° 24' N.

GIGOT, *n. s.* Fr. The hip joint. It seems to mean in Chapman a joint for the spit.

The inwards slit,

They broiled on coales, and ate: the rest, in *gigots* cut, they spit. *Chapman.*

GIJON, a sea-port, situated on a peninsula, in the province of Asturia, Spain. The harbour is well sheltered, has a sound bottom, and is capable of admitting ships of any burden. The town contains a school for navigation, mineralogy, and mathematics; and the environs produce maize, rye, chestnuts, apples, and cyder. Millstones also are exported in quantities. Inhabitants 3200. Eighteen miles north of Oviedo.

GILBERD, or **GILBERT** (William), a celebrated physician, born at Colchester, in 1540. Having spent some time in both universities, he went abroad; and at his return settled in London, where he practised with considerable reputation. He became a member of the college of physicians, and physician in ordinary to queen Elizabeth, who gave him a pension. He was also physician to king James I. He died in 1603, aged sixty-three, in Colchester, where a handsome monument was erected to his memory. His books, globes, instruments, and fossils, he bequeathed to the college of physicians, and his picture to the school gallery at Oxford. He wrote, *De Magnete, Magneticisque Corporibus, et de Magno Magnete Tellure*, *Physiologia Nova*: London, 1600, fol. 2. *De Mundo Nostro Sublunari*, *Philosophia Nova*; Amsterdam, 1651, 4to. He also invented two mathematical instruments for finding the latitude at sea without the help of sun, moon, or stars. A description of these instruments was afterwards published by Thomas Blondville in his *Theoriques of the planets*.

GILBERT (Sir Humphrey), a skilful navigator, born about 1539, in Devonshire, of an ancient and honorable family. He was educated at Eton and Oxford for the legal profession, but being introduced at court by his aunt, Mrs. Catharine Ashley, then in the queen's service, he was diverted from the study of the law, and commenced soldier. Having distinguished himself in several military expeditions, particularly that of Newhaven, in 1563, he was sent over to Ireland to assist in suppressing a rebellion; where, for his signal services, he was made commander-in-chief and governor of Munster,

and knighted by the lord deputy, Sir Henry Sidney, in 1570. He returned soon after to England, where he married a rich heiress. In 1572 he sailed with a squadron of nine ships to reinforce colonel Morgan, who meditated the recovery of Flushing. In 1576 he published his book on the North-West Passage to the East Indies. In 1578 he obtained an ample patent, empowering him to possess in North America any lands then unsettled. He sailed to Newfoundland, but soon after returned to England without success; nevertheless, in 1583, he embarked a second time with five ships, the largest of which put back on account of a contagious distemper on board. He landed on Newfoundland on the 3rd of August, and on the fifth took possession of the harbour of St. John's. By virtue of his patent, he granted leases to several people; and, though none of them remained there at that time, they settled afterwards in consequence of these leases. On the 20th of August he put to sea again, on board a small sloop; which on the 29th foundered in a hard gale of wind. Thus perished Sir Humphrey Gilbert; a brave officer, a good mathematician, a skilful navigator, and of a very enterprising genius. He also was remarkable for his eloquence, being much admired for his patriotic speeches in the English and Irish parliaments. His work, entitled *A Discourse to Prove a Passage by the North-West to Cathaia and the East Indies*, is a masterly performance, and is preserved in Hakluyt's *Collection of Voyages*, vol. iii. p. 11. The style is superior to most, if not to all the writers of that age; and shows the author to have been a man of considerable reading.

GILBERTINES, an order of religious, thus called from St. Gilbert, of Sempringham, in Lincolnshire, who founded it about 1148. The monks observed the rule of St. Augustine, and were accounted canons; and the nuns that of St. Benedict. The founder erected a double monastery, or rather two contiguous to each other, the one for men, the other for women, but separated by a very high wall. He founded thirteen monasteries of this order, viz. four for men alone, and nine for men and women together, which had in them 700 brethren, and 1500 sisters. At the dissolution there were about twenty-five houses of this order in England and Wales.

GILBOA, in ancient geography, mountains of Samaria, stretching from west to east on the confines of the half tribe of Manasseh, and of the tribe of Issachar; and to the south of the valley of Jezreel, beginning westward at the city of Jezreel, at the foot of these mountains, reaching almost quite to the Jordan, six miles from Scythopolis. They are famous for the death of Saul and Jonathan, and the defeat of the Israelites by the Philistines.

GILCHRIST (Octavius), F.S.A., a distinguished modern critic, was the son of an officer of the third regiment of dragoon guards. He was born in 1779, at Twickenham, and educated at Magdalen College, Oxford. His principal works are, *An Examination of the Assertions of Ben Jonson's enmity to Shakspeare*, 8vo. 1808; an edition of the *Poems of Bishop*

Corbet, with Notes, and a Life of the Author, 8vo. 1808; and a Letter to W. Gifford, Esq., on a late edition of Ford's Plays. He is said also to have collected materials for a work intended to illustrate the Rise and Progress of the English stage, comprehending specimens of the minor dramatic writers anterior to the Revolution, &c. The appearance, however, of a similar publication in periodical numbers, entitled *Old Plays*, deterred him from publication. He died at Stamford, in Lincolnshire, in June, 1823, aged forty-four.

GILD, v. a.	} Sax. <i>gilban</i> ; Goth. <i>gil-da</i> ; from GOLD, which see.
GILDER, n. s.	
GIL'DING, n. s.	
} To overlay with gold; to brighten, or illuminate;	
GILT, n. s. & part. } to recommend by adventitious ornaments: the person who lays on the gold; a coin from one shilling and sixpence to two shillings.	

—Yclothed was this mightie god of love
In silke, embroidred full of grené greves;
In whiche there was a fret of red rose leves,
The freshest sins the worlde was first begun:
His gilt here was yerouned with a son.

Chaucer. Prologue to Legende of Good Women.

The room was large and wide,
As it some gilt or solemn temple were:
Many great golden pillars did uprear
The massy roof.

Spenser.

Silvering will sully and canker more than gilding,
which, if it might be corrected with a little mixture
of gold, there is profit.

Bacon.

Gilders used to have a piece of gold in their mouth,
to draw the spirits of the quicksilver.

Id.

Our gayness and our gilt are all besmirched,
With rainy marching in the painful field.

Shakspeare.

When thou wast in thy gilt, and thy perfume, they
mockt thee for too much curiosity: in thy rags thou
knowest none, but art despised for the contrary.

Id. Timon of Athens.

I am bound

To Persia, and want gilders for my voyage.

Shakspeare.

For my part, if a lie may do thee grace,
I'll gilt it with the happiest terms I have.

Id.

Thou did'st drink

The stale of horses and the gilded puddle
Which beasts would cough at.

Id. Antony and Cleopatra.

To gilt refined gold, to paint the lily,
To throw a perfume on the violet.

Shakspeare.

When Britain, looking with a just disdain
Upon this gilded majesty of Spain,
And knowing well that empire must decline,
Whose chief support and sinews are of coin.

Waller.

And the gilded ear of day
His glowing axle doth allay

In the steep Atlantic stream.

Milton.

Yet, oh! the 'imperfect piece moves more delight;
'Tis gilded o'er with youth, to catch the sight.

Dryden.

The lightsome passion of joy was not that trivial,
vanishing, superficial thing, that only gilds the apprehension, and plays upon the surface of the soul.

South.

Purchasing riches with our time and care,
We lose our freedom in a gilded snare.

Roscommon.

Her joy in gilded chariots, when alive;
And love of ombre after death survive.

Pope.

No more the rising sun shall *gild* the morn,
Nor evening Cynthia fill her silver horn.

Id. Messiah.

Could laureate Dryden Pimp and Fryer engage,
And I not strip the *gilding* off a knave,
Unplaced, unpensioned, no man's heir or slave!

Pope.

Where the *gilt* chariot never marked its way.

Id.

We have here a *gilder*, with his anvil and hammer.

Broomer.

This waving field is *gilded* o'er with corn,
That spreading tree with blushing fruit adorn.

Gay.

But death is imaged in shadowy beams,
A picture is the past; even ere its frame
Be *gilt* who sate hath ceased to be the same.

Byron.

GILD, or GUILD. See GUILD.

GILDING, as an adaptation of gold, in the fine and mechanical arts, was not unknown in the ancient world. Pliny states, that the first attempts at the practice of the art seen at Rome was under the censorship of Lucius Mummius, after the destruction of Carthage, when they began to gild the ceilings of the temples and palaces; the capitol being the first place on which this enrichment was bestowed. But he adds, that luxury advanced on them so hastily, that in a little time you might see all, even private and poor persons, gild the very walls, vaults, &c., of their houses. They seem to have had the method now practised of beating gold, and reducing it into leaves; though they did not carry it to the same extent. Pliny says, that they only made 750 leaves of four fingers square out of a whole ounce. But he adds, that they could make more; that the thicker leaves were called *bractæ Prænestinæ*, from a statue of Fortune at Præneste, gilt with such leaves; and the thinner sort *bractæ questoriæ*. The ancients seem to have had no method of gilding bodies that would not endure the fire, but with whites of eggs or size, neither of which will endure the water; so that they could only gild such places as were sheltered from the moisture of the weather. The Greeks called the composition with which they applied their gilding on wood *leucophæum*, or *lencophorum*; which is described as a sort of glutinous compound earth, serving in all probability to make the gold adhere, and bear polishing. But the particulars of this earth, its color, ingredients, qualities, &c., antiquaries and naturalists are not agreed upon. Homer mentions the manner in which the horns of the ram brought by Nestor as an offering to Minerva, were gilt.—*Odys.* l. iii. 492.

The different states in which gold is used for the purposes of modern gilding are the following:—(1.) In the shape of leaf gold of different degrees of thickness, and formed either of the pure metal, or of an alloy of this with silver; (2.) As an amalgam of gold; and (3.) In gold powder.

1. The leaf-gold is procured by the *gilder* from the gold-beater, whose art consists in hammering a number of thin rolled plates of the metal, between skins, or animal membranes.

2. The amalgam of gold is made by heating in a crucible some pure quicksilver; and, when

it is nearly in the boiling state, about the sixth part of its weight of fine gold in thin plates, heated red-hot, is to be immersed in it. The mixture soon becomes homogeneous, and then it is allowed to cool. When cold it is to be put in a piece of soft leather, and by gradual pressure the fluid part of the amalgam, consisting almost wholly of mercury, may be forced through the pores of the leather, while the gold, combined with about twice its weight of mercury, will remain behind, forming a yellow silvery mass of the consistency of butter. This, after being bruised and ground in a mortar, or shaken in a strong phial, with repeated portions of salt and water, till the water comes away quite clear and unsoiled, is fit for use, and may be kept for any length of time, without injuring, in a corked phial. It is of the utmost importance that the materials of this amalgam, and especially the mercury, should be perfectly pure, as the least portion of lead or bismuth would very materially injure the beauty of the gilding, by deteriorating the color of the gold, and filling it with black specks.

3. Gold in powder is prepared by three different methods; the first and most simple is, to put into a glass or earthen mortar some gold leaf, with a little honey, or thick gum-water, and to grind the mixture for a considerable time, till the gold is reduced to extremely minute fragments; when this is done, the honey or gum may be washed away, leaving the gold behind in a flaky, or pulverulent state. A more effectual and quicker method of reducing gold to a state of powder, is to dissolve it in aqua regia, or, as it is now denominated, in nitro-muriatic acid, and then precipitate it with a piece of copper. The precipitate, after being digested in distilled vinegar, and then washed with pure water, and dried, is in the form of a very fine powder, and is said to work better, and is fitter for burnishing, than the powder obtained from leaf-gold. The very finest ground gold is produced by heating very gradually the gold amalgam already described, in an open earthen vessel, and containing the fire till the whole of the mercury is evaporated; taking care that the amalgam shall be constantly stirred with a rod of glass, to prevent the particles of gold from adhering as the mercury flies off. When the mercury is completely evaporated, the residual gold being then ground in a Wedgwood-ware mortar, with a little water, and afterwards dried, is fit for use.

PART I.

OF GILDING WITHOUT HEAT.

Gilding is performed either with or without heat. By the first of these methods those substances are gilt which are not liable to alteration, by exposure to a moderate heat, such as metals, glass, and porcelain. The second method is practised with those substances, as wood, paper, lead, &c., which would be destroyed by being raised to a temperature requisite for gilding the former. We shall first attend to the mechanical art of gilding on wood.

This, both in oil and burnish, is at present at its highest perfection, and is executed in London better than in any other part of the world. That

which is brought from France, and other parts of the continent, is by no means equal to the London work; not that it is to be inferred from hence, that gilding is well executed by all who undertake it in the metropolis. Many men, who have practised this art all their lives, are unable properly to gild a common picture-frame.

Of burnished gilding on wood.—To begin with picture-frames or mouldings, which are the simplest. In an earthen pan, that will hold a quart, take three half-pints of strong size, make it warm, and add some of the best whiting powdered fine; mix them with a brush till they become thoroughly incorporated, and of the consistency of thick cream; put a little of this mixture, with an equal quantity of size, half the former strength, into another pan, heat it till nearly boiling, and, with a brush, lay it over the whole work; this is called thin whitening the work, and makes a ground for the other operations. When the wood is not clean, it is usual to wash it all over with a sponge dipped in hot water, before the thin white is applied, which precaution will prevent the chipping up of the preparation. The coat of thin white should be particularly well dried; after which the work is to receive four more coats of that which is made of the consistency of thick cream; it must be warm, but not so hot as for the first white, taking care that one coat is dry before another is applied. Here it is necessary to observe that, throughout this process, one coat must be dry before another is applied, whatever may be the composition used. The sixth coat, which is also of thick white, must be laid on by passing the brush in a smooth, even, and flowing manner, over two feet of the work at a time, in order to gain a surface, and facilitate the smoothing, hereafter to be described. Before the whitening is dry, the flat parts should be rubbed down with a chisel, the hollows with a gouge, and the rounds with the finger, or fingers, as is most convenient; should the hollows be too large for a gouge, the finger will answer every purpose. When dry, any superfluous whitening that may have fallen over the edges of the mouldings, &c., may be pared off with a chisel or a gouge, according as the parts are situated; then give it a seventh coat, similar to the preceding, and it will be ready for smoothing, which should be performed in the following manner:—

Take some close-grained pumice-stone, and with a sash saw cut it into pieces about three or four inches long (if the work be very small, an inch, or inch and a half will do), rasping or filing them to fit the different mouldings. The flats are to be made by rubbing a piece of the pumice on a smooth stone, making the sides at right angles, that it may smooth two sides at the same time. During these operations, the pumice-stone must be frequently dipped in water. Lay the pieces, thus prepared, in a large earthen pan full of water, not less than two quarts, take a hogs'-hair brush and a sponge, both of convenient sizes, dip the brush in the water, and wet about two feet of the work at a time, taking the mouldings alternately; then, with the pumice already fitted, rub up and down

till a smooth surface is obtained, remove the water with the brush, and squeeze it into the pan: what remains may be taken off with the sponge, which will complete the smoothing of that piece. Proceed in the same manner with similar portions; for, if too much be wetted at a time, the whitening becomes soft and unfit to bear the pumice-stone; the work must then be set aside to dry.

In carved work, the operations of whitening and smoothing differs somewhat from the preceding. After the thin white is dry, the coats that follow must be rather weaker, and not so thick as for frames or mouldings; they are to be laid on by carrying the brush over the work in an even and smooth, but not flowing manner. To smooth, or produce the surface that is required, pieces of lime-wood, or fir, soaked in water instead of pumice, are used, shaped round, flat, or angular, as may be found necessary, occasionally wrapping round them strips of linen cloth. In smoothing, care must be taken not to rub off too much of the whitening, or the gilding will look poor, and it will prevent the burnishing of those parts thereby brought too near the wood. The drying may be hastened in summer by the sun, in winter by placing the work before the fire; not too near, or the whitening will chip.

Now mix a little strong size, with four times as much water, in a half pint earthen pan; these proportions should be adapted so as to make it three parts full; add a quantity twice the size of a large walnut, and half as much prepared yellow stone ochre: mix them well together with a brush, and coat the work once over, when dry, rub it slightly with glass-paper, half-worn out, to improve the surface; then proceed to mix and lay on the gold-size. In another half-pint earthen pan, half full of clear size, mix a quantity of burnished gold-size, twice as big as a large walnut, with which coat the work twice over. When dry, burnish the parts intended to be matted with a burnishing stone. (The burnishing is performed by the friction of a curved polished flint, or agate set in ferules with wooden handles, and termed burnishing stones.) Then give it another coat of the same gold-size. But this must now be reduced by adding to it about two tea-spoons full of water, and as much gold-size as you can take upon the point of a knife. Coat those parts only that are intended to be burnished; and here it must be observed, that in laying gold-size on carved work after it is yellowed, those parts should be missed that are too small to receive the gold from the pencil, such as the small eyes of foliage, &c., to which effect must afterwards be given with high-colored or-moulu; and proceed to lay on the gold with a cushion, knife, and tip, as will be described in oil gilding. But in burnish gilding, camels'-hair pencils must be used, dipped in clear water, to wet the work as fast as the gold can be laid on. The hollows and flats must be gilt first, and be perfectly dry before the other parts can be proceeded with, when the work is all gilt and dry, burnish the parts intended. And should there be any defects which can only arise from the

work not having been carefully wetted, or from grease, those parts must be rubbed off to the whitening, with linen wrapt round the finger. When they are dry, they must be gold-sized, gilt, and burnished as before stated.

Those parts not intended to be burnished are technically called mats, and are to be proceeded with in the following manner:—Reduce a little clear size with hot water, so that when cold it will not set; this being the weakest size used in burnish-gilding, much care should be taken that it be not too strong, or it will show all the joints of the gold. When dry, lay on a coat of this weak size, and when again dry, rub it over with cotton. In double gilding, which is the best style, the matted parts should be again gilt, using water to wet as before; after which, rub them again with cotton, and coat them over again with the same weak size. Then give one coat of clear size, to keep the gold firm, or a coat of or-moulu completes the process. Observe, camels'-hair pencils only are used after the gold is laid on, and care must be taken in sizing the matted parts not to touch those that are burnished, which cannot be improved after the burnishing-stone.

If it be necessary to embellish the frames or work to be gilt in burnished gold, with composition, it may be had in London, soft from the press, and can be put on after the smoothing, with a little hot thick whitening, or weak glue. What is squeezed out round the edges in pressing it close, may be taken off with a brush and cold water: it must then have a coat of thin white, to remove any grease, and be finished like the rest of the work. The composition may also be put on oil-gold work that is not to stand in the weather, but does not require the thin white, and must be finished in the manner of oil-gilding; composition is easily moistened when dry, by wrapping it in a wet linen cloth, for twenty-four hours.

Of oil gilding to stand in the weather.—The object to be gilt, whether metal, stone, or wood, must be coated three times over with a mixture of linseed oil, white-lead, and a small quantity of spirits of turpentine; if it be wood, it should be previously rubbed with glass-paper, or fish-skin. When the last coat is dry, the work should be gold-sized; take any quantity of gold-size, and with a common hogs'-hair brush, kept in water for the purpose, mix it with boiled linseed oil till it is so thin that, when a little of it be laid on the work to be gilt, the white paint before put on, will appear through, though it must not be made so thin as to lose the tinge of the yellow-ochre: then proceed to lay it on sparingly, with fine hogs'-hair brushes, proportioned to the parts of the work. When the gold-size is good, it will dry in twelve hours; if laid on in the evening it will be fit for gilding the next morning. Sometimes in winter, and when the gold-size is fresh made, it will take two or three days; to prevent this, an expedient may be used, unknown to the generality of gilders, i. e. mixing with it a small quantity of japanners' gold-size, which will hasten the drying, but in this instance, when it begins to have the *tack*, hereafter to be explained, it dries very quickly; therefore, great

care should be taken to get the gold on as fast as possible.

In order to ascertain its fitness for receiving the gold, the work must be touched with the finger: if it feel somewhat adhesive or clammy, but not so as to be brought off by the finger, it has the *tack*, or in other words, is in a fit state for gilding; but if it be so clammy as to come off on being touched, or have any inclination thereto, it is not sufficiently dry: if it have no sucking quality, it is too dry, and must be sized over again before it can be gilt. In laying on the gold, a tip is used which must be previously rubbed with a little tallow-grease to make it hold, but it must be so little as to make no appearance. When the surface to be gilt, whether round, hollow, or flat, is sufficiently large and plain to contain whole leaves, they may be taken from the book, which must be held in the left hand, by the part that is sewed, the leaves of it turned carefully over, and kept always so steady, that the gold may be undisturbed, and lie perfectly flat. Take the tip in the right hand, touch the leaf of gold about half an inch deep on the side opposite the sewing of the book, both hands must then be moved to the place meant to be gilt. Having laid the edge of the leaf already attached to the tip, upon the work, which is always considered as having the *tack*, it will be caught and held fast by the gold size, and the tip will be left at liberty; the book must be slowly drawn away, followed as it moves by the tip which is now used gently to press the gold close to the work, until the whole leaf is on, which must be repeated until those parts large enough to receive a leaf, are all gilt. This method may be acquired in an hour's practice.

For those parts that are too small for the entire leaf, it is necessary to use a cushion, upon which about half a book of gold may be blown out, one leaf at a time, each one carefully turned until it lies nearly flat, when, by breathing as near as possible on the centre, it will become smooth and even, and must be cut in strips, with a knife used for the purpose, according to the widths of the different members and mouldings, and then laid on with the tip. As the work advances, or when it is gilt all over, it must be pressed close with a bit of unspun cotton, then brushed over with a dry, soft, hogs'-hair brush, one previously used a little in the whitening, will best answer the purpose, in order to clear away any loose particles of the gold leaf. If any defective parts appear, those which cannot be mended by pressing upon them the loose gold just brushed off (which may be done with the brush in hand, or a bit of cotton), must be covered in the following manner:—Cut a leaf of gold into small square pieces, proportioned to the defects, and with the camel's hair pencil slightly moistening the tip of it, by putting it to the lip, place a piece on each faulty part, which must be again pressed with the cotton. The work is then finished unless the faulty parts are too dry to receive the gold; when they must be again gold-sized and gilt, as before directed. In general boys do not acquire the method of using the gold on the cushion in less than three

months, though a person determined to accomplish it may do so in one week.

Picture frames, and other work in oil-gilding that is not to be exposed to the weather, to be well done, must be prepared, as far as smoothing, in the same way as work to be gilt in burnished gold. When smooth, and after being rubbed with glass-paper, it must be coated twice over with size, rather weaker than that used for whitening, that which is stale answers best. The gold size must be laid on as before directed in oil-gilding, and, when the work is gilt, pressed with the cotton, and brushed over. If faults appear, they must be treated thus:—Take a little weak size, as directed in burnish-gilding, coat the work all over when dry, wet each part where a fault appears with clearwater, and lay on it a piece of gold, with a camels'-hair pencil, as before described. This is not to be pressed with the cotton, but gently rubbed with it when completely dry, which it will be in half an hour (as will all the coats that are used for gilding, except oil gold size), when give the work another coat of the weak size, then one of clear size which completes the gilding; but the effect is considerably heightened with a coat of or-moulu, such as is used to finish the matted part of the burnished gilding.

To make strong size.—Take a clean saucepan of any size most convenient, fill it nearly with water, when heated as much as the hand can bear, keep putting in cuttings of parchment which best answer the purpose, or gloves' white leather shreds, pressing them down well with the hand, till they are within an inch and a half of the surface of the water; boil them slowly for one hour and a half, and the strong size will be made; pass it through a hair sieve into a pan, and set it aside for use, the same parchment or shreds will again yield the same quantity of size, stale size stinks and is unfit for use. Clear size differs only from the preceding in these particulars, it must be made in smaller quantities; the parchment or shreds must be washed in several waters milk warm, till quite clear. It should boil only fifteen minutes; be passed through a finer sieve, and when reduced care must be taken that the water is perfectly clean.

To make gold size for burnished gilding.—Take one pound of pipe-clay, put it into an earthen pan full of water, when soaked; pour off the water and grind it on a stone with a muller, such as is used by house-painters; now and then sprinkling it with water as it becomes dry. Care must be taken that no dirt or grease be on the stone or muller, and, as it is ground, put it into another pan; then take half an ounce of the best black lead, the eighth of an ounce of mutton suet, pound them together with the muller, and proceed to grind them particularly well, using water as before directed for the pipe-clay: when ground, put them into a smaller pan; grind half an ounce of the best red chalk, and mix the black lead, suet, and chalk, well together on the stone, with a pallet knife, and add to them the clay, until these ingredients are thoroughly mixed; when put them into a covered earthen pan to prevent dust or dirt, to be used as wanted.

Ten or twenty pounds may be made at a time. The gold size must be moistened once a month or oftener with clean water to prevent it from getting dry, in which case it would be necessary to grind it again. Care should be taken in selecting these ingredients. The best black lead dust, from the saw of the pencil-makers, is most fit for the purpose. In choosing the clay take that which has the least grit: it may be discovered by putting a little into the mouth, the darkest is generally the best, of which the greatest choice is to be had at the pipe-makers. The softest red chalk, such as is used for drawing, must be chosen, though the gold size may be very well made without any, as its principal use is to heighten the color of the gold when burnished.

Prepared pipe-clay and yellow stone ochre.—The pipe-clay must be chosen and ground, as directed in making gold size; then laid by for use in a covered earthen pan, and occasionally moistened as the gold size. The stone-ochre must be of the best quality, and prepared in the same manner.

To make or-moulu.—In half a pint of clear water, gently boil two ounces of the best gamboge powdered fine, for five minutes, strain it through a linen cloth, and put it into a corked bottle. Take one ounce of saffron, half an ounce of turmeric, and one quarter of an ounce of dragon's blood, boil them in one pint of clear water for fifteen minutes, now and then stirring them from the bottom; strain them also through a linen cloth, and put them into a corked bottle. Put about five or six knobs of starch into a clean half pint earthen pan, make them into a paste, with a teaspoon-full of clean water, using the finger; then add water till the pan is three parts full, boil it for one minute, and it will be clear like clear size: now blow off a scum that will arise from the boiling, and put it immediately into another pan; add four drops of the gamboge liquor, two drops of the repass, stir them round, and the or-moulu is made and fit for use.

The eyes of foliage, &c., in carved work, must be touched with a little of the gamboge liquor, called high-colored or-moulu, unmixed with any thing else.

The or-moulu in general use, though it is by no means the best, is made by dissolving the gamboge in spirits of wine, instead of water, which will give it the appearance of clear varnish: but when dropped into clear size to be substituted in this case for starch, it will be yellow; the quantities of the ingredients are alike in both cases.

Plaster-figures, vases, busts, &c., are gilt both in burnished gold and oil-gilding, by coating them first with very hot weak size, and afterwards four times over with hot clear size: if any holes appear, they must be evenly filled up with putty, made of strong size and whitening; the rest of the process is the same as after smoothing in both cases.

To make oil gold-size.—Put as much linseed oil into a broad earthen vessel as will cover the bottom an inch deep, and add to it as much water as will occupy four or five inches; let the vessel containing this, be exposed to the weather for three or four weeks, occasionally stirring it

till the oil appears of the consistency of treacle; it must then be separated from the water, put into a long bottle, or separating funnel used by the chemists, and placed in such a degree of heat as will render it perfectly fluid. The clear part should then be poured off, and it will be fit for use. Take any quantity of the best yellow-stone ochre, and a fourth part of white-lead, mix them with the oil on a flag, using a muller and pallet knife: this mixture is oil gold-size, it must be put into an earthen vessel, and covered with water, to prevent it from skinning. This gold-size is very troublesome to make; it does not arrive at its highest perfection, until six or seven years old.

The *gilding of books and paper* has been stated in our article BOOK-BINDING, to be a distinct occupation. Generally isinglass size, strong gum-water, or glovers'-size, are employed in this art; but, as the gum-water and weaker sizes are apt to run beyond the edge, isinglass, melted with the addition of some common proof spirit of wine, and a sixth part of honey or sugar-candy is preferred; to which must be added a third of bole armeniac well powdered.

The following composition has been also recommended:—Take bole armeniac and sugar-candy well powdered; mix them with the whites of eggs, beaten to an oily consistence; and the cement will be fit for use. In applying any of these cements, the paper, in quires or in books, should be well cut and polished on the edges to be gilt; and well screwed down by a press; in this state it is to be brushed over, first with a little of the cement without the sugar-candy or the bole; and, when that is dry, either with the cement above given, or any other solution of gum or size with the proper proportion of the bole; after which it may be suffered to dry; and then water-polished, by rubbing it with a fine linen rag slightly moistened. It is then fit for receiving the gold, provided it be moistened at that time; and the leaves may be laid on, being cut according to the breadth which they are to cover, and pressed closely down with cotton. When thoroughly dried, it is polished burnished.

Japaners' gilding may be performed on almost any substance, whether metal, wood, leather, or paper; nor is there any preparation necessary, besides making the surface, on which the size is to be laid, smooth, and perfectly clean. Then spread japaners' size, mixed with a due proportion of oil of turpentine and vermilion, with a brush over the work, if the whole surface is to be gilt; or draw with it, by means of a pencil, the proper figure desired, avoiding carefully any other parts; when it is almost dry, so as to be capable, by its clamminess, of receiving the gold, dip a piece of wash-leather, wrapped round the finger, in the gold powder, and rub it lightly over the sized work; or spread the powder with a soft camels'-hair pencil; and with a camels'-hair when the work is dry, brush away the loose powder. If leaf-gold is used, the method of sizing must be the same as for the powders; but care is necessary in laying on, that the size be in a proper state of dryness.

PART II.

OF GILDING BY MEANS OF HEAT.

This is performed both with leaf and with liquid gold; the former after the same manner in which silver leaf is fixed and burnished by the French platers on brass. See PLATE. The metal for this purpose must be previously cleansed and polished; then heated to about the temperature of melted lead, and covered with a double layer of gold leaf; when a blood-stone burnisher, applied gently at first and gradually increasing the pressure, will cause the surfaces of gold and copper to touch each other and adhere. Successive layers, to a third or fourth, are thus laid on and burnished. But this method has been thought tedious, and is subject to the great difficulty of using a sufficient pressure without injuring the evenness of the gilded surface. Gold wire, as it is called, is thus made, however, very commonly and successfully. The copper bar, before it is committed to the wire-drawer, is plated with gold, by having several leaves successively burnished upon it, and, though then subjected to the strong compression that takes place in wire-drawing, the gold and copper are so perfectly united, as to form, in a manner, one substance, and extend together.

Gilding metals with liquid gold is sometimes termed water gilding. We have already described the best mode of preparing the amalgam. Silver is prepared to be thus gilt by soaking it in warm dilute muriatic acid, so that the surface may be rendered perfectly clean; it is next washed in clean water, two or three times changed, in order to free it from the whole of the acid; and being afterwards dried, and made moderately warm, a little gold amalgam, also warm, is evenly spread upon it, and is found immediately to adhere. In applying the amalgam, the operator uses a little knife, or a brush made of brass wire. Giving the work a gentle heat before the fire, he dabs or spreads the amalgam with the brush. The metal is now set over the fire, upon a grate, or in a sort of cage, under which is a pan of charcoal, yielding a heat sufficient for evaporating the mercury; which, rising in fumes, leaves the gold alone adhering to the work. Successive layers of this kind are frequently spread.

When the mercury is so far evaporated that the surface becomes uniformly pale, the metal is rubbed with a scratch-brush composed of fine brass wire, till its surface is made clean and smooth. Then it is covered over with a composition called gilding-wax, and again exposed to the fire till the wax be burnt off. This application is designed to heighten the color, and it is repeated till that effect is produced. The wax is a mixture of common bees'-wax, red ochre, verdigris, and green vitriol, or alum, and promotes the perfect dissipation of the mercury. The work must be now covered over, while heated, with a composition, consisting of equal quantities of nitre, green vitriol, sal ammoniac, and verdigris, finely powdered, and mixed up into a paste with water or urine. The mixture manifests its effects by smoking, and, if the color of the gilding

be not now sufficiently heightened, a succeeding application rarely fails to complete it.

For the gilding of copper, &c., in button making, see **BUTTONS**.

When iron is to be gilt by amalgamation it is generally first coated with copper; which, with all its combinations with zinc, having less affinity with mercury than silver, must not be expected to adhere to the amalgam so perfectly as that metal, nor to afford at last so even a surface.

The difficulties of well gilding iron, or rather steel, by amalgamation are also great on other accounts.—If simple burnishing down be had recourse to, the heat requisite for this purpose will, in many cases, bring the temper of the steel too low: the parts of the steel to be gilded are often, therefore, pencilled over with nitrate of mercury, by which they are covered with a slightly adhering coating of mercury; then the amalgam is applied, and the gilding finished in the usual way. The objection to this process is, that a considerable heat is required, though inferior to that requisite for burnishing down, and that, even with all possible care, the gilding is apt to scale off. An improvement on this method is previously to trace the figure of the gilding on the steel with a brush charged with a strong solution of sulphated copper, which is made to adhere with considerable firmness by means of the burnisher; and thus the gilding is, in part, performed upon the copper. Another method of gilding upon steel is suggested in the *Phil. Mag.* xi. p. 144, and seems capable of greatly improving the art. It depends upon the fact, that if sulphuric ether and nitro-muriate of gold are mixed together, the ether will by degrees separate from the acid nearly the whole of the gold, and retain it in solution for some time in nearly a metallic state. Ether, therefore, thus charged with gold, is spread, by means of a pen or fine brush, on the surface of highly polished steel; the ether presently evaporates, leaving the gold behind in close contact with the steel, and the adhesion, as in other cases, is finished by the application of the burnisher. If the expense of the ether is an object, the best oil of turpentine may be used instead.

Dr. Lewis makes the following remarks on gilding by amalgamation: ‘There are two principal inconveniences in this business: one, that the workmen are exposed to the fumes of the mercury, and generally, sooner or later, have their health greatly impaired by them; the other, the loss of the mercury; for, though part of it is said to be detained in the cavities made in the chimneys for that purpose, yet the greater part of it is lost. From some trials I have made, it appeared that both these inconveniences, particularly the first and most considerable one, might be, in a good measure, avoided, by means of a furnace of a due construction.’

He suggests, therefore, the communication of a furnace with its chimney under the grate, instead of over the fire: then the ash-pit door, or other apertures beneath the grate, being closed, and the mouth of the furnace left open, the current of air, which otherwise would have entered beneath, enters at the top, and, passing down through the grate to the chimney, carries with it

completely both the vapor of the fuel, and the elements of such matters as are placed upon it.

‘If such a furnace is made of strong forged (not milled) iron plate, it will be sufficiently durable. The upper end of the chimney may reach above a foot and a half higher than the level of the fire; over this is to be placed a larger tube, leaving an interval of an inch or more all round between it and the chimney, and reaching to the height of ten or twelve feet; the higher the better. The external air, passing up between the chimney and the outer pipe, prevents the latter from being much heated, so that the mercurial fumes will condense against its sides into running quicksilver, which, falling down to the bottom, is there caught in a hollow rim, formed by turning inwards a portion of the lower part, and conveyed by a pipe at one side into a proper receiver.’

For the gilding of china ware, see **PORCELAIN**: for gilding on enamel, and glass, **ENAMELLING**: for gilding letters and figures in books, **ILLUMINATING**.

Ornaments of brass are varnished in a manner termed gold *lacquering*, to distinguish them from those that are really gilt. When silver leaves, thus varnished, are put upon leather, it is called gilt leather; and many picture-frames have no other than this counterfeit gilding, which may be discovered by washing it with rectified spirits of wine; for the spirit will dissolve the varnish, and leave the silver leaf of its own whiteness. For plain picture frames, thick tin-foil may be used instead of silver; the tin-leaf fixed on with glue is to be burnished, then polished with emery and a fine linen cloth, and afterwards with putty applied in the same manner; being then lacquered over with the varnish five or six times, it looks like gold. See **LACQUERING**. Inferior or false gildings are also made with thin leaves of copper or brass, called Dutch leaf. In this manner are made most of the kinds of what is called gilt paper.

The following account of *factitious gilding* for chain-bridges, and other works of iron, was communicated by John Robison, Esq. F.R.S.E. to Dr. Brewster's Edinburgh Philosophical Journal of last year (1826):—

‘The Moochees and Naquashes of India, who are the makers and painters of a variety of objects whose purposes require ability to stand the effects of the weather, use an application in ornamenting their works, which, in appearance, nearly equals gilding, and costs little more than common paint. It appears to me that this application might be useful in some cases in this country, particularly in chain-bridges, and other works where iron of a smooth surface is exposed to the atmosphere. I therefore use the freedom of troubling you with what I recollect on the subject.’

‘In preparing the factitious gilding in the small way, a quantity of pure tin is melted, and poured into a joint of bamboo, perhaps a foot long, and two or three inches in diameter, close at both ends, except the perforation at which the tin is poured in, which is instantly plugged up. The bamboo is then violently shaken, which, if well managed, soon makes the metal assume the

form of a very fine gray powder: this being sifted, to separate any coarse particles, is mixed up in thin melted glue, and, if I recollect right, is levigated on a stone with a muller. The result is poured into dishes (commonly cocoa nut-shells) to settle, and the superfluous moisture poured off.

‘When to be applied, it should be of the consistence of thin cream, and is laid on with a soft brush, like ordinary paint. When dry, it appears like a coat of common gray water color. This is gone over with an agate-burnisher, and then forms a bright uniform surface of polished tin; a coating of white or colored roghun (oil-varnish) is immediately laid over it, according as it may be intended to imitate silvering or gilding.’

GILDAS, surnamed the Wise, a celebrated British monk, born in Wales in 511. Where he was educated is uncertain. Some say he went over to Ireland; others, that he visited France and Italy. All agree that, after his return to England, he became a most assiduous preacher of the gospel. Du Pin says he founded a monastery at Veretia in Britain. Gildas is the only British author of the sixth century whose works are printed. His History of Britain is valuable on account of its antiquity, and as containing the only information we have concerning the times of which he wrote; though his style is inelegant.

GILDO, a general in Mauritania, who was raised by the emperor Theodosius to the chief command in Africa. When the empire was divided between Arcadius and Honorius, the two sons of the last-mentioned emperor, he was persuaded to acknowledge the authority of Arcadius, the master of the east, although his allegiance was due to Honorius. The Roman senate, upon the revolt, denounced him a public enemy. He was subdued by Stilicho; and the war which terminated in his discomfiture was celebrated by Claudian in his poem de Bello Gildonico. He was seized and thrown into prison, where he saved himself from his impending fate by a voluntary death.

GILEAD, the son of Machir, and grandson of Manasseh. His posterity had their inheritance allotted them in the mountains of Gilead, so named from him.

GILEAD, a descendant of the above mentioned patriarch, and the father of Jephthah.

GILEAD, BALM OF. See AMYRIS.

The mountains of GILEAD were part of that ridge which runs from mount Lebanon southward, on the east of the Holy Land; gave their name to the whole country which lies on the east of the sea of Galilee, and included the mountainous region, called in the New Testament, Trachonitis. Jer. (xxii. 6) seems to say, that Gilead begins from mount Lihanus. Jacob, at his return from Mesopotamia, came in six days to the mountains of Gilead (Gen. xxxi. 21. &c.) where this patriarch, with Laban his father-in-law, raised a heap of stones, in memory of their agreement and covenant, and called it Galced, i. e. ‘an heap of witnessess,’ and which Laban called Jegar sahadutha. These mountains were covered with trees abounding with gum, called the balm of Gilead, which the Scripture much commends.

(Jer. viii. 21, xlvii. 11, li. 8.) The merchants who bought Joseph came from Gilead, and were carrying balm into Egypt, Gen. xxxvii. 25.

GILES (John), D. D. & M. D., a native of St. Albans, who flourished in the thirteenth century, and was the first Englishman who entered among the Dominicans. He was physician in ordinary to Philip IV. of France, and was professor of medicine in the Universities of Paris and Montpellier. In his Latin Tracts he is styled Johannes Ægidius.

GILES (St.), the tutelar saint of Edinburgh, was a native of Greece, who flourished in the sixth century, and was descended of an illustrious family. On the death of his parents he gave all his estate to the poor: and travelled into France, where he retired into a wilderness near the conflux of the Rhone with the sea, and continued there three years. Having obtained the reputation of extraordinary sanctity, various miracles were attributed to him; and he founded a monastery in Languedoc, known long after by the name of St. Giles’s. In the reign of James II. Mr. Preston of Gorton, whose descendants still possess an estate in the county of Edinburgh, obtained an arm of this saint; which relic he bequeathed to the church of Edinburgh. In gratitude for this donation, the magistrates granted a charter in favor of Mr. Preston’s heirs, by which the nearest heir of the name of Preston was entitled to carry it in all processions. They also obliged themselves to found an altar in the church of St. Giles’s, and appoint a chaplain for celebrating an annual mass for the soul of Mr. Preston; and likewise, that a tablet containing his arms, and an account of his pious donation, should be put up in the chapel.

GILGAL, in ancient geography, a place between Jericho and Jordan, noted for the first encampment of the Israelites on this side Jordan, about a mile from Jericho. It sometimes also denotes Galilee. Joshua xii. 23.

GILL, *n. s.* Sax. *pægel*; Lat. (barb.) *gillo*, *gello*. A liquid measure; the fourth of a pint.

They measure their block-tin by the *gill*, which containeth a pint.

Carew.

Every bottle must be rinsed with wine: some, out of mistaken thrift, will rinse a dozen with the same: change the wine at every second bottle: a *gill* may be enough.

Swift.

GILL, *n. s.* Not improperly, as Dr. Johnson suggests, from gillian, the Old English way of writing Julian or Juliana. The appellation of a woman in ludicrous language.

I can, for I will,

Here at Burley o’ th’ Hill,

Give you all your fill,

Each Jack with his *Gill*.

Ben Jonson’s Gypsies.

GILL, *n. s.* Lat. *chelidonium*. The name GILL-HOUSE, of a plant; ground-ivy; malt-liquor medicated with ground-ivy. Gill-house is the place where it is sold.

Thou shalt each alehouse, thou each *gillhouse* mourn,
And answering ginshops sourer sighs return. *Pope.*

GILL (John), D. D., a Protestant dissenting minister of the Baptist denomination, was born at Kettering, Nov. 23rd, 1697. He was early sent to a grammar-school in the neighbourhood,

where he very soon surpassed boys much his seniors; and after he had left school, though his time was daily devoted to the business of his father, yet he so far improved his leisure hours, as to be able, before he was nineteen, to read all the classical authors that fell in his way. On Nov. 1st, 1716, he made a public profession of his faith before the Baptist church at Kettering, and was baptized by Mr. Thomas Wallis. Of this church Mr. Gill had not been long a member before he was called to the ministry: soon after which, he removed to Higham Ferrers, to pursue his studies under Mr. Davis; but his stay there was soon interrupted by an invitation to London, to preach to the Baptist church at Horslydown, over which he was ordained pastor in 1719, which office he sustained upwards of fifty-one years. Mr. Gill had not been long in London, before rabbinical learning, of which he had acquired considerable knowledge, became an object of his pursuit. To facilitate his progress through the intricacies of this labyrinth, he contracted an acquaintance with one of the most learned Jewish rabbis. He read the Targums, the Talmuds, the Rabbot, their ancient commentaries, the book Zohar, and whatever else of this kind he was able to procure. Of the Oriental languages he made himself complete master: in short, there was no branch of knowledge that could either enlarge or enrich biblical learning, which he did not attempt and attain. In 1748 he published a Commentary on the New Testament, in 3 vols. folio. This work attracted the attention of the University of Aberdeen; and procured for him, without either his solicitation or his knowledge, a diploma, creating him D.D. He died at Camberwell in 1771, aged seventy-three. In 1718 the Dr. had married Mrs. Elizabeth Negus; by whom he had many children, two of whom only survived him. Mrs. Gill died in 1764. His works are, 1. A Commentary on the Old and New Testament, in 9 vols. fol. 2. A Body of Divinity, in 3 vols. 4to. 3. The Cause of God and Truth, 4 vols. 8vo. 4. A Treatise concerning the Prophecies of the Old Testament, respecting the Messiah. 5. A Dissertation on the antiquity of the Hebrew Language, Letters, Vowel Points, and Accents. 6. Sermons on the Canticles, folio; besides a great number of sermons and controversial pieces on different subjects.

GILLS, *n. s.* Goth. *geil, gil*, a fissure; Span. *águlla*; Lat. *gula*. The apertures at each side of a fish's head; the flaps which hang below the beak of a fowl; the flesh under the chin.

The turkeycock hath great and swelling *gills*, and the hen hath less. *Bacon's Natural History.*

In many there is no paleness at all; but contrariwise, redness about the cheeks and *gills*, which is by the sending forth of spirits in an appetite to revenge. *Id.*

The leviathan,

Stretched like a promontory, sleeps or swims,
And seems a moving land, and at his *gills*
Draws in, and at his trunk spouts out a sea.

Milton.

He hath two *gill-fins*: not behind the *gills*, as in most fishes, but before them. *Walton.*

Fishes perform respiration under water by the *gills*. *Ray.*

'Till they, of farther passage quite bereft,

Were in the mesh with *gills* entangled left. *King.*
Like the long bag of flesh hanging down from the
gills of the people in Piedmont. *Swift.*

GILLS of Fish. See ZOOLOGY.

GILLES (Peter), a learned and enterprising French author, born at Albi in 1490. After studying the Latin and Greek languages, philosophy, natural history, &c., he travelled through France and Italy. In 1533 he dedicated a work to Francis I., wherein he advised that monarch to send learned men to travel into foreign countries for the improvement of science; in consequence of which the king sent Gilles into the Levant. But having received no remittances from France, during his journey, he was at last obliged to enlist, for subsistence, in the army of Soliman II. In another voyage he was taken by a pirate, and carried into Algiers. By the generosity of Cardinal Armagnac he obtained his liberty; after which he went to his benefactor at Rome, where he died in 1555.

GILLORI, an island on the coast of West Florida, divided from Dauphin island by a very narrow channel. Between Gillori and the main land, on the west side of Mobile River, is a chain of small islands, and oyster-shells, through which is a passage of four feet, called *Passe au Heron*.

GILLYFLOWER, *n. s.* Corrupted from Julyflower, or from Fr. *girolée*.

In July come *gillyflowers* of all varieties.

Bacon.

Gillyflowers or rather Julyflowers, so called from the month they blow in, may be reduced to these sorts; red and white, purple and white, scarlet and white. *Mortimer's Husbandry.*

Fair is the *gillyflower* of gardens sweet,
Fair is the marygold, for pottage meet.

Gay's Pastorals.

GILLYFLOWER. See CHEIRANTHUS, and DIANTHUS.

GILOLO, or GILLOLO, called also Halamahera, is the largest of the Spice Islands. In its shape, which is very irregular, it most resembles Celebes, being formed of four peninsulas, enclosing three large bays on the east: the interior is occupied by high mountains rising in peaks. It abounds in sago and fruit trees, buffaloes, deer, goats, and wild hogs; and is well inhabited. Towards the south it is said to have nutmeg and clove trees. When captain Forrest visited it, in 1774, its dominion was divided between the kings of Ternate and Tidore, and consequently under the influence of the Dutch; at present, however, it seems to be governed by several independent chiefs. North of Gillolo is the island of Mortay, covered with sago trees, but thinly inhabited. The Moluccas Proper form a chain along the west side of Gillolo. The town of Ossa, on the south side of the bay of that name, is in E. long. 120° 22', and N. lat. 0° 45'. The imports of the island are iron, cutlery, piece goods, and China ware; the exports spices, edible birds'-nests, tortoise-shell, pearl, seed, and sago.

GILPIN (Bernard), an English divine, was descended from an ancient and honorable family in Westmoreland, and born in 1517. Being

brought up in the Roman Catholic religion, he, for some time, defended it, and, at Oxford, held a disputation with Hooper, afterwards bishop of Worcester, and martyr for the Protestant faith; but, after another disputation with Peter Martyr, began seriously to examine the contested points. Presented with the vicarage of Norton, in Durham, he resigned it, and went abroad to consult eminent professors on both sides; and, after three years' absence, returned a little before the death of Mary I. satisfied in the doctrines of the Reformation. He was kindly received by his uncle Dr. Tonstall, bishop of Durham; who soon after gave him the archdeaconry of Durham, and rectory of Eflington. Though the persecution was then at its height, he boldly preached against the vices, errors, and corruptions of the times, especially in the clergy, on which a charge, consisting of thirteen articles, was drawn up against him, and presented in form to the bishop. But Dr. Tonstall dismissed the cause in such a manner as to protect his nephew without endangering himself, and, soon after, presented him to the rich living of Houghton-le-Spring. He was again accused to the bishop, and again protected; when his enemies laid their complaint before Dr. Bonner, bishop of London, who immediately gave orders to apprehend him. Upon this, Mr. Gilpin prepared for martyrdom; and ordering his steward to provide him a long garment, that he might make a decent appearance at the stake, set out for London. He, however, broke his leg on the journey, which protracted his arrival until the queen's death. Being immediately set at liberty, he returned to Houghton, where he was received by his parishioners with the sincerest joy. Upon the deprivation of the popish bishops, he was offered the see of Carlisle, which he declined; and, confining his attention to his rectory, discharged all the duties of his function in the most exemplary manner. He was particularly anxious to improve the minds of the younger part of his flock; pressing them to mix religion with their labors, and, amidst the cares of this life, to have a constant eye upon the next. He attended to every thing which might be of service to his parishioners, and was very assiduous in preventing law-suits. His hall is said to have been often thronged with people, who came to him about their differences. His hospitable manner of living was the admiration of the whole country.—He spent in his family every fortnight forty bushels of corn, twenty bushels of malt, and a whole ox; besides a proportionable quantity of other provisions. Strangers and travellers found a cheerful reception. All were welcome that came; and even their beasts had so much care taken of them, that it was said, 'If a horse was turned loose in any part of the country, it would immediately make its way to the rector of Houghton's.' Every Sunday, from Michaelmas to Easter, was a public day with him. During this season he wished to see all his parishioners and their families. For their reception he had three tables well covered: the first for gentlemen, the second for husbandmen, and the third for day-laborers. This piece of hospitality he never omitted, even when losses or a scarcity of provisions made its continuance

rather difficult. Every year he regularly visited the most neglected parishes in Northumberland, Yorkshire, Cheshire, Westmoreland, and Cumberland, preaching in each for two or three days. And wherever he came he visited all the gaols, few in the kingdom having then any appointed minister. In the *debateable land* also, where no man would even travel who could avoid it, Mr. Gilpin never failed to spend some part of every year. The disinterested pains he took among these barbarous people, and the good offices he was always ready to do them, drew from them the warmest and sincerest expressions of gratitude. One instance is related, that shows how greatly he was revered.—By the carelessness of his servants, his horses were one day stolen; and, the news being quickly propagated, every one expressed the highest indignation at the theft. The thief was rejoicing over his prize, when, by the report of the country, he discovered whose horses he had taken. Terrified at what he had done, he instantly came trembling back, confessed the fact, returned the horses, and declared 'he believed the devil would have seized him directly had he carried them off knowing them to have been Mr. Gilpin's.' Although his income was never more than £400 a year, and out of this he had to support his open house and liberal hospitality, yet he founded and endowed a large grammar school, to which he also devoted a great part of his personal attention. One day, returning home, he saw in a field several people crowding together; and judging something more than ordinary had happened, he rode up, and found that one of the horses in a team had suddenly dropped down dead. The owner of it declaring how grievous a loss it would be to him, Mr. Gilpin bade him not be disheartened: 'I'll let you have,' said he, 'that horse of mine,' pointing to his servant's. 'Ah! master,' replied the countryman, 'my pocket will not reach such a beast as that.' 'Come, come,' said Mr. Gilpin, 'take him, take him; and when I demand my money, then thou shalt pay me.' This excellent divine, who deservedly obtained the glorious titles of the Father of the Poor, and the Apostle of the North, died in 1583, in the sixty-sixth year of his age.

GILPIN (Rev. William), M. A., descended from the above, was born at Carlisle in 1724. He received his education at Queen's College, Oxford, where he took his degree of M. A. in 1748. Afterwards he kept a grammar-school at Cheam in Surrey; but at length obtained a prebend in the cathedral of Salisbury, and the vicarage of Boldre, in the New Forest, Hampshire. Here he died, April 5th 1804. His literary reputation is principally founded on his *Picturesque Tours*. His principal works were *The Life of Bernard Gilpin*, 1751, 8vo.; *The Lives of John Wicliffe, &c.*, 1764, 8vo., which was translated into German; *Lectures on the Catechism of the Church of England*, 1779, 2 vols. 8vo.; *Remarks on Forest Scenery*, 2 vols. 8vo.; *Observations relative to Picturesque Beauty*, made in 1772, on several parts of England, particularly the mountains and lakes of Cumberland and Westmoreland, 2 vols. 8vo.; *Observations relative to Picturesque Beauty*, made in 1776, on several parts of Great Britain,

particularly the Highlands of Scotland, 2 vols. 8vo.; Sermons to a Country Congregation, 2 vols. 8vo.; and Exposition of the New Testament, &c., 4to. 1790, reprinted in 2 vols. 8vo. GILTHEAD, *n. s.* Gilt and head. A sea-fish; a bird.

He blended together the livers of *gilthead*s, the brains of pheasants and peacocks, tongues of phenicopters, and the melts of lampres. *Hakewill.*

GILT-HEAD, in ichthyology. See SPARUS.

GIMCRACK *n. s.* Supposed by Skinner to be ludicrously formed from gin, derived from engine. A slight or trivial mechanism.

For though these *gimcracks* were away,
However, more reduced and plain,
The watch would still a watch remain;
But if the horal orbit ceases,
The whole stands still, or breaks to pieces.

Prior.

What's the meaning of all these trigrams and *gimcracks*? Jumping over my master's hedges, and running your lines cross his grounds? *Arbutnot.*

GIMLET, *n. s.* Fr. *giblet*, *gümbelet*. A borer with a screw at its point.

The *ginlet* hath a worm at the end of its bit.

Moxon.

GIMMAL, *n. s.* According to Skinner and GIMMER, *n. s.* { Ainsworth from Lat. *gemulus*. It seems however, says Johnson, to be rather gradually corrupted from geometry or geometrical. Some little quaint pieces of machinery.

I think by some odd *gimmals* or device
Their arms are set like clocks, still to strike on,
Else they could not hold out so as they do.

Shakspeare.

The holding together of the parts of matter has so confounded me, that I have been prone to conclude with myself, that the *gimmers* of the world hold together not so much by geometry as some natural magick.

More's Divine Dialogues.

GIMP, *n. s.* See GIM. Gimp, in old English, is neat, spruce. A kind of silk twist or lace.

GIN, *n. s.* Corrupted from engine. A trap; a snare; any thing moved with screws, as an engine of torture; a pump worked with rotatory sails. Contracted from Geneva; a spirit drawn from juniper berries.

This same stede shal here you evermore,
Withouten harme, till ye be then you lost
(Though that ye slepen on his back or reste,)
And turne again with writhing of a pin.
He that it wrought, he coude many a *gin*;
He waited many a constellation,
Or he had don this operation.

Chaucer. The Squires Tale.

——— this false *gin*

Was not made ther; but it was made before.

Id. The Chanones Yemanues Tale.

Typhæus' joints were stretched on a *gin*. *Spenser.*

Which two, through treason and deceitful *gin*,
Hath slain sir Mordant. *Id.*

So sirives the woodcock with the *gin*;
So doth the coney struggle in the net.

Shakspeare.

Be it by *gins*, by snares, by subtilty. *Id.*

As the day begins,

With twenty *gins* we will the small birds take,
And pastime make. *Sidney.*

VOL. X.

If those, who have but sense, can shun
The engines that have them annoyed;
Little for me had reason done,
If I could not thy *gins* avoid.

Ben Jonson's Forest.

I know thy trains,
Though dearly to my cost, thy *gins* and toils;
No more on me have power, their force is null'd.

Milton.

He made a planetary *gin*,
Which rats would run their own heads in.
And come on purpose to be taken,
Without the' expence of cheese and bacon.

Hudibras.

Keep from faying, scourge thy skin,
And ankle free from iron *gin*. *Id.*

The delfs would be so flown with waters, it being impossible to make any adits or soughs to drain them, that no *gins* or machines would suffice to lay and keep them dry. *Ray.*

A bituminous plate, alternately yellow and black, formed by water driving on the outside of the *gin* pump of Mostyn coalpits. *Wood on Fossils.*

GIN, in mechanics, a machine for driving piles, fitted with a windlass and winches at each end, where eight or nine men heave, and round which a rope is reeved that goes over the wheel at the top; one end of this rope is fixed to an iron-monkey, that hooks to a beetle of different weights, according to the piles they are to drive, being from eight to thirteen hundred weight; and when hove up to a cross-piece, near the wheel, it unhooks the monkey, and lets the beetle fall on the upper end of the pile, and forces the same into the ground; then the monkey's own weight overhauls the windlass, in order for its being hooked again to the beetle.

GIN. See GENEVA.

GIN, in geography, a town of China, of the third rank, in Petcheli, ten miles south-east of Chun-te.

GINBALA, a district of Central Africa, formed into an island by two branches of the Niger, issuing from the lake Dabbie, and re-uniting west of Tombuctoo. It is only known to be inhabited by industrious and commercial negroes.

GINGEE, a district and fortress of India, in the Carnatic, situated between the twelfth and thirteenth degrees of northern latitude, and bounded on the east by the sea. The English had factories here in the middle of the seventeenth century, and it is now comprehended in the south division of the Arcot collectorship. The fort stands on a stupendous rock, and is impregnable by any ordinary mode of attack. It is said to have been built by the kings of the Chola dynasty, and was, so early as the year 1442, completely repaired and strengthened by the Naik of Tanjore. It was strengthened by the Mahomedan kings of Bejapore, the Mah-rattas, and the Moguls successively, but was taken by surprise from the latter, by the French, in the year 1750, and capitulated to the English in April, 1761. Like other hill forts of India, it is very unhealthy: the French are said to have lost 1200 Europeans by disease, during the ten years they held it, and during peace it is only garrisoned by a small number of native troops.

GINGER, *n. s.* } Ital. *gingero*; Latin
GINGER-BREAD, *n. s.* } *zinziber*. A pungent
aromatic root; and a kind of farinaceous sweet-
meat made of dough sweetened with treacle and
flavored with ginger.

Ginger, and *grein de Paris*,
Canell, and setewale of pris,
And many a spice d-ditable
To eten when men rise to fo table.

Chaucer. Romaunt of the Rose.

They fet him, first, the swete win,
And mede eke in a maselin,
And real spicerie,
Of *gingerbred* that was full fin,
And licoris and eke comin,
With suger that is trie.

Il. Rime of Sire Thopas.

An' I had but one penny in the world, thou
sholdst have it to buy *gingerbread*. *Shakespeare.*

The root of *ginger* is of the thorous kind, knotty,
crooked, and irregular; of a hot, acrid, and pungent
taste, though aromatick, and of a very agreeable
smell. The Indians eat both the young shoots of
the leaves and the roots themselves. *Hill.*

Or waiting *ginger* round the streets to go,
And visit alehouse where ye first did grow. *Pope.*
'Tis a loss you are not here, to partake of three
weeks frost, and eat *gingerbread* in a booth by a fire
upon the Thames. *Sieft.*

Her currants there and gooseberries were spread,
With the enticing gold of *gingerbread*. *King's Cook.*
The flower consists of five leaves, shaped some-
what like those of the iris: these are produced in the
head or club, each coming out of a separate leafy
scale. The ovary becomes a triangular fruit, having
three cells which contain seeds. *Müller.*

To master John, the English maid
A horn-hook gives of *gingerbread*;
And that the child may learn the better
As he can name, he eats the letter. *Prior.*

GINGER. See AMOMUM.

GINGERALL, a celebrated fortified island on
the western coast of India, in the mouth of a
river, on the bank of which is situated the town
of Dunda Rajepore. It was one of the stations
of the fleet commanded by the Siddees or Abyssinians,
who deserted from the service of the
kings of Bijapoore, to that of Aurunzebe, in the
year 1661, and stood a siege by the Mahratta
chief Sevagee (after he had got possession of the
town by stratagem), which lasted with little in-
termission for twenty-five years.

GINGERLY, *adv.* I know not whence de-
rived, says Dr. Johnson; Mr. Thomson, from
Swed. *gångare*, a smooth pace; an amble. Cau-
tiously; nicely.

What is't that you
Took up so *gingerly*? *Shakespeare.*

GINGIVAL, *adj.* Lat. *gingiva*. Belonging
to the gums.

Whilst the Italians strive to cut a thread in their
pronunciation between D and T, so to sweeten it,
they make the occlude appulse, especially the *gingival*,
softer than we do, giving a little of perverseness.

Holder's Elements of Speech.

GINGLE, *v. n.*, *v. a.*, & *n. s.* From Saxon
tinglan; Belg. *tingelen*. To utter or make a
shrill or ringing noise; a resounding noise; af-
fectionation in the sound of periods.

Full many a deinte hors hadde he in stable;
And when he rode, men mighte his bridel here
Gingling, in a whistling wind, as clere,

And eke as loude as doth the chapell belle.
Chaucer. Prologue to Cant. T. &c.

The foot grows black that was with dirt embrowned,
And in thy pocket *gingling* halfpence found. *Gay.*

Once, we confess, beneath the patriot's cloak,
From the cracked bag the dropping guinea spoke
And *gingling* down the backstairs, told the crew,
Old Cato is as great a rogue as you. *Pope's Epistles.*

Her infant grandame's whistle next it grew;
The bells she *gingled*, and the whistle blew. *Pope.*

GINGLYMUS, *n. s.* } Greek γγγλνμος, a
GINGLYMOID, *adj.* } hinge, and αἶδος, the
form of. An anatomical word, descriptive of
the union of two bones after the manner of a
hinge, as the elbow.

The malleus lies along, fixed to the tympanum,
and on the other end is joined to the incus by a dou-
ble or *ginglymoid* joint. *Holder.*

The *ginglymus*, or hinge-joint does not, it is mani-
fest, admit of a ligament of the same kind with that
of the ball and socket-joint, but it is always fortified
by the species of ligament of which it does admit.

Paley's Theology.

GINNET, *n. s.* Lat. *hinnus*; Gr. γίννος. A
nag; a mule; a degenerated breed. Hence, ac-
cording to some, but we believe, erroneously, a
Spanish gennet, improperly written for ginnet.

GINORA, in botany, a genus of the mono-
gynia order, and dodecandria class of plants:
CAL. cleft into six parts; the petals six: CAPS.
unilocular, quadrivalved, colored, and polysper-
mous. Species one only; a myrtle formed shrub
of Cuba.

GINSENG, in botany. See PANAX.

GIOJA, a small town of Naples, in the pro-
vince of Bari, with 1800 inhabitants. Its houses
were overturned by the earthquakes of 1783,
and half the town is still in ruins. Fourteen
miles S.S.W. of Conversano.

GIORGIEV, a town of Walachia, in Euro-
pean Turkey, partly on the north side of the
Danube, and partly on an island in that river.
It covers a large extent of ground, and carries
on a brisk trade. It was taken in 1771, in the
war between the Russians and Turks; and, on
the 2nd June of that year, the Turks received a
complete defeat here. In 1810 it was again
taken by the Russians. It is forty miles south-
west of Bucharest, and 235 north-west of Con-
stantinople.

GIORGI (Augustine Anthony), a learned
modern ecclesiastic, was born in 1711 at St.
Maur, in the diocese of Rimini, and entered, in
1727, the Augustine order, devoting himself par-
ticularly to the study of the oriental languages.
In 1746 he was invited by pope Benedict XIV.
to fill the theological chair of La Sapienza at
Rome; he also made him librarian del Angelica.
The emperor Francis I. repeatedly invited him
to settle at Vienna. In 1761 he published
Alphabetum Thibetanum, a work containing
many valuable dissertations, and the geography,
mythology, history, and antiquities of Thibet.
His next publication was Fragmentum Evangelii
S. Iohannis Græco-Copto Thebaicum sæculi
quarti, &c. &c. His other works consist of
Letters, Dissertations on subjects of Oriental
Criticism, and Antiquities and Polemical Treas-
ises. He died in 1797.

GIORGIO (St.), or St. GEORGE, a strong
fort and suburb of Mantua, in the department of
Mincio. It was taken by the French under

Buonaparte, on the 15th September, 1796, after an obstinate resistance from the Austrians, who lost 2500 men, and twenty pieces of cannon. On the 15th January, 1797, general Provera penetrated thus far with 6000 men to relieve Mantua, but was forced to surrender next day, with his whole troops, provisions, ammunition, &c.

GIORGIONE, an illustrious Venetian painter, born in 1478. He received his first instructions from John Bellino; but, studying afterwards the works of Leonardo da Vinci, he soon surpassed them both, being the first among the Lombards who found out the effects of contrasting strong light and shadows. The most valuable piece of Giorgione in oil is that of Christ carrying his cross, now in the church of San Rovo in Venice. He died of the plague, in 1511.

GIOTTO, an ingenious painter, sculptor, and architect of Florence, born in 1276. He was the disciple of Cimabue; but far superior to his master in the air of his heads, the attitude of his figures, and in the tone of his coloring; though he could not express liveliness in his eyes, tenderness in the flesh, or strength in the muscles of his naked figures. He was principally admired for his works in mosaic; the best of which is over the grand entrance of St. Peter's church at Rome. Alberti says, that, in that piece, the expression of fright and amazement of the disciples, at seeing St. Peter walk upon the water, is so excellent, that each of them exhibits some characteristic sign of his terror. Giotto is said to have been the inventor of crucifix painting, and the story generally told, but which we should hope too horrible to be true, is the following:—

Giotto, intending one day to draw a crucifix, persuaded a poor man to suffer himself to be bound to a cross for an hour, at the end of which he was to be released, and receive a considerable reward for it; but, instead of this, as soon as he had fastened him, he stabbed him dead, and then fell to drawing. When he had finished his picture, he carried it to the pope, who admired it so much, that he was resolved to place it over the altar of his own chapel. Giotto told him, as he liked the copy so well, he would show him the original. 'What do you mean?' said the pope, 'That I will show your holiness the original, from whence I drew this, if you will absolve me from all punishment.' The pope promised this, which Giotto believing, attended him to the place where it was; as soon as they were entered, he drew back a curtain, which hung before the dead man on the cross, and told him what he had done. The pope, troubled at so barbarous an action, retracted his promise, and told Giotto that he should be put to an exemplary death. Giotto, with seeming resignation, only begged leave to finish the piece before he died, which was granted him, and a guard set upon him to prevent his escape. As soon as the picture was delivered into his hands, he took a brush, and, dipping it into a sort of varnish ready for that purpose, daubed the picture all over with it, so that nothing of the crucifix could be seen. His holiness was so

incensed, that he threatened to put Giotto to the most cruel death, unless he drew another equal to the former; if so he would not only give him his life, but also an ample reward in money. Giotto, as he had reason, desired this under the pope's signet, that he might not be in danger of a second repeal. This was granted to him; and taking a wet sponge, he now wiped off all the varnish he had daubed on the picture, so that the crucifix appeared the same in all respects as it did before. Upon this, the pope remitted his punishment; and this crucifix is said long to have formed the original, from which the most famous crucifixes in Europe were drawn. He died in 1336, and the city of Florence honored his memory with a statue of marble over his tomb.

GIOVENAZZO, a town in the province of Bari, on the east coast of Naples. It has a castle, four churches, four convents, and 5000 inhabitants; and is a bishop's see, united to that of Terlizzi. This town is surrounded by high walls of rustic architecture, behind which rise, in a narrow space, houses and lofty towers with flat tops. Ten miles W. N. W. of Bari.

GIPSY, *n. s.* Corrupted from Egyptian; see below. A vagabond who pretends to foretell futurity, by palmistry or physiognomy.—Johnson.

Laura, to her lady, was but a kitchen wench; Did a dowdy; Cleopatra a *gypsy*; Helen and Hero hildings and harlots. *Shakspeare. Romeo and Juliet.*

The widow played the *gypsy*, and so did her confident too, in pretending to believe her. *L'Estrange.*

In this still labyrinth around her lie
Spells, philters, globes, and spheres of palmestry;
A sigil in his hand the *gipsy* bears,
And in the other a prophetic sieve and shears.

Garth.

A frantick *gipsy* now, the house he haunts,
And in wild phrases speaks dissembled wants. *Prior.*

The butler, though he is sure to lose a knife, a fork, or a spoon every time his fortune is told him, shuts himself up in the pantry with an old *gipsy* for above half an hour. *Addison.*

I, near yon stile, three sallow *gypsies* met;
Upon my hand they cast a poring look,
Bid me beware, and thrice their heads they shook.

Gay.

GIRAFFE. See **CERVUS**.

GIRALDI (Lilio Gregorio), an ingenious critic, was born at Ferrara in 1479. He was at Rome when it was plundered by the emperor Charles V.; and having thus lost all he had, and being tormented by the gout, he struggled through life with ill fortune and ill health. He wrote, nevertheless, seventeen works, which were collected and published at Basil, in 2 vols. folio, in 1520, and at Leyden in 1696. Casaubon, Thuanus, and other authors of the first rank, have bestowed the highest eulogies on him.

GIRALDI (John Baptist Cutio), an Italian poet of the same family with the preceding, was born in 1504. He was secretary to the duke of Ferrara, and professor of rhetoric at Pavia. He died in 1573. His works, which consist chiefly of tragedies, were collected and published at Venice by his son Celso Giraldi, in 1583. Some rank him among the best tragic writers Italy has produced.

GIRARD (Gabriel), an ingenious French ecclesiastic, was a native of Clermont, and born in 1678. The duties of a canonry, which he possessed, interfering with his studies, he resigned it, in order to be able to pursue them; when the duchess de Berri made him her almoner. He was employed by the French government as Russian and Sclavonian interpreter to the king, and became a member of the academy in 1744. Girard published a treatise on the principles of the French tongue, in two duodecimo volumes; and another on French Synonymes, which has gone through several editions. He died in 1748.

GIRARDON (Francis), a celebrated French architect and sculptor, born at Troyes in 1627. Louis XIV., being informed of his talents, sent him to Rome with a pension of 1000 crowns. At his return into France, he labored for the royal palaces, and the gardens of Versailles and Trignon; where there are many of his works in bronze and in marble, from the designs of Charles le-Brun. The mausoleum of cardinal de Richelieu, in the Sorbonne, and the equestrian statue of Louis XIV. at the Place de Vendome, where the statue and horse are cast in one piece, are reckoned his best performances. He was professor, rector, and chancellor, of the Academy of Painting and Sculpture; and inspector-general of all the works done in sculpture. He died in 1715.

GIRASOLE, *n. s.* Fr. *girasol*. The herb turnsol; the opal stone.

GIRD, *v. a., v. n. & n. s.* } Saxon *gyrdan*;
GIRDER, *n. s.* } Goth *gyrda*; Belg.
GIRDLE, *n. s. & v. a.* } *gardan*; Tent. *gurtel*. To
GIRDLER, *n. s.* } *ten, gurtel*. To
GIRDLER, *n. s.* } bind; surround;
fasten; invest; dress; cover; encircle; reproach:
an architectural term for the largest piece of timber in a floor; that which is used to bind or encircle: a maker of girdles: to smite.

GIRT, *v. a., part. pass. & n. s.* } See GIRD.
GIRTH, *n. s. & v. a.* }

He throweth on his helme of huge weight;
And girt him with his swerde; and in his honde
His mighty speere, as he was wont to feight,
He shaketh.

Chaucer. *Complaint of Mars and Venus.*

His here, his berde was like saffroun,
That to his girale raught adoun.

Id. *Rime of Sire Thopas.*

And so befell that in the tos they found,
Thurgh girt with many a grevous bloody wound,
Two yonge knights liggig by and by
Bothe in on arnes wrought ful richely.

Id. *The Knightes Tale.*

Men of all sorts take a pride to gird at me: the
brain of this foolish compounded clay, man, is not
able to invent any thing that tends to laughter more
than I invent, or is invented on me: I am not only
witty in myself, but the cause that wit is in other men.

Shakspeare. *Henry IV.*

Those sleeping stones,
That as a waist do girdle you about.

Shakspeare.

Let me look back upon thee, O thou wall,
That girdlest in those wolves! Id. *Timon.*

There will I make thee beds of roses,
With a thousand fragrant posies;

A cap of flowers, and a girdle,
Embroidered all with leaves of myrtle.

Shakspeare.

Being moved, he will not spare to gird the god.

Id.

Sweet king! the bishop hath a kindly gird:

For shame, my lord of Winchester, relent. Id.

Stoop then, and set your knee against my foot,

And in reguardon of that duty done,

I gird thee with the valiant sword of York. Id.

Lay the gentle babes, girdling one another

Within their innocent alabaster arms. Id.

Great breezes in great circles, such as are under
the girdle of the world, do refrigerate. Bacon.

This wondrous error growth

At which our critics gird. Drayton.

Or the saddle turned round, or the girths brake;

For low on the ground, woe for his sake,

The law is found. Ben Jonson's *Underwoods*.

He has the glory of his conscience, when he doth
well, to set against the cheeks and girds of it when he
doth amiss. Goodman.

Many conceive there is somewhat amiss until they
put on their girdle. Browne's *Vulgar Errours*.

On him his mantle, girdle, sword and bow,

On him his heart and soul he did bestow.

Cowley.

Here lies old Hobson, death hath broke his girt;

And here, alas! hath laid him in the dirt. Milton.

That Nyseian isle,

Girt with the river Triton, where old Cham

Hid Amaltha, and her florid son

Young Bacchus, from his stepdame Rhea's eye.

Id.

These, with what skill they had, together sewed,
To gird their waist: vain covering, if it hide

Their guilt, and dreaded shame. Id. *Paradise Lost*.

The son appeared,

Girt with omnipotence. Id.

Conscience by this means is freed from many
fearful girds and twinges which the atheist feels.

Tillotson.

Nor did his eyes less longingly behold

The girdlebelt, with nails of burnished gold.

Dryden.

Tysiphone there keeps the ward,

Girt in her sanguine gown, by night and day,

Observant of the souls that pass the downward way.

Id.

The girders are also to be of the same scantling
the summers and ground-plates are of, though the
back girder need not be so strong as the front girder.

Mozon's *Mech. Exerc.*

No, let us rise at once, gird on our swords,

And, at the head of our remaining troops,

Attack the foe. Addison's *Cato*.

He's a lusty jolly fellow that lives well, at least
three yards in the girth. Id. *Freeholder*.

The combatant too late the field declines,

When now the sword is girded at his loins. Prior.

These mighty girders which the fabrick bind,

These ribs robust and vast in order joined.

Blackmore.

The most common way of bandage is by that of
the girt, which girt hath a bolster in the middle,
and the ends are tacked firmly together. Wiseman.

Cords of the bigness of packthread were fastened
to bandages, which the workmen had girt round my
neck. Swift.

In the dread ocean, undulating wide
Beneath the radiant line that girts the globe.

Thomson.

Oft the long caravan, which in the chill
Of dewy dawn would slowly round each height,

That stretches to the stony belt which *girds*
Asia, where Kaff looks down upon the Kurds.

Byron.

A poniard decked her *girdle* as the sign
She was a sultan's bride (thank heaven not mine).

Id.

The *GIRDLE*, cingulus or zona, in antiquity, was a belt or band of leather or wool tied about the reins. It was anciently the custom for bankrupts and other insolvent debtors to put off and surrender their girdle in open court. The reason was, that our ancestors used to carry all their necessary utensils, as purse, keys, &c., tied to the girdle; whence the girdle became a symbol of the estate. History relates, that the widow of Philip I., duke of Burgundy, renounced her right of succession by putting off her girdle upon the duke's tomb. The Romans always wore a girdle to fasten up the tunica when they had occasion to do any thing; and this custom was so general that such as went without girdles, and let their gowns hang loose, were reputed idle dissolute persons.

GIRDLE, MAIDEN'S OF VIRGIN'S. It was the custom among the Greeks and Romans for the husband to untie his bride's girdle. Homer, lib. xi. of his *Odyssey*, calls the girdle *παρθενική ζώνη*, maid's girdle. Festus relates, that it was made of sheep's wool, and adds, that it was tied in the Herculean knot; and that the husband unloosed it as a happy presage of his having as many children as Hercules, who at his death left seventy behind him.

GIRDLE, in mining, is the name used in Cumberland, and some other counties, to denote the uncertain strata, or chance beds of stone and different substances that are met with in some districts; which, instead of occupying the whole space, of the same or nearly an equal thickness throughout, are only local, preserving, however, constantly the same relative situation to the other strata, wherever they appear. Particular strata in the British series are found to be subject to these chance beds, or strata, within their mass; some of which large nodular masses assume a confusedly crystallised structure, and seem to occasion large hills, and even mountainous tracts.

GIRE, *n. s.* Lat. *gyrus*. A circle described by any thing in motion. See *GYRE*.

GIRGASHITES, or *GERGESENE*, an ancient people of Canaan, whose habitation was beyond the sea of Tiberias, where we find some relics of their name in the city of Gergesa, upon the lake of Tiberias. The Jewish rabbis inform us that, when Joshua first came into the land of Canaan, the Girgashites resolved rather to forsake their country than submit to the Hebrews, and accordingly retired into Africa. Nevertheless it is certain that a great number of them staid behind, since Joshua, xxiv. 11, informs us that he subdued the Girgashites, and they whom he overcame were certainly on this side Jordan. This name is written Girgashi, Gen. x. 16, xv. 21; in the Greek of Judith, chap. v. 16, Γεργεσαοι; and in Matt. viii. 28, Γεργεσηνοι. The Gadarenes of the New Testament are thought to have been a remnant of the ancient Girgashites. See *GADARENES*.

GIRGE, a large town, once the capital, of Upper Egypt. It is situated about a quarter of a mile from the Nile, and is nearly two miles in compass. The architecture is quite modern and mean. Under the government of the Mamelukes a bey appointed by the divan at Cairo resided here, in the capacity of sangiac or governor; but since the last revolution Siont has succeeded Girge as the capital of Upper Egypt. 215 miles south of Cairo.

GIRGENTI, a town of Sicily, which occupies part of the site of the ancient *AGRIGENTUM*, which see. It stands on the top or hill, the site of the old fort, and has about 12,000 inhabitants. This see was some time since the richest in Sicily, but is miserably neglected, as to all its interests. Among the curiosities belonging to the cathedral is an Etruscan vase of rare size and preservation. There are also some golden pateras of extreme rarity. Girgenti has a harbour, formed by a pier carried out in three sides of an octagon, with a battery at the head: the light-house is erected on the cliffs on shore. The work is strong and neat, but the Sirocco commands it entirely, and drives in great quantities of sand. Ships of burden find it difficult therefore to get in, but the magazines of corn, which it exports, in the rocks along the shore are spacious. Girgenti is seated on the St. Baise, four miles from the sea, and sixty south of Palermo. Long. 13° 24' E., lat. 37° 28' N.

GIRL, *n. s.*

GIRLISH, *adj.*

GIRLISHLY, *adv.*

Casaubon derives this word from *κόρη* of the same signification; Minsheu from Lat. *garrula*, a prattler, or Ital. *girella*, a weathercock. Junius thinks that it comes from Welsh *herlodes*, from which, says he, harlot is very easily deduced. Skinner imagines that the Saxons, who used *ceopl* for a man, might also have *ceopla* for a woman, though no such word is now found. Dr. Hickes derives it from the Icelandic *karlinna*, a woman. To these collections of Dr. Johnson may be added Mr. Thomson's suggestion, that it comes from Goth. *kirla*, diminutive of *karla*, a woman, feminine of *kurl*, a man or boor. A young woman, or female child.

In danger hadde he at his owen gise,

The yonge *girdles* of his dioceiso

And knew hir conseil and was of hir dede.

Chaucer. Prologue to the Canterbury Tales.

I will love thee we'er the less, my *girl*.

Shakspeare.

A weather-beaten lover, but once known,

Is sport for every *girl* to practise on.

Donne

The soole Amphimachus, to field brought gold to be his wracke,

Proude *girl* like, that doth ever beare her dowre upon her backe.

Chapman.

True Trojan! whilst this town can *girls* afford

And long as cyder lasts in Hereford,

The *girls* shall always kiss thee though grown old.

And in eternal healths thy name be trowled.

Marvell.

A boy, like thee, would make a kingly line;

But oh! a *girl*, like her, must be divine!

Dryden.

It is pleasant to see the boys and *girls* playing in the streets; but it is ill-favored to see men and women playing there, that should fill up their time with work and business. *Henry. Zech. viii. 5.*

Each *girl*, when pleased with what is taught,
Will have the teacher in her thought. *Swift.*

Chloe of every coxcomb jealous
Admires how *girls* can walk with fellows;
And full of indignation frets
That women should be such coquettes. *Id.*

Tragedy should blush as much to stoop
To the low mimic follies of a farce,
As a grave matron would to dance with *girls*. *Rose.*

GIRN, *v. n.* It seems to be a corruption of grin. It is still used in Scotland, and is applied to a crabbed, captious, or peevish person.

GIRONDE, a department of France, containing part of the *ci-devant* province of Guienne; bounded on the north-east by the department of the Lower Charente, on the east by those of the Dordogne, and Lot and Garonne, on the south by that of Landes, and on the west by the sea. Bourdeaux is the capital. Gironde extends along both sides of the Garonne. Its western division is in a great measure barren, and has the sea on the one side and the river on the other: the eastern part is fertile and well cultivated, yielding annually, it is computed, 800,000 hogsheads of wine. The quantity of corn raised is not equal to the consumption. This department contains six *arrondissements*, viz. those of Blaye, La Reole, Lesparre, Libourne, Bazas, and Bourdeaux; the last is the central station of the military, the seat of a high court of justice, the residence of the *prefet* and bishop, and the centre of all the public business. Wine and brandy are exported from that city in large quantities. Gironde, although the climate is tempered by the vicinity of the sea, is warmer than several provinces in the interior of France, which lie in the same latitude on higher ground.

GIRONDE, a river of France, which is formed by the union of the Garonne and Dordogne, three miles north of Bourdeaux, and runs through the above department into the Atlantic, after a course of twenty-seven miles N.N.W.

GIRONDISTS, a political party in France, who flourished in the first stage of the revolution; so named from the department of Gironde, of which their leading members were representatives; called also *Brissotines*, from Brissot, and *Federalists* from their wishing for a federal government. See FRANCE.

GIRONNE, or **GIRONNY**, in heraldry, a coat of arms divided into girones, or triangular figures, meeting in the centre of the shield, and alternately color and metal.

GIRROCK, *n. s.* *Acus major*. A kind of fish.

GISBOROUGH, a town of England, in the North Riding of Yorkshire, on the road from Whitby to Durham, four miles from the mouth of the Tees, where is a bay and a harbour for ships. It had formerly an abbey, and a church which, from its ruins, seems to have been equal to the best cathedrals in England. The soil is fertile, and has a constant verdure, adorned with field flowers almost all the year. There are some mines of iron and alum, which were first discovered in the reign of king James I., and have been since very much improved. Sir Paul Pindar, who first farmed them, paid rents to the king

£12,300, to the earl Musgrave £1640, and to Sir William Penniman £600, and had 800 men by sea and land in constant pay; yet he was a considerable gainer, as there was then scarcely any other to be had, and the price was £26 a ton; but, as there are now several other alum works in this country, the works here have for some years lain neglected. Market day Monday. Gisborough lies eight miles to the north-east of Stokesley.

GISEL, *v. a.* When the owner feeds his ground with cattle which he takes in to graze.

GISLE, among the English Saxons, signifies a pledge: thus, *Fredgisle* is a pledge of peace; *Gislebert* an illustrious pledge, like the Greek *Homerus*.

GISLEN (Auger), lord of Busbee, a man illustrious on account of his embassies, was born at Commimes in 1522; and educated at the universities of Louvain, Paris, Venice, Bologna, and Padua. He was engaged in several important negotiations, and particularly was twice sent ambassador by the king of the Romans to the emperor Soliman. He collected inscriptions, examined natural history, and, in his second journey to Constantinople, carried with him a painter, that he might be able to communicate to the curious the figures of the plants and animals that were little known in the west. He wrote a *Treaise* on the State of the Ottoman Empire, and a *Relation* of his two Journeys to Turkey, which are much esteemed. He died in 1592.

GISORS, a town of Upper Normandy, in the department of the Eure, having manufactures of woollens, leather, and cottons. Inhabitants 3500. Seventeen miles east of Andelys, and thirty-two north-east of Evreux.

GITH, *n. s.* *Nigella*. An herb called also small *fennel* flower.

GIUDECA, or **ZUECCA**, an island in the Lagoon, about a mile from Venice, consisting properly of six small islands joined together, and containing a number of elegant houses and gardens, six churches, and a monastery. Its name is said to be derived from the number of Jews once residing here.

GIVE, *v. a. & v. n.* } Sax. *gipan*; Gr. *γε*, or *GIV'ER*, *n. s.* } *yea*, prefixed to *Goth*.

GIV'EN, *part.* } and Swed. *gi*, Sax. *fon*, to possess.—Thomson. To bestow without price or reward; to communicate; to yield. This word is used in a great variety of senses. A donor, distributor, &c. The radical idea is transmitting from one person to another, either freely or otherwise: it is frequently used with other words, which fix its definite meaning; as, away; back; forth; over; out; up; into; &c.: it is used also in reference to locality, as, to give place.

My *fadir gyueth* you verey breed fro heuene.

Wiclif. Jon. vi.

All thing that the *fadir gyueth* to me, schal come to me. *Id.*

He was an *esy* man to *give* penance,
Ther as he wiste to han a good pitance;
For uto a poure ordre for to *give*,
Is signe that a man is wel yshrive;
For if he gave,—he dorste make avant,
He wiste that a man was repentant;

For many a man so hard is of his herte,
He may not wepe although him sore smerte;
Therefore, in stede of weping and praieres,
Men mote *give* silver to the poure freres.

Chaucer. Prologue to Cant. Tales.

With all thy hart, with all thy soule and mind,
Thou must Him love, and his behests embrace;
All other loves, with which the world doth blind
Weake fancies, and stirre up affections base,
Thou must renounce and utterly displace,
Then *give* thy selfe unto Him full and free,
That full and freely gave Himselfe to thee.

Spenser's Hymnes.

If they will speak to the purpose, they must *give*
over, and stand upon such particulars only as they can
shew we have either added or abrogated, otherwise
than we ought, in the matter of church polity.

Hooker.

Lessons being free from some inconveniences,
whereunto sermons are more subject, they may in this
respect no less take than in others they must *give* the
hand, which betokeneth pre-eminence.

Id.

The duty of uniformity throughout all churches, in
all manner of indifferent ceremonies, will be very hard,
and therefore best to *give* it over.

Id.

Neither hath Christ, through union of both natures,
incurred the damage of either, lest, by being born a
man, we should think he hath *given over* to be God,
or that, because he continued God, therefore he cannot
be man also.

Id.

This opinion abated the fear of death in them which
were so resolved, and *gave* them courage to all adventures.

Id.

The fathers *give* it out for a rule, that whatsoever
Christ is said in Scripture to have received, the same
we ought to apply only to the manhood of Christ.

Id.

Let novelty therefore in this *give over* endless contradictions,
and let ancient customs prevail.

Id.

Abdemelech, as one weary of the world, *gave over*
all, and betook himself to a solitary life, and became
a monk.

Knolles.

The Rhodians, seeing their enemies turn their backs,
gave a great shout in derision of them.

Id.

Huniades, the scourge of the Turks, was dead long
before; so was also Mathias: after whom succeeded
others, *given* all to pleasure and ease.

Id. History.

Fear him not, Cæsar, he's not dangerous:

He is a noble Roman, and well *given*.

Shakespeare.

The applause and approbation I *give* to both your
speeches.

Id. Troilus and Cressida.

It is *given out*, that, sleeping in my orchard,
A serpent stung me. So the whole ear of Denmark
Is, by a forged process of my death,
Rankly abused.

Id. Hamlet.

One that *gives out* himself prince Florizel,

Son of Prolixenes, with his princess.

Shakespeare.

Never *give* her o'er,

For scorn at first makes after love the more.

Id.

His name is Falstaff: if that man should be lewdly
given, he deceives me; for, Harry, I see virtue in his
looks.

Id.

If you shall marry,

You *give away* this hand, and that is mine;
You *give away* heaven's vows, and those are true:
You *give away* myself, which is known mine.

Id.

If you did know to whom I *gave* the ring,

If you did know for whom I *gave* the ring,

And would conceive for what I *gave* the ring,

And how unwillingly I left the ring,

You would abate the strength of your displeasure.

Id.

It hath been *given out* by an hypocritical thief, who
was the first master of my ship, that I carried with

me out of England twenty-two thousand pieces of
twenty-two shillings per piece.

Raleigh.

The state of human actions is so variable, that to
try things oft, and never to *give over*, doth wonders.

Bacon's Natural History.

Some things are harder when they come from the
fire, and afterwards *give* again, and grow soft; as the
crust of bread, biscuit, sweetmeats, and salt.

Id.

Demetrius, king of Macedon, had a petition offered
him divers times by an old woman, and still answered
he had no leisure; whereupon the woman said aloud,
Why then *give over* to be king.

Bacon.

Though he was *given* to pleasure, yet he was like-
wise desirous of glory.

Id. Henry VII.

Julius Cæsar laid asleep Pompey's preparations, by
a fame that he cunningly *gave out* how Cæsar's own
soldiers loved him not.

Bacon.

In oranges the ripping of the rind *giveth out* their
smell more.

Id.

Finding ourselves in the midst of the greatest wil-
derness of waters, without victual, we *gave* ourselves
for lost men, and prepared for death.

Id.

Philip, Alexander's father, gave sentence against a
prisoner at a time he was drowsy, and seemed to *give*
small attention. The prisoner, after sentence was
pronounced, said, I appeal: the king, somewhat
stirred, said, To whom do you appeal? The prisoner
answered, from Philip, when he *gave* no ear, to Philip,
when he shall *give* ear.

Id. Apophthegms.

The charge was *given* with so well governed fury,
that the left corner of the Scots battalion was enforced
to *give in*.

Id. Hayward.

Soon after it was *given forth*, and believed by many,
that the king was dead.

Id.

Private respects, with him, *gave way* to the common
good.

Carver.

We are the earth; and they,

Like moles within us, heave and cast about:

And 'till they foot and clutch their prey;

They never cool, much less *give out*.

Herbert.

Only a sweet and virtuous soul,

Like seasoned timber never *gives*;

But though the whole world turn to coal,

Then chiefly lives.

Id.

Who say, I care not, those I *give* for lost;

And to instruct them will not quit the cost.

Id.

Up and down he traverses his ground,

Then nimbly shifts a thrust, then lends a wound;

Now back he *gives*, then rushes on again.

Daniel's Civil War.

Let us *give* ourselves wholly up to Christ in heart
and desire.

Taylor's Rule of Holy Living.

Shall we kindle all this flame

Only to put it out again?

And must we now *give o'er*,

And only end where we began?

In vain this mischief we have done,

If we can do no more.

Denham.

Virtue *given* for lost,

Deprest and overthrow'n, as seemed;

Like that self-begotten bird

From out her ashy womb now teemed.

Milton's Argumens.

Since no deep within her gulph can hold

Immortal vigour, though oppress'd and fallen,

I *give* not Heaven for lost.

Id. Paradise Lost.

Well we may afford

Our *givers* their own gifts.

Id.

So Satan, whom repulse upon repulse

Met ever, and to shameful silence brought

Yet *gives* not o'er, though desperate of success.

Milton.

By thee how fairly is the *giver* now
Repaid? But gratitude in thee is lost
Long since. *Milton's Paradise Regained.*

This instance *gives* the impossibility of an eternal
existence in any thing essentially alterable or cor-
ruptible. *Hale.*

Where few the numbers, choice is there less hard;
Give us this court and rule without a guard. *Marvell.*

But worst of all to *give* her over,
"Till she's as desperate to recover. *Hudibras.*

The cause for which we fought and swore
So boldly, shall we now *give* o'er? *Id.*

The more he got, the more he shewed that he *gave*
away to his new mistress, when he betrayed his promi-
ses to the former. *Sidney.*

Zelmane, govern and direct me; for I am wholly
given over unto thee. *Id.*

If any be *given* up to believe lyes, some must be
first *given* up to tell them. *Stillington.*

He is much *given* to contemplation, and the viewing
of this theatre of the world. *More against Atheism.*

Unless it is kept in a hot house, it will so *give*
again, that it will be little better than raw malt. *Mortimer.*

Before you carry your 'large cocks in, open them
once, and spread them: hay is apt to *give* in the cock.
Id.

Nature *gives* us many children and friends, to take
them away; but takes none away to *give* them us again.
Temple.

They who *gave* themselves to warlike action and
enterprises, went immediately to the place of Odin.
Id.

Besides, he is too much *given* to horseplay in his
raillery; and comes to battle like a dictator from
the plough. *Dryden.*

I have some business of importance with her; but
her husband is so horribly *given* to be jealous.

Id. Spanish Fryar.
What can I refuse to a man so charitably *given*?
Dryden.

Scarce had he spoken when the cloud *gave* way;
The mists flew upwards, and dissolved in day. *Id.*

I have not lived since first I heard the news;
The gift the guilty *giver* doth accuse. *Id.*

Ours *gives* himself for gone; you've watched your
time,
He fights this day unarmed, without his rhyme. *Id.*

A woman had a hen that laid every day an egg; she
fancied that upon a larger allowance this hen might lay
twice a day: but the hen grew fat, and *gave* quite over
laying. *L'Estrange.*

Men are *given* to this licentious humour of scoffing at
personal blemishes and defects. *Id.*

The punishment would be kept from being too much,
if we *gave* off as soon as we perceived that it reaches the
mind. *Locke.*

He would *give* his nuts for a piece of metal, and ex-
change his sheep for shells, or wool for a sparkling
pebble. *Id.*

When the Babylonians had *given* themselves over
to all manner of vice, it was time for the Lord, who
had set up that empire, to pull it down. *Grew.*

Give yourselves up to some hours of leisure.

As we desire to *give* no offence ourselves, so neither
shall we take any at the difference of judgment in
others. *Burnet.*

For a man to *give* his name to Christianity in those
days, was to list himself a martyr. *South.*

As the hinder feet of the horse stuck to the moun-
tain, while the body reared up in the air, the poet with

great difficulty kept himself from sliding off his back,
in so much that the people *gave* him for gone.

Addison's Guardian.

Theodosius made a private vow never to inquire
after Constantia, whom he looked upon as *given* away
to his rival, upon the day on which their marriage was
to have been solemnized. *Addison.*

Our minds naturally *give* themselves up to every di-
version which they are much accustomed to; and
we always find that play, when followed with assiduity,
engrosses the whole woman. *Id.*

This is a geography particular to the medalists; the
poets, however, have sometimes *given* in to it, and fur-
nish us with very good lights for the explication of it.
Id. on Medals.

The abess, finding that the physicians had *given*
her over, told her that Theodosius was just gone before
her, and had sent her his benediction. *Addison.*

Constantia accused herself for having so tamely *given*
an ear to the proposal. *Id. Spectator.*

Whence came you here, O friend, and whither
bound?

All *gave* you lost on far Cyclopean ground.

Garth.

I *gave* his wise proposal way;
Nay, urged him to go on: the shallow fraud
Will ruin him. *Rowe's Ambitious Stepmother.*

Have the physicians *given* up all their hopes?
Cannot they add a few days to a monarch?

Rowe.

Forbear contending louts, *give* o'er your strains,
An oaken staff each merits for his pains. *Gay.*

Where yet was ever found a mother,
Who'd *give* her booby for another? *Id. Fables.*

Whatsoever we employ in charitable uses, during
our lives, is *given* away from ourselves; what we be-
queath at our death, is given from others only, as our
nearest relations. *Atterbury.*

Their vices perhaps *give* back all those advantages
which their victories procured. *Id.*

He has not *given* Luther fairer play. *Id.*
He may be brought to *give* up the clearest evidence.
Id.

These people are obliged to demand peace, and
give up to the Romans all their possessions in Sicily.
Arbutnot.

Is any sick? The man of Ross relieves;
Prescribes, attends, the medicine makes and *gives*.
Pope.

Constant at church and 'Change; his gains were
sure,

His *givings* rare, save farthings to the poor. *Id.*

Both gifts destructive to the *givers* prove;
Alike both lovers fall by those they love. *Id.*

This consideration may induce a translator to *give*
in to those general phrases, which have attained a
veneration in our language from being used in the
Old Testament. *Id.*

A good poet no sooner communicates his works,
but it is imagined he is a vain young creature *given* up
to the ambition of fame. *Id.*

Yet this false comfort never *gives* him o'er,
That, whilst he creeps, his vigorous thoughts can soar. *Id.*

Let the first honest discoverer *give* the word about,
that Wood's half-pence have been offered, and caution
the poor people not to receive them. *Swift.*

Madam, I always believed you so stout,
That for twenty denials you would not *give* out. *Id.*

Not one foretells I shall recover;
But all agree to *give* me over. *Id.*

GIVES, *n. s.* Fetters or shackles for the
feet.

GIVET, a strong town in the department of the Ardennes, France, the chief place of a canton. It originally consisted of two villages, one on each side of the Meuse, which Louis XIV. caused to be fortified and united, under the direction of M. Vauban. It is now a place of considerable strength, and has the fortress of Charlemont on an adjoining hill. Givet was one of the frontier towns put into the possession of the allies by the treaty of Paris in 1815. Inhabitants 3500. Fifteen miles north-east of Rocroy, and twenty-four north of Mezieres.

GIULIANO, SAN, OF MONTE SAN GIULIANO, the ancient Eryx, a considerable town in the Val de Mazzara, Sicily. It stands on the summit of a high hill, and is said to be very healthy. Few vestiges of antiquity remain, but the women are remarked for their clear complexions. The town contains fifteen churches, nine convents, an hospital, a Monte di Pietà, and 10,000 inhabitants. It is sometimes called Trapani di Monte, and the mountain Monte di Trapani. Three miles north-east of Trapani.

GIULEMO, a mountain of the Cisalpine republic, in the department of Benaco, and adjacent Veronese. This mountain, with that of Maniva, and the valley of Sabbia, contain twenty-six parishes and 13,000 citizens; who carry on cloth manufactures, and iron forges and foundries. Cattle are also bred in great numbers.

GIZEH, a town of Egypt, on the left bank of the Nile, opposite Cairo. It is a considerable place, and was fortified by Ishmael Bey. It has been supposed, but on no solid ground, that the ancient Memphis stood in the place where Gizeh now stands: which is in the immediate neighbourhood of the pyramids of Cheops and Cephrenes. It is three miles south-west of Cairo, and in 1801 was taken from the French by the British.

GIZZARD, *n. s.* *Fr. gesier; Lat. gigeria.* It is sometimes called gizzern. The strong muscular stomach of a fowl. It is proverbially used for apprehension or conception of mind: as, he frets his gizzard; he harasses his imagination.

But that which does them greatest harm,
Their spiritual gizzards are too warm;
Which puts the overheated sots
In fevers still. *Hudibras.*
Fowls have two ventricles, and pick up stones to convey them into their second ventricle, the gizzern. *More.*

They nestle near the throne,
By their high crops and corny gizzards known. *Dryden.*

Satisfaction and restitution lie so cursedly hard upon the gizzards of our publicans, that their blood is not half so dear to them as the treasure in their coffers. *L'Estrange.*

In birds there is no mastication in the mouth; but, in such as are not carnivorous, it is immediately swallowed into the crop, a kind of ante-stomach, where it is moistened by some proper juice from the glands distilling in there, thence transferred into the gizzard, or muscular stomach. *Ray.*

When our fowls are abundantly supplied with meat, they soon fill their craw: but it does not immediately pass thence into the gizzard; it always enters in very

small quantities, in proportion to the progress of trituration.

GLA'BRITY, *n. s.* From *Lat. glaber.* Smoothness; baldness.

GLACIAL, *adj.*

GLACIATE, *v. n.*

GLACIATION, *n. s.*

GLACIOUS, *adj.*

GLACIERS, *n. s.*

Fr. glacier; Lat. glacies.
Ice; the art of freezing;
icy or cold; mountains
covered with ice.

Ice is plain upon the surface of water, but round in hail, which is also a glaciation, and figured in its guttulous descent from the air.

Brown's Vulgar Errors.
Although exhaled and placed in cold conservatories, it will crystallize and shoot into glacial bodies. *Id.*

GLACIERS, a name given to some very extensive fields of ice among the Alps. Mr. archdeacon Coxe says, that these mountains, in general, are composed of many parallel chains, the highest of which occupy the centre, and the others gradually diminish as we recede thence. The central chain appears covered with pointed rocks; all parts of which, that are not absolutely perpendicular, lie hid under perpetual snow and ice. On each side of this ridge are fertile and cultivated valleys, interspersed with numerous villages, and watered by numerous streams. The elevated peaks of the central chain are covered with snow; but their declivities, excepting those that are extremely steep, have all a covering of ice as well as snow; the intermediate parts being filled with vast fields of ice, terminating in the cultivated valleys. The same phenomena, though on a smaller scale, occur in those chains that are at a distance from the principal one: in those which are most remote, no ice, and scarcely any snow, is observed, unless upon some of the most elevated summits; and the mountains, diminishing in height and ruggedness, appear covered with verdure, until at last they terminate in small hills and plains. Thus the glaciers may be divided into two sorts; the first occupying the deep valleys in the bosom of the Alps, called Ice Valleys; the second covering the declivities and sides of the mountains. These are called by Mr. Coxe the Upper and Lower Glaciers.

The Lower Glaciers are by far the most considerable; some of them extending several leagues in length. They do not communicate with each other, as has been generally supposed, few of them being parallel to the central chain; but, stretching mostly in a transverse direction, are bordered at the higher extremity by inaccessible rocks, and at the lower extend into the cultivated valleys. The thickness of the ice varies in different parts. In the glacier de Bois, which extends more than fifteen miles in length, and upwards of three in breadth, M. Saussure found it generally from eighty to 100 feet; but he was credibly informed that in some places it was not less than 600 feet, and even more. These vast masses of ice usually rest on an inclined plane; where, being pushed forward by their own weight, and but weakly supported by the rugged rocks beneath them, they are intersected by large crevices, and have an appearance of walls, pyramids, &c., according to the position of the

eye in viewing them. In those parts, however, where they lie upon even ground, or such as have only a gentle inclination, the surface of the ice is nearly uniform, the crevices being few and narrow, and the glacier being crossed by travellers on foot without any difficulty. The surface of the ice is rough and granulated, so that people may walk upon it, excepting such places as have a steep descent. It is opaque, full of small bubbles about the size of a pea, very porous, and greatly resembles a mixture of snow and water congealed. A vast quantity of stones and earth falls down from the mountains upon the glaciers, and are by them thrown off on each side according to the descent of the ice. The place on which these rest is more hard and elevated than the rest of the ice, and is very difficult to walk upon; the earth is likewise laid upon them in such regular heaps, that it appears to have been done by art. This collection of earth and stones is termed by the natives the moraine. Mr. Coxé, who visited the Glacier de Bois, informs us, that the appearance of it at a distance was so tremendous that it seemed impracticable to cross it. Numerous and broad chasms intersected it in every direction; but, entering upon it, the company found that courage and activity were only required to accomplish the task. They had large nails in their shoes, and spiked sticks, which on this occasion were found to be particularly serviceable. Having passed the moraine, and descended upon the glacier itself, they found the ice softened by a warm wind which rendered it less slippery than usual. Having walked across it for about a quarter of an hour, they came again to the moraine, along which they continued their journey for half an hour, and then entered upon the great body of the glacier. 'Here,' says Mr. Coxé, 'it was curious to observe the numerous little rills produced by the collection of drops occasioned by the thawing of the ice on the upper part of the glacier: these little rills hollow out small channels, and, torrent-like, precipitate themselves into the chasms with a violent noise, increasing the body of waters formed by the melting of the interior surface, and finding an outlet under the immense arch of ice in the valley of Chamounie, from which the Avern rushes.' As our traveller proceeded on his journey, he was surprised by the noise of a large fragment of rock which had detached itself from one of the highest needles, and bounded from one precipice to another with great rapidity; but before it reached the plain it was almost reduced to dust. 'Having proceeded about an hour,' says he, 'we were astonished with a view more magnificent than imagination can conceive: hitherto the glaciers had scarcely answered my expectations, but now they far surpassed them. Nature had clad herself in all her terrors. Before us was a valley of ice twenty miles in extent, bounded by a circular glacier of pure unbroken snow, named Takul, which leads directly to the foot of Mount Blanc, and is surrounded by large conical rocks, terminating in sharp points like the towers of an ancient fortification: to the right rose a range of magnificent peaks, their intervals filled with glaciers; and, far above the rest, the magnificent summit

of Mont Blanc, his highest point obscured with clouds. He appeared of such immense magnitude, that, at his presence, the circumjacent mountains, however gigantic, seemed to shrink before him, and hide their diminished heads. In half an hour we arrived at the moraine, which forms a boundary of the valley, crossed it, and proceeded upon a body of ice about three quarters of a mile broad. Here the ice was more even and free from chasms than in the great valley. We then passed a second moraine, and beyond that another mass of ice to a third moraine: descending thence we came upon the last ridge of ice, broader considerably than the two former, and full of large chasms: it is separated from the rock only by a very narrow moraine. These moraines contain great quantities of crystal.' They continued to ascend the valley of ice, the scene constantly increasing in magnificence and horror: and, having walked about five miles on the ice, they arrived at last at the foot of the eminence named couverte, where they were obliged to quit the ice. The doing this was extremely dangerous, and at one place very tremendous. It was a bulging smooth rock, with a precipice of considerable depth terminated by a vast crevice in the ice, which seemed to stop all further progress: a small hollow in the middle, however, afforded room for one foot; and, having fixed this, they sprung over to the other side, being helped and directed by the guides who went over first. Having gained the top of the couverte, they had a view of three of the glaciers, viz. that of Talefre to the left, l'Echant in front, and Takul on the right; all uniting in that great one called the Glacier de Bois. The Couverte itself is a most extraordinary rock, having the appearance of a large irregular building with many sides; the substance of which is granite. Having reached the top, they were surprised with a thunder-storm, from which they took shelter under an impending rock. The view was exceedingly magnificent; the glaciers appearing like a rugged expanse of frozen sea bounded by gigantic rocks, and terminated by Mont Blanc. A single rock appeared of a triangular figure covered with Alpine plants; and which, by reason of its contrast with the rugged and snowy mountains in the neighbourhood, has obtained the name of the Garden. During this, as well as other excursions among the Alps, Mr. Coxé had occasion to observe that the color of the sky was of a much deeper blue than in the lower regions.

The Upper Glaciers may be subdivided into those which cover the summits, and those which extend along the sides of the Alps. Those on the very summit, however, though they have the appearance of ice, are not so in reality, but consist entirely of snow hardened by the extreme cold. M. Saussure found that which covered the top of Mont Blanc to be penetrable, though with difficulty, by a stick; but below this hard crust was a soft snow without coherence. The sides are covered with a mixture of ice and snow; by reason of the superior power of the summer sun to dissolve the snow, which afterwards congeals into hard ice.

Mr. Coxé agrees with M. Gruner in opinion,

that the glaciers are produced by the continual dissolution of the snow in summer, and its congelation by the succeeding frosts. Hence, on the summits of the mountains, where the sun has very little power, the glacier is soft, and contains no ice: as we descend the mountains, the consistence becomes firmer, because there is a considerable mixture of snow-water, the congelation of which augments the hardness; and in the valleys the glacier is hardest of all, because the portion of water is there much superior to that of the snow. Hence it seems plain, that the glaciers derive their origin from the melting of the snow on the upper parts of the mountains, and the congelation of the water as it advances: and to this cause M. Saussure adds the quantity of snow which often rolls down into the valleys and congeals along with the water.

Another question concerning the glaciers naturally occurs, namely, Whether they are to be considered as in a state of increase or diminution? Mr. Coxe is of opinion, that they occasionally increase and decrease: in proof of which he adduces the following observations. 'The borders of the glacier of Montanvert are mostly skirted with trees: towards its base a vast arch of ice rises to nearly 100 feet in height; under which the river Averois rushes with considerable force, and in a large body of water. As we approached the ice, we passed through a wood of firs: those trees which stand at a little distance from the arch are about eighty feet high, and are undoubtedly of a very great age. Between these and the glacier the trees are of a later growth; as is evident from their texture and inferior size. Others, still smaller, have been overturned and enveloped in the ice: there seems to be a kind of regular gradation in the age of these several trees, from the largest which are standing to the smallest that lie prostrate. Hence, our author concludes, that the glacier once extended as far as the row of small firs; but that, upon its gradual dissolution, a number of trees shot up on the spot it had occupied; since which time the ice has again advanced, and overturned the last grown trees before they had attained to any considerable height. This he thinks also confirmed by the following facts: large stones of granite are usually found at a small distance from the extremities of the glacier. 'These stones have certainly fallen from the mountains upon the ice; have been carried on in its progress; and have tumbled into the plain upon the dissolution or sinking of the ice which supported them. These stones, which the natives call moraine, form a kind of border towards the foot of the valley of ice, and have been pushed forward by the glacier in its advances: they extend even to the place occupied by the larger pines.' In opposition to those who maintain that there is a constant accumulation of ice and snow in the Alpine regions, our author makes the following remarks: 1. Between the years 1776 and 1785 the glacier of Grindevald had diminished to such a degree, that the spot which its extremity occupied in the former year was at least 400 paces from that occupied by it in the latter. 2. In 1785 the Murailles de Glace, which in 1776 he had described as forming the border of the glacier of Besson, no longer existed; and young

trees had shot up in the parts which were then covered by the glacier of Montanvert. Still, however, it may be urged, that these changes only take place in the valleys, where the power of the sun is considerable; and that from thence we cannot form any adequate idea of what passes in the more elevated regions, where in all probability more snow falls than can be dissolved. In support of this opinion, it is alleged that the cold produced by the mass of ice already formed must have augmented it still more; and that, within the memory of the present generation, many places have been covered with ice, which were not so before. To these arguments, however, Mr. Coxe replies, that the causes which diminish the ice in the upper regions are no less powerful than the cold which tends to augment it. These are, 1. Rain or sleet; which, falling upon the lower glaciers, thaw the ice, increase the rills on its surface, excavate channels, and in many ways tend to diminish its quantity. 2. Evaporation, which takes place even from the surface of the ice itself, acts still more powerfully; and its action is not confined to any particular season. 3. The falling of the snow and ice; both that which comes gradually from the clouds, and which descends from the mountains in great masses, called by the natives avalanches. When these last fall down into milder regions, though sometimes they may resist the influence of the sun and form ice valleys, yet they generally dissolve. They are most common in the upper glaciers, though sometimes they descend upon the lower, while the gradual descent of snow from the clouds, which chiefly takes place in the lower, contributes very much to lessen the mass. 4. All the lower glaciers or valleys of ice rest on an inclined plane, are hollow, and undermined by torrents which are constantly flowing from the upper glaciers, as well as from their own lowermost surface. Their foundation being thus constantly diminishing, the lower glaciers are carried imperceptibly forward into the cultivated fields, where an end is necessarily put to their progress by the heat of the sun. Hence we may see the reason of that strange phenomenon taken notice of by Mr. Coxe, that with one hand he could touch ripe corn, and with the other solid ice. This descent of the glacier is demonstrable from the trees overturned by it, and the moraine always observed at the bottom of the lower glaciers. 5. The heat of the sun is an evident cause of the diminution of the glaciers. To this Mr. Coxe adds another cause less generally known, viz. the warm winds which blow by night as well as by day, both in the upper and lower glaciers. 'These warm winds,' says he, 'are during summer so common in those parts, that I never crossed a glacier without feeling in some particular positions a warmth similar to the air of a hot-bath.' 6. Another cause is the mean temperature of the earth itself; which, where it is not exposed to the piercing cold of the atmosphere, is found to have a temperature always above the freezing point. As the vast thickness of the superincumbent ice, therefore, is in the present case abundantly sufficient to prevent the access of the atmosphere, it is plain that the lower surface of it must, by being in contact with the earth, continually decay.

With regard to the other argument drawn from the known increase of the ice in some places, Mr. Coxe does not deny it; but insists that there is no continual increase of the whole, but that if it increases in some places it diminishes in others; and his opinion in this respect was confirmed by those who frequent the mountains.

We have seen no better account than Mr. Coxe's of these magnificent phenomena: but for more modern observations of travellers amongst them, see ALPS; BLANC, MONT; and EUROPE, p. 673, Vol. VIII.

GLACIS, *n. s.* Fr. In fortification, a sloping bank. It is more especially taken for that which rangeth from the parapet of the covered way to the level on the side of the field.

GLACIS, TERRAIN, or Esplanade, a slope made of earth, and generally covered with sod or grass, which runs from the covert way of a fortified place, towards the country. See FORTIFICATION.

GLAD, <i>adj.</i> & <i>v. a.</i>	} Sax. glæð; Goth, Dan. and Swed. <i>glad</i> ; Teut. <i>glat</i> ; from Lat. <i>latus</i> , joyful; or, says Minshew, a Greek <i>αλαος</i> , <i>clarus</i> , <i>pulcher</i> . Cheerful; gay, expressive of delight and pleasure: its compounds are nearly obsolete.
GLAD'DEN, <i>v. a.</i>	
GLAD'DER, <i>n. s.</i>	
GLAD'FULNESS, <i>n. s.</i>	
GLAD'LY, <i>adv.</i>	
GLAD'NESS, <i>n. s.</i>	
GLAD'SOME, <i>adj.</i>	
GLAD'SOMELY, <i>adv.</i>	
GLAD'SOMENESS, <i>n. s.</i>	

Abraham your fadir *gladde* to se my day: and he saygh and joyede. *Wiclif. Jon. viii.*

O soden wo! that ever art successour,
To worldly blis; spreint is with bitternesse
The' ende of the joye of our worldly labour:
We occupieth the fyn of our *gladnesse*.
Herken this conseil for thy sikernesse,
Upon thy *glade* day, have in thy minde
The unwarly wo of harm that cometh behinde.

Chaucer. The Man of Lawes Tale.

The turtill dove said: Welcom, welcom, May!
Gladding and light to lovers that ben trewe.

Id. The Court of Love.

—Art thou like an asse unto the harpe
That heareth sonn, whan men the stringes ply;
But in his mind, of that no melodie
Maie sinken him to *gladin*; for that he
So dull is in his bestialite.

Id. Troilus and Creseide.

And there him rests in riotous suffisaunce
Of all his *gladfulness*, and kingly joyance.

Spenser.

The highest angels to and fro descend,
From highest heaven in *gladsome* company.

Id. Faerie Queene.

I am *glad* to see your worship.

Shakspeare.

He hath an uncle in Messia will be very much *glad* of it. *Id.*

For his particular I'll receive him *gladly*;
But not one follower. *Id. King Lear.*
He saw rich nectar-thaws release the rigour
Of the' icy North; from frost-bound Atlas' hands
His adamantine fetters fall: green vigour
Gladding the Scythian rocks, and Lybian sands.

Crashaw.

Then first adorned
With their bright luminaries, that set and rose
Glad Evening and *glad* Morn crowned the fourth day.

Milton.

Glad we returned up to the coasts of light. *Id.*

The wily adder blithe and *glad*. *Id.*

Thither they
Hasted with *glad* precipitation. *Id.*

He *glad*
Of her attention, gained with serpent tongue,
His fraudulent temptation thus began. *Id.*

Her conversation
More *glad* to me than to a miser money is. *Sidney.*

It *glads* me
To see so many virtues thus united,
To restore justice and dethrone oppression. *Oweay.*

The *gladsome* ghosts in circling troops attend,
And with unwearied eyes behold their friend. *Dryden.*

The gaping wound gushed out a crimson flood;
The Trojan, *glad* with sight of hostile blood,
His faulchion drew. *Id. Æneid.*

If he be my enemy, let him triumph; if he be my friend, he will be *glad* of my repentance. *Dryden.*

Thou *gladder* of the mount of Cytheron,
Have pity, goddess. *Id.*

By such degrees the spreading *gladness* grew
In every heart, which fear had froze before:
The standing streets with so much joy they view,
That with less grief the perished they deplore. *Id.*

I would be *glad* to learn from those who pronounce
that the human soul always thinks, how they know it. *Locke.*

Oh, he was all made up of love and charms!
Delight of every eye! When he appeared,
A secret pleasure *gladdened* all that saw him. *Addison.*

Each morn they waked me with a sprightly lay;
Of opening heaven they sung and *gladsome* day. *Prior.*

Hark! a *glad* voice the lonely desert cheers:
Prepare the way, a God, a God appears! *Pope.*
Each drinks the juice that *glads* the heart of man. *Id.*

Glad of a quarrel strait I clap the door. *Id.*

If justice Philips' costive head
Some frigid rhymes disburses,
They shall like Persian tales be read,
And *glad* both babes and nurses. *Swift.*

You are going to set us right; and 'tis an advantage every body will *gladly* see you engender the glory of. *Blount to Pope.*

Liberal not lavish is kind nature's hand,
Nor was perfection made for man below,
Yet all her schemes with nicest art are planned,
Good counteracting ill and *gladness* woe. *Beattie.*

A populous solitude of bees and birds,
And fairy formed and many-coloured things,
Who worship him with notes more sweet than words,
And innocently open their *glad* wings,
Fearless and full of life. *Byron. Childs Harold.*

GLADE, *n. s.* From *glopan* to be hot, or to shine; whence the Danish *glod*, and the obsolete English *gled*, a red hot coal. A lawn or opening in a wood.—Lucas. It is taken for an avenue through a wood, whether open or shaded, and has therefore epithets of opposite meaning.

So flamed his eyes, with rage and rancorous ire;
But far within, as in a hollow *glade*,
Those glaring lamps were set, that made a dreadful shade. *Spenser.*

Oft in glimmering bowers and *glades*
He met her, and in secret shades
Of woody Ida's inmost grove
Whilst yet there was no fear of Jove. *Milton.*

O might I here

In solitude live savage, in some *glade*
Obscured, where highest woods, impenetrable
To star or sun-light, spread their umbrage broad,
And brown as evening. *Id. Paradise Lost.*

For noonday's heat are closer arbours made,
And for fresh evening air the opener *glade*.

Dryden.

By the heroes armed shades
Glittering through the gloom; *glades*;
By the youths that died for love,
Wandering in the myrtle grove,
Restore, restore Eurydice to life!
Oh! take the husband, or restore the wife!

Pope.

There interspersed in lawns and opening *glades*;
Thin trees arise that shun each other's shades. *Id.*

Who now, alas! shall teach my humble vein,
That never yet durst peep from covert *glade*;
But softly learnt for fear to sigh and plain,
And vent his griefs to silent myrtle's shade?

Fletcher's Purple Island.

She smiled, arrayed

With all the charms of sunshine, stream, and *glade*,
New drest and blooming as a bridal maid. *Harte.*

GLADEN, *n. s.*

Fr. *gladiateur*; Lat. *gladius*.

GLADDER, *n. s.*

The first two a.e.

GLADIATOR, *n. s.* } a general name given to
plants that rise with a broad blade like sedge;
swordgrass. The latter is a sword-player, or
prize-fighter.

Here Amphitrite sails through myrtle bowers,
There *gladiators* fight or die in flowers. *Pope.*

GLADIATORS, in antiquity, were persons who fought, generally in the arena at Rome, for the entertainment of the people. They were usually slaves, and fought out of necessity; though sometimes freemen adopted the profession, like our prize-fighters, for a livelihood. The Romans borrowed this cruel diversion from the Asiatics; some suppose out of policy, the frequent combats of gladiators tending to accustom the people to despise dangers and death.

From the earliest times with which we have any acquaintance in profane history, it had been the custom to sacrifice captives, or prisoners of war, to the manes of the great men who had died in the engagement; thus Achilles, in the *Iliad*, lib. xxiii., sacrifices twelve young Trojans to the manes of Patroclus; and in Virgil, lib. xi. ver. 81, Æneas sends captives to Evander, to be sacrificed at the funeral of his son Pallas. In course of time they came also to sacrifice slaves at the funerals of all persons of condition: this was even esteemed a necessary part of the ceremony; but, as it would have appeared barbarous to have massacred them like beasts, they were appointed to fight with each other, and endeavoured to save their own lives by killing their adversary. This seemed somewhat less inhuman, because there was a possibility of avoiding death, by an exertion of skill and courage. This occasioned the profession of gladiator to become an art; hence arose masters of the art, and men learned to fight and exercise it. These masters, whom the Latins called *Lanista*, bought young slaves to be trained up to this cruel trade, whom they afterwards sold to such as had occasion to present the people with so horrible a show. These exhibitions were at first performed near the sepulchre of the de-

ceased, or about the funeral pile; but were afterwards removed to the circus and amphitheatres, and became ordinary amusements. The first show of gladiators, called *munus gladiatorum*, was exhibited at Rome, according to Valerius Maximus, by M. and D. Brutus, upon the death of their father, A.U.C. 490. On this occasion there were probably only three pairs of gladiators. In 537, the three sons of M. Æmilius Lepidus the augur, who had been three times consul, entertained the people with the cruel pleasure of seeing twenty-two gladiators fight in the forum. In 547 Scipio Africanus diverted his army at New Carthage with a show of gladiators; which he exhibited in honor of his father and uncle, who had begun the reduction of Spain. In process of time the Romans became so fond of these bloody entertainments, that not only the heir of any great and rich citizen lately deceased, but all the principal magistrates, presented the people with shows of this nature, to acquire popularity. The aediles, prætors, consuls, and, above all, the candidates for offices, made their court to the people, by entertaining them frequently with these fights; and the priests were sometimes the exhibitors of the barbarous shows. Suetonius mentions the *ludi pontificales*, August. cap. 44, and Pliny, the *ludi sacerdotales*, Epist. lib. vii. As for the emperors, to ingratiate themselves with the populace, they humored them with combats of gladiators almost upon all occasions; and, as these increased, the number of combatants increased likewise. Accordingly, Julius Cæsar, in his ædileship, diverted the people with 320 couple. Even Titus Vespasian exhibited a show of gladiators, wild beasts, and representations of sea-fights, which lasted 100 days; and Trajan continued a solemnity of this nature for 123 days; during which time he brought out 1000 pairs of gladiators. Before this time, under the republic, the number of gladiators was so great, that when the conspiracy of Catiline broke out, the senate ordered them to be dispersed into the garrisons and secured, lest they should have joined the disaffected party.

These sports were become so common, and their consequences in a variety of respects so dangerous, that Cicero preferred a law, that no person should exhibit a show of gladiators within two years before he appeared candidate for any office. Julius Cæsar ordered that only a certain number of men of this profession should be in Rome at a time. Augustus decreed that only two shows of gladiators should be presented in a year, and never above sixty couple of combatants in a show; and Tiberius provided, by an order of senate, that no person should have the privilege of gratifying the people with such a solemnity, unless he was worth 400,000 sesterces. They were also considerably regulated by Nerva. Claudius restrained them to certain occasions; but he soon after annulled his decree, and private persons began to exhibit them at pleasure as usual. Some carried the brutal satisfaction so far as to have them at their ordinary feasts. And not slaves only, but other persons, would hire themselves to this infamous office. The master of the gladiators made them all first swear that they would fight to death; and, if they failed,

they were put to death, either by fire, or swords, clubs, whips, or the like. It was a crime for the wretches to complain when they were wounded, or to ask for death, or seek to avoid it when overcome; but it was usual for the emperor to grant them life when they gave no signs of fear, but waited the fatal stroke with courage and intrepidity. Augustus even decreed that it should always be granted them. From slaves and freedmen the inhuman sport at length spread to people of rank and condition; so that Augustus was obliged to issue a public edict that none of the senatorian order should become gladiators; and soon after he laid the same restraint on the knights: nevertheless, Nero is said to have brought upwards of 400 senators, and 600 Roman knights, upon the arena; though Lipsius takes both these numbers to be falsified, and reduces them to forty senators and sixty knights: yet Domitian, that other monster of cruelty, refined upon Nero, exhibiting combats of women in the night-time. Constantine the Great is said to have first prohibited the combats of gladiators in the east. At least he forbade those who were condemned to death for their crimes to be employed; there being an order still extant to the *præfectus prætorii*, rather to send them to work in the mines, dated at Berytus, in Phœnicia, the 1st of October 325. Honorius forbade them at Rome on occasion of the death of Telemachus, who, coming out of the east into Rome at the time of one of these spectacles, went down into the arena, and used all his endeavours to prevent the gladiators from continuing the sport; upon which the spectators of that carnage, fired with anger, stoned him to death. The practice was not, however, totally abolished in the west, before Theodoric, king of the Ostrogoths, put a stop to it entirely, A.D. 500.

Some time before the day of combat, the person who presented the people with the shows gave them notice thereof by *programmas* or bills, containing the names of the gladiators, and the marks whereby they were to be distinguished; for each had his several badge; which was most commonly a peacock's feather, as appears from the scholiast of Juvenal on the 158th verse of the 3d satire, and Turnebus *Advers. lib. ii. cap. 3*. They also gave notice how long the shows would last, and how many couples of gladiators there were; and, it appears, from the 52nd verse of the 7th satire of the 2nd book of Horace, that they sometimes made representations of these things in painting, as is practised among us by those who have any thing to show at fairs. The day being come, they began the entertainment by bringing two kinds of weapons; the first were staves or wooden files, called *rudes*; and the second were effective weapons, as swords, poniards, &c. The first were called *arma lusoria*, or *exercitoria*; the second *decretoria*, as being given by decree or sentence of the prætor, or of him at whose expense the spectacle was exhibited. They began to fence or skirmish with the first, which was to be the prelude to the battle; and, from thence, when well warmed, at the sound of the trumpets they advanced to the second, with which they fought naked. Then they were said *vertere arma*. The terms of striking were *petere*

et *repetere*; of avoiding a blow, *exire*; and, when one of the combatants received a remarkable wound, his adversary or the people cried out, *habet, or hoc habet*. The first part of the engagement was called *ventilare*, *præludere*; and the second, *dimicare ad certum*, or *versis armis pugnare*; and some authors think, with much probability, that it is to these two kinds of combat that St. Paul alludes in the passage, 1 Cor. ix. 26, 27. 'I fight, not as one that beateth the air; but I keep my body under, and bring it into subjection.' If the vanquished surrendered his arms, it was not in the victor's power to grant him life. The people during the time of the republic, and the prince or people during the time of the empire, were alone empowered to grant it. The reward of the conqueror was a branch of palmtree, and a sum of money, probably collected among the spectators: sometimes they gave him his congé, or dismissed him by putting one of the wooden files or *rudes* in his hand; and sometimes they even gave him his freedom, putting the pileus on his head. The sign or indication, whereby the spectators showed that they granted the favor, was *premere pollicem*, which M. Dacier takes to be a clenching of the fingers of both hands between one another, and so holding the two thumbs upright close together; and, when they would have the combat finished, and the vanquished slain, *verterunt pollicem*, they bent back the thumb; which we learn from Juvenal, Sat. iii. ver. 26. The gladiators challenged or defied each other, by showing the little finger; and, by extending this, or some other, during the combat, they owned themselves vanquished, and begged mercy from the people: '*Vieti ostensam digiti veniam a populo postulabant*,' says the old scholiast on Persius.

There were various kinds of gladiators, distinguished by their weapons, manner, and time of fighting, &c.; as, the *andabata*, mentioned under *ANDABATE*: the *catervarii*, who always fought in troops or companies, number against number; or, according to others, who fought promiscuously, without any certain order: the *dimacha*, who fought armed with two poniards or swords, or with sword and dagger: the *essedarii*, who fought in cars: the *fiscales*, or *Cæsariani*, who belonged to the emperor's company; and who, being more robust and dexterous than the rest, were frequently called for; and therefore named also *postulatii*. Several other kinds are mentioned in the ancient authors.

GLADIATORS', WAR (*bellum Gladiatorium*, or *Spartacum*) called also the servile war, was a war which the Romans sustained about A.U.C. 680. Spartacus, Crinus, and Oenomaus, having escaped with other gladiators to the number of seventy-four, out of the place where they had been kept at Capua, gathered together a body of slaves, put themselves at their head, rendered themselves masters of all Campania, and gained several victories over the Roman prætors. At length they were defeated in 682, at the extremity of Italy; having, in vain, attempted to pass over into Sicily. This war proved very formidable to the Romans. Cassius was not able to finish it: Pompey the Great was forced to be sent as general.

GLADIATOR, THE DYING, a most valuable

monument of ancient sculpture, long preserved in the palace of Chigi, but carried to Paris with the Laocoon, &c., in 1796. This gladiator, after having received the mortal stroke, appears particularly careful ut procumbat honeste, 'that he might fall honorably. He is seated in a reclining posture on the ground, and seems to have just strength sufficient to support himself on his right arm; and in his expiring moments he does not abandon himself to grief and dejection; but is solicitous to maintain that firmness of aspect and attitude which the gladiators valued themselves on preserving in this last scene of distress. He betrays no tokens of fear by his countenance, nor sheds one tear. 'Quis mediocris gladiator ingemuit, quis vultum mutavit unquam? Quis non modo stetit, verum etiam decubuit turpiter?' says Cicero, in that part of his Tusculan where he is describing the astonishing firmness of those persons. He appears, notwithstanding his remaining strength, to have but a few moments to live. Thus the ancients knew how to animate marble, and to give it almost every expression of life.

GLADIOLUS, corn-flag, a genus of the monogynia order, and triandria class of plants; natural order sixth, ensate: cor. sexpartite, and ringent; the stamina ascending and bending upwards. There are fifty-two species, of which the best known is, *G. communis*, the common gladiolus. It has a round, compressed, tuberous root; long sword-shaped leaves; an erect flower-stalk, two or three feet high; the top garnished with several pretty large flowers of a red or white color, having each six petals. They appear in May and June, and are succeeded by plenty of seed in August. The plants are very hardy, and will thrive in any soil or situation. They are propagated by offsets from the roots.

GLAIRE, *n. s. & v. a.* Sax. *glær*, amber; Dan. *glar*, glass; Fr. *glair*; Lat. *glarea*. The white of an egg; to sinure with the white of an egg; a kind of halbert.

Unskelked lime, chalk, and *gleire* of an egg.

Chaucer. The Chanones Yemaun's Tale.

GLAMORGANSHIRE, a beautiful county of South Wales, received its name from a contraction of the Welsh words Gwald Morgan, or the county of Morgan, and is supposed to have been so called from a prince of this part of the country said to have been killed 800 years before the birth of our Saviour; but some writers derive its name from the word *mor*, which in Welsh signifies the sea, this being a maritime county. It is bounded on the south and part of the west by the Bristol Channel; on the north-west by Caermarthenshire; on the north by Brecknockshire; and on the east by Monmouthshire; extending forty-eight miles in length from east to west, twenty-seven in breadth from north to south, and 116 in circumference.

The air in the southern part of Glamorganshire towards the sea is temperate and healthful; but the northern part, which is mountainous, is cold and piercing, full of thick woods, extremely barren, and thin of inhabitants; but the mountains serve to feed herds of cattle, and send forth streams which add greatly to the fertility of the

other parts of the county. Indeed, between the mountains there are some fertile valleys, which afford good pasturage; for the level parts, being more capable of cultivation, produce remarkably sweet grass, and pretty large crops of corn. The principal rivers are the Rhymney, the Taff, the Ogmore, the Avon, the Neath, and the Tavey. The Lower Taff rises in the mountains which separate Glamorganshire from Brecknockshire, and traversing a wild district towards the south soon becomes immersed in the coal and copper works with which the vicinage of Swansea abounds, and attended by parallel canals passes through their sulphureous regions to the busy town of Swansea, where it falls into the Glamorganshire Bog. Were it not for the prevalence of these works, and the atmosphere they create, the valley formed by this river would be pleasant, as the hills which encircle it are bold, and not unadorned with wood. An arid sterility, however, marks many of the heights near the copper works, disrobing them of their verdure, and contrasts disagreeably the black soil and aspect of the collieries, combining with them to involve the whole surrounding country in volumes of smoke. The Neath is a much more considerable river than the Tavey, finding its origin in the same range of mountains, but somewhat to the eastward: descending from these, with great rapidity, it forms at last a deep valley, through which it pursues its course southward, inclining a little to the west to Neath, where it meets the tide, and after several curves in the marsh below that town, falls into the centre of the Swansea. The rapid increase of this stream from a cataract to a rivulet, and from a rivulet to a river, as it descends from its mountainous source, is much admired. At Pont-Neath-Vaughan it receives several tributary streams, each of which is adorned with highly romantic glens, intermixed with rock and fringed with brush-wood. It then pervades a valley abounding in rich woods and overhanging groves, which, as it widens, presents a canal and its attendant works parallel with the course of the river. The lawns, plantations, and fine buildings of the Gwoll appear next, proudly overlooking the numerous forges and collieries of Neath; a broad marsh succeeds, after which the entrance of the Neath into the fine bay of Glamorgan is graced with the groves encircling the beautiful territory of Briton Ferry, and the more distant summit of the high hill of Margam, covered with oaks from its base to its summit. The Avon, the Ogmore, and the Ewenny, are three small rivers pervading the vale of Glamorgan, and each falling successively into the great bay formed by the coast of that county. Neither of these is attended with any peculiar features, except the collieries and copper-works which encircle the exit of the Avon, a little below the fine park of Margam, and the town of Bridgend, on the Ogmore, which rises in a small lake among the mountains, and is soon joined by the Llanvy. The Ewenny meets these united streams at last, and each river pursues a line but little deviating from the south in its short course. The Taaffe boasts the same mountainous origin with the rest of the Glamorganshire rivers, but is generally larger and more beautiful than the

others; it inclines throughout to the south-east, forming in its passage a great variety of curves. The more inconsiderable rivers of this county are the Elag, the Hlepsey, the Melta, the Trawgath, the Dulishe, and the Turch.

Glamorganshire has but one mineral spring, i. e. at Swansea. This has an acid styptic taste like alum, though the predominant salt is a martial vitriol. It turns blue with vinegar, and will not curdle with milk. A gallon of this water yields forty grains of sediment of a brown color, which will ferment with spirit of hartshorn and oil of tartar. At Newton, north-west of the mouth of the Ogmore, is a very remarkable spring about eighteen feet in circumference, the water of which sinks at high tide nearly to the bottom, and at the ebbing of the sea it rises almost to the brim. In order to account for this phenomenon, it has been supposed that at high water the air in the veins of the spring, by its being pent up, not being at liberty to circulate, the water is prevented from issuing out; but when the sea retires from the shore, and frees these natural aqueducts from these obstructions, the water is at liberty to issue through them.

Another curiosity of this county is in a promontory near Penrice, the most westerly point of Glamorganshire, called Warmshead-point; it runs about a mile into the sea, and at half-flood the isthmus, which joins it to the main land, is overflowed, so that it is rendered a small island. Near the extremity of this point is a cleft or crevice in the ground, into which if dust or sand be thrown, it will be blown back again into the air; and if a person applies his ear to the crevice, he will plainly hear a deep noise like the blowing of a large pair of bellows. These phenomena are attributed to the undulatory motion of the sea under the arched and rocky hollow of the promontory, which occasions an alternate inspiration and expiration of the air through the cleft.

The roads over the mountains are excessively steep, and strewed with stones of various sizes, detached from the rocks by the winter rains. The lower road from Caerdiff through the county is good. Thence to Cowbridge and Margan the distance is divided by mile-stones. There is no where perhaps south of the Tweed a greater air of rudeness than among the inhabitants of the Glamorganshire mountains; being constantly employed in the coal, iron, and copper works, they are almost naked, excessively dirty, and even their long straight hair hanging about their tawny faces. The women outdo the men in hard labor. Their huts are like their stone fences, confusedly piled up, and locked together without cement or earth.

The various rivers rising in the northern parts of this county, expanding so as to form a middle district tolerably fit for cultivation, are well clothed with wood, terminating in the great level or vale of Glamorgan. This tract, extending along the sea-coast to eight or ten miles inland, is rich in corn and pasture, and well stored with treasures of coals, lead, iron, and limestone. The sea-shores are delightful, having a level sand beach and romantic cliffs mostly of marle. Castles are planted thickly along the coast and in Gowerland; the former to secure the Norman,

the latter the English conquests. Gower is the peninsulated extremity of the county beyond Swansea. In 1099 Henry Beaumont came into this district against the sons of Caradoc ap Jestin, and won from them large portions of their territories. He built the towns of Swansea, Lloughor, Llanridian, and Penrice; the last was erected where Rhys the son of Caradoc ap Jestin was slain. In this manner he fortified himself, exercising intolerable oppressions.

The inhabitants of this peninsula were probably the same people, whether Flemings or English, as those who had settled in Pembroke-shire. The language from a very remote period was English, and their communication with the Welsh continues reserved and jealous. A striking resemblance exists between Gower and the hundred of Castle Martin in Pembrokeshire, in its peninsular form, its exposure, soil, climate, sea-coasts, and inhabitants. In each of these districts, the soil is chiefly upon the same kind of limestone, similar in quality and fertility, backed to the north by rich veins of coal. The buildings indeed are more neat and clean than those of Castle Martin, which exceeds Gower in the number of gentlemen's seats and well-built churches. There are more orchards and more wood in Gower. The west part of each is nearly destitute of wood. Loughor Bay is greatly inferior to Milford Haven, as a harbour, from admitting by a wider entrance a raging sea, especially during the prevalence of south-west winds. In both counties barley-bread is chiefly eaten, though they have wheat of the best quality.

The sea cliffs of both districts are grand, frequented by elegants and some uncommon birds; and the respective coasts abound with plenty of fish, particularly oysters, lobsters, birt, turbot, and soles. The houses are more generally white-washed in Gower. In Castle Martin there are many mud-built houses; in Gower none. The women wear whittles in both counties. In Gower most of the lands are held by that kind of copyhold tenure called Borough English. They are mostly, if not all, freeholders in Castle Martin. This county is stated to contain 422,400 acres of land, of which 305,000 are in a state of cultivation, viz. 43,000 as arable, and 262,000 in pasturage. It is divided into ten hundreds, viz. Caerphilly, Cowbridge, Danis Powis, Kibbor, Llangewelach, Miskin, Neath, Newcastle, Ogmore, and Swansea; comprising 118 parishes, one city (Landaff), one borough (Caerdiff), and four other market-towns (Cowbridge, Neath, Penrice, and Swansea).

The northern and middle parts of Glamorganshire comprise a portion of that great mineral tract which begins at Pontypool in Monmouthshire, and terminates at St. Bride's Bay in Pembrokeshire. The exterior stratum or boundary is, as we have said, a bed of limestone, within which are contained all the strata of the other minerals in the following order:—On the north side of a line, drawn from east to west through the middle of the district, all the strata rise gradually to the north, and on the south side of the same line they rise to the south till they come to the surface, except at the east end, where they rise to the eastward. In the centre of this

ract the iron and coal mines in the vicinity of Myrthr-Tydvil are both the richest and most abundant. The whole of the coal is at the depth of 440 feet beneath the surface of the ground, which is composed of argillaceous strata, with occasional veins of hard rock. The coal is about fifty-two feet deep, the thickness of the veins varying from twelve inches to nine feet in thickness. The iron-stone lies under the stone for about 108 feet, and is separated by argillaceous earth and stone into eighteen different veins, each about four feet ten inches in thickness. When this ore is smelted, it yields iron to the amount of three-tenths of the weight of the ore. The largest and most famous are those near the recently built town of Myrthr-Tydvil, which, within a few years, has grown up from an obscure village to the most populous place in the whole principality of Wales, and contained, in 1811, 11,000 inhabitants. There are seventeen blast-furnaces near this place, each of which can make from fifty to 100 tons of iron weekly. The most extensive of the works, that of Cyfartha, belonging to Messrs. Crawshaw and company, produce annually 11,000 tons of pig-iron, and 12,000 tons of bar-iron.

The manufactory of what are called tin plates, is next in importance: the cheapness of iron and coal causing the tin of Cornwall to be sent here, and spread over those iron plates, which are afterwards to be found in all parts of the world. Thus also the copper ore from Cornwall, from North Wales, and from Ireland, is attracted to Glamorganshire by the cheapness of coal; and is smelted in the extensive works of Aberavon, Neath, and Swansea, whence it is forwarded by water-carriage to the places where it receives its final destination or consumption. There are also some extensive manufactories of earthenware, salt, soap, and woollen cloths in different parts of the county.

The most considerable export from this county is coals from the ports of Swansea and Neath. At the former, the facility of loading vessels is so great, that ships of 300 tons enter with one tide, and are loaded and enabled to sail sometimes the next; but usually with the next tide but one. The quantity exported in a year has amounted to 300,000 tons.

GLAMOUR, or GLAMER, an old term of popular superstition in Scotland, denoting a kind of magical mist believed to be raised by sorcerers, and which deluded their spectators with visions of things which had no real existence, altered the appearance of those which really did exist, &c.

GLANCE, *n. s., v. n. & v. a.* } Goth. *glans*;
GLANC'INGLY, *adv.* } Germ. *glantz*,
to glitter; or from *To Glow*, which see. A sudden ray of light: to shoot as a ray; to fly off or strike obliquely; to view with a quick cast of the eye; to move nimbly; to censure by oblique hints; transiently.

He double blows about him fiercely laid,
That *glancing* fire out of the iron played,
As sparkles from the anvil use,
When heavy hammers on the wedge are swayed.

Spenser.

How can'st thou thus, for shame, Titania,
Glance at my credit with Hippolita,
Knowing I know thy love to Theseus?

Shakspeare.

He has a little galled me, I confess;
But as the jest did *glance* away from me,
'Tis ten to one it maimed you two outright.

Id.

Glancing an eye of pity on his losses,
Enough to press a royal merchant down. *Id.*
Some men *glance* and dart at others, by justifying themselves by negatives; as to say, this I do not.

Bacon.

The aspects which procure love are not gazings, but sudden *glances* and dartings of the eye. *Id.*

O' the' sudden up they rise and dance,
Then sit again, and sigh and *glance*;

Then dance again and kiss.

Suckling.

Sir Richard Hawkins hath done something in this kind, but brokingly and *glancingly*, intending chiefly a discourse of his own voyage.

Hakewill.

His offering soon propitious fire from heaven

Consumed with nimble *glance*, and grateful steam,

The other's not; for his was not sincere. *Milton.*

There are of those sort of beauties which last but for a moment; some particularity of a violent passion, some graceful action, a smile, a *glance* of an eye, a disdainful look, and a look of gravity.

Dryden.

When through the gloom the *glancing* lightnings fly,

Heavy the rattling thunders roll on high. *Rowe.*

I have never *glanced* upon the late designed procession of his holiness and his attendants, notwithstanding it might have afforded matter to many ludicrous speculations.

Addison.

Mighty dulness crowned,
Shall take through Grub-street her triumphant round,
And her Parnassus *glancing* o'er at once,
Behold a hundred sons, and each a dunce. *Pope.*

Through Paris' shield the forceful weapon went,
His corslet pierces, and his garment rends.
And *glancing* downwards near his flank descends.

Id.

He had written verses wherein he *glanced* at a certain reverend doctor, famous for dulness. *Swift.*
The ample mind takes a survey of several objects with one *glance*. *Watts on the Mind.*

Boldly she looked, like one of high degree;

Yet never seemed to cast a *glance* on me;

At which I inly joyed, for truth to say,

I felt an unknown awe, and some dismay.

Harle.

To trim the ringlets of his scented hair,

To aim insidious Love's bewitching *glance*,

Or cull fresh garlands for the gaudy fair,

Or wanton loose in the voluptuous dance.

Beattie.

Ours to the *glance*, none saw beside,

The smile none else might understand,

The whispered thoughts of hearts allied,

The pressure of the thrilling hand. *Byron.*

Match me those Hours, whom ye scarce allow
To taste the gale lest Love should ride the wind,
With Spain's dark-*glancing* daughters—deign to know,

There your wise Prophet's Paradise we find,

His black-eyed maids of Heaven, angelically kind.

Id. Child Harold.

GLAND, *n. s.*

GLAND'ERS, *n. s.*

GLAND'EROUS, *adj.*

GLAND'ULE, *n. s.*

GLANDULOSITY, *n. s.*

GLAND'ULOUS, *adj.*

Fr. *gland, glandule*;

Lat. *glands and glandula*;

Fr. *glanduleux*;

Lat. *glandulosus*. Used

also in composition

with Lat. *fero*. Organs

P

for secreting fluids in the human body. Hence applied to the secretions themselves when diseased; that which bears acorns or fruit like acorns, from supposed resemblance in shape to a gland.

His horse is possessed with the *glanders*, and like to mose in the chine.

Shakspeare. Taming of the Shrew.

In the upper parts of worms are found certain white and oval *glandulosities*. *Brouene's Vulgar Errors.*

The beaver's bags are no testicles, or parts official unto generation, but *glandulous* substances that hold the nature of emunctories. *Id.*

Nature hath provided several *glandules* to separate this juice from the blood, and no less than four pair of channels to convey it into the mouth, which are called ductus salivales. *Ray.*

The beech is of two sorts, and numbered amongst the *glandiferous* trees. *Mortimer's Husbandry.*

All the *glands* of a human body are reduced to two sorts, viz. conglobate and conglomerate. A conglobate *gland* is a little smooth body, wrapt up in a fine skin, by which it is separated from all the other parts, only admitting an artery and nerve to pass in, and giving way to a vein and excretory canal to come out: of this sort are the *glands* in the brain, the labial *glands*, and testes. A conglomerate *gland* is composed of many little conglobate *glands*, all tied together, and wrapt up in the common tunicle or membran.

Quincy.

The *glands*, which o'er the body spread,
Fine complicated clues of nervous thread,
Involved and twisted with the arterial duct,
The rapid motion of the blood obstruct.

Blackmore.

Such constitutions must be subject to *glandulous* tumours, and ruptures of the lymphaticks.

Arlthnot.

The abscess begun deep in the body of the *glands*.

Wiseman.

GLANDS. See ANATOMY, Index.

GLANDERS, a disease in the horse, so termed, probably, from the swelling with which it is usually accompanied, of the sub-maxillary glands. It consists of an altered and vitiated action of the vessels which, in a state of health, secrete the mucus covering the pituitary membrane, or that membrane which lines the cavity of the nostrils.

The marks of glanders are a discharge of purulent matter from ulcers situated in one or both nostrils, more often from the left than the right. This discharge soon becomes glairy, thick, and white-of-egg-like: it afterwards shows bloody streaks, and is fetid. The glands of the jaw of the affected side, called the kernels, swell from an absorption of the virus or poison, and as they exist or do not exist, or as they adhere to the bone or are detached from it, so some prognosis is vainly attempted by farriers, with regard to the disease; for in some few cases these glands are not at all affected, and in a great many they are not bound down by the affection to the jaw. As there are many diseases which excite a secretion of matter from the nose, and which is kept up a considerable time; so it is not always easy to detect glanders in its early stages. Strangles and violent colds keep up a discharge from the nostrils for weeks sometimes. In such cases a criterion may be drawn from the existence of ulceration within the nose, whenever the disease has

become confirmed. These glanderous chancres are to be seen on opening the nostril a little way up the cavity, sometimes immediately opposed to the opening of the nostril: but a solitary chancre should not determine the judgment. The health often continues good, and sometimes the condition also, until hectic takes place from absorption, and the lungs participate, when death soon closes the scene.

The glanders is the opprobrium medicorum, for hitherto no attempts have succeeded in the cure of more than a few cases. By some peculiar anomaly in the constitution of the horse, although conclusive proofs are not wanting that this and farcy are modifications of one disease, and can each generate the other; yet the one is incurable, while the other is cured every day. When glanders has been cured, the time and labor necessary to accomplish the end has swallowed up the value of the horse; and has also, in many supposed instances of cure, left the animal liable to future attacks which have occurred. The experiments on glanders, pursued at the Veterinary College and by White of Exeter, have thrown great light on the disease itself, its causes, connexions, and consequences; but have done little more. From these we are led to conclude that glanders will produce farcy, and that farcy can produce glanders; that glanders is highly infectious, and that such infection may be received by the stomach, or by the skin when it is at all abraded or sore: and it is also probable that it is received by the noses of horses being rubbed against each other. White's experiments go to prove that the air of a glandered stable is not infectious; but this matter is by no means certain, and should not be depended on without a greater body of evidence.

The cure, it has already been stated, is so uncertain that it is hardly worth the attempt; however, when the extreme value of the horse or the love of experiment leads to it, it may be regarded as fixed by experience, that nothing but a long course of internal remedies, drawn from the mineral acids, can effect it. These have all been tried in their endless variety. White recommends the mildest preparations of mercury, as athiops mineral; under the conviction that the more acrid preparations disturb the powers of the constitution so much, as to destroy as effectually as the disease. At the Veterinary College the sulphate of copper (blue vitriol) has been long in use. Others have used the sulphates of iron and zinc. Clark recommends the daily administration of a drink or ball, composed of the following ingredients: sulphate of zinc fifteen grains, powdered cantharides seven grains, powdered allspice fifteen grains; of which he gives one or two extraordinary proofs of utility. All glandered horses in the army are ordered to be shot.

GLANDEVES, a town of France, in the department of the Lower Alps, formerly flourishing but now almost deserted, on account of the overflowing of the Var.

GLANDORE, a town of Ireland, in Cork, with an excellent harbour, three miles west of Ross, and six west of Galley Head. Between this harbour and Ross, the coast is high and bold with only two small coves: viz. Mellecove on the

east and Cowcove on the west. Near the harbour is a castle; and on the upper end a deep and dangerous glen, called the Leap. Long. 8° 56' W., lat. 51° 22' N.

GLANDORP (Matthias), M.D., a learned physician, born in 1595, at Cologne, in which town his father was a surgeon. After taking his degree at Padua, and visiting the principal towns of Italy, he settled at Bremen in 1618, where he practised physic and surgery with success, and was made physician to the republic and to the archbishop. He published at Bremen, 1. *Speculum chirurgorum*, in 1619. 2. *Methodus medendæ paronychiæ*, in 1623. 3. *Tractatus de polypo narium affectu gravissimo*, in 1628; and, 4. *Gazophylacium polypusium foniculorum et Setonium reseratum*, in 1633; which were republished, with his life prefixed, at London, in 4to. 1729. He died young.

GLANDULÆ RENALES. See ANATOMY.

GLANVIL (Joseph), a learned and ingenious, but fanciful and credulous writer in the seventeenth century, born at Plymouth in 1636, and bred at Oxford. He was a great admirer of Mr. Baxter, and zealous for a commonwealth. After the Restoration, he published *The Vanity of Dogmatizing*; was chosen F. R. S. and, taking orders in 1662, was presented to the vicarage of Frome-Selwood in Somersetshire. In 1662 he published his *Lux Orientalis*; in 1665 his *Scep sis Scientifica*; and in 1666 *Some philosophical considerations touching the being of witches and witchcraft*. In 1668 he published *Plus ultra*; or, the progress and advancement of knowledge since the days of Aristotle. He likewise published, *A seasonable recommendation and defence of reason*; and *Philosophia Pia*, or *A discourse of the religious temper and tendencies of the experimental philosophy*. In 1678 he was made a prebendary of Worcester, and died in 1680.

GLANVILLE (Bartholomew), an English botanical author of the fourteenth century, commonly called Bartholomæus Anglus. He was a Franciscan friar, descended of the noble family of Suffolk, and flourished in the reign of Edward III. He wrote a book on natural history, entitled *De Proprietatibus Rerum*; which was translated into English by John de Trevisa, in 1398.

GLARE, *v. n.*, *v. a.* & *n. s.* } Dut. *glaren*;
GLAREOUS, *adj.* } French *glaireux*;
GLARING, *adj.* } Latin *glaricosus*.
To shine with intense splendor: a piercing overpowering look; any thing transparent, as the white of an egg; notorious as a glaring crime.

Thou hast no speculation in those eyes,
Which thou dost glare with.

Shakspeare. *Macbeth*.

Look, how pale he glares. *Id.* *Hamlet*.

After great light, if you come suddenly into the dark, or, contrariwise, out of the dark into a glaring light, the eye is dazzled for a time, and the sight confused.

Bacon.

His glaring eyes with anger's venom swell,
And like the brand of foul Aleeto flame. *Fairfax*.

About them round,
A lion now he stalks with fiery glare.

Milton.

One spirit in them ruled, and every eye
Glared lightning, and shot forth pernicious fire
Among the' accurst, that withered all their strength.

Id.

Now friends no more, nor walking hand in hand;
But when they met they made a surly stand,
And glared, like angry lions, as they passed,
And wished that every look might be their last.

Dryden.

The frame of burnished steel that cast a glare
From far, and seemed to thaw the freezing air.

Id. *Fables*.

He is every where above conceits of epigrammatic wit, and gross hyperboles: he maintains majesty in the midst of plainness; he shines, but glares not; and is stately without ambition.

Dryden.

The court of Cæus stands revealed to sight;
The cavern glares with new admitted light.

Id.

Beholds this man in a false glaring light,
Which conquest and success have thrown upon him.

Addison.

I have grieved to see a person of quality gliding by me in her chair at two o'clock in the morning, and looking like a spectre amidst a glare of flambeaux.

Id. *Guardian*.

The most glaring and notorious passages are none of the finest, or most correct. *Felton on the Classics*.

Here in a grotto, sheltered close from air,
And screened in shades from day's detested glare,
She sighs for ever.

Pope's *Rape of the Lock*.

When flattery glares, all hate it in a queen,
While one there is who charms us with his spleen.

Pope.

Then, nor till then, the veil's removed away
And all the woman glares in open day.

Id.

Sighs from a breaking heart my voice confound;
With trembling step to join your weeping train,
I haste where gleams funeral glare around,
And, mixed with shrieks of woe, the knells of death resound.

Beattie.

Maidens, like moths, are ever caught by glare,
And Mammon makes his way where seraphs might despair.

Byron.

GLARIS, or GLARUS, a Protestant canton of Switzerland, bounded by those of St. Gall, the Grisons, Uri, and Schweiz, and having a superficial extent of about 400 square miles. The aspect of the country is not attractive; a large proportion of the surface being occupied by rocks, inaccessible forests, barren heaths, or lofty mountains: its wealth is in pasture, sheep, goats, and cattle.

The canton properly consists of one great valley, and three lateral ones, enclosed by mountains on all sides except the north-east. In the valleys, the climate is warm and pleasant, but the soil is stony throughout, and little adapted to agriculture. The principal river is the Linth, from the banks of which the great valley extends in the form of an amphitheatre of fine meadows terminated by rocks and mountains covered with snow. This gives the country, on entering it from the north, a very picturesque appearance. The principal lakes are those of Wallenstadt and Clonthal. The only mineral production of importance is slate; but rock crystal, marble, gypsum, spar, and different petrifications, are found in all parts of the country; and large quantities of cheese are annually exported. Merino sheep were lately introduced here, and the quality of the wool has thus been much im-

proved. The carrying trade between Italy and Germany is also prosecuted with activity, and there is also some trade with Holland, by means of the Rhine. Corn is imported.

The inhabitants manufacture, on a small scale, woollen, linen, and cottons. This canton belonged in the middle ages, to the imperial abbey of Seckingen, and was under the protection of Austria till the end of the fourteenth century, when it joined the Swiss confederacy. In the seventeenth century the inhabitants sustained some obstinate contests for their religion, which were, however, terminated in 1683, and liberty of conscience recognised by all parties. The present government is democratic; all males above sixteen years of age having a voice in the general assembly. Glaris was the scene of some hostile operations between the French and Austrians in 1799. It is divided into fifteen small districts. Population 20,000.

GLARUS, the chief town of the above canton of the same name, is situated on a rising ground near the Linth, from the inundations of which it is secured by a thick dam. It is well built, and has a population of about 2500, extensive bleach-fields, and manufactures of cotton. Thirty-two miles east of Lucerne.

GLASGOW, an extensive, commercial, and manufacturing city of Lanarkshire in Scotland, pleasantly situated on the north bank of the river Clyde, which is here crossed by three bridges. The observatory, which stands a little to the north-west of the city, is in W. long. $4^{\circ} 15' 51''$ and N. lat. $55^{\circ} 52' 10''$. The greater portion of the city is built upon a plain on the banks of the river, whence it gradually ascends towards the north till it reaches the rising ground on which the cathedral stands. Glasgow, with its various suburbs, the barony of Gorbals, Calton, Bridgetown, Brownfield, Anderston, and Finnieston, stands on nearly 700 acres of ground; and when viewed from many points at a distance, has, with its numerous spires, domes, and towers, a very beautiful and interesting appearance.

It is built with great regularity and order, the streets being upon an average sixty feet wide, and laid out, almost universally, at right angles with each other. They are well paved with whinstone, and broad flag-stone, and kept remarkably clean and in good order. The houses are in general lofty, and built of free-stone, with polished and ornamented fronts. In the older parts of the town they are divided, as is customary in Scotland, into flats, and some of them contain six stories above the ground; but of late years numerous new streets and ranges of buildings of great architectural beauty have been erected, the houses of which are on the English plan. The principal street in Glasgow, one of the finest in Europe, and which assumes, at different points, the names of Trongate and Argyle Streets, is in length about a mile, and in breadth, upon an average, seventy feet. Its chief interest, however, arises from its being the principal scene of that restless spirit of enterprise and industry which has raised Glasgow to the rank of the second city in the empire.

Though the climate is generally healthy, the air is here somewhat moist. The yearly average

of rain which fell during the thirty years previous to 1790 was $29\frac{65}{100}$ inches. The following table shows the quantity of rain which fell from 1810 to 1814, as ascertained at the Macfarlane Observatory.

Year.	Inches.
1810 . . .	25-132
1811 . . .	27-801
1812 . . .	22-81
1813 . . .	18-368
1814 . . .	19-522

The soil around the city is very various, but is so much improved by an abundant supply of manure as to produce heavy crops of every description. Coal, free-stone, whin-stone, and clay of excellent quality, are to be found in almost every direction.

The word Glasgow has been said to signify, in Gaelic, gray smith; whence it has been inferred that a mechanic of this description had exercised his trade here in very early times. The name is also conjectured to be derived from *glass*, *cocd*, two words signifying the green wood; and it is certain there was in ancient times an extensive forest in the neighbourhood of the cathedral. *Clais-ghee*, in Gaelic, means a black or dark ravine, which, if this is the origin, may allude to the dark glen which has been formed by the stream to the east of the cathedral. Other etymologists derive the name from *egclais*, a church, and *dlu*, black; *egclaisdlu*, or *egclaisghu*, signifying, on this hypothesis, the black kirk. It is said that the bishopric of Glasgow was founded in 560 by St. Mungo Kentigern, the tutelary saint of the city. History has recorded nothing respecting his successors, or the bishopric, for a period of more than 500 years afterwards. Prior to 1100 the church appears to have been a mean building, chiefly constructed of timber which had gone into decay. In the year 1123 John Achais, then bishop, finished and decorated a considerable proportion of the present cathedral, which was consecrated in the presence of the king, David I., who bestowed on the church the lands of Partick, &c. In 1174 bishop Joseline made additions to the cathedral; and in 1180 he procured a charter from William, surnamed the Lion, erecting Glasgow into a royal burgh, and granting liberty to hold a fair for eight days annually. The town appears to have slowly increased, and additions to have been made to the cathedral from time to time by succeeding bishops, until in the beginning of the fifteenth century we find that it contained several streets and received not a little benefit from the wealth which the extensive revenues of the bishopric introduced. About this time bishop Cameron, a very high-minded prelate, made great additions to the episcopal palace, and compelled his prebends, and the other clergy connected with the cathedral, to erect houses, and reside here. In 1450 bishop Turnbull obtained a charter from James II. erecting the town and the patrimonies of the bishopric into a legality; and he likewise procured a bull from pope Nicholas V. for erecting a university within the city, which he afterwards endowed. The establishment of this seminary of learning tended

considerably to increase the number of the inhabitants; and the consequent necessity for additional houses caused the town to spread down the High Street, towards the present cross; and thence along the Salt-market, the Gallow-gate, and the Trongate. Notwithstanding this increase of buildings, however, Glasgow at this time held but an inferior rank among the towns of Scotland; for it would appear that, in 1556, when the royal burghs were taxed by the order of queen Mary, it held only the eleventh place.

In 1652 a great fire broke out which destroyed the greater portion of the Salt-market, Trongate, and High Streets, the houses of which were at that time formed chiefly of wood, and nearly 1000 families were thus ruined. It would appear, however, that in 1695 Glasgow had in some measure recovered from her disasters; for, at the assessment of the burghs that year, she was rated as the second in Scotland in point of wealth. About this period the buildings in the Trongate extended no farther west than the Tron-church. The town continued to increase but very slowly for a considerable period; and, indeed, it is not till the union of the two kingdoms, which, by throwing open the trade to America, gave a vast impulse to the west of Scotland, that we find any important additions made to the city. About the commencement of the last century several new streets were opened up, an additional church was erected, and a few street lamps were introduced for the first time. In 1752 the first four-wheeled gentleman's carriage appeared in use. Subsequent to the middle of the last century, however, the increase of Glasgow in wealth, population, and extent has been rapid and unprecedented. The wealth which began to be acquired in the trade to Virginia has continued to accumulate and increase by the introduction of various manufactures; and by the cultivation of a commerce which now connects the city with every corner of the civilised world. Since the period to which we have alluded, streets, squares, and public buildings have been yearly added, and are still adding to the splendour of the city. Religious and charitable institutions; associations for the improvement of manufactures and commerce; and societies for the dissemination of science and literature, have been formed on a scale worthy of the wealth and enterprise of the inhabitants.

In 1712, a few years after the union, the rental of property within the burgh was £7840 2s. 6d. sterling; in 1824-5 it was, as taken from the government surveys, £279,600 sterling. The value of heritable property within the burgh, taking it at twenty years purchase of the government rental, which, as it is always below the real rent, may be assumed as a fair criterion, is £5,592,000 sterling. The property tax, when last exacted, which was in 1815, was £82,000 sterling; of which £24,000 sterling was raised from property, and £58,000 sterling from business. The assessed taxes were formerly about £30,000 per annum, but in consequence of the late reductions they amount only at present to about £20,000. The total amount of stamp duties collected in Glasgow may be es-

timated at considerably above £100,000. In 1781 the revenue arising from the post-office was £4341; at present it is usually about £36,000. In 1821 the population was 147,043; the last calculation, made by McClelland in 1824, raises it to 170,000.

Since the erection of Glasgow into a burgh in 1180 its constitution has undergone many alterations. In 1268, however, it appears that the town was governed by a provost and bailies. From the year 1450, when the town and patrimony of the bishops were incorporated down to the Reformation, the bishops, or certain lay lords, in their right nominated the magistrates. In 1633 the parliament declared the burgh to be royal, with a power of electing their magistrates; yet we find their right afterwards disturbed by Cromwell and the privy council. In 1690 the town was again declared free by a charter of William and Mary, confirmed by an act of parliament in the same year, to the effect that the town council should have power to elect their own magistrates. The constitution of the burgh underwent some alterations at the convention of royal burghs in 1801, and is now declared to be as follows:—The affairs of the burgh shall be governed by a provost and three bailies of the merchants' rank and two bailies of the trades' rank; twelve counsellors of the merchants' and eleven of the trades' rank; a master of works, who must be of the merchants' rank, and a treasurer of the merchants' and trades' rank, alternately. The dean of guild and a convener of the trades house, are counsellors *ex officio* during the first year they are in office, after which they must be elected ordinary counsellors. The lord provost and the five bailies are charged with the executive, while the magistrates and council conduct the other affairs of the community. This burgh of itself does not return any representative to parliament. The magistrates and council of the burghs of Glasgow, Rutherglen, Dumbarton, and Renfrew, elect one member among them; in the event of equality, each burgh takes the casting vote in rotation.

The revenue of the burgh of Glasgow arises from various sources, but chiefly from what is called the common good; which consists of an impost of two-pennies Scots on the Scotch pint of ale or beer sold within the burgh—ladies and multerries which are certain dues on grain, meal, and fruit brought into it—dues from the public washing-house—rents of markets, church seats, houses, mills, and lands—feus of lands, feudal casualties, and ground annuals—fees from burgh-entries, &c. &c. The expenditure is incurred by burgh assessments—criminal prosecutions, alimenter criminal prisoners, and expense of the prison—contribution to the police establishment—expense of the ecclesiastical and civil establishment—of the grammar school—repairs of heritable property—interest of money, and general improvements. The revenue usually exceeds the expenditure; but, in the ecclesiastical department, it falls considerably short. The following tables show the particulars and total amount of the revenue and expenditure from 1817 to 1824.

REVENUE.

Church and Rents.	Penalties and Casualties.			Rents of Lands, Houses, Mills, Quarries, Salmon-Fisheries, &c.			Dues of Markets, Slaughter-houses, Washing-houses, Lardies and Mul-tories. * The city books were regularly balanced on the 31st of December, annually, till 1822, when an act of Parliament was passed, requiring that in future the accounts of every royal borough in Scotland shall be made up each year to the day preceding the annual election of magistrates. The statement for 1822, therefore, exhibits an incomplete view of the receipts and expenditure for that year. The accounts are now balanced on the 30th of September, annually.

* See Note to preceding Table.

† Since Whitsunday, 1824, the City has been freed from the expense of Bridewell; the act of Parliament, lately passed, ordaining it to be supported by an assessment on the inhabitants of the city and county.

In addition to the revenue of the burgh, the magistrates are entrusted in whole, or in part, with the administration of several other funds, viz. that arising from the navigation of the river Clyde, assessment for the maintenance of the poor, statute labor conversion fund, portage of the bridges, &c.

By the constitution of the burgh, besides the magistrates and council, two other distinct bodies are recognised, the merchants' and trades' houses. The merchants' house consists of all the merchant-burgesses who have paid their regular fee to the funds of the house. The dean of guild, by courtesy styled the lord dean of guild, is president of this house. The members have only the privilege of attending one meeting in the course of the year, and of sharing in the election of twenty-four members of the dean of guild's council. This council consists of the dean of guild, the provost, the three merchant bailies, the collector, and the twenty-four merchants nominated councillors; and to this body is intrusted the administration of the whole funds and affairs of the house throughout the year. The funds arise chiefly from rents, fees, ground annuals, interest, entry-money of members and burgesses, donations and mortifications. The trades' house consists of the deacon-convener, who is president, the late convener, the two trades' bailies, the present and late collector, the present and late deacons of the different incorporated trades, and twenty-six assistants nominated from the incorporations. To these members the whole civil and political interests of the house are entrusted. The affairs of finance are placed under the management of the convener, the deacons, and extraordinary members of the house; these latter are the trades' bailies, collector, and members who have passed the chair, or been at any time in the magistracy. The funds of this body arise from sources similar to those of the merchants' house. Glasgow has the advantage, not only of several local courts of law, where questions of every description, from the most important to the most trifling are decided; but is visited half yearly by branches of the supreme judiciary and civil jury courts. These courts make their circuits in the months of April and September. In the judiciary court all criminal matters arising in the counties of Lanark, Renfrew, or Dumfries, considered to be of an aggravated nature, are tried before two presiding judges, and a jury of fifteen persons chosen from the city, and from other portions of the county of Lanark or the adjoining counties of Renfrew and Dumfries. The judges of this court have likewise a power of reviewing all questions below the value of twenty-five pounds brought before them from any of the inferior local courts. The civil jury court is but of recent introduction into Scotland, and has been adopted in imitation of the English courts. In this court all questions arising out of matters of fact are tried before a presiding judge and twelve jurymen, whose verdict must be unanimous. Issues are prepared previous to the trial in a concise yet comprehensive manner; and it is to the truth or falsehood of the statements con-

tained in these that the verdict of the jury refers.

The sheriff's court, in which the sheriff and his substitute, who are both lawyers, preside, has jurisdiction in civil as well as criminal matters within the county. A court for ordinary civil procedure is held every Wednesday during the sitting of the supreme court at Edinburgh, and once a fortnight during vacation. In this court the procedure is entirely in writing, and the members of the faculty of procurators are the practitioners before it. Besides this, for all civil matters which require despatch, access may be had to the judges each day, and the procedure, in such cases, is summarily despatched, and does not wait for the ordinary court days. In trying criminal matters, which infer capital or corporal punishment or banishment from the county, the sheriff sits with a jury of fifteen persons, though he investigates and punishes the more petty crimes by fine or short imprisonment without the intervention of a jury. The decisions, both civil and criminal, of the sheriff, like those of all other local judges, are subject to the review of the court of session or court of judicatory at Edinburgh. The town court, in which one of the magistrates, with the assistance of a legal assessor, presides, meets each Friday during session, and once a fortnight during vacation for the despatch of business. The powers and the forms of this court are precisely similar to those of the sheriffs, but are limited within the liberties of the city. Here the members of the faculty of procurators likewise practice. The magistrates also judge in criminal matters, but, as they limit their right to petty delinquencies, they never use the intervention of a jury. The dean of guild's court takes cognizance of all disputes arising between neighbouring proprietors of heritable property within the burgh, encroachments on streets, insufficiency of buildings, and adjustment of weights and measures. The court consists of the dean of guild, who is president, four members from the merchants' house, and four from the trades' house, who are styled the dean of guild's brethren. They are assisted in their decisions by a legal assessor. The court meets on Thursdays, and the procedure is nearly similar to that before the sheriff and magistrates' court. In the water bailie court, which is open daily, all questions of a civil and criminal nature connected with maritime affairs, and occurring within the jurisdiction of the court, which extends on the river from the harbour at Glasgow to the Clough light-house, twenty-six miles below the town, are decided. The justices of the peace, as elsewhere, hold petty and quarter sessions in the city, in which all infringements of the excise laws, game laws, disputes between master and servant, and questions of county police are investigated and decided. Besides the local courts before enumerated, in which questions of great value and of nice legal import are often tried, courts are weekly held on separate days by the sheriff, the magistrates, and the justices of the peace, for the investigation and discussion of petty claims, at which the parties attend personally, and a *viva voce* decision is given by

the presiding judge. In these small debt courts, particularly the sheriff's, which is but of recent origin, a vast number of petty claims are discussed; and justice is thus quickly, and at a trifling expense, administered among the poorer classes. The taste for litigation among the inhabitants of this wealthy city, may be in some degree estimated from the following statement. Exclusively of the suits carried on in the sheriff's court, justice of the peace court, and police court, 5798 processes were instituted in the magistrates' courts within the royalty, in 1815, viz. ordinary town court, 1658; summary town court, 608; criminal cases in the town court, 720; dean of guild court, ninety; maritime court, 109; conscience small-debts court, 1053; convene small-debts court, 1560. Since 1815 there is every reason to believe that litigation has increased, particularly before the sheriff, since the institution of his small-debts court.

It is not to be expected, in an article so limited as the present, that any very minute account of the numerous public buildings of the city can be given; or that even the names of many of them can be mentioned. The most important, however, are the cathedral, which stands on a rising ground in the north-east division of the city, and is a very magnificent specimen of the early English style of architecture, and is the only perfect specimen but one of the ancient religious edifices, which the misdirected zeal of the Scottish reformers has spared. It is a cross church with remarkably short transepts, having a very beautiful tower and spire at the intersection, and a smaller tower at the north-west end. Much pains have been taken of late years in preserving and repairing it. The greatest internal length of the building from east to west is 319 feet; the breadth sixty-three feet; the height of the nave ninety feet; and of the choir eighty-five feet. The edifice is supported by 147 pillars, and lighted by 157 windows. It at present accommodates two congregations, thus serving for two city parish churches. One of these congregations is accommodated in the choir, now called the inner High Church; the western part of the nave, an internal wall having been erected, accommodates the other congregation, and is called the outer High Church. The portion of the nave between the entrance to the choir and the outer High Church is used as a vestibule or place of entrance for both churches. The crypt, certainly the finest in the kingdom, and situated immediately beneath the choir, is used as a burying ground for the heritors of the barony parish. Besides the cathedral, Glasgow contains ten other parish churches, among which St. Andrew's, St. George's, and St. David's, deserve to be not ced as being ornamental to the city. St. Andrew's was founded in 1739, is a pretty exact copy of St. Martin's in the Fields, Westminster, and is considered the best specimen of the composite order in Scotland. St. George's was built in 1807, from designs by Mr. William Stark: the original design, however, was considerably injured by some unfortunate deviations which were considered necessary to be made in erecting the building. St. David's, erected in 1825, is one of the greatest ornaments the city has re-

cently received: it is in the Gothic style, and from designs by Mr. Rickman of Birmingham. The Catholic chapel, which is in the pointed style, is a very fine structure, and richly decorated both externally and internally. Glasgow and its neighbourhood possess eight chapels connected with the established church, and upwards of thirty belonging to different denominations unconnected with the establishment; besides several others where the worship is conducted by lay elders. Some of the chapels recently erected, by dissenting congregations, are handsome buildings, and good specimens of the various orders according to which they are erected.

The most ancient of the three bridges is situated at the foot of Stockwell Street, and was erected in the year 1345 by William Rae, then bishop of Glasgow. In the year 1777 an addition of ten feet was made to its breadth, by which it was strengthened, and the passage was rendered more convenient for carriages. Being the great thoroughfare, however, to the city from the south, it was still found too narrow, and was therefore, in 1820, again widened in a very ingenious manner. The whole former breadth of the bridge is now allotted for carriages, and, the old parapets having been removed, a new series of cast iron arches have been added to each side, on which pavements of stone, for the convenience of foot passengers, are supported. The other stone bridge, at the foot of Jamaica Street, was erected in 1768 from designs by Mr. Milne, and appears to combine strength with simple elegance. It is in contemplation at present to widen it in the same manner as the other bridge has been widened. In 1803 the third bridge, which is of timber, and much admired for the simplicity of its structure, was thrown across the Clyde at the foot of Saltmarket Street, for the accommodation of foot passengers only. This useful structure, notwithstanding that much money and great care have been yearly expended in keeping it in repair, seems to be now too much decayed to be longer used with safety. The magistrates have, therefore, very wisely closed it as a thoroughfare. In 1814 an act of parliament was obtained for building a bridge near the site of one which fell ere it was completed in 1795; and designs were procured from Mr. John Rennie; but nothing farther has yet been done with regard to it.

The town-hall buildings are situated at the cross. The basement story forms an arcade with a rusticated front; the upper part is in the Ionic order, and the hall itself is elegantly fitted up. It contains portraits of the kings and queens of Scotland, and other public characters; the bust of his late majesty, and a statue of the late Mr. Pitt by Flaxman.

The trades-hall buildings, in which the four-teen incorporated trades hold their meetings, were erected in 1791, by designs from Mr. Robert Adams. The front consists of a centre building and two wings, the former having two stories, supported by a rustic basement. The whole is crowned by a dome, terminating in a lantern, which has a very fine effect. The merchants of Glasgow have, at present, no hall of their own in which to hold their meetings; their former hall stood in the Bridgegate, but, as nei-

ther its situation nor condition was considered suited to their wealth and respectability, the building was taken down, and the ground sold some years ago; the steeple, however, one of the finest in the city, has been allowed to remain. Many proposals have been made for building a new hall and an exchange, and a committee for the accomplishment of these objects has been in existence for some years, but they have not, as yet, done more than plan.

The jail, court-hall, and public offices, situated at the west end of the green, were erected in 1810, from designs by Mr. William Stark. This building is of the Doric order, the portico in front possessing very nearly the proportions of the celebrated Parthenon. The columns are placed on colossal steps; and there is a recess divided from the portico by a screen of columns like the pronaos of the ancient temple. These buildings are of a quadrangular form, and contain halls for the several courts of justice, and ample accommodation for the whole civil and criminal establishments. The entry to the jail is by the west front. This portion contains two court yards, seventy-four fire rooms, fifty-eight cells, and two apartments for prisoners under sentence of death, so completely cased with iron that it is not necessary to put the criminals in chains. There are also a chapel, a military guard-house, and a dwelling for the governor of the jail. The following tables show the number of persons incarcerated in Glasgow Jail for debt or crime from the year 1815 to the year 1822 inclusive:—

Persons incarcerated for debt,

Years.	Persons.	Years.	Persons.
1815	405	1819	779
1816	458	1820	742
1817	433	1821	838
1818	320	1822	832

Persons incarcerated for crime,

Years.	Persons.	Years.	Persons.
1815	914	1819	1323
1816	1044	1820	1221
1817	1021	1821	1196
1818	1016	1822	1150

The city and county bridewell recently erected (the old buildings having been found inadequate) is in the Gothic style of architecture. It consists of a central compartment and two projecting wings. The former contains the governor's house, offices, and a chapel. The wings, in which the delinquents are kept, is thus under the constant inspection of the governor, while the important object of solitary confinement is completely effected.

The university buildings, and the houses for the accommodation of the professors, are situated on the east side of the High Street. The buildings, and the quadrangles which they circumscribe, occupy a space equal to 9556 square yards. The centre gate, in the principal front,

is ornamented with a species of demi-rusticated work; the royal arms in basso relievo, gilt, are placed over the gate, and consols, supporting a broad balcony, are formed at each side. The entire of the façade is terminated on the south by the principal's house, and on the north by that occupied by the professor of oriental languages. The eastmost range of buildings, having become unfit for the purposes intended, were taken down in 1811, and a magnificent range, in the Doric order, erected on their site. This new erection contains the common hall, anatomical theatre, and rooms for the humanity, Greek, logic, chemistry, medical, and mathematical classes. The grounds to the east of the university, called the college garden, are laid out in walks and shrubbery for the use of the professors and students. The Macfarlane observatory is situated at the east end of them. At the west end of these grounds, and immediately in front of that part of the college buildings mentioned as having been erected in 1811, stands the edifice provided for the splendid bequest left by the celebrated Dr. William Hunter to the university. The portico, forming the principal front of this building, which contains the Hunterian Museum, is a very fine specimen of the Roman Doric. The other fronts of the building exhibit a simplicity and elegance which render many views of it little if at all inferior to the principal front. The interior corresponds, in a remarkable degree, to the beauty of the exterior. It exhibits the same simplicity and the same elegance. The saloon, for paintings, is particularly fine in its form, proportions, and decorations, while, at the same time, it is admirably adapted for exhibiting the collection which it contains.

The royal infirmary, both from its appearance and situation, has a very imposing effect. In form it is somewhat of a parallelogram with projections at each end, having a pediment in the centre, supported by pillars of the Corinthian order; a spacious dome terminates the building, which consists of four stories. It was constructed to accommodate 150 patients, yet, some years ago, it was found insufficient to admit the numerous applicants. A large addition has therefore been made to the building, which, while it does not injure its appearance, adds a third part to the accommodation.

The lunatic asylum is a plain edifice, consisting of a central building and four ranges of wards projecting diagonally from it. Its dome and general proportions are considered very beautiful. Hutcheson's hospital, erected in 1803 from designs by Mr. David Hamilton, is also a very respectable addition to the buildings devoted to purposes of benevolence in Glasgow. The theatre is one of the largest and most elegant in the kingdom out of London; and the assembly rooms are, in design and accommodation, worthy of the city.

There can be little question that the situation of Glasgow has tended in a high degree to advance her in the scale of commercial cities. Placed on the border of one of the richest coal and mineral fields in the island with which it communicates by a canal, and connected on the one hand with the Atlantic by the Clyde, and on

the other with the North Sea and German Ocean by the Forth and Clyde navigation, its leading advantages are peculiarly great. Previously to 1707 the foreign trade of Glasgow, such as it was, was chiefly confined to Holland and France. The union of the kingdoms having, however, opened the colonies to the Scotch, the merchants of Glasgow immediately engaged in a trade with Virginia and Maryland. The city soon became a mart for tobacco, and the chief medium through which the French obtained their supplies. This trade was suspended by the breaking out of the American war, and the merchants of Glasgow were obliged to engage their capital in other pursuits. Until about the year 1775 many attempts had been made without effect to open a connexion with the West Indies. In that year the imports from that quarter into the Clyde were as follows: sugar 4621 hogsheads and 691 tierces; rum 1154 puncheons and 193 hogsheads; cotton 503 bags.

The increase of trade which has taken place since that period may be appreciated from the following statement of imports, taken from the custom-house books for the year 1815. Exclusive of grain, hemp, tallow, &c., from the Baltic through the great canal, sugar 540,198 cwt. 2 qr. 25 lbs.; rum 1,251,092 gallons; cotton wool 6,530,177 lbs. The import duties on these and other articles amounted to £363,958 2s. 6d. They employed 448 ships, the tonnage of which was 79,219 tons and 4868 men. The exports during the same period to America, the West Indies, and different parts of Europe, amounted to £4,016,181 12s. 2½d. In this traffic were employed 592 ships, 94,350 tonnage, and 6,476 men. Previous to 1718 the commerce of Glasgow was carried on in vessels chartered from the English ports. In that year the first ship built on the banks of the Clyde belonging to the city crossed the Atlantic. At the close of the American war an intercourse was opened with the different states of the American union, and this trade together with that to Canada and Nova Scotia has become both valuable and important to the merchants of Glasgow.

In the spring of 1816 the first ship which sailed direct from Scotland to the East Indies was despatched to Calcutta by Messrs. James Finlay, and Co. Since then a number of Glasgow merchants have engaged in the trade to India. Twenty-two banks and branches of banks do business in the city, many of them to a considerable amount. Linens, lawns, cambrics, and other articles of similar fabric were the staple manufacture in Glasgow till 1785, when the introduction of fine muslins from yarn spun by mule-jennies, gave to the city a new branch of trade. The progress of the cotton manufacture after its introduction was very rapid, and has come to be of great importance; the manufactures of Glasgow not only supplying their own export merchants, but having opened extensive connexions with London and other parts of England, and even with the continent. In the year 1818 there were fifty-four mills for spinning cotton, containing 600,000 spindles, belonging to Glasgow, situated either in the city or country adjacent. Since then the number has increased to 737,500 spindles. In the summer of 1845

there were in the city or neighbourhood fifty-four loom factories, of which thirty were in full operation and twenty partly filled with machinery. The gross number of power looms then working amounted to 7400, producing about 37,000 pieces weekly, or 1,924,000 pieces containing 48,100,000 yards per annum. The number of hand looms employed by Glasgow manufacturers was calculated in 1819 at 32,000, but of these only 18,537 were situated in Glasgow or its neighbourhood, the rest being in different small towns around the country. In 1802 the manufactures of Bandana handkerchiefs was established by Messrs. Monteith, Bogle, and Co.; and this branch of trade, which has become very important, has hitherto been confined to Glasgow. There are at present thirty-eight calico printing establishments in Glasgow and its vicinity, in which Britannias, black and purple shawls of various widths, handkerchiefs of various sizes and patterns, and garments are printed. The excise duties paid on printed goods for the year ending July 1825 was £380,421 0s. 10d. Glasgow possesses twenty-two iron foundries, besides several other large establishments for the manufacture of steam engines, and of cotton, flax, and wool, machinery. The manufacture of steam engines has become very extensive from the number employed in manufactures and in steam navigation, besides a considerable demand from other parts of the kingdom. From a calculation made by McClelland, in April 1825, there were then employed in connexion with the city 310 steam engines, aggregating 6406 horse power. There are sixteen brass foundries carried on, in one of which the casting of tower or turret bells is executed with great skill and success. For the dressing, upmaking, and finishing, of cotton goods there are twelve calender houses containing thirty-two calenders worked by steam, and twenty lapping-houses, which are able on a moderate computation to calender 296,000 yards in a day, and to dress 530,000 yards. The Clyde was the first river in Europe on which steamboats began to sail; and since their introduction, in 1811, an immense number have been constructed by Glasgow engineers, some of them at great cost and for various parts of the world. At present there are upwards of a xty plying on the river belonging to the city. The flour mills belonging to the corporation of bakers are probably the most complete in Britain; there are nineteen pairs of stones moved by water, and six by steam, by which 65,000 quarters of wheat can with ease be annually manufactured into flour. In 1815 90,000 bolls of wheat were manufactured into flour. The granaries are calculated to contain from 30,000 to 35,000 bolls of grain.

The chemical manufactories of Glasgow are deserving of much more particular notice than we can afford to bestow on them. The works of Messrs. Charles Tennant, and Co. are understood to be the largest of the kind in the world, covering many acres of ground. About 1000 large earboys of concentrated sulphuric acid are said to be manufactured weekly, besides a corresponding quantity of oxymuriate of lime for bleaching, crystals of soda, and soaps. There are besides several other similar establishments,

though on a smaller scale, which together manufacture a supply of chemical products, adequate not only to the bleaching and dyeing manufactories of Scotland, but capable of supplying the paper manufacturers of London, and many calico printers in Lancashire. The works of Mr. Charles Macintosh are celebrated for cudbear of the finest quality, made from lichens gathered in great quantities in Sardinia, Sweden, and Norway: his crystals and prussiate of potassa are unrivalled for their beauty and purity, and his Prussian blue cannot be excelled. The chemical works of Messrs. Turnbull and Ramsay are famous for the manufacture of pyroligneous acid of the finest quality, and for superb crystals of bichromate of potassa used for dyeing the brilliant chrome yellow on calicoes. At a little distance from the city are several large chemical manufactories, particularly those belonging to Mr. Macintosh at Hurlett and at Campsie, where alum and coppers are prepared on a very extensive scale. There is also a similar manufactory carried on near Hurlett by Messrs. Wilson.

There are also twelve large distilleries in the city and suburbs, besides others on a smaller scale, and several breweries. The coal trade is carried on to a very great extent, and vast quantities are exported to the West Indies, and other parts of the world.

There seems to be little doubt that much benefit has accrued to Glasgow from the institution of its chamber of commerce and manufactures, the earliest establishment of the kind made in the island. It was incorporated by royal charter in 1783. The object of this institution is to keep a watchful eye on whatever may be supposed to affect the commercial interest of Glasgow, or its neighbourhood; and, at the same time, to serve as the organ of communication between the manufacturing and commercial body of the district, acting either generally or separately, and the legislature, or any departments of the state.

The art of printing was first introduced into Glasgow by George Anderson in 1630. A century afterwards Robert Foulis, and soon after his brother Andrew, were appointed printers to the university. They both possessed considerable genius, taste, and literary enterprise, and are celebrated for printing a series of the classics in a style of beauty and elegance previously unrivalled in Britain. At present the university printing-office is the largest in Scotland, with the exception of that of king's printer in Edinburgh. The following newspapers are here in present circulation:—The Journal, published every Friday; the Herald, on Monday and Friday; the Courier, and the Chronicle, on Tuesday, Thursday, and Saturday; the Free Press, on Wednesday and Saturday; and the Scots Times, and Saturday Evening Post, every Saturday.

The police establishment is as efficient as any in the kingdom. It consists of a superintendant, collector, treasurer, clerk, and surveyor; three constables, twenty-eight officers, 100 watchmen, and twelve patrol-men, besides the superintendants of lamps, weighing-machines, and fire-engines. The latter has fifty firemen under him, with a suitable equipment of fire-engines and water-butts. The executive power, and the

administration of all the other affairs, is vested in the magistrates and twenty-four general commissioners. The establishment is supported by an assessment on dwelling-houses, shops, or warehouses, and a sum contributed yearly from the city funds. The receipts for the year ending June, 1825, were £14,069 17s. 7d., the disbursements £12,884 2s. 2d.

Among the literary institutions of Glasgow, the university, long so famous, deserves the first notice. It possesses professors of great talent in every branch of human learning. In the year 1819 there were 1264 students attending it. In the Andersonian institution lectures are regularly delivered on natural philosophy, chemistry, and mechanics; other departments, such as anatomy, mathematics, and botany, have occasionally been introduced. This institution has two peculiarities; there is a course of lectures delivered to ladies yearly, and another to mechanics. It was the first institution in the world in which scientific instruction at a cheap rate was delivered to the laboring man. The mechanics' institution arose out of a difference which occurred in the mechanics' class of the Andersonian institution. The new institution has been incorporated by the magistrates, and is at present in a very flourishing condition. In it lectures are delivered to about 800 students, on mechanics, chemistry, mathematics, and geography, natural history, popular anatomy, and political economy. In the public grammar-school there are six classes, viz. the rector's, for Latin and Greek; four others for Latin; and a commercial class; the school is generally attended by from 500 to 600 students. Glasgow possesses several literary and scientific societies, among which the college library, the literary and commercial, the philosophical, the medical, and the dilettanti societies, are the most conspicuous. The royal botanic garden, consisting of nearly six acres and a half of ground, contains 9000 distinct named species of plants, besides 3000 un-named; the plants in pots amount to 60,000; grasses 500; the collection of bulbous plants contains upwards of 900 species and varieties. Besides the college library, which is very valuable; Stirling's public library, containing upwards of 7000 volumes; the Glasgow public library, which contains 6000 volumes; and the foreign library, the object of which is to form a collection of all valuable works in the modern European languages; there are a great variety of circulating libraries for the use of the inhabitants. In the year 1819 there were 239 teachers, besides those in the public seminaries already alluded to, who taught privately various branches of education in the city and suburbs; from this, some estimate may be formed of the extent to which education is sought after. The public institutions, and benefit societies, which are established in this city for the relief of the necessitous are so numerous, and of so complicated a nature, that it is impossible to do more than mention the names of a few of them. The Merchants' and Trades' houses, Faculties of Physicians and Surgeons and Procurators, and the fourteen incorporated trades, bestow considerable sums on the poor connected with their respective bodies. Aged and destitute people, and children,

are supported in the Town's hospital, besides a large number of out-door pensioners, who are relieved weekly. Hutcheson's hospital, besides educating and clothing poor children, distributes yearly, to 200 individuals, pensions varying from £5 to £25. Large sums are yearly raised by subscription for the support of the Royal Infirmary, Lunatic Asylum, Magdalen Asylum, Lock Hospital, Humane Society, Dispensary, &c. In addition to these, the general session, the Highland, Buchanan, Graham, Stirlingshire, Dumfriesshire, Ayrshire, &c., societies, and a variety of benevolent and benefit societies, are careful in providing for the wants of the poor entitled to apply to them. It has been calculated by McClelland, whose general accuracy leaves little doubt as to the correctness of the result, that in the year 1818-19 the sum of £35,711 6s. 7d. was expended by the various public charities, including the free schools and public hospitals: that £102,020 19s. 4d. was distributed in private charity; and £2272 11s. 3d. was raised for the support of the various religious societies: thus making a grand total of £140,004 17s. 8d. expended in charity in the city and suburbs in one year.

In addition to the public markets for the sale of butchers' meat and vegetables, the magistrates have recently erected a market for the sale of live cattle; when the whole design is completed, the market will be the most extensive in the kingdom, with the exception of Smithfield, to which however it will be superior in regard to arrangement.

Glasgow is well supplied with water from the Clyde, which is brought into the town, and distributed through every street and house in the city. In 1817 a company was incorporated for the purpose of supplying the city with gas-light. Under the direction of their talented and accomplished engineer Mr. J. B. Neilson, their works have been brought to a state of unrivalled perfection. They have laid down upwards of sixty miles of pipes, of different sizes, for conducting the gas to the various public works, shops, warehouses, and street lamps, which are now entirely lighted in this manner.

The value of the butchers' meat sold in the Glasgow market during the year 1822 is calculated at £242,800: the tallow, hides, &c., at £61,169 4s. 5d.; making in all £303,969 4s. 5d.; the value of the bread, baked and sold, in the city and suburbs, at £177,266 10s. 8d.; and of the milk sold during the same period £67,375 7s. 0d.

The Barony parish of Glasgow was originally part of the parish of Glasgow, but was erected into a separate one in the year 1595. The boundaries of this extensive parish are exceedingly irregular; but it may be shortly described as lying around Glasgow, and encircling it on the east, north, and west sides, both its extremities above and below the city being bounded on the south by the river Clyde. This parish contains a population of upwards of 50,000 inhabitants, who are included, however, in the enumeration of the inhabitants of Glasgow; extensive suburbs of the city being, with the exception of the Barony of Gorbals, situated in this parish. The suburb of Calton is situated

in the east part of this parish, and to the east of the city. It contains about 16,000 inhabitants, who are mostly weavers, or employed in the cotton factories. It was erected in 1817 into a burgh of Barony, is governed by its own magistrates, and possesses an effective police establishment. Bridgeton, containing a population of 14,000, extends in a south-east direction from the Calton to the Clyde. The inhabitants are likewise chiefly employed as weavers or cotton spinners. To the west of Glasgow stand the suburbs of Anderston and Finnieston, erected in 1824 into a burgh of Barony, containing a population of 7000 inhabitants, and governed by magistrates, and a police establishment of its own. These suburbs contain extensive glass-works, potteries, breweries, foundries, and cotton factories. Besides these more important parts the Barony parish contains numerous other villages and public works connected with the city. A considerable portion of it is laid out in villas and country houses by the merchants and manufacturers of Glasgow; and that part of it which is applied to agricultural purposes, from being liberally supplied with manure from the city, yields much richer crops than the quality of the soil would lead us to anticipate. In various parts of the parish are numerous coal works and free-stone quarries, which are as valuable to the city as they are profitable to the proprietors. Notwithstanding the extent and population of the parish, and the numerous townships and manufacturing villages which it contains, it possesses only one parish church. There are several chapels however in connexion with the established church, and numerous dissenting chapels and meeting-houses, situated in different parts of the parish. The Barony of Gabals, situated on the south side of the river, opposite to the city, contains upwards of 26,000 inhabitants, and is the most extensive and best built of any of the suburbs of Glasgow. The ground on which it stands contains upwards of 400 acres, and originally formed part of the parish of Govan, from which it was disjoined and erected into a separate parish in 1771. From different parts of it having been begun to be built by different proprietors, they have received the different appellations of Hutchesontown, Laurieston, Tradeston, Kingston, and Maxwellton; a small portion only, and that the oldest part, receiving the name of Gorbals. The whole, however, constitutes one barony, and is governed by bailies, and possesses a police establishment. The magistrates of Glasgow as superiors of the burgh, appoint the bailies; and the commissioners of police are chosen by the inhabitants. The burgh contains several fine streets and ranges of houses; the parish church is a beautiful modern structure, erected fronting the Clyde; and a jail and public offices have recently been built on a commodious and elegant plan.

GLASGOW PORT, a town in Renfrewshire, on the south bank of the Clyde, distant from Glasgow about twenty, and from Greenock two and a half miles. It is built on the Barony of Newark, and owes its origin to the corporation of Glasgow establishing a port and building a

harbour there in 1668. In 1695 it was erected into a parish. The town has a neat appearance, many of the private houses being handsome. In the centre is a rather elegant structure, with a fine spire, appropriated as public offices, reading room, jail, &c. There is a parish church, and two other places of worship in the town. The harbour is good, and a graving-dock is attached, which at the time of its construction was the only one of the kind in Scotland. With the exception of ship-building, sugar-refining, and rope-making, Port Glasgow is almost entirely indebted to the shipping which frequent

it for the employment of its population, and in the latter respect the proximity of Greenock has of late years operated unfavorably upon it. By the constitution of the town, it is governed by two bailies and thirteen councillors, one part of which are elected by the corporation of Glasgow, and the other by trustees for the community. By the official returns of the trade of the port for 1826, it appears that 19,498 tons of British shipping, and 1,121 tons of foreign shipping cleared inwards; and 20,610 tons of British, and 1,344 tons of foreign shipping, cleared outwards in that year.

G L A S S.

GLASS, *n. s., adj. & v. a.* } Sax. glær; Dut.
GLASS-FURNACE, *n. s.* } *glas*; Fr. *glaise*; as
GLASS'-GAZING, *adj.* } Pezon imagines from
GLASS'-GRINDER, *n. s.* } gläs, British, green.
GLASS'-HOUSE, *n. s.* } In Erse it is called
GLASS'-MAN, *n. s.* } *klann*, primarily sig-
GLASS'-METAL, *n. s.* } nifying clean, or clear,
GLASS'-WORK, *n. s.* } being so denominated
GLASS'-WORT, *n. s.* } from its transparency.
GLASS'-Y, *adj.* } See the article. The
GLAZE, *v. a.* } several compound
GLAZIER, *n. s.* } words are applied to

the persons who manufacture glass, or the place wherein the operation is conducted. Glass-wort is a plant, the ashes of which are used in making fine glass; several kinds of glasses, as hour-glasses, mirrors, telescopes, &c., wine glasses, &c.: glass-metal is glass in a state of fusion. The two last words are alterations or corruptions of glass and glassier. One whose trade is to make glass windows.

And in an erthen pot how put is al,—
And salt yput in, and also pepere
Before these poudres that I speke of here,—
And wel ycovered with a lampe of *glas*?
And of moche other thing which that ther was?
And of the pottes and *glasses* englutting,
That of the aire might passen out no thing?

Chaucer. *The Chanones Yemannes Tale.*

And soth to saine, my chambre was
Full well depainted, and with *glas*
Were al the windowes wel yglased
Ful clere, and nat an hole yerased,—
That to beholde it was grette joie;
For wholly al the story of Troy
Was in the *glaisinge* ywrought thus,—

Id. *Boke of the Duchesse.*

Whose womb produced the *glassy* ice? Who bred
The hoary frosts that fall on Winter's head?

Sandys.

He was the mark and *glass*, copy and book,
That fashioned others. *Shakspeare. Henry IV.*

I'll see no more:

And yet the eighth appears, who bears a *glass*
Which shews me many more. *Id. Macbeth.*

Man! proud man!

Drest in a little brief authority,
Most ignorant of what he's most assured
His *glassy* essence, like an angry ape,
Plays such fantastick tricks before high heaven,
As make the angels weep.

Id. *Measure for Measure.*

Methought all his senses were lockt in his eye,
As jewels in crystal for some price to buy;
Who tendering their own worth, from whence they
were *glasst*,
Did point out to buy them, along as you past.

Shakspeare.

To this last costly treaty,
That swallowed so much treasure, and like a *glass*
Did break i' the' rinsing. *Id. Henry VIII.*

Were my wife's liver

Infected as her life, she would not live

The running of one *glass*. *Id. Winter's Tale.*

Sorrow's eye, *glazed* with brining tears,

Divides one thing entire to many objects.

Shakspeare.

Get thee *glass* eyes:

And, like a scurvy politician, seem

To see the things thou doest not.

Id. *King Lear.*

There is a willow grows aslant a brook,

That shows his hoary leaves in the *glassy* stream.

Shakspeare.

A whorson, *glassgazing*, finical rogue.

Id.

The crystalline Venice *glass* is a mixture, in equal portions, of stones brought from Pavia, and the ashes of a weed called kali, gathered in a desert between Alexandria and Rosetta; by the Egyptians used first for fuel, and then they crush the ashes into lumps like a stone, and so sell them to the Venetians for their *glassworks*.

Bacon's *Natural History.*

Let proof be made of the incorporating of copper or brass with *glassmetal*.

Id. *Physical Remains.*

In the valley near mount Carmel in Judea there is a sand, which, of all others, hath most affinity with *glass*; insomuch as other minerals laid in it turn to a *glassy* substance.

Bacon.

Let there be two delicate cabinets daintily paved, richly hanged, and *glazed* with crystalline glass.

Id. *Essays.*

No more his rovall self did live, no more his noble
sonne,

The golden Meleager now their *glasses* all were run,

Chapman.

Let princes gather

My dust into a *glass*, and learn to spend

Their hour of state—that's all they have—for when

That's out, Time never turns the glass again.

Shirley.

Fill up the bowl there, fill it high,

Fill all the *glasses* there; for why

Should every creature drink but I,

Why, man of morals, tell me why.

Cowley.

While a man thinks one *glass* more will not make

him drunk, that one *glass* hath disabled him from well discerning his present condition.

Taylor's Rule of Holy Living.

The moon whose orb

Through optick *glass* the Tuscan artist views.

Milton.

The magnet attracteth the shining or *glassy* powder brought from the Indies, usually employed in writing-dust.

Browne.

For the fine glass we use the purest of the finest sand, and the ashes of chali or *glasswort*; and for the coarser or greener sort the ashes of brake or other plants.

Id. Vulgar Errors.

Methinks I am partaker of thy passion,
And in thy case do *glass* mine own debility.

Sidney.

I have observed little grains of silver to lie hid in the small cavities, perhaps *glassed* over by a vitrifying heat, in crucibles wherein silver has been long kept in fusion.

Boyle.

The *glassgrinders* complain of the trouble they meet with.

Id.

Glass is thought so compact and firm a body, that it is indestructible by art or nature, and is also of so close a texture that the subtlest chymical spirits cannot pervade it.

Id.

The first *glass* may pass for health, the second for good-humour, the third for our friends; but the fourth is for our enemies.

Temple.

He spreads his subtle nets from sight
With tinkling *glasses*, to betray
The larks that in the meshes light.

Dryden's Horace.

White, with other strong colours, with which we paint that which we intend to *glaze*, are the life, the spirit, and the lustre of it.

Id. Dufresnoy.

Like those who survey the moon by *glasses*, I tell of a shining world above, but not relate the glories of the place.

Dryden.

As when a taper shines in *glassy* frame,
The sparkling crystal burns in glittering flame,
So does that brightest love brighten this lovely dame.

Fletcher's Purple Island.

If our dreamer pleases to try whether the glowing heat of a *glass-furnace* be barely a wandering imagination in a drowsy man's rancy, by putting his hand into it, he may perhaps be awakened into a certainty that it is something more than bare imagination.

Locke.

Glass bottles are more fit for this second fining than those of wood.

Mortimer's Husbandry.

Showers of grenadoes rain, by sudden burst

Displinging murderous bowels, fragments of steel
And stones, and *glass* and nitrous grain adust.

Phillips.

When thy heart

Dilates with fervent joys, and eager soul

Prompts to pursue the sparkling *glass*, be sure

'Tis time to shun it.

Id.

Into rabbets the several panes of *glasswork* are set, and fastened by the *glazier*.

Mocon's Moch. Ex.

The reason of one man operates on that of another in all true oratory; wherein, though with other ornaments he may *glaze* and brandish the weapons, yet is it sound reason that carries the strike home.

Grew's Cosm. Soc.

I remember to have met with an old Roman mosaic, composed of little pieces of clay half vitrified, and prepared at the *glasshouses*.

Addison.

The dexterous *glazier* strong returns the bound.

And ginging sashes on the penthouse sound.

Gay.

Nature's ethereal, human, angel, man,

Beast, bird, fish, insect, what no eye can see;

No *glass* can reach from infinite to thee,

From thee to nothing.

Pope.

The profit of *glasses* consists only in a small present made by the *glassman*.

Swift.

And Vanity with pocket-*glass*,

And impudence with front of brass.

Id.

It hath an apetalous flower, wanting the empalement; for the stamina, or clives, and the embryos grow on the extreme part of the leaves; these embryos afterward become pods or bladders, which, for the most part, contain one seed. The inhabitants near the sea-coast cut the plants up toward the latter end of Summer; and, having dried them in the sun, they burn them for their ashes, which are used in making of *glass* and soap. These herbs are by the country people called kelp. From the ashes of these plants is extracted the salt called sal kali, or alkali, by the chymists.

Miller.

And then, without the aid of neighbour's art,
Performed the carpenter's and *glazier's* part.

Harte.

James I. granted to Sir Robert Mansell an exclusive patent for making *glass*, in consideration of his having introduced pit-coal instead of wood.

Campbell's Pol. Survey.

Upon my shoulders here I must aver

My muse a *glass* of weatherology.

Byron.

A mutual language, clearer than the tome they
spake

Of his lands tongue, which he would oft forsake

For Nature's pages *glassed* by sunbeams on the lake.

Id.

GLASS, in a general sense, may denote any earthy, saline or metallic substance or compound, which is reduced by igneous fusion to a hard, uniform, brittle mass, having a considerable degree of lustre. It breaks with a conchoidal fracture, passing into splinters. More particularly it denotes that brittle, factitious, transparent substance produced by the vitrification of siliceous earths with salts and metallic oxides.

Some writers have derived the term from *glastrum*, another name with the Roman writers for *vitrum*, a plant with which the ancient Britons, as they say, painted or dyed their bodies, and which was of a light blue color; others from *glasum* or *glusum*, the name of amber among the ancient Gauls and Germans, connected with which is our English word *glisten*, to shine; the Swedes and Dutch use *glas* in the same sense as we do. Merret, in his notes on Neri's Treatise on Glass-Making, mentions certain characters or properties of glass, by which it is distinguished from all other bodies: of which we may enumerate these. It is an artificial concrete of salt and sand or stones; it is fusible by a strong heat, and when fused is tenacious and coherent; it does not waste nor consume in the fire; it is ductile when red-hot, and may be fashioned into any form, but is not malleable; and is capable of being blown into a hollow: it is frangible, always diaphanous, whether hot or cold; flexible and elastic: it may be graven, or cut with a diamond, or other hard stones and emery; it receives any color or dye, and admits of being polished: it is the most pliable thing in the world, and that which best retains the fashion given it.

De Neri traces the art of making glass to the times of the patriarch Job, who ranks it amongst the most valuable of earthy productions, chap. xxviii. 17. But this is mere conjecture; the word זכוכית translated crystal, from the root זכ, to

cleanse or purify, admits of various significations, and evidently, from the context, means some precious stone.

It is said that the Egyptians were taught the art of glass-making by Hermes. Among the Greek writers Dr. Falconer contends that Herodotus uses the word *balog*, with this signification; but this is very dubious; the historian more probably means the natural crystal, or some transparent natural stone, capable of forming the transparent case he is describing. Aristophanes, Aristotle, Alexander, Aphrodiscus, Lucretius, and St. John the divine, put it out of all doubt that glass was used in their days. Pliny relates, that it was first discovered accidentally in Syria, at the mouth of the river Belus, by certain merchants driven thither by a storm; who being obliged to dress their victuals by making a fire on the shore, where there was great plenty of the herb kali; of the ashes of that plant the salts mixed and incorporated with the sand, or stones fit for vitrification, and thus produced glass; and that, this accident being known, the people of Sidon in the neighbourhood first attempted to form it artificially, and brought glass into use.

Be this as it may, the first glass-houses mentioned in history were erected in Tyre, where the only staple of the manufacture was for many ages; the sand which lay on the shore for about half a mile round the mouth of the Belus being peculiarly adapted to the making of glass; and the wide range of the Tyrian commerce affording an ample channel for the productions of the furnace.

The first time we hear of glass made among the Romans was in the reign of Tiberius, when Pliny relates that an artist had his house demolished for making glass malleable, or rather flexible; though Petronius Arbiter and others assure us, that the emperor ordered the artist to be beheld for his invention. It is certain that a plate of glass was found at Herculaneum, which was destroyed, A. D. 80; and that glass vessels were made at Rome under Nero. The earliest mention made of glass windows is by Lactantius, in the third century.

Before the conquest of Britain by the Romans, glass-houses had been erected in this island, as well as in Gaul, Spain, and Italy. Hence, in many parts of the country, are to be found amulets of glass, having a narrow perforation and thick rim, denominated by the remaining Britons *gleinen naid-reedh*, or glass adders, and which were probably in former times used as amulets by the druids. See *ANGUINUM OVUM*. It can scarcely be doubted that the Britons were sufficiently well versed in the manufacture of glass, to form out of it more useful instruments than glass beads. History indeed assures us, that they manufactured a considerable quantity of glass vessels. These, like their amulets, were green, blue, yellow, or black, and many of them curiously streaked with other colors. The process of the manufacture was nearly the same with that of the Gauls or Spaniards. The sand of the shores, being reduced to a sufficient degree of fineness by art, was mixed with three-fourths of its weight of nitre, and both were melted

together. The metal was then poured into other vessels, where it was left to harden into a mass; and afterwards replaced in the furnace, where it became transparent in the boiling; it was now figured by blowing, or modelling in the lath, into such vessels as they wanted.

According to Bede, artificers, skilled in making glass for windows, were brought over into England in 674, by abbot Benedict, and were employed in glazing the church and monastery of Weremouth. According to others, they were first brought over by Wilfrid, bishop of Worcester, about the same time. Till this time the art of making glass for windows was unknown in Britain; and sash windows did not begin to be common before 1180. Italy had them first; next France, whence they came to England. Venice, for many years, excelled all Europe in the fineness of its glasses; in the thirteenth century, the Venetians were the only people that had the secret of making crystal looking-glasses.

The glass manufacture of England was first established in 1537; the finer sort being made at Crutched Friars, London; the fine flint glass, little inferior to that of Venice, in the Savoy. This manufacture appears to have been much improved in 1635, when it was carried on with pit coal instead of wood; and a monopoly was granted to Sir Robert Mansell, who was allowed to import the fine Venetian flint glasses for drinking. But in the reign of William III. these were made at home with considerable skill.

The first plate glass, for looking glasses and coach windows, was made in 1673 at Lambeth, under the patronage of the duke of Buckingham; who introduced it by the means of Venetian artists, and with amazing success. So that, within the last century and half, the French and English have not only equalled but even excelled the Venetians, and are now no longer supplied from abroad. The French made a considerable improvement in the art of glass, by the method of casting very large plates, till then unknown. This was imitated in Lancashire in 1773, and is now very flourishing.

Of the vitrification of glass generally.—Pure substances vitrify with difficulty, and the glass which proceeds from them is in general dry and very brittle. But the same substances mixed, enter more easily into fusion. Alumine and lime, although unvitriifiable separately, are easily reduced into glass when mixed together. The alkalis facilitate the fusion and vitrification of all the earthy principles. On account of this property, these salts are employed for forming the base of the composition of glass manufactured for our use. Besides the degree of fusibility which the alkalis communicate to the earthy substances, they give to the glass which proceeds from their mixture with the earths a pliability which admits of its being wrought, blown, extended, and even hammered while it is warm and soft. The manufactories where glass is made, are called glass-works. The compositions, the working, and the furnaces, vary in the different manufactories, according to the nature of the glass made in them: hence the va-

rious denominations of bottle-glass, flint-glass, plate-glass crystal-glass, &c. But, whatever may be the nature of the glass to be made, there are certain principles essentially dependent upon science which are applicable to all glass-works, and according to which all the operations are directed. These general principles have for their object every thing relating to the manufacture of the pots or crucibles, to the composition of the substances, to the construction of the furnace, to the management of the fire, and to the manner of working the glass. We shall glance at each of these subjects in succession.

Of the manufacture of crucibles, or glass pots.—Good crucibles ensure the success of a glass-work. This truth can only be felt by those who have appreciated the loss occasioned by pots which break or melt, the loss of time, and the difficulty of replacing them. Clay forms the basis of glass-house pots. But as the qualities of clays are very variable, because they are naturally and constantly mixed in various proportions, with lime, silice, iron, and magnesia, which renders them more or less fusible, the clay must be picked before employing it. The qualities of a good clay are as follow: 1st. It must not vitrify upon an exposure of several days in the hottest place of the furnace. 2nd. It must preserve its form without sinking down, or becoming soft. 3rd. It must be wrought and moulded easily. 4th. It must undergo the action of the fire without contracting, or cracking. 5th. Good clay assumes, upon being fired, a very great hardness and compactness.

When we have ascertained all these qualities in the clay, it must be still picked, in order to separate from it every thing foreign or prejudicial. To this effect it must be carefully picked, in order to take out the pyrites and all the small colored veins, which render it fusible: we may content ourselves with raking together the pieces tinged with ochre, and separating all the coloring principle from them. After having taken away every visible impurity, the clay must be diluted and soaked in water; it is afterwards passed through sieves, in order to separate the coarse, weighty, and insoluble bodies from it. Sand, quartz, or raica, do not sensibly injure the qualities of clay, particularly if they are in small quantity: but mixtures of calcareous earths, plaster, pyrites, and metallic oxides, render clay improper for glass-house pots, as it is material to give to the sides of a crucible such a thickness only as to render it capable of resisting the effects of the substance it contains, and the shocks it receives in the work.

M. Loysel has suggested that we should calculate the tenacity of the clay, by forming small sticks of it in the form of parallelipedons, which he dries at a temperature of 25° of Reaumur, and one of the extremities of which he reduces to a diameter of six lines. He fastens this extremity in a cubical cavity; and at the distance of eighteen lines he suspends, from one of these sticks, the saucer of a pair of scales, in which he places weights until they produce a fracture in the stick. He observed that good clay, employed for crucibles of three feet diameter by three feet six lines thick, did not break, ex-

cept with a weight of 56 oz.; and that of a furnace of fusion, of eight feet diameter, by a weight of 24 oz. But clay, employed by itself, contracts too much, and it is mixed for forming the composition of pots with the broken pieces of crucibles, ground, and well cleared of all vitrified matter, or with clay strongly fired. Great care must be taken not to employ sand in forming pots, because the alkali employed in making the glass would act upon the sand, dissolve it, and speedily destroy the crucibles. After having prepared the clay well, it is mixed with the cement formed of ground fragments of crucibles, and a paste is made with it which has such a consistence that a leaden bullet of 4 oz. weight may sink into it completely upon falling from a height taken between sixty-six and eighty-three inches. This paste must be dressed with the greatest care in a proper place, and out of the way of all dust, and the mixture of every foreign substance. When the paste is thus prepared, either the one or the other of the two following processes may be employed for making the crucible. 1st. In some glass-houses they have a wooden mould, furnished in the inside with a strong and well-stretched cloth. Rolls of paste are applied to the interior surface of this cloth, and the frame of the crucible is successively raised, by gradually diminishing its thickness from the bottom to the upper edge. 2nd. In other glass-houses the workman has a round piece of wood, a little broader than the crucible is to be, and he raises with his hand, and without a mould, his crucible upon this kind of foundation. This last method is preferable to the former, because the workman can work his paste at all places, and he leaves no cracks nor crevices in the body of the crucible, and he can join perfectly and uniformly all the parts. This process is particularly necessary in the bottle glass-houses, because this composition corrodes the crucibles more than any other. When the pots are manufactured they are allowed to dry in the shade, at a temperature of 10° or 15° of Reaumur's thermometer. We should equally dread a too strong heat, which might crack the pot; or a too sharp cold, which might freeze it, dampness and currents of air should be also carefully avoided: the apartment which serves as the drying-place should be shut, and very little frequented. When the pots begin to be dry they are enclosed in a close place, where the heat is constantly kept up to 25° or 30° of Reaumur. From this they are brought out to be put in use. For this purpose they are exposed by degrees to a heat which produces redness, and in this state they may be placed upon their seat in the furnace. Prudence requires that they should not be charged with any composition after they are placed upon the furnace until they have undergone the strongest possible heat for twenty-four hours.

Of the construction of glass-house furnaces.—The paste intended for making the bricks of a glass-house furnace is prepared by mixing crude with fired clay, or rather with broken pieces of crucibles: white infusible quartz, or a very refractory sand, are also employed instead of fired clay. In order to pound the pieces of quartz more completely, they are made red-hot, and then thrown

into water. This operation, as is well-known, renders them pulverulent, without hurting their refractory quality. Bricks are sometimes used which have not been fired; these are merely dried in the air to such a degree that a leaden bullet, falling from a height of from twenty-five to forty-five feet, only sinks half its bulk into the brick. The furnace of a glass-house is always erected in the middle of very spacious premises, in order that the working and the surface of it may be easy. The draught of the furnace is effected by means of four currents of air, which enter the hall at separate apertures, and unite at right angles at the grate of the fire. The interior form of the furnace is almost always that of a square, or of a rectangular parallelogram, the broadest sides of which are occupied by the pots, which are supported and fixed on trevets or shelves. The interval between these shelves, or trevets, forms the grate upon which the combustibles are placed. The fire is fed by apertures made in the sides: the pots are charged and emptied by means of openings immediately above them, and which exactly correspond with them, in order that the business may be more easily conducted. The furnace is surmounted or terminated by an arch, which rests upon the two longest sides, and which is full of holes, in order to establish a proper draught, and to give a passage to the flame, which also heats other arches placed before these angles, or above the vault.

Of the substances employed in the composition of glass.—Silica and the alkalies form the base of glass in all countries: the other ingredients are, properly speaking, only necessary for facilitating the flux and purifying the glass, or for giving it any peculiar quality. The purest silices and alkalies form the clearest glass, and it is this composition which forms the basis of all the operations of glass-houses. But silica and alkali exist nowhere pure; it is only by troublesome, difficult, and expensive processes that we can bring them to this degree of purity. These substances are therefore very generally employed in the state in which nature and commerce afford them. Attention must be paid, however, among the varieties which these two substances present, to choose such as experience has shown to give constantly the production we are desirous of obtaining. In some delicate works such as the making of fine crystal or plate-glass, the alkali of commerce is purified, in order to clear it of all foreign bodies. In general, white sand is the purest, but it is also the most refractory; the colored sands fuse much more easily. Alicant soda holds the first place among the alkalies of commerce. It is therefore most employed in the delicate operations of the glass works. Sicilian ashes, the salicornia, and sea-wrack, are employed in the manufacture of all the common clear glass. Potassa and salt are also well adapted for vitrification: the latter is employed in most of the manufactories of drinking-glasses and crystal-glass, as it is called. In France the ashes of our fires, melted with sand, is the most general composition of bottle-glass. When the sand is very fusible, lixiviated ashes may be employed. I have seen, says M. Chaptal, most

VOL. X.

excellent bottle-glass formed with lixiviated ashes and river-sand, mixed with equal parts of quartz and rubbish of lava. The salts contained in the alkalies enter into fusion, and swim upon the surface of the metal (as the workmen call it) in the state of a very fluid liquid, which must be carefully taken off with a ladle or skimmer before beginning to work the glass. This precaution is only necessary when sodas are employed highly charged with marine salt. The glass-works where these kinds of soda were used, made a considerable trade of this salt, which was sold by the name of glass-house salt, when the gabelle or salt-tax rose to such an enormous height in France. Glass-house salt is also known by the name of gall of glass, or sandiver; and when the matter is not well melted, or when all the marine salt is not evaporated, it is found dispersed through the glass in small grains, which injure much the beauty and solidity of the article. When we wish to purify soda for delicate operations, it is dissolved in water, in order to separate by a previous operation every thing that may be insoluble; it is afterwards evaporated, and concentrated to 40° of Baume's areometer, in order to precipitate the foreign salts, which crystallise; the remaining liquor is afterwards concentrated to dryness, and by this means we obtain a very pure salt of soda. We may even obtain it in crystals, by stopping the evaporation at the degree of a syrupy consistence. The proportions of the substances which form the composition of glass vary according to the nature of the sand, the purity of the alkalies, the quality of the glass, and the degree of heat in the furnace. Experience alone must prescribe and determine the most proper composition: the more fusible the sand is, the less alkali it requires; the purer the alkali, the greater is the quantity of sand which is necessary in the composition. In order to facilitate the fusion of the compounds, and to give the glass more ductility, more weight, and less hardness, oxide of lead is added to the composition, in variable proportions, according to the object in view. Minium, or red-lead, is always preferred for this purpose in the manufactories of crystal-glass.

The oxide of manganese is also used, by the name of glass-maker's soap, in order to clear the glass of all coloring matter. Its effect must probably be chiefly ascribed to the facility with which it gives up its oxygen, which combines with the coloring principles, and destroys them. Too much red-lead makes the glass yellow; this defect may be corrected by applying a little oxide of cobalt, which, in its turn, will produce a blue color, if in excess. Too much manganese gives it a violet color, and forms streaks, or violet-colored ribands, in the thick parts of the glass. This fault may be corrected by throwing a combustible body into the melted mass. There are circumstances where a tried composition attains a proper degree of fusion with great difficulty; this may proceed from the draught of the furnace being interrupted, or when the fire is ill managed; in this case, borax, or arsenic, must be resorted to for restoring the fusion. The latter substance is held in the bottom of the pots, until it has evaporated in fumes; it spreads

Q

through the whole mass, agitates it, and hastens the flux of it. Arsenic serves in particular for destroying the green color of glass, besides the advantage it has of facilitating the flux. The glass is colored with the metallic oxides; cobalt makes blue; manganese, violet; glass of antimony, yellow; precipitate of Cassius, purple; chrome, green, &c. Various colors may be obtained by the mixture of these oxides; and we may obtain all the shades we desire.

Muriate of soda and sulphate of soda may be employed, and at times with advantage, in glass-making. A casting is readily obtained of very fine glass, having, when about three or four lines in thickness, a very slight green tinge. Its composition is as follows:—decrepitated muriate of soda 100 parts; slaked lime 100; sand 110; clippings of glass, of the same quality, from 50 parts to 200. Sulphate of soda likewise offers a great economy in its employment. The results are very satisfactory. The glasses made with this salt were of a very fine quality. The following is the composition:—dry sulphate of soda 100 parts; slaked lime 12; powdered charcoal 19; sand 225; broken glass from 50 to 200. These proportions give a rich colored glass, which may be employed with advantage in glass-houses, where a fine quality is sought after. The following is the second way of operating with sulphate of soda; the proportions may be as follows:—dry sulphate of soda 100 parts; slaked lime 266; sand 500; broken glass from 50 to 200. According to this process, it is obviously easy to operate in a regular manner, and to avoid expensive trials in the manufacture.—*Annales de l'Industrie Nationale*.

According to M. Achard, equal parts of lime, magnesia, and silica, melt into a greenish colored glass, hard enough to strike fire with steel. When the magnesia exceeds either of the other two ingredients, the mixture is infusible; when the silica exceeds, the only fusible proportions were, 3 silica, 2 lime, 1 magnesia; and, when the lime is in excess, the mixture usually melts in a strong heat. With mixtures of lime, alumina, and silica, a fusible compound is usually obtained, when the lime predominates. The only refractory proportions were,

Lime	2	3
Silica	1	1
Alumina	2	2

Excess of silica gives a glass or porcelain, but excess of alumina will not furnish a glass.

When, in mixtures of magnesia, silica, and alumina, the first is in excess, no fusion takes place at 150°; when the second exceeds, a porcelain may be formed; and 3 parts of silica, 2 magnesia, and 1 alumina, form a glass. From Achard's experiments it would appear, that a glass may be produced by exposing to a strong heat equal parts of alumina, silica, lime, and magnesia. Other proportions gave fusible mixtures, provided the silica was in excess.

M. Westrumb is said to have found, that the salts of potassa and soda, deprived of their water of crystallisation, answer as well as the pure alkali for the manufacture of glass. In order to make an excellent glass, 21 parts of sulphate

of soda are thoroughly dried, and mixed with 8 parts of powdered charcoal, and 16 of good white sand. The mixture must be calcined in the drying oven, until the sulphate is dissipated, and is then put into the pots for fusion.—*Annales Gen. de Phys. de Bruxelles*, May 1820.

Of the flux of the substances forming the composition of glass.—The flux of the substances embraces two principal operations; first the fritte; second the fusion. If we throw into the crucible the substance which forms the composition, without having prepared it by a previous strong calcination, the crucibles would be destroyed in a short time, in consequence of the water which would be disengaged on the first impression of the fire; the flux would be almost impossible, in consequence of the greater fusibility of the alkali, which would come to the surface; the glass would be colored, and the paste itself would experience a swelling which would drive it over the crucible. In order to obviate all these inconveniences, the substances undergo the fritte, in all the glass-works, before put into the pots to be melted. The fritte is conducted on the substances either separately or in their state of mixture and composition. The second method is preferable, for the reasons above given. The fritte is executed in furnaces made in the glass-house; and which very often communicate with the melting furnace, from which they receive the heat by apertures made at the base of the great arch, and at the angles. These places are then called fritte arches. The substances are fritted some time, keeping them red-hot, and by this means they often receive a commencement of a pasty fusion, which unites the parts of the composition so as to form one mass. The manufacturers of bottle-glass, already mentioned, give the form of bowls to their composition, in order to roast it more completely. Others throw the composition, when well mixed, upon the bottom of the arch, taking care to strew it very thinly, in order that the calcination may act equally upon all the parts. Previous to putting the composition into the melting-pots, a new activity is given to the fire, and it is stirred three or four hours before charging them. The pots are charged at two and even three times; a fresh quantity of composition is not added until the first quantity is melted. As soon as the pot is filled, the fire is carefully kept up, for a longer or shorter time, according to the fusibility of the composition and the draught of the furnace. Ten or twelve hours are sufficient to melt the whole composition; but, although it is well melted, it is not yet fit for working. It must be allowed to settle, to clear itself of the numberless bubbles which are dispersed through the paste; and this effect can only be produced by keeping the composition at a very liquid fusion for some hours. This operation is called fining. When the glass is thus fined down, or rendered fit for working with, the heat of the fire is allowed gradually to diminish by adding no more coals to it. The vitreous mass then assumes a little more consistency, which facilitates the work.

Of working the glass in glass-houses.—The

working of glass is very simple ; but, notwithstanding this, it requires a great deal of practice, and no one can expect to become a good artist in this branch of the business, if he has not acquired the art early in life. Every thing respecting the working of the glass may be reduced to the act of blowing or running it. In blowing the glass, an iron tube about five feet long is used ; with this the workman takes out of the pot the quantity of glass necessary for his operation : the air, which he exhales from his lungs through the hollow of the tube into the mass of glass he has taken up, distends it ; he afterwards gives this mass, while it is distending, the form and dimensions he wishes. Compasses, scissors, and other iron tools, are employed to shape, pare, or dilate the glass. Care is taken to present it to the furnace as soon as it begins to cool ; when again heated, and it begins to melt, it is withdrawn, in order to bestow additional labor upon it. The softness of glass, when it is made red-hot, forms such a contrast to its fragility when it is cold, that it would be difficult to conceive how easily it may be kneaded, soldered, and distended, if we did not see it actually done before our eyes. Much has been said of the malleability of glass ; researches have been made in order to recover this important art, which it was thought the ancients possessed ; and people have been unwilling to allow that there is no metal more ductile or more malleable than glass, when red-hot ; or that this art, supposed to exist among the ancients, is practised among the moderns every day in our glass-houses. Plate-glass is formed by pouring melted glass upon a copper table, the surface of which is very flat, and by passing a level above the melted matter, in order to give the plate a uniform thickness. This operation is very similar to that by which metallic tablets are formed, by throwing melted metal upon sand. In order that the glass may be less brittle, it is necessary that it should be cooled very slowly : this last operation is called annealing. In the large manufactories of bottle-glass, the glass is annealed in furnaces made in the angles of the room where the melting furnace is : these furnaces are red-hot when the glass is deposited in them, and, as soon as they are filled with the glass articles, the apertures are closed, and the heat allowed to subside of itself. In small glass-houses, the annealing furnace is generally placed upon the melting-furnace, or at one side of it, so as to be heated by the current of flame which escapes from the furnace ; this is merely, properly speaking, the commencement of a very wide flue, and which insensibly diminishes in width the further it is removed from the fire ; so that the glass, deposited at its base, gradually cools as it is drawn towards the extremity. The glass is annealed very imperfectly in this manner, because it cools too quickly.

Of the combustibles employed in glass-works.—Two kinds of combustibles are used in glass-works ; wood and coals. The employment of the latter is very advantageous, but it colors the glass by producing a fuliginous matter which is deposited upon the melted mass, and tinges it of a yellow hue. When we wish to make a clear

or crystal glass, therefore, we must take the precaution of covering the pots, to which only one aperture must be left, corresponding with the working hole ; this is called working with covered pots. When wood is employed, it must be carefully dried ; the flux in this case is easier, and the work expedited. Elm, beech, and oak, are the three best woods for a melting-furnace. The resinous woods give out too much smoke. It requires an active and intelligent person to manage the fire of a glass-house ; care must be taken neither to choke it with too much fuel, nor to let the heat fall off. It must be fed by renewing the fuel in small quantities at a time, and at short intervals. The weight of clear glass to that of water, is :: 23 : 10. That of argil and alkali :: 25 : 10. That of lime and alkali :: 27 : 10. The metallic oxides add to its gravity.

Such is very much the practice in France. We shall now detail the processes adopted in our own country, and describe the materials made use of in the several manufactures. It will have been observed that glass contains, invariably, two essential ingredients, silex, and an alkali ; these are the only things necessary ; and, as we have seen, were the only substances from which glass was made accidentally on the shores of the river Belus ; the sand existed on the spot, and the saline substance was the substance in contact with the sand, and made use of as supports to the kettles in which the provisions were to be dressed. The fire, rendered fierce by being exposed to the open air, soon united the sand and the saline substances in fusion, and produced that glass which was the object of so fortunate and important a discovery.

Though sand and a saline substance are all that are absolutely necessary in the manufacture of glass, yet several other substances are likewise made use of for particular purposes, among which may be particularly noticed, lime, in the form of chalk, that is, a combination of lime and carbonic acid, or what is chemically denominated, a carbonate of lime, borax, the oxides of lead, manganese, arsenic, and nitre. A brief account of these will be necessary to render this article complete : though they are treated of alphabetically under their respective heads.

Silex may be found in almost all parts of the known world ; but of different kinds, and of various degrees of purity, and such will be selected in the manufacture as is adapted to the nature and fineness of the glass required. The siliceous material generally used in this country is sea-sand, which it is well known consists of minute rounded grains of quartz, which are sufficiently small to be used without any other preparation than that of washing. Sand, well adapted for the manufacture of glass, is found on the coast of Norfolk, near Lynn, and likewise on the western shores of the Isle of Wight. Common black gun-flints afford a very pure kind of silex, which before they are used must be heated red-hot, and instantly quenched in cold water. The heat whitens the flints, and the water splits them in every possible direction after which they may be ground without difficulty, in mills constructed for this kind of work. This ground flint is chiefly confined to the manu-

factures of the potteries, and is but seldom resorted to in glass-works. The alkali used in the manufacture of glass is either soda or potash. It is used in the state of a carbonate, though it is evident that the carbonic acid gas is driven off in the process, and the glass is a compound of silex and pure alkali, and not an alkaline carbonate. The finest flint-glass requires the best pearl ashes, purified by solution and evaporation; but inferior glass is made with coarser substances, as barilla, where it is abundant, with common wood-ashes, and with kelp. These alkalis, it is true, are impure; but this does not prevent their dissolving the silex into a very good and perfect glass, for the very impurities, consisting of neutral salts, lime, and other earths, assist in vitrification. Glass made from these alkalis has always a greenish tinge, owing to the iron contained in them. Lime, in the form of chalk, is used only in small proportions, because if much is used, the glass becomes opaque and milky on cooling, though it was perfectly transparent when hot: hence the reason of what is called smoky glass among the glaziers. The proper proportions are, to 100 parts of silex and alkali, only 6 or 7 of quick-lime can be added. Lime, though mischievous, if used too liberally, has its particular uses when properly proportioned; for, besides affording a cheap flux, it renders the glass easier to work, and much less liable to crack by sudden and violent changes of temperature. Borax is the best flux that is known; its high price is the only objection to its more general use; this prevents it from being used in common glasses, but it is never omitted in the finer kinds of plate glass, and those other articles of manufacture that are required to be clear and free from specks and bubbles. Borax renders all vitrescent compounds into which it enters remarkably thin-blowing, as the phrase is, and therefore peculiarly adapted for being cast in a mould, which is the way plate-glass is manufactured. A very small quantity of borax will correct any deficient strength in the alkali. The oxides of lead, of which litharge and minium are the only ones employed in the large way, are of great importance in glass-making. Litharge, of itself, melts into a very dense, clear, yellow, transparent glass, fusible at a low degree of heat; and when melted it acts so powerfully on all kinds of earthen vessels, as to run through the common porous crucibles in a very short time, like liquor through a filter, but vitrifying and corroding the bottom of the crucible in its passage. Litharge, therefore, is not only a most powerful flux to all earthy mixtures, but imparts to glass the valuable qualities of greater density, and greater power of refracting the rays of light; of bearing any sudden changes of temperature; of greater tenacity when red-hot, and therefore easier to be worked. Most of the finer glasses contain a considerable quantity of this oxide, particularly the London flint-glass, or that species which is used for most of the purposes of the table, for lustres, and other ornamental works, which, when cut into various forms, display such beauty and brilliance, as to present a most dazzling appearance, for artificial gems and for most optical purposes. Glass,

however, in which there is much lead, has the defect of being extremely soft, so as to be readily scratched and injured by almost every hard body it rubs against. It is likewise so fusible, that thin tubes made of it will bend with ease in the flame of a candle, and will sink down into a shapeless mass, at a moderate red-heat. This quality is often very useful for chemical purposes, but in other cases it is a great defect. If lead is in excess, there is great danger that the glass will be corroded by the contact of acrid liquors.

The black oxide of manganese has been long used in this manufacture: its ancient name was glass soap, which proves that it was used for the purpose of clearing the glass from any accidental foulness of color, which it might otherwise contract from the impurity of the alkali or other materials employed. The oxide of manganese is a very powerful flux for earthy matters, which is seen in the result of all attempts to reduce it to a reguline state in the usual way of combining with a saline carbonaceous flux, and heating in a naked crucible. Not a particle of the oxide is reduced in this way, but the crucible constantly runs down in a heat sufficiently intense for the reduction of the manganese, together with all its contents, into a green slag. The only way known at present of reducing this oxide, is to enclose it without any saline or earthy addition in a crucible lined with charcoal, and apply to it a very intense heat. Manganese, like lead, gives a density to glass, and has, like that metal, a tendency to settle to the bottom of the pots where it accumulates, and, being here out of the way of most of the discoloring additions, it yields a purple tinge immediately adhering to the bottom, and partly corrodes the pots, so that, when they are worn out and broken up, they are thickly incrustated with a purple vitrescent slag, easily separable by the hammer.

The white oxide of arsenic is another flux used in this manufacture: this is volatile in the fire in proportion as it approaches the metallic state, and hence it is of great advantage to employ nitre to oxygenate it more highly, and to render it more fixed. Arsenic is a powerful and a cheap flux, but it must be used only in great moderation, as taking a longer time to mix intimately with glass, and, allowing it to be perfectly clear, than almost any other additions that can be employed. Glass, in which arsenic is not most intimately combined, has a milky hue, which increases by age; and when this oxide is in excess, the glass tends to deliquesce, and gradually to become soft, and at length a decomposition will take place. Drinking glasses, and others used for purposes connected with our food, should not be made with this flux, as being one of the most dangerous poisons. As arsenic is entirely volatilised, when in contact with any carbonaceous matter, another use has been made of it, which is to disperse the carbon that may remain in the glass pot, owing to any defect in the calcination of the alkali, or any other more latent cause. When this happens small lumps of white arsenic are thrust to the bottom of the glass pots, and stirred in with the contents, and the fumes of the arsenic, meeting with the existing carbon

diffused through the glass, unites with it, is speedily volatilised, and the glass is left entirely free both from the carbon and the arsenic that was added.

Nitre is used, in glass-making, only in small quantities, and is an accessory ingredient for particular purposes. Nitre is readily decomposed, giving out a large quantity of oxygen, some nitrous gas, and azote, leaving behind its pure potash. It is of great service in destroying any carbonaceous matter in the ingredients of glass: it is also useful in fixing arsenic, and in keeping up the tinging power communicated by manganese. The same circumstance, of keeping metallic oxides up to their highest state of oxidation, also renders this salt often useful, sometimes indeed essentially necessary, in the preparation of certain colored glasses.

While glass is in fusion, the substances which enter into its composition may be considered as combined with each other, so as to form a homogeneous mass similar to water, holding in solution a variety of salts. If it be cooled down very gradually, the different tendency of the constituents to assume solid forms, at peculiar temperatures, will cause them to separate successively in crystals, in the same manner as salts held in solution in water assume the form of crystals, when the liquid is slowly evaporated. But, if the glass be rapidly cooled down to the point of congelation, the constituents have not time to separate in succession, and the glass remains the same homogeneous compound as while in a state of fusion; just as would happen to a saline solution if suddenly exposed to a degree of cold sufficient to congeal it completely. Hence it should seem that the vitreous quality depends entirely upon the fusibility of the mixture, and the suddenness with which it is cooled down to the point of congelation. The solid substance is precisely the same, as to its chemical composition, as if it were still in a state of fusion; the sudden abstraction of heat having been the means of fixing the constituents before they had time to assume a new arrangement. All fusible mixtures, as we have seen, of the earths with fixed alkalies, &c., may be made at pleasure to assume the form of glass, or the appearance which characterises stone or porcelain, according to the rate of cooling; and glass may be deprived of its vitreous form merely by fusing it, and cooling it down with sufficient slowness to enable the constituents to separate in succession. Experiments have been made on this subject by Reaumur and Lewis, who have both pointed out the method of converting different kinds of glass into an opaque, white, hard, refractory substance like porcelain. Lewis, however, demonstrated, by a variety of experiments, that it is not every kind of glass that can be converted into porcelain. He succeeded only with those that were composed of a variety of constituents, because such glasses alone contain ingredients that become solid in succession. Green glass, which is apt to acquire a crystallised form, succeeded the best with him, and he found that the temperature, which was peculiarly adapted to the change, is that in which the glass is softened without being melted. It was the curious ex-

periment of Sir James Hall on basalt and greenstone that first led to an explanation upon what the vitreous state of substances depends. He found that glass, consisting of various earthy bodies, loses its vitreous state, and assumes that of a stone, if more than a minute or two elapses while it is cooling down from the complete fusion to the point at which it congeals.

There are, it is well known, different kinds of glass in common use in this country, adapted to various purposes. The finest is plate-glass, of which looking-glasses are manufactured: flat-glass, or, as it is frequently denominated, crystal, is not much behind the plate-glass in the excellence of its qualities. These are both perfectly transparent and colorless, heavy, and very brilliant. They are composed of fixed alkali, pure silice, calcined flints, and litharge. The proportions, as far as can be obtained, will be given hereafter. Flint-glass contains also much oxide of lead: though it is solid, it does not appear to be absolutely impervious to gaseous bodies, at least when heated nearly to the melting point. Dr. Lewis surrounded a piece of it with charcoal powder, and kept it some time in a heat not quite sufficient to melt it. The lead was revived in drops through the whole substance of the glass. Dr. Priestley ascertained, that glass tubes filled with hydrogen gas, and heated, became quite black, from the revival of the lead. When alkaline hydrosulphurets are kept in glass phials, the inside is coated with a black rust, which is, in fact, the lead separated by the sulphur from the glass.

Crown-glass is made without lead; it is, therefore, much lighter than flint-glass. It consists chiefly of fixed alkali, fused with siliceous sand. Bottle-glass is the coarsest and cheapest kind, and in this but little fixed alkali enters into the composition. It consists of an alkaline earth, combined with alumine and silica. In this country it is composed of sand and the refuse of the soap-boiler, which is the lime employed in rendering his alkali caustic, and of the earthy matters with which that alkali was contaminated. Some of this kind of glass was analysed by M. Vauquelin, and was found to be composed of

Silice	57
Lime	31
Alumine	4
Oxides of manganese and iron	4
					<hr/> 96
Loss	4
					<hr/> 100

A small portion of potassa was also discerned, but it was too small to admit of being appreciated.

Of the different species of glass, the most fusible is flint-glass, and the least fusible bottle-glass. Flint-glass melts at the temperature of 19° Wedgwood; crown-glass at 30° , and bottle-glass at 47° . The properties that distinguish good glass are as follows. It is perfectly transparent, and its hardness very considerable; its specific gravity varies from 2.3, to 4, according to the materials of which it is composed. When cold,

it is brittle; but when at red-heat, it is one of the most ductile bodies known, and may be drawn into threads nearly invisible to the naked eye. It is almost perfectly elastic, and of course is one of the most sonorous of bodies. Few chemical agents have any action upon it; but fluoric acid dissolves it with great rapidity.

Although glass is chiefly made of sand, flints, fixed alkalis and metallic oxides, yet there are various other substances which frequently enter into the composition, and which should therefore not be wholly omitted in the description. Polverine or Rochetta is one that is procured from the Levant, and is prepared from a plant called kali, which is cut down in the summer, dried in the sun, and burnt in heaps either on the open ground or on iron grates; the ashes falling into a pit grow into a hard mass, and are fit for use when purified. Kelp which grows upon our coasts, and the ashes of the fucus vesiculosus furnish a similar salt: to these we may add the barilla of Spain.

To prepare ashes for making glass.—Take what quantity and what sort of wood-ashes you will, except those of oak; have a tub ready with a spigot and faucet towards the bottom, and in this tub put a layer of straw, and fling your ashes on it; then pour water upon them and let the ashes soak thoroughly until the water stands above them: let it thus continue over night, then draw out the faucet and receive the lie in another tub, put under the first for this purpose: if the lie looks troubled, pour it again on the ashes, and let it settle until it is clear and of an amber color. This clarified lie put by, and pour fresh water on the ashes; let this also stand over night; then draw it off, and you will have a weak lie, which, instead of water, pour upon fresh ashes; the remaining ashes are of use in the manuring of land. After you have made a sufficient quantity of lie, pour it into an iron caldron, bricked up like a brewing or washing copper, but let it not be filled above three parts full. On the top of the brickwork place a little barrel with lie; towards the bottom of which bore a hole, and put a small faucet in, to let the lie run gently into the caldron, in a stream about the roundness of a straw; but this you must manage according to the quantity of lie, for you ought to mind how much the lie evaporates, and make the lie in the barrel run proportionally to supply that diminution. Care must be taken that the lie do not run over in the first boiling; but, if you find it will, put some cold lie to it, and slacken the fire, and let all the lie boil gently to a dry salt: when this salt is cold, break it and put it into the calcar, and raise your fire by degrees until the salt is red-hot, yet so as not to melt it. If you think it calcined enough, take out a piece and let it cool, then break it in two, and if it is thoroughly white, it is done enough; but if there remains a blackness in the middle, it must be put in the calcar again, until it comes out completely white. If you will have it still finer, you must dissolve it again, filtrate it, boil it, and calcine it as before: the oftener this is repeated the more will the salt be cleared from the earthy particles, and it may be made as clear as crystal and as white as snow. Of this may

be made the finest glass possible. According to Dr. Merret, the best ashes in England are burnt from thistles and hop-stalks, after the hops are gathered: and among trees the mulberry is reckoned to afford the best salt. The most thorny and prickly plants are observed to yield better and more salt than others; also herbs that are bitter, as hops, wormwood, &c. Tobacco stalks, when burnt, produce likewise plenty of salt: and it is observed that fern ashes yield more salt than any other ashes. Dr. Thomson, to whose admirable work on chemistry we have been indebted for part of this article, says the fullest account of glass-making is to be found in a treatise by Neri, an Italian. Dr. Merret, an Englishman, translated it into Latin, and enriched it with notes. Kunkel translated this Latin edition into German, with additions, which were the result of his own numerous experiments on glass-making. Kunkel's work was translated into French in 1752. An elaborate account of glass-making has been published in the Arts et Metiers; and since that a small volume on glass-making has been written in French by Loysell.

To make the glass frit.—Take white silver sand, wash it, and separate all the impurities from it, and let it dry, or rather calcine it. Of this take sixty pounds, and of prepared ashes thirty pounds, mix them well together, then set them in the melting furnace; the longer it is melting, the clearer will the glass be made. If it stands for two days and two nights, it will be fit to work with, or to tinge with what color you please. Before you work it, add forty pounds of lead and half a pound of manganese to it. Or take ashes, prepared as above, sixty pounds, of prepared silver sand 160 pounds, arsenic four pounds, white lead two pounds, clear dry nitre ten pounds, borax two pounds; mix all well together, and proceed as has been directed, and you will have a beautiful crystal.

Of glass-blowing.—Glass-blowing is the art of forming vessels of glass. This term, however, is exclusively applied to those vessels which are blown by the mouth. The operation is exceedingly simple: the workman has a tube of iron, the end of which he dips into a pot of melted glass, and thus gathers a small quantity of glass on the end of it; he then applies the other end of the tube to his mouth, and blows air through it: this air enters into the body of the fluid glass, and expands it out into a hollow globe, similar to the soap-bubbles blown from a tobacco-pipe. Various methods are used to bring these hollow globes into forms of the different utensils in common domestic use. The first and greatest of the glass-blower's implements is the furnace, which consists of two large domes set one over the other; the lower one stands over a long grating (on a level with the ground), on which the fuel is placed; beneath the grate is the ash-pit, and a large arch leading to it conveys air to the furnace. In the sides of the lower dome, as many holes or mouths are made as there are workmen to make use of the furnace, and before each mouth a pot of melted glass is placed. The pots are very large, like crucibles, and will hold from 300 to 400 cwt of liquid glass: they

are supported upon three small piers of brick-work, resting on the floor of the furnace. The form reverberates the flame from the roof down upon the pots, and they are placed at some distance within the furnace, that the flame may get between the wall and the pots. The upper dome is built upon the other, and its floor made flat by filling up, round the roof of the lower dome, with brick-work; there is a small chimney that opens from the top of the lower dome into the middle of the floor of the upper one, which conveys the smoke away from it, and a flue from the upper dome leads it completely from the furnace. The upper dome is used for annealing the glass, and is exactly similar to a large oven; it has three mouths, and in different parts a small flight of steps leads up to each. A green-glass furnace is square; and at each angle it has an arch for annealing or cooling glasses or bottles. The metal is wrought on two opposite sides, and on the other two they have their colors, into which are made linnet holes for the fire to come from the furnace to bake the frit, and to discharge the smoke. Fires are made in the arches to anneal the work, so that the whole process is done in one furnace. These furnaces must not be of brick, but hard sandy stones. In France they build the outside of brick; and the inner part, to bear the fire, is made of a sort of fuller's earth or tobacco-pipe clay, of which they also make their melting pots. In Britain the pots are usually made of Stourbridge clay. It is observed, that the roughest work in this art is the changing the pots when they are worn out or cracked. In this case the great working hole must be uncovered; the faulty pot must be taken out with iron hooks and forks, and a new one must be speedily put in its place through the flames (for glass-furnaces are always kept burning) by the hands only. In doing this the man guards himself with a garment made of skins, in the shape of a pantaloon, that covers him all but his eyes, and is thoroughly wetted all over: his eyes are defended by proper shaped glass of a green color.

We now come to describe the smaller implements, which are as follows:—1. A bench, or stool, with two arms at its ends, which are a little inclined to the horizon. 2. A pair of shears, or rather pliers, formed of one piece of steel: they have no sharp edges and spring open of themselves if permitted. 3. A pair of compasses to measure the work, and ascertain when it is brought to the proper size. 4. A pair of common shears for cutting soft glass. 5. A blowing-pipe, which is a wrought-iron tube, three or four feet long, covered with twine at the end by which it is held. We may now explain the use of these tools in the manufacture of some vessel, as a lamp, &c. The operation is conducted by three workmen. The first takes the blowing-pipe, and after heating it to a red-heat, at the mouth of the furnace, dips it into the pot of melted glass, at the same time turning it round that it may take up the glass, which has then much the consistence of turpentine; in the quantity of metal he is guided by experience, and must proportion it to the size of the vessel to be blown; he then brings it from the furnace to the stool, and rolls

the lump of glass upon it to bring it to a round form, after which he blows through the pipe, resting the glass upon an iron plate behind the stool and rolling it backwards and forwards. The blowing makes the glass hollow, and he has several methods of bringing it to a proper shape to be worked; by simply blowing, it would assume a figure nearly globular; if he wants it any bigger in the equatorial diameter, he lays the pipe on a book driven into the side of the stool, and turns it round very quickly; the centrifugal force soon enlarges it in the equator. If, on the other hand, he wishes to lengthen its polar diameter he holds the pipe perpendicular, the glass hanging downwards, its weight lengthening it; and to shorten the polar diameter he holds the pipe upright, the glass at the top; by blowing through the pipe the capacity is increased, and the thickness of the glass of the vessel diminished. We now suppose that, by a very dexterous application of the above methods, the workman has brought it to a proper shape; he now carries it to the mouth of the furnace, and holds it in to get a fresh heat (for by this time it is become too stiff to work easily), taking care to turn it round slowly, that it may not alter its figure. The vessel in this stage is delivered to the second, or principal workman, the other two being only assistants; he is seated upon the stool, and lays the blowing-pipe with the glass at its end across its arm, and with his left hand rolls the pipe along the arms, turning the glass and pipe round at the same time; in his right hand he holds the pliers, whose blades are rubbed over with a small piece of bees'-wax, and as the glass turns round he presses the blade of the shears against it, following it with the shears as it rolls, at the end or side as occasion requires, until he has brought it to the proper size, which he determines by the compasses, though not materially altering its figure, the first workman kneeling on the ground, and blowing with his mouth at the end of the pipe when directed by his principal. The third workman now produces a small rod, which is dipped into the melting-pot to take up a small piece of metal to serve as cement; the end of this rod he applies to the centre of the glass just opposite the blowing pipe, the principal workman directing it by holding its end between his pliers; the rod by the small piece of glass on its end immediately sticks to the glass vessel, and the third workman draws it away, both workmen turning their rods round, but in contrary directions; this operation forms a short tube on the end. The principal workman then takes the short tube between the blades of a pair of pliers exactly like the others, but which are not covered with bees'-wax, the cold of these pliers instantly cracks the glass all round, and a very slight jerk struck upon the rod breaks it off. A hole is now made in the end of the glass, which is enlarged by the pliers while the glass is turned, until the neck is brought to the proper size and length to fit the brass cup as before described, and the inferior half of the lamp is brought to its shape and size in the same manner. In order to form the upper half, the third workman has in the mean time been preparing a round lump of glass on the end of one

of the rods, which he applies hot to the end of the neck, it being guided by the principal workman, and it immediately holds tight; he then breaks off the other neck by the cold pliers, and thus separates it from the blowing-pipe. The glass is now heated a third time, and brought from the furnace to the principal workman, who enlarges the small orifice at the end by turning it round, and holding the pliers against it until he enlarges it to the right shape: it is now finished, and the third workman takes it to a stool strewed over with small coals; he rests the rod upon the edge of the stool, and with a file files the joint at the bottom neck: it soon breaks off and the lamp falls upon the coals, the distance being so very small as to be in no danger of breaking; a boy now puts the end of a long stick into the open mouth of the glass, and thus carries it to the annealing oven, where it remains some hours; when taken out it must be cooled gradually, and is fit for sale.

About forty-six years ago a Bohemian manufacturer first attempted to *incrust* in glass small figures of a grayish clay. The experiments which he made were in but few instances successful, in consequence of the clay not being adapted to adhere properly to the glass. It was, however, from the Bohemian that the idea was caught by some French manufacturers, who, after having expended a considerable sum in the attempt, at length succeeded in incrusting several medallions of Buonaparte, which were sold at an enormous price. From the extreme difficulty of making these medallions, and their almost invariably breaking while under the operation of cutting, very few were finished, and the manufacture was on the point of being abandoned, when it was fortunately taken up by a French gentleman, who, with a perseverance not less honorable to himself than in its results advantageous to the arts, prosecuted a series of experiments, by which, in a few years, he brought the invention to a state of great improvement. The French have never succeeded, however, in introducing it into articles of any size, such as decanters, jugs, or plates; but have contented themselves with ornamenting smelling-bottles and small trinkets: nor had the invention been applied to heraldry, or any other useful purpose, antecedently to the recent improvements upon the art of this country.

England has always been famed for bringing to perfection, and directing to a useful application, the crude inventions of other countries. A patent has recently been taken out by Mr. Pelat of St. Paul's Church-yard for ornamental incrustations, called *crystallo ceramic*, which bids fair to form an era in the art of glass-making. By the improved process ornaments of any description, arms, cyphers, portraits, and landscapes, of any variety of color, may be introduced into the glass, so as to become perfectly imperishable. The substance of which they are composed is less fusible than glass, incapable of generating air, and at the same time susceptible of contraction or expansion, as, in the course of manufacture, the glass becomes hot or cold. It may previously be formed into any device, or figure, by either moulding or modelling; and

may be painted with metallic colors, which are fixed by exposure to a melting heat. The ornaments are introduced into the body of the glass while hot, by which means the air is effectually excluded, the composition being actually incorporated with the glass. In this way every description of ornamental glass ware may be decorated with embossed white or colored arms or crests. Specimens of these incrustations have been exhibited, not only in decanters and wine-glasses, but in lamps, girandoles, chimney-ornaments, plates, and smelling-bottles. Busts and statues on a small scale, caryatides to support lamps or clocks, masks, after the antique, have been introduced with admirable effect. The composition used in the patent incrustation, is of a silvery appearance, which has a superb effect when introduced into richly cut glass. Miniatures, however, may be enamelled upon it, without the colors losing any of their brilliancy; and thus, instead of being painted on the surface of the crystal, may be embodied in it.

A most important advantage to be derived from this elegant invention respects the preservation of inscriptions. Casts of medals and coins present no equal security for perpetuating them. The inscription, when once incrustated in a solid block of crystal, like the fly in amber, will effectually resist for ages the destructive action of the atmosphere.

Of making plate-glass.—The materials of the finest plate-glass are white sand, soda, and lime, to which are added manganese and zaffre, or any other oxide of cobalt for particular coloring purposes. The sand is of the finest and whitest kind, and is previously passed through a wire sieve of moderate closeness into water, where it is well stirred and washed till all dirt and impurity are got rid of. The sharpest grained sand is preferred, and indeed it is found that the grains of moderate size melt with the alkali sooner than either the very fine dust or the larger fragments. The alkali used is always soda, and there seems good reason to prefer this to potash, as glasses made with soda are found to be softer and to flow thinner when hot, and yet to be equally durable when cold. Besides, the neutral salts with the basis of soda, which constitute the glass-gall in this instance, such as the muriate and sulphate of soda, appear to be dissipated more readily by the fire than the corresponding salts of potash. Lime is of considerable use, and adds much to the fusibility of the other materials, supplying in this respect the use of litharge in the flint glass. Too much lime, however, impairs the color and solidity of the glass. The coloring, or rather discoloring, substances used are azure, or cobalt blue, and manganese. The latter is here in the state in which its effect is that of giving a slight red tinge, which mixes with the blue of the cobalt, and the natural yellow of the other materials; and if properly proportioned they neutralize each other so that scarcely any tint remains. Besides these ingredients there is always a great quantity of fragments of glass arising from what is spilt in the casting and the ends cut off in shaping the plates, which are made friable by quenching in water when hot, and used in this state with the fresh materials. Of the above materials the

sand, soda, lime, and manganese are first mixed together with great care, and are fritted in small furnaces built for this purpose, the heat being gradually raised to a full red-white, and kept at this point with frequent stirring till the materials undergo no further change, nor give any kind of vapor. The azure and the glass fragments, being already perfectly vitrified, are not added till towards the end of the process, which lasts about six hours. The glass-house for this manufacture differs in several particulars from the common houses for blowing glass, being about eighteen feet long and fifteen wide, made of good bricks. They are particularly distinguished from the common furnaces by containing two kinds of crucibles; the larger ones, called 'pots,' are in the form of an inverted and truncated cone, and in these the glass is melted. The others are smaller, called 'cuvettes.' Another essential part of this furnace is the flat table (of which there is one corresponding with each pot) on which the glass is cast. These tables are of copper-plate, about ten feet by six, supported by masonry; and contiguous to each, on the same level, are flat ovens heated from underneath, upon which the glass when cast and sufficiently cooled may be slid without difficulty from off the table, and then annealed. The tops of the flat oven and the table are on a level with the corresponding opening of the furnace, whence the cuvettes are withdrawn. When the glass is thoroughly melted, and fine, the cuvette is filled in the following way: the workman takes a copper ladle about ten inches in diameter, and fixed to an iron handle seven feet long, plunges it into the glass-pot, brings it up full of melted glass and empties it into the cuvette, the ladle being supported at the bottom by a strong iron rest held by two other workmen, lest the red-hot copper should bend and give way with the weight of the glass within. The cuvette being filled is suffered to remain in the furnace for some hours, that the bubbles formed by this disturbance of the glass may have entirely disappeared, and the samples taken out from time to time become quite clear and limpid. The door of the furnace is now opened, the cuvette is slid out and pulled upon a low iron cradle, and immediately drawn on to the side of the copper table, where it is hoisted by a tackle and iron chains, and overset upon a table, on which a thick flood of melted glass flows and spreads in every direction to an equal thickness. It is then made quite smooth and uniform at the surface, by passing over it a heavy hollow roller or cylinder of copper made true and smooth by turning, after it is cast, and weighing about 500 pounds. At the same time, the empty cuvette is returned by the iron cradle to its proper place within the furnace. The number of workmen required for the whole process of casting is at least twenty, each of which has his separate employment. The plate being cast, the inspector examines whether there are any bubbles on any part of the surface, and if found, the plate is immediately cut up through them. The plate being now cool is slid by an iron instrument from the casting table to the contiguous annealing oven, previously well heated, and is carefully taken up and ranged within it. Each

oven will contain six entire plates, and, when full, all the openings are stopped with clay, and the plates allowed to remain there for ten days or a fortnight, to be thoroughly annealed. When fit to be taken out of the annealing oven they are sent away to receive all the subsequent operations of polishing, silvering, &c.; but first the edges are cut smooth and squared. This is done by a diamond, which is passed along the surface of the glass upon a square ruler in the manner of glaziers, and made to cut into the substance of the glass to a certain depth. The cut is opened by gently knocking with a small hammer on the under side of the glass just beneath, and the piece comes off, and the roughnesses are removed by pincers. The plate is then finished as far as the glass-house business is concerned. The glass is now to be polished, which is done with sand and water; the glass being first fastened down to a wooden frame, with plaster of Paris, the operation is performed by means of another glass fastened in a frame, which is made to rub upon the other, wet sand being interspersed between the two. As the surfaces of the plates wear down, the sand is used finer and finer. Emery is next used of two or three degrees of fineness, which brings the glass to an even surface, but it is still perfectly opaque. To render it transparent, coleothar, which is the residue left in the retorts of the aquafortis makers, is applied. The polishing instrument is a block of wood, covered with several folds of cloth and carded wool, so as to make a firm elastic cushion. This block is worked by the hand; but, to increase the pressure of the polisher, the handle is lengthened by a wooden spring, bent to a bow three or four feet long, which, at the other extremity, rests against a fixed point to a beam placed above. The plate is now fastened to a table with plaster, covered with coleothar, and the polisher begins his operation by working it backwards and forwards over the surface of the plate till one side is done; then the other is to be polished in the same manner.

Crown-glass is the name given to the best window glass, the composition of which varies very considerably: but a good glass of this kind may be made with 200 parts of soda, 300 of fine sand, 33 of lime, and from 250 to 300 of the ground fragments of glass that has already been worked. A small quantity of arsenic is sometimes added to facilitate the fusion. Zafre, or the oxide of cobalt, with ground flint, is often used to correct the dingy yellow which the inferior kind of crown-glass naturally acquires. The manufacture of the common window glass, though made by blowing, is carried on very differently from that of the common flint glass articles, as the object is to produce a large flat and very thin plate, which is afterwards to be cut by the glazier's diamond into the required shapes and sizes. It is difficult to convey to the reader a proper and precise idea of the process by mere description, but it may be mentioned, that the workman takes a large mass of glass on the hollow iron rod, and by rolling it on an iron plate, and swinging it backwards and forwards, causes it to lengthen by its own weight into a cylinder, which is then rendered hollow by blowing with a force

of breath till it is brought out to the requisite thickness. The hollow cylinder is then opened by holding it to the fire, which by expanding the air confined within it (the hole of the iron rod being stopped) bursts it at its weakest part; and when still soft it is ripped up through its whole length by iron shears, opened out into a flat surface, and then it is finished by annealing as usual.

Common green bottle glass is another kind, which is made almost entirely of sand, lime, and sometimes clay, alkaline ashes of any kind, according as cheapness or convenience direct, and more especially of kelp in this country; of barilla, varec, and the other varieties of soda, in France; and of wood ashes in many parts of Germany, and in North America. The following composition has been given as a good and cheap material for bottle-glass, 100 parts of common sand, 30 of varec (a coarse kind of kelp made on the western coasts of France) 160 of the lixiviated earth of ashes, 30 of fresh wood ash, 80 of brick clay, and about 100 of broken glass. Bottle-glass is a very hard, well vitrified glass, not very heavy relatively to its bulk, and being fused at a very high degree of heat, and from other circumstances, it resists the corrosive action of all liquids much better than flint-glass. Besides being used for wine and beer bottles, it is much employed for very large retorts, subliming vessels, and other processes of chemistry, for which it is admirably adapted, being able to bear as much as a pretty full red-heat, without melting or sinking down into a shapeless lump.

Composition for white and crystal-glass.—To make crystal-glass, take of the whitest terso, pounded small, and sifted as fine as flour, 200lbs.; of the salt of polyverine 130lbs.; mix them together, and put them into the furnace called the calcar, first heating it. For an hour keep a moderate fire, and keep stirring the materials with a proper rake, that they may incorporate and calcine together; increasing the fire for five hours; after which the matter is taken out, being sufficiently calcined, and is called frit. After this, remove it immediately from the calcar to a dry place, and cover it up from dust, for three or four months. Now, to make the crystal glass, take of the above crystal frit, called also bollito, and set it in the melting pots in the furnace, adding to it a due quantity of manganese; when the two are fused, cast the flour into fair water, to clear it of the salt called sandiver, which would otherwise make the crystal obscure and cloudy. This washing must be repeated again and again, till the crystal be fully purged; or this scum may be taken off by proper ladles. Now set it to boil for four, five, or six days; which being finished, see whether it have manganese enough, and, if it be yet greenish, add more manganese at discretion, by little and little at a time, taking care not to over dose it, because it will incline it to a blackish hue. Let it clarify, and become of a shining hue; which done, it is fit to be used, and blown into vessels of any kind. Or, 120 parts of fine sand, 40 of purified pearl-ash, 35 of litharge, 13 of nitre, and a small quantity of black oxide of manganese, make a good glass.

Compositions for flint-glass.—Flint glass, as it

is usually called by us, is of the same general kind with that which, in other places, is called crystal-glass. It has this name from its having been originally made with calcined flints, before the use of white sand was understood; and it has retained this name, though there are now no flints used in its composition. This glass differs from the crystal-glass in having lead in its composition to flux it, and white sand for its body, whereas the fluxes used in the other are salts or arsenic, and the body consists of tarso, white river pebbles, and such kinds of stones. To the lead and white sand a due proportion of nitre is added, and a small quantity of magnesia. The most perfect kind of flint-glass is made by fusing, in a very strong fire, 120 lbs. of white sand, 50 lbs. of red-lead, 40 lbs. of the purest pearl-ash, 20 lbs. of nitre, and 5 oz. of magnesia. Another composition of flint-glass is said to consist of the following: 120 lbs. of white sand, 54 lbs. of the purest pearl-ash, 36 lbs. of red-lead, 12 lbs. of nitre, and 6 oz. of magnesia. To either of the above compositions a pound or two of arsenic may be added, to increase the flux of the composition. A still cheaper flint-glass may be made with 120 lbs. of white sand, 35 lbs. of the best pearl-ash, 40 lbs. of red-lead, 13 lbs. of nitre, 6 lbs. of arsenic, and 4 oz. of magnesia; or, instead of the arsenic, may be substituted 15 lbs. of common salt; but this will make it more brittle than the other. But the cheapest of all the compositions hitherto employed, consists of 120 lbs. of white sand, 30 lbs. of red-lead, 20 lbs. of the best pearl-ash, 10 lbs. of nitre, 15 lbs. of common salt, and 6 lbs. of arsenic. Or, 100 parts of sand, 80 to 85 of red-lead, 35 to 40 of pearl-ash, 2 or 3 of nitre, and 1 oz. of manganese. The oxide of lead may be reduced in this glass.

Of silvering glass.—Glass when smoothed and polished does not acquire the property of reflecting objects till it has been silvered, as it is called, an operation effected by means of an amalgam of tin and quicksilver. The tin-leaf employed must be of the size of the glass, because, when pieces of that metal are united by means of mercury, they exhibit the appearance of lines. Tin is one of those metallic substances which become soonest oxidated by the means of mercury. If there remains a portion of that oxide or calx, of a blackish gray color, on the leaf of tin, it produces a spot or stain in the mirror, and that part cannot reflect objects presented to it: great care, therefore, is taken in silvering glass to remove the calx of tin from the surface of the amalgam. The process is as follows:—The leaf of tin is laid on a very smooth stone table, and mercury being poured over the metal, it is extended over the surface of it by means of a rubber made of bits of cloth. At the same moment the surface of the leaf of tin becomes covered with blackish oxide, which is removed with the rubber. More mercury is then poured over the tin, where it remains at a level to the thickness of more than a line, without running off. The glass is applied in a horizontal direction to the table at one of its extremities, and being pushed forwards it drives before it the oxide of tin which is at the surface of the amalgam. A number of leaden

weights, covered with cloth, are then placed on the glass which floats on the amalgam, in order to press it down. Without this precaution the glass would exhibit the interstices of the crystals resulting from the amalgam. These crystals have the form of large square laminae irregularly disposed.

To obtain leaves of tin, which are sometimes six or seven feet in length, with a proportionate breadth, they are not rolled but hammered after the manner of gold-beaters. The prepared tin is first cast between two plates of polished iron, or between two smooth stones not of a porous nature, such as thunder-stone. Twelve of these plates are placed over each other; and they are then beaten on a stone mass with heavy hammers, one side of which is plain and the other rounded. The plates joined together are first beaten with the latter: when they become extended the number of the plates is doubled, so that they amount sometimes to eighty or more. They are then smoothed with the flat side of the hammer, and are beaten till they acquire the length of six or seven feet, and the breadth of four or five. The small block of tin from which they are formed is at first ten inches long, six in breadth, and a line and a quarter in thickness. When the leaves are of less extent, and thin, from eighty to 100 of them are smoothed together.

Tin, extracted from the amalgam which has been employed for silvering glass, exhibits a remarkable peculiarity. When fused in an iron pan, its whole surface becomes covered with a multitude of tetrahedral prismatic crystals, two or three lines in length, and a quarter of a line in thickness. The interior of these pieces of tin, when cut with a chisel, have a grayer tint than pure tin, which is as white as silver. The latter crystallises also by cooling; but it requires care. When it begins to be fixed, decant the part which is still in fusion, and there will remain at the bottom of the crucible beautiful crystals of a dull white color, which appeared to me to be cubes or parallelopipedons.

Painting on glass.—The primitive manner of painting on glass was very simple, and, of consequence, very easy; it consisted in the mere arrangement of pieces of glass of different colors, in some sort of symmetry; and constituted a kind of what we call Mosaic work. Afterwards, when they came to attempt more regular designs, and even to represent figures raised with all their shades, their whole address went no farther than to the drawing the contours of the figures in black, with water colors, and etching the draperies after the same manner, on glasses of the color of the object intended to be painted. For the carnations they chose glass of a bright red; upon which they designed the principal lineaments of the face, &c., with black. At last, the taste for this sort of painting being considerably improved, and the art being found applicable to the adorning of the churches, basilicas, &c., they found means of incorporating the colors with the glass itself, by exposing them to a proper degree of fire, after the colors had been laid on.

Those beautiful works, among the painters in glass, which were made in the glass-house, were of two kinds: in some the color was diffused through the whole body of glass; in others, which

were the more common, the color was only on one side, scarcely penetrating within the substance above one-third of a line; though this was, more or less, according to the nature of the color, the yellow being always found to enter the deepest. These last, though not so strong and beautiful as the former, were of more advantage to the workmen; because, on the same glass, though already colored, they could show other kinds of colors, where there was occasion to embroider draperies, enrich them with foliage, or represent other ornaments of gold, silver, &c. In order to this, they made use of emery: grinding, or wearing down the surface of the glass, till such time as they were got through the color to the clear glass: this done, they applied the proper colors on the other side of the glass. By this means the new colors were prevented from running, and mixing among the former, when the glasses came to be exposed to the fire, as will hereafter be shown.

When the intended ornaments were to appear white, or silvered, they contented themselves to bare the gloss of its color with emery, without applying any new color at all; and it was in this manner that they wrought the lights and heightenings on all kinds of colors. The painting with vitreous colors on glass depends entirely on the same principles as painting in enamel, and the manner of executing it is likewise the same, except that in this, the transparency of the colors being indispensably requisite, no substances can be used to form them but such as vitrify perfectly: and, therefore, the great object is to find a set of colors which are composed of such substances, as, by the admixture of other bodies, may promote their vitrification and fusion; are capable of being converted into glass; and melting in that state, with less heat than is sufficient to melt such other kinds of glass as may be chosen for the ground, or body to be painted; to temper these colors, so as to make them proper to be worked with a pencil, and to burn or reduce them by heat, to a due state of fusion, without injuring or melting the glass which constitutes the body painted. The first thing to be done, in order to paint on glass, in the modern way, is to design, and even color, the whole subject on paper. Then they make choice of pieces of glass proper to receive the several parts, and proceed to divide or distribute the design itself, or the paper it is drawn on, into pieces suitable to those of glass; having always a view that the glasses may join in the contours of the figures, and the folds of the draperies; that the carnations and other finer parts may not be damaged by the lead wherewith the pieces are to be joined together. The distribution being made, they mark all the glasses, as well as papers, with letters or numbers, that they may be known again; which done, applying each part of the design on the glass intended for it, they copy or transfer the design upon this glass, with the black color, diluted in gum-water, by tracing and following all the lines and strokes as they appear through the glass with the point of a pencil.

When these first strokes are well dried, which happens in about two days, the work being only in black and white, they give it a slight wash over with urine, gum arabic, and a little black;

and this several times repeated, according as the shades are desired to be heightened; with this precaution, never to apply a new wash till the former is sufficiently dried. This done, the lights and risings are given, by rubbing off the color in the respective places with a wooden point, or the handle of the pencil.

As to the other colors above-mentioned, they are used with gum-water, much as in painting in miniature, taking care to apply them lightly, for fear of effacing the outlines of the design; or even, for the greater security, to apply them on the other side, especially yellow, which is very pernicious to other colors by blending therewith.

And here too, as in pieces of black and white, particular regard must be always had not to lay color on color, or lay on a new lay till such time as the former are well dried. It may be added, that the yellow is the only color that penetrates through the glass, and incorporates therewith by the fire; the rest, and particularly the blue, which is very difficult to use, remaining on the surface, or at least entering very little. When the painting of all the pieces is finished, they are carried to the furnace or oven, to anneal or bake the colors. The furnace here used is small, built of brick, from eighteen to thirty inches square. At six inches from the bottom is an aperture to put in the fuel, and maintain the fire. Over this aperture is a grate, made of three square bars of iron, which traverse the furnace, and divide it into two parts. Two inches above this partition is another little aperture, through which they take out pieces to examine how the operation goes forward. On the grate is placed a square earthen pan, six or seven inches deep, and five or six inches less every way than the perimeter of the furnace. On one side hereof is a little aperture, through which to make the trials, placed directly opposite to that of the furnaces destined for the same end. In this pan are the pieces of glass to be placed in the following manner:—At first, the bottom of the pan is covered with three strata, or layers, of quicklime pulverised; those strata being separated by two others of old broken glass, the design whereof is to secure the painted glass from the too intense heat of the fire. This done, the glasses are laid horizontally on the last, or uppermost layer of lime. The first row of glass they cover over with a layer of the same powder an inch deep; over this they lay another range of glasses; and thus alternately till the pan is quite full, taking care that the whole heap always ends with a layer of the lime-powder.

The pan thus prepared, they cover up the furnace with tiles on a square table of earthenware, closely luted all round, only having five little apertures, one at each corner, and another in the middle to serve as chimneys.

Things thus disposed, there remains nothing but to give the fire to the work. The fire for the first two hours must be very moderate, and must be increased in proportion as the coction advances for the space of ten or twelve hours, in which time it is usually completed. At last the fire, which at first was only of charcoal, is to be of dry wood; so that the flame covers the whole pan, and even issues out at the chimneys. During the last hours they make assays from time to

time by taking out pieces laid for that purpose, through the little aperture of the furnace and pan, to see whether the yellow be perfect, and the other colors in good order. When the annealing is thought sufficient, they proceed with great haste to extinguish the fire, which otherwise would soon burn the colors and break the glasses.

Mr. Collins, glass-manufacturer of the Strand, near Temple Bar, has furnished the following observations and receipts on this subject:—

‘Enamel colors and painting on glass,’ says Mr. Collins, ‘differ totally from all others, it being requisite on glass that the colors used should appear transparent, and bear (without blistering in the kiln) to be laid on very thick. In every other style of enamel painting the fluxes must be so compounded as to bring the beauty of the color on the surface, and they do not require to be any thing like the substance compared to those used on glass.’

‘Crown window glass is the best for the purpose of enamelling upon, its principal composition or base being silex, which is not only the best substance for receiving colors, but also by far the best as the base for the fluxes. The best fluxes are obtained from finely calcined flints, lead and salts forming the fusing matter; these latter must be carefully used in various proportions, as the colors or oxides require.’

‘Receipts for the colors.’—From gold only are prepared any pink or rose colors, although it has often been asserted that the French have prepared them from iron, which may sometimes answer for an orange-red, but will never produce a pink; and is very far (even as a red) from being so fixed a color as those made from gold, although it has been stated to be more so. In fact, a color being well fixed (on the contrary) depends as much upon the properties of the flux being rightly prepared to receive it as on the oxide or coloring matter itself, which experiment only can firmly elucidate.

‘All metals should be as far removed from their metallic state as possible, and when in that state from which it would be the most difficult to restore it, it is best calculated for the purpose, therefore gold precipitated by tin is better than that by an alkali, being a much more perfect oxide. Besides that tin is the firmest and best base for receiving and holding the color struck from gold.’

‘In combining the fluxes, so that they shall bear the greatest possible affinity for the oxides intended, rests the principal art of color-making.’

‘In the solutions of gold and tin it is best to use more of the nitric and as little of the muriatic acid as possible, and the larger the proportion of metal that can be dissolved in a certain portion of acids the better.’

‘In the solution of gold the beauty of the color rests principally in the precipitate; to obtain the best, use the water as hot as possible; into about a pint of which drop a little gold (about fifteen or twenty drops), then the tin most carefully, by a drop at a time until it becomes as nearly as possible the color of port-wine at the edge of the basin; it will then instantly precipitate itself. Wash it several times with very hot water; it must now be mixed with its flux before it is suffered to dry.’

'Rose color should always be made from an oxide that inclines to the pink (as it occasionally differs); the flux should contain scarcely any lead, a small portion of silver is then added, and the whole finely ground before dry.

'I have entered at greater length into the pink and rose colors produced from gold than on any others, they being by far the most difficult to produce, and should never be made but on a bright and clear sun-shiny day, which I am persuaded has great influence on the preparation, as you never can produce this color good with a damp atmosphere or a cloudy sky.

'Blue is made from cobalt; the best is that prepared by fire, as in Staffordshire, being more condensed than that which is prepared by the acids. It is then fused with borax ground fine and washed several times; when dry, mixed with the flux and melted together.

'Purple is made from an oxide that inclines to the blue, and the flux may contain a much larger portion of lead, &c., as the rose color, only omitting the silver.

'Yellows are made from varied proportions of the oxides of antimony and lead. Tin is best omitted and silex used in its place; the whole to be well melted.

'Orange. Prepared as the yellow, only introducing a small quantity of the purple oxide of gold, and melted as yellow.

'Brown is made from manganese and antimony ground with the flux, and well melted together.

'Black is best when made from good iron scales and oxide of cobalt, with a little of the darkest possible purple oxides of gold, mixed with the flux and melted together.

'Green is made from copper oxidated by fire, united with the flux, and well melted. It is then mixed with yellow to produce a grass green, and with white enamel (made by arsenic) to produce a blue-green.

'White, which is seldom used on glass, is made from arsenic mixed with the flux, and when in a state of fusion kept well covered. Tin

is also considered, for some purposes, the only thing from which a good fixed white can be made, but all that I have yet seen made in this country is very bad. The Venetian white enamel only can be depended on, which latter more particularly applies to enamelling on copper. The hard white enamel is but very little understood in this country. By some its base is stated to be the oxide of tin, but it is very doubtful. This is that substance used as the first ground or coating of the copper-plates for enamel painting, over which a somewhat more transparent and softer enamel (termed flux) is laid, which, melting sooner than the first, is better adapted for receiving the colors. In this style of painting so little can be done before it is necessary to fire the picture, that it frequently requires a dozen fires to complete a painting.

'Ruby. That produced by the ancients is what has made the greatest noise, the art of making which being considered lost, and for this reason principally admired. But this is an error, as that beautiful color is now made in as great perfection as ever, and equally well understood. Ruby may be made either from gold or copper. When made from the latter the color is liable to change by various degrees of heat, any thing above a red heat totally dissipating it. That made from gold is perfectly fixed, though not quite so deep a tint; with this latter, antimony, iron, and silver are used. With the copper red tartar.

'Painting on glass requires infinitely more care in burning than enamel, both on account of the superior size and brittleness of the substance; it therefore requires many hours annealing.

'In the preparing of glass and enamel colors there is great difference; but the oxides or coloring matters are alike in all, excepting the yellow, which on glass is produced from silver, on enamel from antimony. A fine red is produced on glass by the union of silver and antimony.'

GLAS (John), M. A., the founder of that sect of Independents commonly distinguished in Scotland by the name of Glassites, and in England by that of Sandemanians. See INDEPENDENTS. His father was minister of Abernethy; and he was born at his father's manse in 1695. He was educated and obtained the degree of M.A. at St. Andrews; and was, when a very young man, ordained minister of Tealing, near Dundee. His doctrines and ministry were remarkable, and drew much attention; and, even while connected with the establishment, his peculiar ideas of the purity of church communion and government, were observable. In 1727 he published a work, entitled *The Testimony of the King of Martyrs*, in which his Independent principles were fully developed. In that treatise he maintains the inconsistency of any connexion between civil establishments and the church of Christ, which is not of this world. This publication, with other concurring circumstances, produced a long controversy between Mr. Glas and

the Synod of Angus and Mearns. So far, however, from retracting or trimming in his principles, he still more openly avowed and maintained them, in a tract published the following year, entitled, *A Congregation subject to no Jurisdiction under Heaven*. He was deposed in 1728, and immediately afterwards connected himself with a few poor people who adhered to him; and, although his adherents have never been numerous, the doctrines which he taught have been generally spread through Britain and many parts of America. He was subjected to great poverty for many years, in supporting a numerous family of thirteen children; and died at Dundee, in November, 1773, highly valued by his friends, and respected by all who knew him. He published many religious Tracts, which were collected and printed in 4 vols. 8vo., and since reprinted in 5 vols. The leading doctrines in these works, are, 1. The divinity of Christ, and the perfection of his righteousness to justify the ungodly; 2. Purity of Christian com-

munion; 3. Independence of all human authority in matters of conscience; 4. The strictest subjection to civil government and magistracy in civil concerns; and, 5. Unqualified obedience to the commands of Christ and his apostles.

GLASSE (George Henry), a modern classical scholar of some eminence, was educated at Christ Church, Oxford, where he took the degree of M.A. in 1782. His father, Dr. Samuel Glasse, resigned in 1785 the rectory of Hanwell, Middlesex, in his favor. He held it till his death in November, 1809. Mr. Glasse at an early period of his life possessed a remarkable facility of writing Greek verses. In 1781 he published a translation of Mason's *Caractacus*, and in 1788 a translation of the *Samson Agonistes* of Milton into Greek verse. He published likewise *Contemplations on the Sacred History*, altered from the Works of Bishop Hall, 4 vols. 12mo.; *Louisa, a Narrative of Facts*, supposed to throw light on the Mysterious History of the Lady of the Hay-stack, translated from the French; a Volume of Sermons on various subjects, &c.

GLASTONBURY, a town of England, in Somersetshire, anciently called Avalonia. It is noted for a famous abbey, some magnificent ruins of which still remain. The curious structure called the abbot's kitchen is pretty entire. The monks pretended that it was the residence of Joseph of Arimathea, and of St. Patrick. Ina, king of the West Saxons, erected a church here, A.D. 708, which he and his successors enriched so much, that the abbot had the title of lord, and sat among the barons in parliament: not even a bishop or prince durst set foot on the isle of Avalon, in which the abbey stands, without his leave. The revenue was about £40,000 a-year, besides seven parks stocked with deer. In 853 it was ruined by the Danes, but rebuilt by king Edward I. In 1184 both the town and abbey were burnt, and in 1276 suffered much by an earthquake. Richard Witing, the last abbot, who had 100 monks and 400 domestics, was hanged on Torhill, in his pontificals, with two of his monks, for refusing to take the oath of supremacy to Henry VIII. Edgar and many other Saxon kings were buried here. It is said that Henry II., relying on the tradition of several songs, which recorded this to be the burial-place of king Arthur, ordered a search to be made, when a leaden cross was discovered with a Latin inscription in rude Gothic characters, thus translated: 'Here lies the famous king Arthur, buried in the isle of Avalon.' Beneath was found a coffin hollowed out of the solid rock, wherein were the bones of a human body, supposed to be those of king Arthur; which were then deposited in the church, and covered with a sumptuous monument. Every cottage has part of a pillar, a door, or a window of the old building. Here are two parish churches. This town, while under its abbots, was a parliamentary borough, but it lost that and its privilege of a corporation; the latter of which, however, was restored by queen Anne, who granted it a new charter for a mayor and burgesses. The only manufacture is stockings, but the chief support of the place is the resort of strangers to see the

ruins of the abbey. Glastonbury is five miles S.S.W. of Wells, and 126 west of London.

GLASTONBURY THORN, *n. s.* A species of medlar.

This species of thorn produces some bunches of flowers in Winter, and flowers again in the Spring. *Miller.*

GLATZ, or KLADSKO, a country of the Prussian States, surrounded by Silesia, Moravia, and Bohemia. It has a territorial extent of 550 square miles, and is one of the most elevated parts of Europe, lying in the midst of the Sudetic range of mountains. The most noted of this province are the Eulengebirge, the Schneeberg, which divides it from Moravia, and the Heuscheuer. In the interior some beautiful valleys diversify and animate the scenery. The rivers are the Neiss, the March, and the Erlitz. The pastures are fine, the cattle numerous, and some little corn is exported. This country also contains coal, chalk pits, and a number of mineral springs; together with mines of silver, lead, copper, and iron, but they are wrought on but a small scale. Flax is cultivated commonly, and spinning and weaving are considerable pursuits. This was formerly a lordship, dependent on the crown of Bohemia, and subject to Austria till 1742, when it was seized by Frederic II., and has ever since been retained by Prussia. It forms an important pass between Bohemia and Silesia, and is included in the government of Reichenbach, in that province. Inhabitants 100,000.

GLATZ, the capital of the above district, stands on the Neiss, between two noble hills, one of which is surmounted by an old castle, and the other by a regular modern fortress. The town itself is likewise fortified. The manufactures are leather and carpets. Glatz contains the only Lutheran parish church in the district. It surrendered to the Prussians in 1742, was taken by storm by the Austrians in 1759, but restored at the peace of 1763. It surrendered to a body of Wirtemberg and Bavarian troops 26th of July, 1807, and is now the chief town of a circle in the government of Reichenbach, fifty-five miles south by west of Breslau, and ninety-four east of Prague. Inhabitants 6700.

GLATZERGEIRGE, a mountain ridge, forming part of the Sudetic chain, in the north-east of Bohemia. The main range touches the north of Moravia, and sends off secondary branches to the west, through the south of Bohemia, and through the north as far as Saxony.

GLAUBER (John Rodolphus), a celebrated German chemist, who flourished about 1646. He wrote a great number of treatises on chemistry, some of which have been translated into French. All his works have been collected into one volume, entitled, *Glauberus Concentratus*, which has been translated into English, and was printed at London in folio, in 1689. Mr. Brande speaks highly of his discoveries. Sulphate of soda was first combined by him, and called Glauber's salts.

GLAUCHAU, a town and district of the county of Schonburg, Saxony, on the Mulda. Its neighbourhood, though not fertile, abounds in wood and metals, and its cotton manufac-

tures are considerable. It is also the centre of the public business of the different districts belonging to the court of Schonburg. Inhabitants 4000. It is fifty-three miles west of Dresden, and six north of Zwickau.

GLAUCOMA, *n.s.* Gr. *γλαύωμα*; Fr. *glaucome*. A fault in the eye, which changes the crystalline humor into a grayish color, without detriment of sight, and therein differs from what is commonly understood by suffusion.

The *glaucoma* is no other disease than the cataract. *Sharp.*

GLAUCOMA, from *γλαυκος*, sea-green, or sky color, is a disease in the eyes, wherein the crystalline humor is turned of a bluish or greenish color, and its transparency hereby diminished. To those in whom this disorder is forming, all objects appear as through a cloud or mist; when entirely formed, the visual rays are all intercepted and nothing is seen at all. The *glaucoma* is usually distinguished from the cataract or suffusion, in this, that in the cataract the whiteness appears in the pupil, very near the cornea; but it shows deeper in the *glaucoma*. Some late authors, however, maintain the cataract and *glaucoma* to be the same disease. According to them, the cataract is not a film, or pellicle, formed before the pupil, as had always been imagined; but an inspissation or induration of the humor itself, whereby its transparency is prevented; which brings the cataract to the *glaucoma*. According to Mr. Sharp, the *glaucoma* of the ancient Greeks is the present cataract; but M. St. Yves says, it is a cataract accompanied with a gutta serena. See *SURGERY*.

GLAUCUS, in ancient mythology, a deity of the sea, who, before his deification, was a fisherman of Anthedon. Having one day taken a considerable number of fishes, which he laid upon the bank, he perceived that as soon as they touched an herb that grew on the shore, they received new strength, and leaped again into the sea; upon which he was tempted to taste of the herb himself, and instantly leaped into the sea after them, where he was metamorphosed into a Triton, and became one of the sea gods.

GLAIVE, *n.s.* Fr. *glaive*; Welsh *glaf*, a hook. A broad sword; a falchion.

And whet her tonge as sharpe as swerde or gleve.

Chaucer. The Court of Love.

Two hundred Greeks came next in sight well tryed,
Not surely armed in steel or iron strong,
But each a *glave* hath pendant by his side. *Fairfax.*

GLAVER, *v.n.* Sax. *glupan*; Welsh *glave*, flattery. It is still retained in Scotland. To flatter; to wheedle. A low word.

Kingdoms have their distempers, intermissions, and paroxysms, as well as natural bodies; and a *glavering* council is as dangerous as a wheedling priest, or a flattering physician. *L'Estrange.*

GLAUX, in botany, a genus of the monozynia order, and pentandria class of plants, natural order seventeenth calycanthemæ: cal. monophyllous: cor. none: caps. unilocular, quinquevalved, and pentaspermous. Species one only; a sea-coast herb.

GLAZING. The most ancient species of glazing was in lead-work, as our many cathedrals and religious houses, still extant, demonstrate; and fixing glass in leaden frames is still continued for the same description of buildings.

The business of a glazier, if considered in its most simple operations, consists in fitting all the various kinds of glass manufactured and sold, into sashes previously prepared to receive them. The sashes, as they are now made, have a groove or rebate formed on the back of their cross and vertical bars, adapted to admit the glass: into these rebates the glazier minutely fits the squares, which he beds in a composition called putty. The putty consists of pounded whiting beaten up with linseed oil, and so kneaded and worked together as to make a tough and tenacious cement, and is of great durability; this the glazier colors to suit the sashes he may have in hand. If they are common deal sashes the putty is left and used as first manufactured; but if they are mahogany it is colored with ochre till it approaches more nearly that of the sashes.

In glazing windows the color of the glass is that on which the greatest beauty is given to the work; and to effect this successfully many different manufactories have been established. The most usual kind of window-glass now found at the glaziers' is called crown glass: it is picked and divided at the manufactory into the several different kinds which are known as firsts, seconds, and thirds, and which particularly denote the qualities of the several kinds of glass, the first being known as best crown, the next in quality second crown, and the last thirds or third crown, the price of each varying according to the quality. The glass is in pieces, called tables, of about three feet in diameter each; and, when selected and picked as above, they are packed in crates, twelve of such tables being put in each crate of best glass, fifteen in the seconds, and eighteen in the thirds. The crates consist of an open framing of unhewn wood, and the glass is packed in them in straw for security. The glaziers purchase such glass by the crate, although the duty on it is collected by the pound. The price of a crate of glass varies as its quality, the best crown being now (since the late additional duty) worth about four guineas per crate, the seconds three, and the thirds two guineas. There are several manufactories for what is called crown glass, but the most esteemed in the market is that which is made at Newcastle and its neighbourhood.

Green glass is another of these species, and which is greatly in demand for all the purposes in which color is not so particularly sought for. This sort of glass is used in the glazing of the windows of cottages; also for green and hot-houses, to which it is found to answer every purpose. It is not more than one-half the cost of the crown glass. The green glass appears to have been the most ancient kind made use of, as most of the vestiges remaining in the old windows approach very nearly in their quality to what is now sold under that designation. The glaziers also prepare the crown glass so as to produce an opaque effect: it is adapted to prevent the inconvenience of being overlooked. It is tech-

nically called ground glass, which is not improper, inasmuch as it is rendered opaque by rubbing away the polish from off its surface; to do which the glazier takes care to have the sheets or panes of glass brought to their proper size; then they are laid down smoothly as well as firm, either on sand or any other substance which is adapted to admit of its lying securely. He then rubs it with sand and water, or emery, till the polish is completely removed: it is then washed, dried, and stopped into the window for which it was prepared. There was a species of glass, made originally at Venice, which was manufactured wholly for this purpose, and is now to be seen in many counting-houses and old buildings. Its general appearance presented an uneven surface, appearing as though indented all over with wires, leaving the intervening shapes in the form of lozenges. This glass was very thick and strong, and is of the description known as plate glass. None of it has been imported into England for many years past; in consequence of which grinding the crown glass, as above described, has been made use of to answer the same purpose. However, it was lately manufactured and sold in tables at the depot for plate glass lately established in East Smithfield.

The crown glass not admitting of being cut to very large size squares, and the fashion of making folding sashes having become general, recourse has been had to obtain tables of sizes adequate to admit of pieces being taken out of them adapted to glaze such windows. This was first attempted at a glass-house at Ratcliffe, near London; it failed however, from there not being a demand capable of supporting such a manufactory. The Newcastle people are, however, at this time succeeding in producing their tables in size commensurate to answer almost every purpose.

The most beautiful glass made use of is that sold by the British Plate Glass Company of Albion Place, which is manufactured by them at Ravenscroft, in Lancashire. This glass is nearly colorless, and of a sufficient thickness to admit of its being polished to the greatest delicacy. From this depot looking-glasses may be obtained of surprising dimensions; and hence it is that most of the plate glass, so much the fashion in our windows, is obtained. This company sell their glass in proportion to its size, the value increasing as it increases. At their warehouse are to be seen thousands of different sized plates, every one of which is labelled of its size in inches only, as it is by inches that such glass is bought and sold.

The glaziers, in glazing windows of plate glass, strike it out to the size required by a fine diamond, after which they break off the pieces by pincers; such glass varies in its thickness from one-eighth to as much as a quarter of an inch. Purchasers of glass of this company may almost always be suited in the sizes they may want at the depot in Albion Place, but if the pieces are larger than the size required, the loss occasioned by reducing it falls on the buyer, as he must pay for the whole of its admeasurement. But if an order be left to be executed, and time allowed to send to the manufactory at Ravenscroft, the

glass is sent in sizes exactly corresponding to the order given, and will be charged as such only: this circumstance is of some importance when large quantities are required, as is not unfrequently the case at this time, when plate glass is so much in fashion. The company often require three or four months to execute an order of any magnitude. The value of such kind of glass is very considerable in comparison of the other sorts; common sized squares for windows amounting from two to three pounds each, and sometimes, in French windows, as high as five pounds. It is, nevertheless, so much preferred, at this time, that even our shop windows in the leading streets are daily becoming glazed with it.

There are also many other sorts of plate glass in use, among these, that which is called German sheet is the most esteemed; its color is beautiful, being the most colorless of any made, but its outside appearance is disagreeable, it being very uneven or wavy. Indeed it resembles, on its outside, a substance which has been subjected to the hammer. The plate glass seen in windows, of a red tint, was much in use about twenty years since, and is of German manufacture, and known among the glaziers as Bohemian plate glass; its color at first was calculated to strike, but color is no recommendation to glass, and hence it is now almost laid aside.

Glaziers value their work by feet, inches, and parts, and the value of the glass increases as that of the size of its squares. Their charges are regulated by the master, and wardens, and court-assistants of the Company of Glaziers, who are generally not unmindful of themselves.

The glass squares of cottages, and church-windows which are glazed in leaden rebates, are technically called quarries. The lead for such windows is cast for the purpose, and purchased by the glaziers in packages by the cwt; it is cut to the sizes and lengths required, and soldered together at their intersections: the leaden work is of various sizes, in proportion to the strength of the work for which it is wanted; and is so soft as to be easily bent where the groove is left in it for the glass: one side or cheek of which is pressed down all round, the shape being left in it for the glass by a small tool called a stopping-knife; the quarry is put into the place so made for it, and, with the same tool, the side of the groove, which had been thus bent down to admit it, is raised up to the quarry, and is afterwards smoothed close to it. These kinds of windows are further strengthened by vertical and cross bars of iron, to which the leaden ones are secured by bands soldered to the latter, and bent and twisted round the former; in cottage windows these bars are often of wood, to which the bands are fastened in a similar manner.

Glaziers now cut all their glass out with the diamond, whereas formerly an iron was made use of for that purpose, called a grozing iron. It was an instrument in shape not unlike a key, such as is used for the purpose of opening and shutting locks; and had wards in its sides which were applied to scratch the surface and snap off the part required to be separated. The diamond now in general use is as complete for this pur-

pose as can possibly be wished, as, by merely drawing it over the glass to be cut, its surface becomes so regularly fractured as to allow, by a small pressure downwards, the piece operated upon to be easily removed. But, to answer this purpose, the diamond spark must be left in its natural state as found in the mines, its principal virtue lying in its outward coat. It is ascertained that, when it is cut or polished, it loses all its power in promoting the fracture on the glass. To make the diamond useful to the glazier it is fixed in lead, secured by a ferule of brass, fastened to a handle of ebony or other hard wood; the whole together not assuming a size larger than a moderate-sized drawing pencil. The diamond, thus described, constitutes the principal working tool of the glazier, and its scarcity renders its value to a journeyman of some little importance; some masters in this business supply their men with this tool, while others require them to find their own.

The other tools which they use consist of a *rule*, commonly of three feet in length, divided into thirty-six parts or inches, and each part or inch again divided into fractions. With this the squares and tables of glass are divided, and cut to the several sizes wanted. A glazier also wants several small *straight-edges* for the diamond to work against. A straight-edge consists merely of a thin piece of mahogany, or other hard wood, about two inches wide, and one-eighth of an inch in thickness, wrought quite parallel, having its faces right and left splayed off a little to allow of the diamond being drawn more correctly against its edge. They have also *stopping-knives* for bedding the glass in the wooden rebates of the sashes. With this knife the workman smooths and spreads the putty to secure the glass in the sashes. In repairs of windows for broken squares, which the glazier calls 'stopping in,' or 'squares stopped in,' he makes use of another knife for the purpose of hacking out the old putty, and which is termed the 'hacking-out tool,' and consists literally of no more than an old broken knife ground sharp on its edge, and also at the end where it has been broken off from the rest of the blade. The old putty is cut out of the rebates by applying the hacking-out tool all round them, by striking it at its thickest or upper edge with a common hammer until the whole of the old putty is removed, which, when done, the rebate of the sash is scraped and smoothed all round by the stopping-knife, and the new square of glass is cut into the sash, bedded in putty, and finished. The glazier also requires a pair of compasses, made in one of their legs with a socket adapted to receive the handle of the diamond; with the compasses so prepared he draws and cuts out all the shapes of glass required for the glazing of fan-lights, or other circular portions of glass wanted in sashes.

There are in London several tradesmen known only as *glass-cutters*; their business embraces the cutting out of the glass only, which they retail in pieces or squares exactly to the size applied for, the parties purchasing undertaking of themselves the business of stopping them in.

The prices of the glaziers are very irregular, when left to themselves to make their own

charges. They adopt those of the Glaziers' Company usually, and it is from these charges that the surveyors regulate theirs (or, as it is generally called, the measure and value); but glazing may be done (with a good profit to the glazier) at fifteen per cent. less than either, and with glass as good, and as neatly and well cut in as it is generally by the master who adopts his charges from the Company's list of prices. Good glazing requires that all the glass be cut full into the rebates, that is, that the glass fill the void left for it in the sash completely. When the glass is cut too small, or even too large, it is easily broken by the pressure of the air from within, or by the wind from without; careless glaziers not unfrequently, when they have cut their glass too small, leave the putty projecting from the wood very full all round to hide this defect in their glazing, but no glazier who has any respect for his reputation would suffer glass so cut to be sent from out of his premises. The putty in no case should project beyond the line of the wood in the inside, or, more properly, the moulding side of the window; but should be exactly fair and level with it in every part. Large squares of glass should be firmly bedded in the rebate of the sash, in putty of a moderate consistence in point of tempering, and, when so bedded all round, small sprigs or tacks should be driven into the rebate to further secure it in the sash, and the whole should afterwards be further covered with another lining of putty spread quite smoothly all round the rebate on the outside. Sashes, of whatever description they may be, should always be once painted over, or, as it is called, primed, before they are put into the hands of the glazier.

GLEAM, <i>v. n. & n. s.</i>	} Sax. <i>gelhoma</i> ; Germ. <i>gliurnen</i> . Sudden shoot of light; lustre; brightness; to dart suddenly, as a flash of lightning; a bright and gentle light.
GLEAM'ING, <i>adj.</i>	
GLEAM'y, <i>adj.</i>	

Then was the fair Dodonian tree far seen

Upon seven hills to spread his gladsome gleam;

And conquerors bedecked with his green,

Along the banks of the Ausonian stream. *Spenser.*

At last a gleam

Of dawning light turned thitherward in haste

His travelled steps. *Milton's Paradise Lost.*

As I bent down to look just opposite,

A shape within the watery gleam appeared,

Bending to look on me. *Id.*

Mine is a gleam of bliss too hot to last;

Watery it shines, and will be soon o'ercast.

Dryden.

We ken them from afar; the setting sun

Plays on their shining arms and burnished helmets,

And covers all the field with gleams of fire. *Addison.*

In the clear azure gleam the flocks are seen,

And floating forests paint the waves with green.

Pope.

Nought was seen, and nought was heard,

But dreadful gleams,

Fires that glow.

Id. St. Cecilia.

Observant of approaching day.

The meek-eyed morn appears, mother of dews,

At first faint gleaming in the dappled East.

Thomson.

On each hand the gushing waters play,

And down the rough cascade white dashing fall,

Or gleam in lengthened vistas through the trees.

Id.

And first a wildly mourning wind 'gan creep
Shrill to ringing ear; then tapers bright,
With instantaneous gleam, illumed the vault of night.

Beattie.

And this she told with some confusion and
Dismay, the usual consequence of dreams
Of the unpleasant kind, with none at hand
To expound their vain and visionary gleams.

Byron.

GLEAM, *v. a. & n. s.* } Fr. *glaner*; Lat. *gru-*
GLEAM'ER, *n. s.* } *num*; or more probably,
GLEAM'ING, *n. s.* } according to others.
from Lat. *glans*, an acorn. To gather ears of
corn after the reapers; to collect slowly.

They gleaned of them in the highways five thousand
men. *Judges xx. 45.*

She came and gleaned in the field after the reapers.

Ruth ii.

There shall be as the shaking of an olive-tree, and
as the gleanings of grapes when the vintage is done.

Isaiah.

And I come, after, *gleaning* here and there;

And am full glad, if I may find an ere

Of any godely worde that ye han lefte.

Chaucer. Prol. to the Legende of Good Women.

Gather

So much as from occasions you may glean,

If aught, to us unknown, afflicts him thus.

Shakspeare.

That goodness

Of *gleaning* all the land's wealth into one,

Into your own hands, card'nal, by extortion.

Id.

Plains, meads, and orchards, all the day he plies;
The gleams of yellow thyme distend his thighs:

He spoils the saffron. *Dryden's Virgil.*

But Argive chiefs, and Agamemnon's train,
When his refalgent arms flashed through the shady
plain,

Fled from his well-known face with wonted fear;
As when his thundering sword and pointed spear
Drove headlong to their ships, and gleaned the routed
rear. *Id. Æneid.*

Cheap conquest for his following friends remained;
He reaped the field, and they but only gleaned.

Dryden.

In the knowledge of bodies we must be content to
glean what we can from particular experiments; since
we cannot, from a discovery of their real essences,
grasp at a time whole shreaves, and in bundles com-
prehend the nature and properties of whole species
together. *Locke.*

An ordinary coffee-house gleaner of the city is an
arrant statesman. *Id.*

The precept of not gathering their land clean, but
that something should be left to the poor to glean, was
a secondary offering to God himself. *Nelson.*

The orphan and widow are members of the same
common family, and have a right to be supported out
of the incomes of it, as the poor Jews had to gather
the gleanings of the rich man's harvest. *Atterbury.*

For still the world prevailed, and its dread laugh,
Which scarce the firm philosopher can scorn,
Should his heart own a gleaner in the field.

Thomson.

She went, by hard necessity compelled,

To glean Palæmon's fields. *Id. Autumn.*

GLEANING. By the customs of some coun-
tries, particularly those of Melun and Estampes
in France, before the revolution, all farmers and
others were forbid, either by themselves or ser-
vants, to put any cattle into the fields, or pre-
vent *gleaning* in any manner whatever, for

twenty-four hours after carrying off the corn
under penalty of confiscation. But it has been
settled in England that there is no common law
right to glean; and in Scotland it is almost for-
bidden by the law.

GLEBE, *n. s.* } Lat. *gleba*. Turf; soil;

GLEBOUS, *adj.* } ground. The land possessed

GLEBY, *adj.* } as part of the revenue of an
ecclesiastical benefice: fruitful; rich.

This, like the moory plots, delights in sedge bowers;

The grassy garlands loves, and oft attired with
flowers

Of rank and mellow *glebe*.

Drayton.

The ordinary living or revenue of a parsonage is of
three sorts: the one in land, commonly called the
glebe; another in tythe, which is a set part of our
goods rendered to God; the third, in other offerings
bestowed upon God and his church by the people.

Spelman.

Fertile of corn the *glebe*, of oil and wine,

With herds the pastures thronged, with flocks the hills.

Milton.

Mark well the flowering almonds in the wood;

If odorous blooms the bearing branches load,

The *glebe* will answer to the sylvan reign,

Great heats will follow, and large crops of grain.

Dryden.

Sleeping vegetables lie,

Till the glad summons of a genial ray

Unbinds the *glebe*, and call them out to day.

Garth.

A trespass done on a parson's *glebe* land, which is a
freehold, cannot be tried in a spiritual court.

Ayliffe's Parergon.

Pernicious flattery! thy malignant seeds

In an ill hour, and by a fatal hand

Sadly diffused o'er virtue's *glebe* land,

With rising pride amidst the corn appear,

And choke the hopes and harvest of the year.

Prior.

Many parishes have not an inch of *glebe*. *Swift.*

GLECHOMA, ground ivy, a genus of the
gymnospermia order, and didynamia class of
plants; natural order forty-second, verticillate.
Each pair of the antheræ come together in the
form of a cross: *cal.* quinquefid. Species one
only. *G. hederacea*, the common ground ivy.
Many virtues were formerly attributed to this
plant, which it is now found not to be possessed
of. Some, however, it has. The leaves are
thrown into the vat with ale to clarify it and
give it a flavor. Ale thus prepared is often
drunk as an antiscorbutic. The expressed juice
mixed with a little wine, and applied morning
and evening, destroys the white specks upon
horses' eyes. The plants that grow near it do
not flourish. It is said to be hurtful to horses if
they eat much of it. Sheep eat it, horses are
not fond of it; cows, goats, and swine, refuse it.

GLEDE, *n. s.* Sax. *gloughæ*. A kind of
hawk.

Ye shall not eat the *glede*, the kite, and the vulture.

Deuteronomy.

GLEDITSIA, triple-thorned acacia, or hon-
ey-locust; a genus of the dicæia order, and
polygamia class of plants; natural order thirty-
third, lomentaceæ. Hermaphrodite *cal.* qua-
drifid: *cor.* tetrapetalous; the stamina six, one
pestil and legumen. Male *cal.* triphyllous: *cor.*
tripetalous, with six stamina. Female *cal.* pen-

taphyllous: cor. pentapetalous; one pistil and legumen. There are two species, viz.

1. *G. inermis*, so named because the stem is unarmed, or without thorns. It is a native of South America, and in this country requires to be kept in a stove.

2. *G. triacanthos*, a native of Virginia and Pennsylvania. It is of an upright growth, and its trunk is guarded by thorns three or four inches long, in a remarkable manner. These thorns have also others coming out of their sides at nearly right angles; their color is red. The branches are smooth, and of a white color; but are likewise armed with red thorns, that are proportionally smaller; they are of several directions, and at the ends of the branches often stand single. The young shoots of the preceding summer are perfectly smooth, of a reddish green, and retain their leaves often until the middle of November. The flowers are produced from the sides of the young branches in July. They are a greenish catkin, and make little show; though many are succeeded by pods, that have a wonderful effect; for these are exceedingly large, more than a foot, sometimes a foot and a half in length, two inches in breadth, and of a nut-brown color when ripe. There is a variety of this species, with fewer thorns, smaller leaves, and oval pods. It has nearly the resemblance of the other; but the thorns are not so frequent, and the pods smaller, each containing only one seed. These trees are easily propagated by seeds received from America in spring, which keep well in the pods, and are for the most part good. They generally arrive in February; and, as soon as possible after, they should be sown in a well-sheltered warm border of light sandy earth. The seeds should be sown about half an inch deep; and they will for the most part come up the first spring. If the summer should prove dry, they must be constantly watered; and, if shade could be afforded them in the heat of the day, they would make stronger plants by autumn. Attention to this is peculiarly requisite; for, as the ends of the branches are often killed, if the young plant has not made some progress, it will be liable to be wholly destroyed by the winter's frost, without protection: and this renders the sowing the seeds in a warm border, under a hedge, in a well sheltered place, necessary; for these shrubs will endure our winters, even when seedlings, and will require no farther trouble; nay, though the tops should be nipped, they will shoot out again lower, and will soon overcome it. They should remain two years in the seed-bed before they are planted out in the nursery. The spring is the best time for the work. Their distances should be one foot by two; the rows should be dug between every winter; and, being weeded in summer, they may continue with no other particular care, until they are set out to remain. These trees are late in spring before they exhibit their leaves, but keep shooting long in autumn.

GLEE, *n. s.* } Sax. gligge. Joy; merriment; gaiety. It anciently signified music played at feasts. It is not now used, except in ludicrous writing, or with some mixture of irony and contempt. Cheerful; gay.

Were his nailes poincted never so sharpe,
It shuldé maken every wight to dull
To here his glee and of his strokes fall.

Chaucer. Troilus and Creseide.
She marcheth home, and by her takes the night,
Whom all the people follow with great glee.

Faerie Queene.
My lovely Aaron, wherefore look'st thou sad,
When every thing doth make a gleeful boast?

Shakespeare.
Many wayfarers make themselves glee by vexing
the inhabitants; who again foretell not to baigne them
with perfume. *Carew.*

Is Blouzelinda dead? Farewell my glee!
No happiness is now reserved for me. *Gay.*
The poor man then was rich, and lived with glee;
Each barley-head untaxt, and day-light free.

Harte.
Full well they laughed with counterfeited glee
At all his jokes; for many a joke had he.

Goldsmith.
GLEED, *n. s.* From Sax. glopan, to glow.
A hot glowing coal. A provincial and obsolete
word.

He sent hire pinnes, meth and spiced ale,
And wafres piping hot out of the glee.

Chaucer. The Milleres Tale.
And in his hande, methought I saw him hold
Two fire darts as the gledes rede;
And angelike his winges sawe I sprede.

Id. Prologue to Legend of Good Women.
Four gledes han we, which I shall devise,
Avaunting, lying, anger, and covetise,
These four sparkes longen unto elde.

Chaucer. The Reves' Prologue.
GLEEK, *n. s.* Sax. gligge. Musick, or musician.

What will you give us?—No money, but the
gleek: I will give you the minstrel. *Shakespeare.*

To GLEEK, *v. a.* Sax. gligman, is a mimic
or a droll. This word is yet used in Scotland
to signify spending time idly; with something
of mimicry or drollery.

I can gleek upon occasion. *Shakespeare.*
I have seen you gleeking or galling at this gentleman twice or thrice. *Id.*

GLEEN, *v. a.* To shine with heat or polish.
I know not the original notion of this word,
says Dr. Johnson: it may be of the same race
with glow or with gleam. I have not remarked
it in any other place.

Those who labour
The sweaty forge, who edge the crooked scythe,
Bend stubborn steel, and harden gleaming armour,
Acknowledge Vulcan's aid. *Prior.*

GLEET, *n. s.* & *v. a.* } Written by Skinner
GLEET, *v. a.* } glitt, and derived from
Sax. gliean, to run softly. A sanious ooze; a
thin ichor running from a sore. Generally used
as a medical term.

His thumb being inflamed and swelled, I made an
incision into it to the bone: this not only bled, but
gleeted a few drops. *Wiseman.*

If the flesh lose its ruddiness, and the matter
change to be thin and gleetly, you may suspect it cor-
rupting. *Id.*

A hard dry eschar, without either matter or gleet.
Id. Surgery.

Vapours raised by the sun make clouds, which are
carried up and down the atmosphere, till they lit
against the mountainous places of the globe, and by
this concussion are condensed, and so gleet down the

caverns of these mountains, whose inner parts, being hollow, afford them a bason.

Cheyne's Philosophical Principles.

GLEICHEN (Frederick Von), in biography, was born in the year 1714. He was intended and educated for the profession of arms, and spent the early part of his life as an officer in the service of Bayreuth, and was distinguished by his attention to military discipline. He rose to the rank of lieutenant-colonel, and obtained the favor of the margrave. In 1756 he obtained a dismissal from the service with a handsome pension, to which was afterwards added the rank of privy counsellor. He now had leisure to distinguish himself as a philosopher, a naturalist, and a writer. His attention was accidentally excited to microscopical observations; and, not satisfied with the instruments already in existence, he constructed a universal microscope, with which he combined the solar microscope. He died in June 1783, leaving behind him numerous works in natural history, as *Observations on the Parts of Fructification in Plants when in bloom*, and on the *Insects found in them*; *History of the Common House Fly*; *Treatise on seminal Animalcula and infusion Animals*; *Essay towards the History of the Tree-louse of the Elm*.

GLEICHEN, a district of Saxony, adjoining Gotha and Erfurt. It is divided into two parts, the larger of which is the property of various branches of the house of Hohenlohe, and has about 7000 inhabitants; the other part, containing about 1500 inhabitants, belongs chiefly to Schwartzburg-Sondershausen.

GLEEN, *n. s.* Erse. *glean*. A valley; a dale; a depression between two hills.

From me his madding mind is start,
And woos the widow's daughter of the *glen*.

Spenser.

For whosoever the shrieking victim hath
Poured forth his blood beneath the assassin's knife,
Some hand erects a cross of mouldering lath;
And grove and *glen* with thousand such are rife,
Throughout this purple land, where law secures not life.

Byron's Child Harold.

GLENDOWER (Owen), a celebrated Welsh chieftain, was born, as some writers state, May 28th, 1349; or, according to others, on the same day in 1354, at Trefgarth, in Pembrokeshire, of Ellen, a lineal descendant from Catherine, daughter and heiress to Llewellyn, last Prince of Wales. His father Gryffyd Vychan sent him to London for education, where he for a time studied for the English bar, but relinquished the legal profession on being appointed scutiger to Richard II. A contemporary bard, Jolo Goch, describes his family mansion in high terms, and his contest with Reginald lord Grey de Ruthyn respecting an estate called Croesau. On the deposition of his royal patron, by Henry IV., his antagonist prevailed; and, being charged with the delivery of a summons from the new king to Owen to attend him on an expedition, he purposely neglected to deliver it, Glendower was in consequence outlawed; when his enemy Grey seized all his lands, and the parliament utterly neglected his remonstrances. Glendower now forcibly dispossessed Grey of his lands, and,

having raised a large force, caused himself, September 20th, 1400, to be proclaimed prince of Wales, a measure to which he is said to have been incited by some traditionary prophecies of Merlin. In 1402 he made prisoner his old persecutor the lord Grey, and fixed the price of his ransom at 10,000 marks, with a stipulation of neutrality, which was cemented into amity afterwards, by that nobleman marrying Jane, Owen's third daughter. Owen now defeated the king's forces under Sir Edward Mortimer, and was joined by the Percys, as well as occasionally assisted by Charles VI. of France, with whom a treaty of his is still extant, dated 1404, in which he is styled *Owenus Dei gratia Princeps Wallie*. He at last caused himself to be formally crowned, at Machynlaeth in Montgomeryshire, as sovereign of Wales. When the rashness of Henry Percy brought on the fatal battle of Shrewsbury before all his Welsh auxiliaries had come up, this prince is said to have been so near as to have reconnoitred the action from the top of a tree, and seeing all was lost, retreated to a marauding warfare. In 1415 Henry condescended to treat with him; but Owen dying on the 20th of September, the negotiation was continued and ratified by his son Meredyd ap Owen, February 24th, 1416. Descendants of his are said to be yet living in the family of Monington, at the place of that name in Herefordshire.

GLEW, *n. s.* Lat. *gluten*. A viscous cement made by dissolving the skins of animals in boiling water, and drying the gelly. See GLUE.

GLIB, *n. s., adj. & v. a.* } From Gr. *λεωγ*.
GLIBLY, *adv.* } Any thing smooth

GLIBNESS, *n. s.* } and slippery; when applied to conversation, it implies volubility to castrate.

The Irish have from the Scythians mantles and long *glibs*; which is a thick curled bush of hair hanging down over their eyes, and monstrously disguising them. *Spenser on Ireland.*

I want that *glib* and oily art

To speak and purpose not, since what I well intend,

I'll do before I speak. *Shaksp. King Lear.*

I'll gold them all: fourteen they shall not see,
To bring false generations; they are coheirs,

And I had rather *glib* myself, than they
Should not produce fair issue. *Shakspeare.*

A polished ice-like *glibness* doth enfold
The rock. *Chapman's Odyssey.*

I undertook that office, and the tongues
Of all his flattering prophets *glibbed* with lies
To his destruction as I had in change.

Milton's Paradise Regained.

There was never so much *glib* nonsense put together
in well sounding English. *Locke.*

Liquid bodies have nothing to sustain their parts,
nor any thing to cement them; the parts being *glib*,
and continually in motion, fall off from one another,
which way soever gravity inclines them.

Burnet's Theory.

Many who would startle at an oath, whose stomachs
as well as consciences recoil at an obscenity, do yet
slide *glibly* into a detraction.

Government of the Tongue.

The tongue is the most ready for motion of any
member, needs not so much as the flexure of a joint,
and by access of humours acquires a *glibness* too, tho
more to facilitate its moving. *Id.*

Habakkuk brought him a smooth strong rope compactly twisted together, with a noose that slipt as *glib* as a birdcatcher's gin. *Arbutnot.*

Be sure he's a fine spoken man;
Do but hear on the clergy how *glib* his tongue ran. *Swift.*

Now Curl his shop from rubbish drains;
Three genuine tomes of Swift's remain:
And then, to make them pass the *glibber*,
Revised by Tibbald, More, and Cibber. *Id.*

GLIDE, *v. n. & n. s.* } Sax. *gliban*; Dutch,
GLIDER, *n. s.* } *glijden*. To flow
smoothly, gently, and silently; to move regularly and swiftly along, as in skating on the ice.

His goode stede he al bestrode,
And forth upon his way he *glode*,
As sparle out of bronde.

Chaucer. Rime of Sire Thopas.
The vapour, which fro the erthe *glode*,
Maketh the sunne to seme rody and brode.

Id. The Spüeres Tale.
She *glade* forth as an adder doth.

Gower. Confessio Amanti's.
The glauce into my heart did *glide*;
Hey ho the *glider*;
Therewith my soul was sharply gride,
Such wounds soon waxen wider. *Spenser.*

About his neck
A green and gilded snake had wreathed itself,
Who, with her head nimble in threats, approached
The opening of his mouth; but suddenly,
Seeing Orlando, it unlinked itself,
And with indented *glides* did slip away
Into a bush. *Shakspeare. As You Like It.*

If one of mean affairs
May plod it in a week, why may not I
Glide thither in a day? *Id. Cymbeline.*

Like a clear river thou dost *glide*,
And with thy living stream through the close channel
slide. *Cowley.*

Shoals of fish, with fins and shining scales,
Glide under the green wave. *Milton.*

Just before the confines of the wood,
The *gliding* Lethe leads her silent flood. *Dryden.*
Broke by the jutting land on either side,
In double streams the briny waters *glide*. *Id.*
He trembled every limb, and felt a smart
As if cold steel had *glided* through his heart.
Id. Fables.

Where stray the muses, in what lawn or grove?
In those fair fields where sacred Isis *glides*,
Or else where Cam his winding vales divides.

Pope.
Now *gliding* remote, on the verge of the sky,
The moon half-extinguished her crescent displays. *Beattie.*

Sofas 'twas half a sin to sit upon,
So costly were they; carpets every stitch
Of workmanship, so rare they made you wish
You could *glide* o'er them like a golden fish.

Byron.

GLIKE, *n. s.* Sax. *glig*. See GLEEK. A
sneer; a scoff; a flout. Not now in use.

Where's the bastard's-braves, and Charles his
glikes? *Shakspeare.*

GLIMMER, *v. n. & n. s.* } Dan. *glimmer*;
GLIMPSE, *n. s.* } Isl. *glimber*; Belg.
glimmen. To shine faintly; a weak and gentle
light, sometimes quick and flashing.—Hence
metaphorically, a brief enjoyment; a transitory
view; a resemblance.

—if that ye mighten see,
Ye wold not say thise wordes unto me
Ye have some *glimsing* and no parfit sight.

Chaucer. The Merchant's Tale.
The west yet glimmers with some streaks of day. *Shakspeare.*

The truth appears so naked on my side,
That any purblind eye may find it out.
—And on my side it is so well apparelled
So clear, so shining, and so evident,
That it will *glimmer* through a blind man's eye. *Id.*

No man hath a virtue that he has not a *glimpse* of. *Id.*

On the way the baggage post-boy, who had been at
court, got a *glimmering* who they were. *Wotton.*
Some God punisheth exemplarily in this world,
that we might have a taste or *glimpse* of his present
justice. *Hakewill.*

For there no twilight of the sun's dull ray
Glimmers upon the pure and native day. *Cowley.*
There no dear *glimpse* of the sun's lovely face
Strikes through the solid darkness of the place. *Id.*

Oft in *glimmering* bowers and glades
He met her. *Milton.*
O friends! I hear the tread of nimble feet
Hasting this way, and now by *glimpse* discern
Ithuriel, and Zephon, through the shade. *Id.*

Such vast room in nature,
Only to shine, yet scarce to contribute
Each orb a *glimpse* of light, conveyed so far
Down to this habitable, which returns
Light back to them. *Id.*

See'st thou yon' dreary plain, forlorn and wild,
The seat of desolation, void of light,
Save what the *glimmering* of these livid flames
Casts pale and dreadful? *Id. Paradise Lost.*

If I, celestial sire, in aught
Have served thy will, or gratified thy thought,
One *glimpse* of glory to my issue give;
Graced for the little time he has to live. *Dryden.*

What should I do! while here I was enchained,
No *glimpse* of godlike liberty remained. *Id.*
Thousands of things, which now either wholly
escape our apprehensions, or which our short-sighted
reason having got some faint *glimpse* of, we, in the
dark, grope after. *Locke.*

Through these sad shades, this chaos in my soul,
Some seeds of light at length began to roll;
The rising motion of an infant ray
Shot *glimmering* through the cloud, and promised day. *Prior.*

If, while this wearied flesh draws fleeting breath,
Not satisfied with life, afraid of death,
If haply be thy will that I should know
Glimpse of delight, or pause from anxious woe;
From now, from instant now, great sire, dispel
The clouds that press my soul. *Id.*

Stones which are composed of plates, that are
generally plain and parallel, and that are flexible and
elastic: tale, catsilver, or *glimmer*, of which there
are three sorts, the yellow or golden, the white or
silvery, and the black. *Woodward.*

The lesser masses that are lodged in sparry and
stony bodies, dispersedly, from their shining and
glimmering, were an inducement to the writers of
fossils to give those bodies the name of mica and
glimmer. *Id. On Fossils.*

The pagan priesthood was always in the druids;
and there was a perceivable *glimmering* of the Jewish
rites in it, though much corrupted. *Swift.*

Of by the winds, extinct the signal lies ;
Or smothered in the *glimm'ring* socket dies.

Gay's Trivia.

When rosy morning *glimmered* o'er the dales,
He drove to pasture all the lusty males. *Pope.*
Long while the silent passion, waiting vent,
Made flowing tears her words, and eyes her tongue ;
Till faith, experience, hope, assistance lent
To shut both flood-gates up with patience strong ;
The streams well ebb'd, new hopes some comforts
horrour

From firmest truth ; then *glimpsed* the hopeful morrow ;
So spring some dawns of joy, so sets the night of
sorrow. *Fletcher. Purple Island.*

And the pale smiles of beauties in the grave,
The charms of other days in star-light gleams,
Glimmer on high. *Byron.*

GLINUS, in botany, a genus of the pentagynia order, and decandria class of plants ; natural class twenty-second, Caryophyllæ: cal. pentaphyllous : cor. none ; the nectarium is composed of bifid bristles : cap. quinqueangular, quinquelocular, quinquevalved, and polyspermous. Species twelve : of the most common is the *G. vulgaris*, the blue daisy, which is common to the south of Europe, and to the Levant.

GLISSON (Francis), a learned English physician of the seventeenth century, who was educated at Cambridge, and made regius professor of the University. In 1634 he was admitted a fellow of the College of Physicians in London. During the civil wars he practised physic at Colchester, and afterwards settled in London. He greatly improved physic by his anatomical dissections. He wrote, 1. De Rachitide, &c. 2. De Lymphaductis nuper Repertis ; with the Anatomical Prolegomena, et Anatomia Hepatis. 3. De Naturæ Substantia Energetica ; seu de Via Vitæ Naturæ, ejusque Tribus Primis Facultatibus, &c. quarto. 4. Tractatus de Ventriculo et Intestinis, &c. He discovered the capsula communis, or vagina portæ.

GLISTEN, *v. n.* } Sax. *glitman* ; Ger. *glissen* ; Dut. *glis-*
GLISTER, *v. n.* } *teren*. To shine
GLITTER, *v. n. & n. s.* } brightly ; to exhibit
GLITTERAND, *part.* } lustre. They are
GLITTERINGLY, *adv.* } words of similar meaning ; glitterand, is an old participle, used especially by Chaucer and the old poets ; still retained in Scotland : showy or spurious.

His crispe here like ringes was yronne,
And that was yelwe, and *glistered* as the sonne.

Chaucer. The Knights Tale.

His *glitterand* armour shined far away,
Like glauncing light of Phæbus' brightest ray ;
From top to toe no place appeared bare,
That deadly dint of Steele endanger may.

Spenser. Faerie Queene.

Is not from hence the way that leadeth right
To that most glorious house that *glistereth* bright
With burning starres. *Id.*

The wars flame most in Summer, and the helmets
; *lister* brightest in the fairest sunshine. *Spenser.*

'Tis better to be lowly born,

And range with humble livers in content,
Than to be perked up in a *glistering* grief,

And wear a golden sorrow. *Shakspeare.*

All that *glisters* is not gold. *Id.*

Steel glosses are more resplendent than the like
plates of brass, and so is the *glittering* of a blade.

Bacon's Physical Remains.

You were more the eye and talk
Of the court to-day, than all
Else that *glistered* in Whitehall. *Ben Jonson.*
Clad

With what permissive glory since his fall
Was left him, or false *glitter*. *Milton.*

When the sword *glitters* o'er the judge's head,
And fear has coward churchmen silenced,
Then is the poet's time, 'tis then he draws,
And single fights forsaken virtue's cause. *Marvell.*

It consisted not of rubies, yet the small pieces of it
were of a pleasant reddish colour, and *glistered* prettily.
Boyle.

Before the battle joins, from afar
The field yet *glitters* with the pomp of war.
Dryden's Virgil.

A fresher green the smiling leaves display,
And *glittering*, as they tremble, cheer the day.
Parnell.

Flourish not too much upon the *glitter* of fortune,
for fear there should be too much alloy in it.

Collier on Pride.

Scarce had'st thou time to unsheath thy conquering
blade ;

It did but *glitter*, and the rebels fled. *Granville.*

On the one hand set the most *glittering* temptations^s
to discord, and on the other the dismal effects of it.

Decay of Piety.

Take away this measure from our dress and habits,
and all is turned into such paint and *glitter*, and
ridiculous ornaments, as are a real shame to the
wearer. *Law.*

The ladies' eyes *glistered* with pleasure.

Richardson's Pamela.

In *glittering* scenes, o'er her own heart severe ;
In crowds collected ; and in courts sincere. *Young.*

Her sky-like arms *glittered* in golden beams,
And brightly seemed to flame with burning hearts ;
The scorching ray with his reflected streams
Fire to their flames, but heavenly fire imparts ;
Upon his shield a pair of turtles shone ;
A lovely pair still coupled, ne'er alone ;
Her word, 'though one when two, yet either two or
none. *Fletcher's Purple Island.*

What tho' we quit all *glittering* pomp and greatness,
The busy, noisy, flattery of courts,
We shall enjoy content ; in that alone
Is greatness, power, wealth, honour, all summed up.

Powel's King of Naples.

The Convents' white walls *glisten* fair on high.
Byron. Childe Harold.

————— it is a splendid sight to see
(For one who hath no friend or brother there)
Their rival scarfs of mixed embroidery,
Their various arms that *glitter* in the air. *Id.*

GLISTER, *n. s.* Properly written clyster,
from κλύζω. See CLYSTER. It is written wrong
even by Browne.

Now enters Bush with new state airs,

His lordship's premier minister ;

And who, in all profound affairs,

Is held as needful as his *glister*. *Swift.*

Choler is the natural *glister*, or one excretion whereby
nature excludeth another ; which, descending daily
unto the bowels, extimulates those parts, and excites
them unto expulsion. *Browne.*

GLITNESS, one of the smaller Shetland
Isles, eleven miles north from Lerwick, on the
east coast of Shetland. Long. 1° 16' W., lat.
60° 22' N.

GLOAT, *v. n.* This word Dr. Johnson conceives to be ignorantly written from gloar (Belg.

gloceen. To cast side glances as a timorous lover.

Teach every grace to smile in your behalf,
And her deluding eyes to *gloat* for you. *Romce.*

GLOBE, *n. s.* } Lat. *globus, globosus,*
GLOBATED, *adj.* } *globulus*; Fr. *globe, glo-*
GLOBOSE, *adj.* } *bule*; Gr. *γῆλοφος*. It is
GLOBOSITY, *n. s.* } properly an irregular
GLOBOUS, *adj.* } round body, and thus
GLOBULAR, *adj.* } differing from a ball which
GLOBULE, *n. s.* } is entirely circular. A
GLOBULOUS, *adj.* } term applied to our earth;
GLOBULARIA, *n. s.* } to the mechanical body
which represents it: the various adjectives are
applied to matter which assumes this form, as the
red particles of blood; spheres of quicksilver;
&c.: and to different kinds of plants and flowers,
as globe amaranth; globe daisy; globe ranuncu-
lus; globe thistle: globularia, a flosculus flower:
also to a fish called globe fish. A body of soldiers
drawn into a circle.

The astrologer who spells the stars,
Mistakes his *globe*, and in her brighter eye
Interprets heaven's physiognomy. *Cleaveland.*

These are the stars,
But raise thy thoughts from sense, nor think to find
Such figures as are in *globes* designed. *Creech.*

On his right side stood a fair *globe* of beaten gold,
on a pyramid, with a cross upon it; to which, before
he spake, turning a little, he crossed himself.
Milton. History of Moscow.

Regions, to which
All thy dominion, Adam, is no more
Than what this garden is to all the earth,
And all the sea; from one entire *globose*
Stretched into longitude. *Id. Paradise Lost.*

Then formed the moon
Globose, and every magnitude of stars. *Milton.*

Him round
A *globe* of fiery seraphim inclosed,
With bright emblazoning, and horrent arms. *Id.*

Wide over the plain, and wider far
Than all this *globose* earth in plain outspread;
Such are the courts of God! *Id.*

See, the' apish Earth hath lighted many a star,
Sparkling in dewy *globes*. *Fletcher's Purple Island.*

The whiteness of such *globulous* particles proceeds
from the air included in the froth. *Boyle.*

Where God declares his intention to give dominion,
he meant that he would make a species of creatures
that should have dominion over the other species of
this terrestrial *globe*. *Locke.*

Why the same eclipse of the sun, which is seen to
them that live more easterly, when the sun is elevated
six degrees above the horizon, should be seen to
them that live one degree more westerly, &c., no
account can be given, but the *globosity* of the earth.
Ray on the Creation.

The youth, whose fortune the vast *globe* obeyed,
Finding his royal enemy betrayed,
Wept at his fall. *Stepney.*

The brazen instruments of death discharge
Horrible flames, and turpid streaming clouds:
Large *globous* irons fly, or dreadful hiss,
Singing the air. *Philips.*

The figure of the atoms of all visible fluids seemeth
to be *globular*, there being no other figure so well
fitted to the making of fluidity. *Grew.*

The hailstones have opaque *globules* of snow in
their centre, to intercept the light within the halo.

Newton's Opticks.

Blood consists of red *globules*, swimming in a
thin liquor called serum; the red *globules* are elas-
tick, and will break; the vessels which admit the
smaller *globule*, cannot admit the greater without a
disease. *Arbutnot on Aliments.*

Where is the world of eight years past? 'Twas there
I look for it—tis gone, a *globe* of glass. *Byron.*

GLOBE, in geometry. See SPHERE.

GLOBE, in geography and astronomy, is par-
ticularly used for an artificial sphere of metal,
plaster, paper, or other matter; on whose convex
surface is drawn a map, or representation either
of the earth or heavens, with the several circles
conceived thereon. See GEOGRAPHY.

Globes are of two kinds, terrestrial and celest-
tial; each of very considerable use, the one in
astronomy, and the other in geography, for per-
forming many of the operations in these sciences,
in an easy obvious manner, so as to render them
intelligible without any knowledge of the mathe-
matical grounds of them. The fundamental
parts, common to both globes, are an axis, re-
presenting that of the world; and a spherical
shell, or cover, which makes the body of the
globe, on the external surface of which the re-
presentation is drawn.

(OF THE CONSTRUCTION OF GLOBES.)

The globes most commonly used are made of
plaster and paper. A wooden axis is provided
somewhat less than the intended diameter of the
globe; into the extremes of which two iron
wires are driven for poles: this axis is to be the
beam, or basis of the whole structure. On the
axis are applied two spherical or rather hemi-
spherical caps, formed on a kind of wooden
mould or block. These caps consist of paste-
board, or paper, laid in layers, on the mould, to
the thickness of a crown-piece; after which, having
stood to dry and embody, making an incision
along the middle, the two caps thus parted are
slipped off the mould. They are next applied
on the poles of the axis, as before they were on
those of the mould; and, to fix them, the two
edges are sewed together with pack-thread, &c.
The rudiments of the globe thus laid, it must be
strengthened and made smooth and regular. In
order to this, the two poles are hasped in a me-
talline semicircle of the size intended; and a
kind of plaster, made of whitening, water, and
glue, heated, melted, and incorporated together,
is daubed all over the paper surface. In pro-
portion as the plaster is applied, the ball is
turned round in the semicircle, the edge whereof
 pares off whatever is superfluous and beyond
the due dimension, leaving the rest adhering in
places that are short of it. After such applica-
tion of the plaster, the ball stands to dry; which
done, it is put again in the semicircle, and fresh
matter applied: thus they continue alternately
to apply the composition, and dry it, till the ball
every where accurately touches the semicircle, in
which state it is perfectly smooth, regular and
firm. The ball thus finished, it remains to paste
the map or description thereon: in order to this,
the map is projected in several gores, or gussets,

all of which join accurately on the spherical surface, and cover the whole ball. To direct the application of these gores, lines are drawn by a semicircle on the surface of the ball, dividing it into a number of equal parts corresponding to those of the gores, and subdividing those again answerably to the lines and divisions of the gores. There remains only to color and illuminate the globe; and to varnish it, the better to resist dust, moisture, &c. The globe itself, thus finished, is hung in a brass meridian, with an hour circle, quadrant of altitude; and then fitted into a wooden horizon.

The following is the detailed mode of their construction:—

Fig. 1.

Fig. 2.

Fig. 3.

From the given diameter of the globe find a right line *AB*, fig. 1 of the diagram above, equal to the circumference of a great circle, and divide it into twelve equal parts. 2. Through the several points of division, 1, 2, 3, 4, &c., with the interval of ten of them, describe arches mutually intersecting each other in *D* and *E*: these figures or pieces duly pasted and joined together will make the whole surface of the globe. 3. Divide each part of the right line *AB* into thirty equal parts, so that the whole line *AB*, representing the periphery of the equator, may be divided

into 360 degrees. 4. From the poles *D* and *E*, fig. 2, with the interval of twenty-three degrees and a half describe arches *ab*; these will be twelfth parts of the polar circles. 5. After the like manner, from the same poles *D* and *E*, with the interval of sixty-six degrees and a half reckoned from the equator, describe arches *cd*; these will be twelfth parts of the tropics. 6. Through the degree of the equator *e*, corresponding to the right ascension of any given star, and the poles *D* and *E*, draw an arch of a circle; and, taking in the compasses the complement of the declination from the pole *D*, describe an arch intersecting it in *i*; this point *i* will be the place of that star. 7. All the stars of a constellation being thus laid down, the figure of the constellation is to be drawn according to Bayer, Hevelius, or Flamsteed. 8. Lastly, after the same manner are the declinations and right ascensions of each degree of the ecliptic, *dg*, to be determined. 9. The surface of the globe thus projected on a plane is to be engraven on copper, to save the trouble of doing this over again for each globe. 10. A ball in the mean time is to be prepared of paper, plaster, &c., as before directed, and of the intended diameter of the globe; on this, by means of a semicircle and style, is the equator to be drawn; and through every thirtieth degree a meridian. The ball thus divided into twelve parts, corresponding to the segments before projected, the latter are to be cut from the printed paper, and pasted on the ball. 11. Nothing now remains but to hang the globe as before in a brazen meridian and wooden horizon; to which may be added a quadrant of altitude made of brass, and divided in the same manner as the ecliptic and equator. If the declinations and right ascensions of the stars be not given, but the longitudes and latitudes in lieu thereof, the surface of the globe is to be projected after the same manner as before; except that, in this case, *D* and *E*, fig. 2, are the poles of the ecliptic, and *f'h* the ecliptic itself; and that the polar circles and tropics, with the equator *g d*, and parallels thereof, are to be determined from their declinations.

M. De La Lande, in his *Astronomie*, tom. 3, p. 736, suggests the following method:—"To construct celestial and terrestrial globes, gores must be engraven, which are a kind of projection, or enclosure of the globe, fig. 3, similar to what is now to be explained. The length *PC* of the axis of this curve is equal to a quarter of the circumference of the globe; the intervals of the parallels on the axis *PC* are all equal, the radii of the circles *KDI*, which represent the parallels, are equal to the cotangents of the latitudes, and the arches of each, as *D I*, are nearly equal to the number of the degrees of the breadth of the gore (which is usually thirty degrees) multiplied by the sine of the latitude: thus, there will be found an intricacy in tracing them; but the difficulty proceeds from the variation found in the trial of the gores when pasting them on the globe, and of the quantity that must be taken from the paper, less on the sides than in the middle (because the sides are longer), to apply it exactly to the space that it should cover.

The method used among workmen to delineate

the gores, and which is described by M. Bion, (*Usage des Globes*, tom. 3) and by M. Robert de Vaugendy in vol. vii. of the *Encyclopedie*, is hardly geometrical, but yet is sufficient in practice. Draw on the paper a line AC, equal to the chord of fifteen degrees, to make the half breadth of the gore; and a perpendicular PC equal to three times the chord of thirty degrees, to make the half length: for these papers, the dimensions of which will be equal to the chords, become equal to the arcs themselves when they are pasted on the globe. Divide the height CP into nine parts, if the parallels are to be drawn in every ten degrees; divide also the quadrant BE into nine equal parts, through each division point of the quadrant, as G: and through the corresponding point D of the right line CP, draw the perpendiculars HGF and DF, the meeting of which in F gives one of the points of the curve BEP, which will terminate the circumference of the gore. When a sufficient number of points are thus found, trace the outline PIB with a curved rule. By this construction are given the gore breadths, which are on the globe, in the ratio of the cosines of the latitudes; supposing these breadths taken perpendicular to CD, which is not very exact, but it is impossible to prescribe a rigid operation sufficient to make a plane which shall cover a curved surface, and that on a right line AB shall make lines PA, PC, PB, equal among themselves, as they ought to be on the globe. To describe the circle KDI, which is at thirty degrees from the equator, there must be taken above D a point which shall be distant from it the value of the tangent of sixty degrees, taken out either from the tables, or on a circle equal to the circumference of the globe to be traced; this point will serve as a centre for the parallel DI, which should pass through the point D, for it is supposed equal to that of a cone circumscribing the globe, and which would touch at the point D. The meridians may be traced to every ten degrees, by dividing each parallel, as KI, into three parts at the points L and M, and drawing from the pole P, through all these division points, curves, which represent the intermediate meridians between PA and PB (as BR and ST, fig. 4). The ecliptic AQ may be described by means of the known declination from different points of the equator that may be found in a table: for ten degrees, it is $3^{\circ} 58'$; for twenty degrees, $7^{\circ} 50' \equiv \text{BQ}$; for thirty degrees, $11^{\circ} 29'$, &c. It is observed, in general, that the paper on which charts are printed, such as the colombier, shortens itself $\frac{1}{2}$ part of a line in six inches upon an average, when it is dried after printing; this inconvenience must therefore be corrected in the engraving of the gores: if, notwithstanding that, the gores are found too short, it must be remedied by taking from the surface of the ball a little of the white with which it is covered; thereby making the dimensions suitable to the gore as it was printed. But what is singular is, that in drawing the gore, moistened with the paste to apply it on the globe, the axis GI lengthens, and the side AK shortens, in such a manner that neither the length of the side ACK nor that of the axis

G E H, of the gore, are exactly equal to the quarter of the circumference of the globe, when compared to the figure on the copper, or to the numbered sides shown in fig. 4 Mr. Bonn having made several experiments on the dimensions that gores take, after they had been parted ready to apply to the globe, and particularly with the paper named *Jesus*, that he made use of for a globe of one foot in diameter, found that it was necessary to give to the gores on the copper the dimensions shown in fig. 4. Supposing that the radius of the globe contained 720 parts, the half breadth of the gore is $AG = 188 \frac{2}{3}$, the distance AC for the parallel of ten degrees taken on the right line LM is 12.81, the small deviation from the parallel of ten degrees in the middle of the gore ED is four, the line ABN is right, the radius of the parallel of ten degrees or of the circle CEF is 4083, and so of the others as marked in the figure. The small circular cap, which is placed under H, has its radius 253 instead of 547, which it would have if the sine of twenty degrees had been the radius of it.

Fig. 4.

Mr. George Adams, late mathematical instrument maker to his majesty, made some useful improvements in the construction of globes. His globes, like others, are suspended at their poles in a strong brass circle, and turn therein upon two iron pins, which are the axis. They have besides a thin brass semi-circle, moveable about the poles, with a small, thin, sliding circle upon it. On the terrestrial globe, the thin brass semi-circle is a moveable meridian, and its small sliding circle the visible horizon of any particular place to which it is set. On the celestial globe, the semi-circle is a moveable circle of declination, and its small annexed circle an artificial sun or planet. Each globe has a brass wire circle, placed at the limits of the twilight,

which, together with the globe, is set in a wooden frame, supported by a neat pillar and claw, with a magnetic needle at its base. On the terrestrial globe the division of the earth into land and water is laid down from the latest discoveries; there are also many additional circles, as well as the rhumb-lines, for solving all the necessary geographical and nautical problems. On the celestial globes, all the southern constellations, observed at the Cape of Good Hope by M. de la Caille, and all the stars in Mr. Flamsteed's British Catalogue, are accurately laid down and marked with Greek and Roman letters of reference, in imitation of Bayer. Upon each side of the ecliptic are drawn eight parallel circles, at the distance of one degree from each other, including the zodiac; and these are crossed at right angles with segments of great circles at every fifth degree of the ecliptic, for the more readily noting the place of the moon, or of any planet upon the globe. The author has also inserted, from Ulugh Beigh, printed at Oxford in 1663, the mansions of the Moon of the Arabian Astronomers, so called, because they observed the moon to be in or near one of these every night during her monthly course round the earth, to each of which the Arabian characters are fixed. On the strong brass circle of the terrestrial globe, and about twenty-three degrees and a half on each side of the north pole, the days of each month are laid down according to the sun's declination; and this brass circle is so contrived, that the globe may be placed with the north and south poles in the plane of the horizon, and with the south pole elevated above it. The equator, on the surface of either globe, serves the purpose of the horary circle, by means of a semi-circular wire placed in the plane of the equator, carrying two indices, one of which is occasional, to be used to point out the time. A farther account of these globes, with the method of using them, will be found in Adams's Treatise on their Construction and Use.

Mr. G. Wright, of London, has simplified the construction of the hour-circle. There are engraved on his globes two hour-circles, one at each of the poles; which are divided into a double set of twelve hours, as usual in the common brass ones, except that the hours are figured round both to the right and left. The hour-hand or index is placed in such a manner under the brass meridian, as to be moveable at pleasure to any required part of the hour-circle, and yet remain there fixed during the revolution of the globe on its axis, and is entirely independent of the poles of the globe. In this manner, the motion of the globe round its axis carrying the hour-circle, the fixed index serves to point out the time, the same as in the reverse way by other globes. There is an advantage in having the hour-circle figured both ways, as one hour serves as a complement to XII. for the other, and the time of the sun rising and setting, and vice versa, may be both seen at the same time on the hour-circle. In the problems generally to be performed, the inner circle is the circle of reckoning, and the outer one only the complement.

In the Philosophical Transactions for 1789,

p. 1, Mr. Smeat on has proposed some improvements of the celestial globe, especially with respect to the quadrant of altitude, for the resolution of problems relating to the azimuth and altitude. The difficulty, he observes, that has occurred in fixing a semi-circle, so as to have a centre in the zenith and nadir points of the globe, at the same time that the meridian is left at liberty to raise the pole to its desired elevation, I suppose, has induced the globe makers to be contented with the strip of thin flexible brass, called the quadrant of altitude; and it is well known how imperfectly it performs its office. The improvement I have attempted, is in the application of a quadrant of altitude of a more solid construction; which being affixed to a brass socket of some length, and this ground, and made to turn upon an upright steel spindle, fixed in the zenith, steadily directs the quadrant, or rather arc, of altitude to its true azimuth, without being at liberty to deviate from a vertical circle to the right hand or left; by which means the azimuth and altitude are given with the same exactness as the measure of any other of the great circles.

OF THE USE OF THE GLOBES.

We subjoin the principal problems which exemplify the use of these elegant and important scientific instruments.

SECT. I.—OF THE USE OF THE TERRESTRIAL GLOBE.

PROB. I. *To rectify the globe.*—The globe being set upon a true plane, raise the pole according to the given latitude; then fix the quadrant of altitude in the zenith; and, if there be any mariner's compass upon the pedestal, let the globe be so placed that the brazen meridian may stand due south and north, according to the two extremities of the needle, allowing for its variation.

PROB. II. *To find the longitude and latitude of any place.*—Bring the given place to the brazen meridian, and the degree it is under is the latitude; then observe the degree of the equator under the same meridian, and you will have the longitude.

PROB. III. *The longitude and latitude of any place being given, to find that place on the globe.*—Bring the degree of longitude to the brazen meridian; find upon the same meridian the degree of latitude, whether south or north, and the point exactly under that degree is the place desired.

PROB. IV. *The latitude of any place being given, to find all those places that have the same latitude.*—The globe being rectified (Prob. I.) according to the latitude of the given place, and that place being brought to the brazen meridian, make a mark exactly above the same, and, turning the globe round, all those places passing under the said mark have the same latitude with the given place.

PROB. V. *Two places being given on the globe, to find the distance between them.*—If the places are under the same meridian, that is, have the same longitude, their difference of latitude,

reckoning sixty-nine miles and a half to a degree, will give the distance.

If they have the same latitude, but differ in longitude, their distance may be found by their difference of longitude, reckoning the number of miles in a degree of longitude in their common parallel of latitude, according to the table given above.

If they differ both in latitude and longitude, lay the graduated edge of the quadrant of altitude over both the places, and the number of degrees intercepted between them will give their distance from each other, reckoning every degree to be sixty-nine English miles and a half.

PROB. VI. *To find the sun's place in the ecliptic at any time.*—The month and day being given, look for the same upon the wooden horizon; and opposite the day you will find the sign and degree in which the sun is at that time; which sign and degree being noted in the ecliptic, the same is the sun's place, or nearly, at the time desired.

PROB. VII. *The month and day being given, as also the particular time of that day, to find those places of the globe to which the sun is in the meridian at that time.*—The pole being elevated according to the latitude of the place where you are, bring the said place to the brazen meridian, and setting the index of the horary circle at the hour of the day, in the given place, or where you are, turn the globe till the index points at the upper figure of XII; which done, fix the globe in that situation, and observe what places are exactly under the upper hemisphere of the brazen meridian; for those are the places desired.

PROB. VIII. *To know the length of the day and night in any place of the earth at any time.*—Elevate the pole (Prob. I.) according to the latitude of the given place; find the sun's place in the ecliptic (Prob. VI.) at that time; which being brought to the east side of the horizon, set the index of the horary circle at noon, or the upper figure of XII; and, turning the globe till the aforesaid place of the ecliptic touch the western side of the horizon, look upon the horary circle; and where the index points, reckon the number of hours to the upper figure of XII; for that is the length of the day; the complement of which to twenty-four hours is the length of the night.

PROB. IX. *To know by the globe what o'clock it is in any part of the world at any time, provided you know the hour of the day where you are at the same time.*—Bring the place in which you are to the brazen meridian, the pole being raised (Prob. I.) according to its latitude, and set the index of the horary circle to the hour of the day at that time. Then bring the desired place to the brazen meridian, and the index will point out the hour at that place.

PROB. X. *A place being given in the torrid zone, to find the two days of the year in which the sun shall be vertical to the same.*—Bring the given place to the brazen meridian, and mark what degree of latitude is exactly above it. Move the globe round, and observe the two points of the ecliptic that pass through the said degree of latitude. Find upon the wooden

horizon (or by proper tables of the sun's annual motion) on what days he passes through the aforesaid points of the ecliptic; for those are the days required, in which the sun is vertical to the given place.

PROB. XI. *The month and the day being given, to find by the globe those places of the northern frigid zone, where the sun begins then to shine constantly without setting; as also those places of the southern frigid zone, where he then begins to be totally absent.*—The day given (which must be always one of those either between the vernal equinox and the summer solstice, or between the autumnal equinox and the winter solstice), find (Prob. VI.) the sun's place in the ecliptic, and marking the same, bring it to the brazen meridian, and reckon the like number of degrees from the north pole towards the equator, as there is between the equator and the sun's place in the ecliptic, making a mark where the reckoning ends. Then turn the globe round, and all the places passing under the said mark are those in which the sun begins to shine constantly without setting, upon the given day. For solution of the latter part of the problem, set off the same distance from the south pole upon the brazen meridian towards the equator, as was in the former case set off from the north; then marking as before, and turning the globe round, all places passing under the mark are those where the sun begins its total disappearance from the given day.

PROB. XII. *A place being given in either of the frigid zones, to find by the globe what number of days the sun constantly shines upon the said place, and what days he is absent, as also the first and last day of his appearance.*—Bring the given place to the brazen meridian, and observing its latitude (Prob. II.), elevate the globe accordingly; count the same number of degrees upon the meridian from each side of the equator, as the place is distant from the pole; and, making marks where the reckonings end, turn the globe, and carefully observe what two degrees of the ecliptic pass exactly under the two points marked on the meridian: first for the northern arch of the circle, namely, that comprehended between the two degrees marked, which, being reduced to time, will give the number of days that the sun constantly shines above the horizon of the given place; and the opposite arch of the said circle will, in like manner, give the number of days in which he is totally absent, and also will point out which days those are. And in the interval he daily will rise and set.

PROB. XIII. *The month and day being given, to find those places on the globe to which the sun, when on the meridian, shall be vertical on that day.*—The sun's place in the ecliptic being found (Prob. VI.), bring the same to the brazen meridian, on which make a small mark exactly above the sun's place. Then turn the globe; and those places which have the sun vertical in the meridian, will successively pass under the said mark.

PROB. XIV. *The month and day being given, to find upon what point of the compass the sun then rises and sets in any place.*—Elevate the pole according to the latitude of the place, and, finding the sun's place in the ecliptic at the given time,

bring the same to the eastern side of the horizon, and it will show the point of the compass upon which he then rises. By turning the globe till his place coincides with the western side of the horizon, you may also see upon that circle the exact point of his setting.

PROB. XV. *To know by the globe the length of the longest and shortest days and nights in any part of the world.*—Elevate the pole according to the latitude of the given place, and bring the first degree of Cancer, if in the northern, or Capricorn, if in the southern hemisphere, to the eastern side of the horizon. Then, setting the index of the horary circle at noon, turn the globe about till the sign of Cancer touches the western side of the horizon, and observe upon the horary circle the number of hours between the index and the upper figure of XII, reckoning them according to the motion of the index; for that is the length of the longest day, the complement of which to twenty-four hours is the extent of the shortest night. The shortest day and longest night are only the reverse of the former.

PROB. XVI. *The hour of the day being given at any place, to find those places of the earth where it is either noon or midnight, or any other particular hour, at the same time.*—Bring the given place to the brazen meridian, and set the index of the horary circle at the hour of the day in that place. Then turn the globe till the index points at the upper figure of XII, and observe what places are exactly under the upper semicircle of the brazen meridian; for in them it is mid-day at the time given. Which done, turn the globe till the index points at the lower figure of XII; and whatever places are then in the lower semicircle of the meridian, in them it is midnight at the given time. After the same manner we may find those places that have any other particular hour at the time given, by moving the globe till the index points at the hour desired, and observing the places that are then under the brazen meridian.

PROB. XVII. *The day and hour being given, to find by the globe that particular place of the earth to which the sun is vertical at that time.*—The sun's place in the ecliptic (Prob. VI.) being found, and brought to the brazen meridian, make a mark above the same; then (Prob. X.) find those places of the earth in whose meridian the sun is at that instant, and bring them to the brazen meridian; which done, observe that part of the earth which falls exactly under the aforesaid mark in the brazen meridian; for that is the particular place to which the sun is vertical at that time.

PROB. XVIII. *The day and hour at any place being given, to find all those places where the sun is then rising, or setting, or in the meridian; consequently all those places which are enlightened at that time, and those which have twilight, or dark night.*—This problem cannot be solved by any globe fitted up in the common way, with the hour-circle fixed upon the brass meridian, unless the sun be on or near either of the tropics on the given day. But by a globe fitted up with the hour-circle on its surface below the meridian, it may be solved for any day in the year, according to the following method.

Having found the place to which the sun is

vertical at the given hour, if the place be in the northern hemisphere, elevate the north pole as many degrees above the horizon as are equal to the latitude of that place; if the place be in the southern hemisphere, elevate the south pole accordingly, and bring the said place to the brazen meridian. Then, all those places which are in the western semicircle of the horizon have the sun rising to them at that time, and those in the eastern semicircle have it setting: to those under the upper semicircle of the brass meridian it is noon; and to those under the lower semicircle it is midnight. All those places which are above the horizon are enlightened by the sun, and have the sun just as many degrees above them as they themselves are above the horizon; and this height may be known, by fixing the quadrant of altitude on the brazen meridian over the place to which the sun is vertical; and then, laying it over any other place, observing what number of degrees on the quadrant are intercepted between the said place and the horizon. In all those places that are eighteen degrees below the western semicircle of the horizon the morning twilight is just beginning; in all those places that are eighteen degrees below the eastern semicircle of the horizon the evening twilight is ending; and all those places that are lower than eighteen degrees have dark night.

If any place be brought to the upper semicircle of the brazen meridian, and the hour-index be set to the upper figure of XII, or noon, and then the globe be turned round eastward on its axis,—when the place comes to the western semicircle of the horizon, the index will show the time of the sun's rising at that place; and when the same place comes to the eastern semicircle of the horizon the index will show the time of the sun's setting.

To those places which do not go under the horizon, the sun sets not on that day: and, to those which do not come above it, the sun does not rise.

PROB. XIX. *The month and day being given, with the place of the moon in the zodiac, and her true latitude, to find the exact hour when she will rise and set, together with her southing, or coming to the meridian of the place.*—The moon's place in the zodiac may be found by an ordinary almanack; and her latitude, which is her distance from the ecliptic, by applying the semicircle of position to her place in the zodiac. For the solution of the problem, elevate the pole (Prob. II.) according to the latitude of the given place; and the sun's place in the ecliptic at the time being (Prob. VI.) found, and marked, as also the moon's place at the same time, bring the sun's place to the brazen meridian, and set the index of the horary circle at noon; then turn the globe till the moon's place successively meet with the eastern and western side of the horizon, as also the brazen meridian; and the index will point at those various times the particular hours of her rising, setting, and southing.

SECT. II.—DIRECTIONS FOR USING THE CELESTIAL GLOBE.

We shall now proceed to the use of the celestial globe, premising, that as the equator,

ecliptic, tropics, polar circles, horizon, and brazen meridian, are exactly alike on both globes, the former problems concerning the sun are solved in the same way. The method also of rectifying the globe is the same. Observe also that the sun's place for any day of the year stands directly over that day on the horizon of the celestial globe, as on the terrestrial.

The *latitude* and *longitude* of the stars, and of all other celestial phenomena, are reckoned differently from that of places on the earth: for all terrestrial latitudes are reckoned from the equator; and longitudes from the meridian of some remarkable place; but all astronomers reckon the latitudes of the heavenly bodies from the ecliptic; and their longitudes from the equinoctial colure, in that semicircle of it which cuts the ecliptic at the beginning of Aries; and thence eastward, quite round; so that stars between the equinoctial and the northern half of the ecliptic, have north declination and south latitude: those between the equinoctial and the southern half of the ecliptic have south declination and north latitude; and all between the tropics and poles, have declinations and latitudes of the same denomination.

There are six great circles on the celestial globe, which cut the ecliptic perpendicularly, and meet in two opposite points in the polar circles; which points are each ninety degrees from the ecliptic, and are called its poles. These polar points divide those circles into twelve semicircles, which cut the ecliptic at the beginning of the twelve signs. They resemble so many meridians on the terrestrial globe; and, as all places which lie under any particular meridian semicircle on that globe have the same longitude, so all those points of the heaven through which any of the above semicircles are drawn have the same longitude. And, as the greatest latitudes on the earth are at the north and south poles of the earth, so the greatest latitudes in the heaven are at the north and south poles of the ecliptic.

For the division of the stars into constellations, &c., see ASTRONOMY.

PROB. I. *To find the right ascension and declination of the sun or any fixed star.*—Bring the sun's place in the ecliptic to the brazen meridian: then that degree in the equinoctial which is cut by the meridian is the sun's right ascension; and that degree of the meridian which is over the sun's place is his declination. Bring any fixed star to the meridian, and its right ascension will be cut by the meridian in the equinoctial; and the degree of the meridian that stands over it is its declination.

So that right ascension and declination, on the celestial globe, are found in the same manner as longitude and latitude on the terrestrial.

PROB. II. *To find the latitude and longitude of any star.*—If the given star be on the north side of the ecliptic, place the ninetyeth degree of the quadrant of altitude on the north pole of the ecliptic, where the twelve semicircles meet, which divide the ecliptic into the twelve signs; but if the star be on the south side of the ecliptic, place the ninetyeth degree of the quadrant on the south pole of the ecliptic. Keeping the

ninetyeth degree of the quadrant on the proper pole, turn the quadrant about, until its graduated edge cuts the star; then the number of degrees in the quadrant between the ecliptic and the star, is its latitude; and the degree of the ecliptic cut by the quadrant, is the star's longitude, reckoned according to the sign in which the quadrant then is.

PROB. III. *To represent the face of the starry firmament, as seen from any given place of the earth, at any hour of the night.*—Rectify the celestial globe for the given latitude, the zenith, and sun's place in every respect, as taught by the sixteenth problem for the terrestrial; and turn it about, until the index points to the given hour; then the upper hemisphere of the globe will represent the visible half of the heaven for that time; all the stars upon the globe being then in such situations as exactly correspond to those in the heaven. And, if the globe be placed duly north and south, every star in the globe will point toward the like star in the heaven: by which means the constellations and remarkable stars may be easily known; all those stars under the upper part of the brazen meridian, between the south point of the horizon and the north pole, are at their greatest altitude, if the latitude of the place be north; but if the latitude be south those stars which lie under the upper part of the meridian, between the north point of the horizon and the south pole, are at their greatest altitude.

PROB. IV. *The latitude of the place, and day of the month, being given; to find the time when any known star will rise, or be upon the meridian, or set.*—Having rectified the globe, turn it about until the given star comes to the eastern side of the horizon, and the index will show the time of the star's rising; then turn the globe westward, and, when the star comes to the brazen meridian, the index will show the time of the star's coming to the meridian of your place; lastly, turn on, until the star comes to the western side of the horizon, and the index will show the time of the star's setting. N. B. In northern latitudes, those stars which are less distant from the north pole than the quantity of its elevation above the north point of the horizon never set; and those which are less distant from the south pole than the number of degrees by which it is depressed below the horizon never rise; and vice versa in southern latitudes.

PROB. V. *To find at what time of the year a given star will be upon the meridian at a given hour of the night.*—Bring the given star to the upper semicircle of the brass meridian, and set the index to the given hour; then turn the globe, until the index points to twelve at noon, and the upper semicircle of the meridian will then cut the sun's place, answering to the day of the year sought; which day may be easily found against the like place of the sun among the signs on the wooden horizon.

PROB. VI. *The latitude, day of the month, and azimuth of any known star being given; to find the hour of the night.*—Having rectified the globe for the latitude, zenith, and sun's place, lay the quadrant of altitude to the given degree of azimuth in the horizon: then turn the globe on

its axis, until the star comes to the graduated edge of the quadrant; and when it does, the index will point out the hour of the night.

PROB. VII. *The latitude of the place, the day of the month, and altitude of any known star, being given; to find the hour of the night.*—Rectify the globe as in the former problem, guess at the hour of the night, and turn the globe until the index points at the supposed hour; then lay the graduated edge of the quadrant of altitude over the known star; and, if the degree of the star's height in the quadrant upon the globe answers exactly to the degree of the star's observed altitude in the heaven, you have guessed exactly; but if the star on the globe is higher or lower than it was observed to be in the heaven, turn the globe backwards or forwards, keeping the edge of the quadrant upon the star, until its centre comes to the observed altitude in the quadrant; and then the index will show the true time of night.

PROB. VIII. *An easy method for finding the hour of the night by any two known stars, without knowing either their altitude or azimuth; and then of finding both their altitude and azimuth, and thereby the true meridian.*—Tie one end of a thread to a common musket bullet; and, having rectified the globe as above, hold the other end of the thread in your hand, and carry it slowly round betwixt your eye and the starry heaven, until you find it cuts any two known stars at once. Then, guessing at the hour of the night, turn the globe until the index points to that time in the hour circle; which done, lay the graduated edge of the quadrant over any one of these two stars on the globe which the thread cut in the heaven. If the said edge of the quadrant cuts the other star also, you have guessed the time exactly; but if it does not, turn the globe slowly backwards or forwards, until the quadrant (kept upon either star) cuts them both through their centres; and then the index will point out the exact time of the night; the degree of the horizon cut by the quadrant will be the true azimuth of both these stars from the south; and the stars themselves will cut their true altitudes in the quadrant: at which moment, if a common azimuth compass be so set upon a floor or level pavement, that these stars in heaven may have the same bearing upon it (allowing for the variation of the needle) as the quadrant of altitude has in the wooden horizon of the globe, a thread extended over the north and south points of that compass will be directly in the plane of the meridian; and if a line be drawn upon the floor or pavement, along the course of the thread, and an upright wire be placed in the southmost end of the line, the shadow of the wire will fall upon that line when the sun is on the meridian, and shew upon the pavement.

PROB. IX. *To find the place of the moon, or of any planet; and thereby to show the time of its rising, setting, and setting.*—Seek in an almanack or Ephemeris the geocentric place of the moon or planet in the ecliptic, for the given day of the month; and according to its longitude and latitude, as shown by the ephemeris, mark the same with chalk upon the globe. Then, having rectified the globe, turn it round its axis

westward; and as the said mark comes to the eastern side of the horizon, to the brazen meridian, and to the western side of the horizon, the index will show at what time the planet rises, comes to the meridian, and sets, in the same manner as it would do for a fixed star.

For an explanation of the harvest moons by a globe, and the equation of time. See *ASTRONOMY*, Index.

GLOBE AMARANTH. See *GOMPHIRENA*.

GLOBE ANIMALCULE. See *ANIMALCULE*.

GLOBE DAISY. See *SPHERANTHUS*.

GLOBE FISH. See *OSTRACION*.

GLOBE FLOWER. See *SPHERANTHUS*.

GLOBE RANUNCULUS. See *TROLLIUS*.

GLOBE THISTLE. See *ECHINOPS*.

GLOBULARIA, globular blue daisy, a genus of the monogynia order, and tetrandria class of plants: natural order forty-eighth, aggregatæ: *cal.* common imbricated; proper tubulated inferior; the upper lip of the florets bipartite, the under one tripartite; the receptacle paleaceous. There are several species; but only one is commonly to be met with in our gardens, viz. the

G. vulgaris, or common blue daisy. It has broad thick radical leaves three-parted at the ends, upright stalks from about six to ten or twelve inches high, garnished with spear-shaped leaves, and the top crowned by a globular head of fine blue flowers composed of many florets in one cup. It flowers in June, and makes a good appearance: but thrives best in a moist shady situation. It is propagated by parting the roots in September.

GLOCKNER, one of the highest mountains in Europe, on the confines of Salzburg, the Tyrol, and Carinthia, is computed to be 12,760 feet above the level of the sea. It stands in long. 12° 51' 40" E., lat. 47° 4' 33" N.

GLOGAU, a large district or principality of Silesia, contiguous to Prussian Poland, and Lusatia. Its territorial extent is 1826 square miles, and the Oder traverses its whole extent; which is also watered by the Bober. The soil is clayey; producing corn and flax, and a small quantity of wine. This principality is now included in the Prussian government of Liegnitz.

GLOGAU, or GROSS GLOGAU, in Silesia, the chief place of the foregoing principality, is well built and strongly fortified. It is situated about a mile from the Oder, and contains an elegant garrison church, erected in 1790, a Lutheran church and school, a synagogue, a Catholic academy, and two hospitals. The cathedral stands on an island formed by the Oder: it was built in 1260. Glogau has cotton and tobacco manufactures, and some considerable breweries. It was taken by the Prussians and its works greatly strengthened in 1741. In 1807 it surrendered to the forces of Bavaria and Wirtemberg, and was for a considerable time garrisoned by the French troops: the inhabitants amount to 9000, of whom 2000 are said to be Jews. Thirty-four miles east of Sagan, and sixty north-west of Breslau.

GLOGAU, LITTLE or UPPER, is a town of Silesia, in the government of Oppeln, inhabitants 2200. Twenty-one miles south of Oppeln, and sixty-seven south-east of Breslau.

GLOMERATE, *v. a.* } Lat. *glomero*, *glo-*
GLOMERATION, *n. s.* } *meratio*, *glomerosus*.
GLOMEROUS, *adj.* } To gather into a ball
or sphere; a filamentous substance gathered into
a ball is said to beglomerated, but discontin-
uous particles are conglobated. Thus in the
human body on this principle the glands are
divided into conglobate and conglomerate.

The rainbow consisteth of a *glomeration* of small
drops, which cannot fall but from the air that is
very low. *Bacon.*

GLOMME, the largest river of Norway, rises
in the lake of Stor Scargen, passing by Tonset,
and Kongswinger, and falls into the Cattegat at
Frederickstadt. It contains several cataracts,
the largest of which is at Halsland; and, when
swelled by the snows and heavy rain, flows with
great vigor and rapidity. In 1702 it burst its
banks and devastated a large extent of country.

GLOOM, *n. s.* & *v. a.* } Sax. *glomang*, *twi-*
GLOOM'ILY, *adv.* } light. Defect of
GLOOM'INESS, *n. s.* } light; heaviness or
GLOOM'y, *adj.* } obscurity: applied to
the mind it is a disposition the reverse of ease
and happiness; a mind tinctured with melan-
choly feelings and forebodings of evil; pros-
pects which present but little of light or hope;
a state opposed equally to light or cheerful-
ness.

Like to the morne, when first her shyning face
Hath to the gloomy world itself bewrayed;
That same was fayrest Amoret in place
Shyning with beauties light, and heavenly virtues
grace. *Spenser. Faerie Queene.*

His glist'ring armour made
A little glooming light much like a shade. *Spenser.*

Scarcely had Phœbus in the glooming East
Yet harnessed his fiery-footed team. *Id.*

I shall be your faithful guide
Through this gloomy covert wide,
And not many furlongs thence
Is your father's residence. *Milton.*

This the seat,
That we must change for heaven? This mournful
gloom,
For that celestial light? *Id. Paradise Lost.*

These were from without
The growing miseries, which Adam saw
Already in part, though hid in gloomiest shade,
To sorrow abandoned. *Id.*

Deep in a cavern dwells the drowsy god,
Whose gloomy mansion nor the rising sun,
Nor setting visits, nor the lightsome noon.

Dryden's Fables.
See, he comes: how gloomily he looks! *Dryden.*

The gloominess in which sometimes the minds of
the best men are involved, very often stands in need
of such little incitements to mirth and laughter as are
apt to disperse melancholy. *Addison.*

Thou mak'st the gloomy face of nature gay,
Giv'st beauty to the sun, and pleasure to the day.
Id.

Neglect spreads gloominess upon their humour, and
makes them grow sullen and inconvertible.

Collier of the Spleen.
Now warm in love, now with'ring in thy bloom,
Lost in a convent's solitary gloom. *Pope.*

The surface of the earth is clearer or gloomier,
Just as the sun is bright or more overcast. *Id.*

Gloomily retired the spider lives. *Thomson.*

GLORIED, *adj.* } Fr. *glorie*, *glorieux*,
GLORIOUS, *adj.* } *glorifier*; Belg. *gloor*;
GLORIOUSLY, *adv.* } Lat. *gloria*, *gloriosus*,
GLORIFICATION, *n. s.* } *glorifico*. Glory is
GLORIFY, *v. a.* } something dazzling
GLORY, *v. n.* & *n. s.* } and diffused or shed
abroad, as radii from a centre; applied figura-
tively to language, to acts, to states, especially
the heavenly; as praise, illustrious achieve-
ments, exaltation, splendor, &c.; also boastful,
ostentatious. The original idea is splendid, daz-
zling light. This word in a religious sense sig-
nifies adoration and praise, given to God.

If I glorifye my self, my glorie is naught: my fadir
is that glorifieth me, whom ye seyen that he is youre
God. *Wiclif. Jon. ix. 1.*

Thou shalt guide me with thy counsel, and af-
terwards receive me into thy glory. *Psalm lxxiii. 24.*

Glory to God in the highest. *Luke ii. 14.*
If God be glorified in him, God shall also glorify
him in himself, and shall straitway glorify him.
John xiii. 32.

Whom he justified, them he also glorified.
Rom. viii. 30.

I shuld have deyed, ye longe time agon:

But Jusu Crist, as ye in hookes finde,
Wol that his glory last and be in minde;
And for the worship of his moder dere
Yet may I sing O Alma loude and clere.

Chaucer. The Prioresse's Tale.

No chymist yet the elixir got
But glorifies his pregnant pot,
If by the way to him befall,
Some odoriferous thing, or medicinal.

Donne.

In her the riches of all heavenly grace,
In chiefe degree, are heaped up on hye,
And all that else this worlds' enclosure bace
Hath great or glorious in mortall eye,
Adornes the person of her maiesty.

Spenser. Faerie Queene.

Whomsoever they find to be most licentious of life,
desperate in all parts of disobedience and rebellious
disposition, him they set up and glorify. *Spenser.*

This form and manner of glorifying God was not at
that time first begun; but received long before, and
alleged at that time as an argument for the truth.

Hooker.

They were wont, in the pride of their own proceed-
ings, to glory, that whereas Luther did but blow away
the roof, and Zuinglius batter but the walls of popish
superstition, the last and hardest work of all remained,
which was to raze up the very ground and foundation
of popery. *Id.*

God is glorified when such his excellency, above all
things, is with due admiration acknowledged. *Id.*

Let them look they glory not in mischief,
Nor build their evils on the graves of great men;
For then my guiltless blood must cry against them.

Shakspeare.

Two such silver currents, when they join,
Do glorify the banks that bound them in. *Id.*

Glorious followers, who make themselves as trump-
pets of the commendation of those they follow, taint
business for want of secrecy. *Bacon.*

And with that word and warning soon was dight,
Each soldier longing for near coming glory.

Fairfax.

No place alters the condition of nature: an angel is
glorious, though he be upon earth; and man is but
earth though he be above the clouds. *Bp. Hall.*

Israel's bright sceptre far less *glory* brings,
There have been fewer friends on earth than kings.

Cowley.

At opening your eyes, enter upon the day with
thanksgiving for the preservation of you the last night,
with the *glorification* of God for the works of the crea-
tion.

Taylor.

Then enter into *glory*, and resume
His seat at God's right hand, exalted high
Above all names in heaven.

Milton's Paradise Lost.

Old respect,

As I suppose, toward your once *gloried* friend,
My son, now captive, hither hath informed,
Your younger feet, while mine cast back with age
Came lagging after.

Id. Agonistes.

Such did the manna's sacred dew distil
White and entire, although congealed and chill
Congealed on earth; but does dissolving run
Into the *glories* of the' almighty sun.

Marvell.

Some to the *glory* of the Lord
Perjured themselves and broke their word.

Butler.

Oh! she is the pride and *glory* of the world:
Without her all the rest is worthless dross;
Life a base slavery; empire but a mock;
And love, the soul of all, a bitter curse.

Rochester's Valentinian.

The success of those wars was too notable to be un-
known to your ears, to which all worthy fame hath
glory to come unto.

Sibney.

With like judgment *glorifying* when he had happened
to do a thing well, as when he had performed some
notable mischief.

Id.

Think it no *glory* to swell in tyranny.

Id.

The members of the church remaining, being per-
fectly sanctified, shall be eternally *glorified*; then shall
the whole church be truly and perfectly holy.

Pearson.

Treated so ill, chased from your throne,

Returning, you adorn the town;

And with a brave revenge do show

Their *glory* went and came with you.

Waller.

This is the perfection of every thing, to attain its true
and proper end; and the end of all these gifts and en-
dowments, which God hath given us, is to *glorify* the
giver.

Tillotson.

They inspire with those celestial flames, which shine
so *gloriously* in their works.

Dryden.

He is *glorious* in respect of the brightness and splen-
dor of his celestial body, still made more *glorious* and
majestick by the authority which his Father hath com-
mitted to him of universal judge.

Nelson.

Can we imagine that neither the ambition of princes,
or interest, or gain in private persons, or curiosity and
the desire of knowledge, or the *glory* of discoveries,
could ever move them in that endless time to try their
fortunes upon the sea.

Burnet.

It is not a converting but a crowning grace; such an
one as irradiates, and puts a circle of *glory* about the
head of him upon whom it descends.

South.

Aristotle says, that should a man under ground con-
verse with works of art, and be afterwards brought up
in the open day, and see the several *glories* of the
heaven and earth, he would pronounce them the
works of God.

Addison's Spectator.

Thou hast seen mount Atlas,

While storms and tempests thunder on its brow,

And oceans break their billows at its feet,

It stands unmoved, and *glories* in its height.

Id. Cato.

Let us remember we are Cato's friends,
And act like men who claim that *glorious* title.

This title of Freeholder is what I most *glory* in, and
what most effectually calls to my mind the happiness of
that government under which I live.

Addison's Freeholder.

Impartial justice holds her equal scales,
Till stronger virtue does the weight incline;

If over thee thy *glorious* foe prevails;

He now defends the cause that once was thine.

Prior.

Take but the humblest lily of the field,
And, if our pride will to our reason yield,
It must by sure comparison be shown

That in the regal seat great David's son,
Arrayed in all his robes and types of power,
Shines with less *glory* than that simple flower.

Id.

A smile plays with a surprising agreeableness in the
eye, breaks out with the brightest distinction, and sits
like a *glory* upon the countenance.

Collier of the Asper.

If others may *glory* in their birth, why may not we,
whose parents were called by God to attend on him at
his altar?

Atterbury.

Now sleeping flocks on their soft fleeces lie;
The moon, serene in *glory*, mounts the sky. *Pope.*
From opening skies may streaming *glories* shine,
And saints embrace thee with a love like mine.

Id.

Glorious ambition! Peter, swell thy store,
And be what Rome's great Didius was before.

Id.

Great wits sometimes may *gloriously* offend,
And rise to faults true critics dare not mend.

It is hardly possible for you to beseech and intreat
God to make any one happy in the highest enjoyments
of his *glory* to all eternity, and yet be troubled to see
him enjoy the much smaller gifts of God, in this short
and low state of human life.

Law.

If there be nothing so *glorious* as doing good, if there
is nothing that makes us so like to God, then nothing
can be so *glorious* in the use of our money, as to use it all
in works of love and goodness.

Id.

No one is out of the reach of misfortune; no one
therefore should *glory* in his prosperity.

Clarissa.

On death-beds some in conscious *glory* lie,
Since of the doctor in the mode they die.

Young.

Your sexes *glory* 'tis to shine unknown,

Of all applause be fondest of your own.

Id.

Oh Love! O *Glory*! what are ye? who fly

Around us ever rarely to alight;

There's not a meteor in the polar sky

Of such transcendent and more fleeting flight.

Byron.

GLORIOSA, superb lily, a genus of the mo-
nogynia order, and hexandria class of plants;
natural order eleventh, samentaceæ: cor. hex-
apetalous, undulated, and reflected; the style
oblique. There is but one species; a native of
Malabar. It has a thick, fleshy, tuberous root,
sending forth from its centre declinated round
stalks, growing eight or ten feet long, and gar-
nished with very long narrow leaves running out
into a point, terminated by a long tendril. From
the upper part of the stalks proceed large flame-
colored drooping flowers, consisting of six widely
spreading reflected petals. It flowers in June
and July; and is of admirable beauty, whence
its name. This plant requires the protection of
a hot-house in this country. The flower-stalks
shoot forth in March or April; which, being
long and trailing, must have tall sticks for their
support. The plants are propagated by offsets,
which are produced in tolerable plenty, and
may be separated any time after the stalks decay,
or in spring before new ones arise.

GLOSE, *v. a.* To flatter; to collogue.—*Hamer.* See GLOZE.

GLOSS, *n. s., v. a. & v. n.* } *Fr. glosser*; *Lat. glossarius*; *Gr. γλωσσά and γράφω.* These words are connected with glaze, and signify to render the outward surface shining by friction.

In a figurative sense, to give the best appearance by way of comment; used sometimes in a bad sense, and then they imply false, or specious coloring. A commentary; embellishment; a dictionary which explains antique words: a commentator, or one who furnishes expositions, whether specious or otherwise: a smooth polished surface.

I have this day ben at your chirche at messe,
And said a sermon, to my simple wit,
Not all after the text of holy writ;
For it is hard to you as I suppose;
And therefore wol I teche you, ay the *glose*.
Glosing is a full glorious thing certain;
For letter sleth, so as we clerkes sain.

Chaucer. The Sompnours Tale.

His iron coat all over-grown with rust,
Was underneath enveloped with gold,
Whose glistering *gloss* darkened with filthy dust

Spenser.

Is this the paradise, in description whereof so much
glossing and deceiving eloquence hath been spent?

Hooker's Sermons.

They never hear sentence, which mentioneth
the word or scripture, but forthwith their *glosses* upon it are
the word preached, the scripture explained, or delivered
unto us in sermons.

Hooker.

It is no part of my secret meaning to draw you hereby
into hatred, or to set upon the face of this cause any
fairer *gloss* than the naked truth doth afford.

Id. Preface.

You are a sectary,
That's the plain truth: your painted *gloss* discovers,
To men that understand you, words and weakness.

Shakspeare.

Golden opinions from all sorts of people,
Which would be worn now in their newest *gloss*.

Id.

He seems with forged quaint conceit

To set a *gloss* upon his bad intent.

Id.

The doubt will be whether it will polish so well; for
steel *glosses* are more resplendent than plates of brass.

Bacon.

There came towards us a person of place; he had on
him a gown with wide sleeves, of a kind of water-
camblet, of an excellent azure color, far more *glossy*
than ours.

Id.

If then all souls, both good and bad, do teach,

With general voice, that souls can never die;

'Tis not man's flattering *gloss*, but nature's speech,

Which, like God's oracles, can never lie.

Dorset.

In parchment then, large as the fields, he draws
Assurances, big as *glossed* civil laws.

Donne.

Weeds that the wind did toss

The virgins wore: the youths, woven coats, that cast a
faint dim *gloss*,

Like that of oil.

Chapman's Iliads.

Some mutter at certain passages therein, by putting
ill *glosses* upon the text, and taking with the left hand
what I offer with the right.

Howell.

The rest entire

Shone with a *glossy* scurf.

Milton.

VOL. X.

The common *gloss*
Of theologians. *Id.*

All this, without a *gloss* or comment,
He could unriddle in a moment.

Hudibras.

Besides, he was a shrewd philosopher,
And had read every text and *gloss* over.

Id.

Poor painters oft with silly poets join,
To fill the world with strange but vain conceit;
One brings the stuff, the other stamps the coin,
Which breeds nought else but *glosses* of deceit.

Sidney.

Their surfaces had a smoothness and *glossiness* much
surpassing whatever I had observed in marine or com-
mon salt.

Boyle.

According to Varro, when delubrum was applied to
a place, it signified such a one, in quo dei simulachrum
dedicatum est; and also in the old *glossaries*.

Stillingfleet.

They give the scandal, and the wise discern;
Their *glosses* teach an age too apt to learn.

Dryden.

His surcoat was a bearskin on his back;

His hair hung long behind, and *glossy* raven black.

Id.

Thou detainest Briscis in thy bands,
By priestly *glossing* on the god's commands.

Id.

Do I not reason wholly on your conduct?

You have the art to *gloss* the foulest cause.

Philips.

It was the colour of devotion, giving a lustre to
reverence, and a *gloss* to humility.

South.

The reason why the assertion of a single judge does
not prove the existence of judicial acts, is because his
office is to pronounce judgment, and not to become an
evidence: but why may not the same be said of two
judges? Therefore, in this respect, the *glossator's*
opinion must be false.

Ayliffe.

Groves, fields, and meadows, are at any season plea-
sant to look upon; but never so much as in the opening
of the Spring, when they are all new and fresh, with
their first *gloss* upon them.

Addison's Spectator.

Her equals first observed her growing zeal,

And laughing *glossed*, that Abra served so well.

Prior.

Explaining the text in short *glosses*, was Accursius's
method.

Baker on Learning.

I could add another word to the *glossary*.

Baker.

Indentures, covenants, articles, they draw,

Large as the fields themselves, and larger far

Than civil codes with all their *glosses* are.

Pope.

Ah! what avails his *glossy* varying dyes,

His purple crest, and scarlet-circled eyes,

The vivid green his shining plumes unfold,

His painted wings, and breast that flames with gold?

Id.

To me more dear, congenial to my heart

One native charm, than all the *gloss* of art.

Goldsmith.

Thy boastful mirth let jealous rivals spill,

Insult thy crest, and *glossy* pinions sear,

And ever in thy dreams the ruthless foe appear.

Beattie.

GLOSSOPETRA, or GLOTTOPETRA, from
γλωσσα, a tongue, and *πετρα*, a stone, in natural
history, a kind of extraneous fossil, somewhat in
form of a serpent's tongue; frequently found in
the island of Malta and various other parts. The
vulgar notion is, that they are the tongues of
serpents petrified. Hence their extraordinary
virtue in curing the bites of serpents. The
general opinion of naturalists is, that they are
the teeth of fishes, left at land by the waters of
the deluge, and since petrified. The several sizes

S

of the teeth of the same species, and those of the several different species of sharks, afford a vast variety of these fossil substances. Their usual colors are black, bluish, whitish, yellowish, or brown; and in shape they usually approach to a triangular figure. Some are simple, others tricuspidate, having a small point on each side of the large one: many of them are quite straight; but they are frequently found crooked, and bent in all directions; many of them are serrated on their edges, and others plain; some are undulated on their edges, and slightly serrated on these undulations. They differ also in size as much as in figure; the larger being four or five inches long, and the smaller less than a quarter of an inch. They are most usually found in the strata of blue clay, though sometimes also in other substances, and are common in the clay-pits of Richmond and other places. They are very frequent also in Germany, but nowhere so plentiful as in the island of Malta. The Germans attribute many virtues to these fossil teeth; they call them cordials, sudorifics, and alexipharmics: and the people of Malta, where they are extremely plentiful, hang them about their children's necks to promote dentition. They may possibly be of as much service this way as an anodyne necklace; and, if suspended in such a manner that the child can get them to its mouth, may, by their hardness and smoothness, be of the same use as a piece of coral.

GLOTTIS, in anatomy, the narrow slit at the upper part of the aspera arteria, which is covered by the epiglottis when we hold our breath and when we swallow. The glottis, by its dilatation and contraction, modulates the voice. See **ANATOMY**, Index.

GLOUCESTER, a county in the east part of Virginia, North America, bounded N. N. E. by Middlesex and Matthews counties, east by Chesapeake Bay, S. S. W. by York River, and west by King and Queen county. It is fifty-five miles in length, and thirty in breadth.

GLOUCESTER, a county in New Jersey, bounded north by Burlington county, east by the Atlantic, south by Cape May, Cumberland, and Salem counties, and north-west by the Delaware. The chief town is Woodbury.

GLOUCESTER, a post and sea-port town, of the county of Essex, Massachusetts, North America, situated on Cape Ann, at the north extremity of Massachusetts Bay; sixteen north-east Salem, thirty north-east Boston. It contains a bank, an insurance office, and two public libraries, and is divided into five parishes, in each of which is a congregational meeting house. The harbour is open and accessible for large vessels; and it is one of the most considerable fishing towns in the state. Besides the harbour, properly so called, there are two small open ports, Squam, and Sandy Bay, at which the bay fishery is carried on with spirit. The shipping belonging to this port, in 1816, amounted to 11,080 tons. The harbour is defended by a battery and citadel. Thatcher's Island, on which are two lights of equal height, lies on south-east side of Gloucester and is joined to the continent by a beach of sand which is rarely overflowed. The greatest part of the town is situated on a peninsula, which was formerly

an island, and it is now united to the main land by a narrow isthmus, on which is built a causeway.

GLOUCESTER, a town of Providence, county of Rhode Island, eighteen miles N. N. W. of Providence. Here are several cotton manufactories: and Chepachet village, which contains a post office and a bank, is in this township.

GLOUCESTERSHIRE. This county seems to have obtained its name from the city of Gloucester, the Colonia Glevum of the Romans, and the *Caer Gloew* of the ancient Britons, and so called from a prince Gloew, said to have lived at the commencement of the Roman period of the British history. Anterior to the Roman invasion, the inhabitants of the chief parts of this county, and of Oxfordshire, were distinguished by the appellation of Dobuni, from the British *Dwfu*, denoting inhabitants of low or vale districts. On the division of the island into Britannia Prima et Secunda, that part of this county lying south-east of the river Severn was included in the first province; the other, of course, belonging to the second division. Subsequently to this, under Constantine, the whole county in the province was named Flavia *Cæsariensis*. Under the Anglo-Saxon dominion it formed a portion of the kingdom of Mercia; Winchcomb and King's Stanley being the residences of the Anglo-Saxon monarchs.

Gloucestershire extends northward from 51° 28' to 52° 12', and from 1° 38' E. to 2° 42' W. from London. It is bounded on the north and north-east by Worcestershire and Warwickshire, on the east by Oxfordshire, on the south-east by part of Berkshire and Wiltshire, on the south and south-west by Somersetshire and the Bristol Channel, and on the west and north-west by Monmouthshire and Herefordshire. Its extreme length is from the parish of Clifford Chambers, near Stratford-upon-Avon, to Clifton, beyond the city of Bristol, in a south-west direction, about seventy statute miles; and its breadth, from Lechdale, north-westward, to Preston, in the hundred of Botloe, about forty statute miles. Its superficial contents are nearly 1,100,000 acres. The principal divisions of this county are four: called the Knifsgate, the Seven Hundreds, the Forest, and the Berkeley divisions; twenty-eight hundreds, included in the above divisions, one city, twenty-eight market towns, and 320 parishes. The ecclesiastical division of the county is that of parishes just named. It is, with the exception of the chapelry of Icomb and Cow-honyborn, included in the diocese of Gloucester, which comprehends one archdeaconry and ten deaneries, and is in the province of Canterbury, and is included in the western district. Besides these artificial divisions, there are three natural districts: Cotswold, or Hill, Vale, and Forest.

Speed remarks that the air of this county is pleasant, sweet, and delectable; and certainly, except on the Cotswold hills, where it is very sharp, it is remarkably healthy, although of various temperatures. Even during the winter months, it is generally soft and mild in the valleys. Of the hilly district, however, it has been remarked by the inhabitants, that eight months in the year are winter, and the other four too

cold for summer; but that in the Vale district eight months are summer, and the other four too warm for winter.

The soil is, in general, extremely fertile, and capable of producing all sorts of corn and fruits. William of Malmesbury, who died in 1142, says that 'the ground of this shire throughout yieldeth plenty of corn, and bringeth forth abundance of fruit; the one through the natural goodness only of the ground; the other through the diligent manuring and tillage, in such wise, that it would provoke the laziest persons to take pains.' This old writer adds that, in his time, 'one might see the highways and common lanes clad with apple trees and pear trees, not engrafted by the industry of man's hand, but growing naturally of their own accord.' He also adds, that no county in England was 'so thick set with vineyards as this province,' producing wines but little inferior to the French wines. According to Mr. Rudge's Map of the soil of Gloucestershire, it appears that nearly one-half the soil, extending from near Bristol, north-west to Campden, near the Warwickshire border, is a stone brash on calcareous sand-stone. A second portion, nearly as extensive, reaching in the same direction, from the western side of Bristol to Dorrington, also bordering on Warwickshire, is brown clay, generally on a subsoil of blue clay; but there are in this district various mixed patches of red loamy clay on marl, ferruginous clay, or argillaceous loam, light loam on compact limestone, red sand or grit, black loamy soil, and peaty earths of various colors. The rest, for the most part, appears to be a mixed loam, on a stratum of broken rock, found chiefly along the Wiltshire border, and more particularly to the north and north-east of Cirencester.

The principal rivers are the Severn, Isis or Thames, Upper Avon, and Lower Avon; but there are others intimately connected with this county, particularly the Wye, the Frome, the Stroud, &c. The Severn, which rises on the east side of the huge mountain of Plyn Limmon, in the south-east part of Montgomeryshire, is deemed the second commercial river in England, and has been navigable time immemorial. It is of sufficient depth for vessels of from 150 to 200 tons burden, up to the city of Gloucester. The tide flows as far as Tewkesbury, nearly seventy miles from the sea. This county has the honor of containing the source of the prince of English rivers, the Thames. It rises at a place called the Thames' Head, near the village of Cotes, about two miles south-west of Cirencester.

Of the several navigable canals constructed in this country, the most remarkable are, 1. The Thames and Severn canal, which communicates with the latter river through the Stroud canal, and with the former river at the town of Lechlade. It was begun in 1783, and finished in ten years. The summit level is 241 feet above the level of the Stroud canal, and 130 feet above the river Thames at the place of its junction. These rises of level are surmounted by locks, admirably contrived and executed; and in one place it passes under the park of Lord Bathurst, through Sapperton tunnel, and, after being buried for the distance of two miles and five furlongs, again

emerges near Cirencester. The breadth of the canal is forty-two feet at the top, and thirty feet at the bottom, and it is constructed for barges adapted to the locks on the river Thames, as well as to those of the canal. This work has, however, been more splendid than useful: the expense has exceeded £250,000, and the tolls are scarcely more than sufficient to defray the current repairs. In fact, it connects two rivers, the navigation of both of which is bad; but especially that of the Thames, and the trade, which once passed through this canal, has been diminished by the opening of the Kennet and Avon, which forms a better medium for the transit of goods from Bristol or Gloucester to London. 2. The Berkley canal, parallel to the river Severn, but which, by avoiding its sinuosities, shortens the navigation twenty miles, was begun in 1794. Though an improvement of importance, it languished many years, and is now scarcely completed. 3. The Hereford and Gloucester canal, designed to connect those two cities, passes near Boyce through a tunnel one mile and a quarter in length, between the Severn and Ledbury, to which place, a distance of seventeen miles, the rise is 183 feet.

The virtues of the MEDICINAL SPAS, at Cheltenham, are too well known to need a particular notice here, particularly after the account we have given of them in our article of that name. They form the point of the greatest resort of fashionable company in the county.

At Clifton, one of the most healthy and pleasant villages in the kingdom, and peculiarly distinguished by the immense acclivities of its rocks, is a celebrated medicinal spring called the hot-well, very anciently known as an efficacious remedy in cases of bodily decay. The water is perfectly pellucid; but in the year 1755, at the time of the great earthquake at Lisbon, it became as red as blood, and so turbid that it could not be drunk.

This county sends eight members to parliament, viz. two for the county, two for the city of Gloucester, two for Cirencester, two for Tewkesbury. The Berkeleys, Chesters, Southwells, Moretons, Duttons, and Guises have successively represented this county. Admiral Berkeley was returned 1780, 1784, 1790, 1796, 1802, 1806, and 1807, till he vacated his seat in favor of his nephew, the eldest son of the late earl Berkeley, respecting whose legitimacy there was such a memorable dispute. Gloucester sent members to parliament as early as the reign of Edward I.

This county has produced the following eminent persons:—Sir Robert Atkyns, a learned judge and able writer. Born 1621. Died 1709. —Sir Robert Atkyns, son of the preceding, wrote the history of this county. Born 1646. Died 1711.—Richard Clutterbrock, an extraordinary mechanical genius, though blind. Born at Rodborough in 1638.—Richard Coriensiis, or Richard of Cirencester. Born in that town. He wrote the History of Roman Britain. Several of his MSS. are in different libraries. He was born in the year 1355. Died 1400. The monk Benedict, who wrote the life of St. Dubricius, lived about the year 1120. Born at the city of Gloucester.—William Cartwright, divine, poet,

and dramatic writer. Born 1611. Died 1644.—Edward Chamberlayne, an English historian. Born at Odington, 1616. Died 1703.—Thomas Coxeter, critic and bibliographer. Born at Lechlade, 1682. Died 1747.—Robert of Gloucester, the oldest of our English poets, lived in the time of Henry II., about 1263. He wrote a Chronicle of Britain, in verse, from the age of Brutus to the reign of Henry III.—Richard Graves, an ingenious divine and miscellaneous writer, was author of the *Spiritual Quixote*, and of a much better work, entitled *The Invalid*, &c. He was a very learned and able man. Born at Micleton, 1715. Died 1804.—William Guise, a learned divine. Born 1653. Died 1683.—Sir Matthew Hale, a learned and pious judge. Born at Aldersley, 1600. Died 1675.—John Harmer, a famous Greek professor. Born at Churchdown, 1595. Died 1670.—This county had also the honor of giving birth to Dr. Edward Jenner, whose discovery of the vaccine inoculation will convey his name to the latest posterity.—Sir Thomas Overbury, sometimes said to have been a Warwickshire gentleman, was born at Bourton-on-the-Hill, in this county, in 1581; and was poisoned in the tower of London, 1613. He wrote several pieces in prose and verse.—John Taylor, the water poet, was born at Gloucester, 1580. Died 1654.—The learned Dr. Joseph Trapp, was born at Cherington, 1672. Died 1747.—And, lastly, this county gave birth to the zealous and laborious founder of the Calvinistic Methodists, the Rev. George Whitefield. He was born at the Bell Inn, Gloucester, 1714. Died suddenly in America, 1770.

The principal manufactures of the county are those of woollen broad cloths of various sorts, but chiefly superfine, made of Spanish wool; and of fine narrow goods in the stripe and fancy way, to a very great extent. There are also manufactures of thin stuffs, composed of worsted yarn; and of carpets, stocking-frame-knitting, rugs, blankets, flax-spinning, felt hats, &c. There are also some pretty extensive brass, wire, and iron manufactories, &c. &c. The articles of agricultural commerce are cheese, bacon, cyder, perry, and grain of all sorts. Salmon are sent in great quantities to London from this county. The city of Gloucester is celebrated for the manufacture of pins, which was introduced in the year 1626, by the public spirit of an individual named John Tilsby, the inventor. This trade affords employment for the laboring part of the inhabitants, but is not carried on so extensively as at the end of the last century; it is hoped, however, that the recent pacification of Europe will be the means of again placing the manufactories in a state of prosperity equal to the most favorable times. Borough-English (whereby lands and estates descend to the youngest son) is observed within the city.

GLOUCESTER, a city of England, the capital of the foregoing county, is situated in the beautiful vale of the Severn, on the left bank of that river, about thirty miles from the Bristol Channel. The Severn here dividing itself into two branches, forms the island of Alney: it is navigable for barges, and at spring tides for brigs. Gloucester is well supplied with water from springs in

the neighbourhood; and coal is brought down the Severn from Shropshire and Staffordshire. It is preferred to that of the adjacent collieries for its superior quality; and a considerable quantity is sent by the new railway to Cheltenham. Coal is also procured from the forest of Dean, and brought up the river at an easy rate of carriage. The markets are well furnished with corn, meat, poultry, &c. Gloucester is the see of a bishop, and returns its two members to parliament by 2000 electors. The chief manufactory at Gloucester is that of pins, which is here the most extensive in the kingdom; and a bell foundry has been established here since A.D. 1500, in a family of the name of Radhall. The city forms, with its towers and spires, an imposing appearance from the surrounding country. It is 106 miles west by south of London.

Gloucester is a large but not a populous place, consisting principally of four spacious streets, meeting each other at right angles, near the centre of the city, which take their names from the situation of the gates which originally stood at the bottom of each; as East-Gate Street, West-Gate Street, North-Gate Street, and South-Gate Street; besides some back streets and lanes, chiefly on the west of the city. Where the above four streets meet, a lofty and beautiful cross formerly stood, which was removed in 1750. West-gate is still remaining, though in a ruinous state. The city is well-paved and cleaned; and contains, besides the cathedral, five parish churches, two grammar-schools, called the College and Crypt schools; a blue-coat school, where twenty poor boys are taught reading, writing, and arithmetic, and are afterwards apprenticed to trades; several places of worship for Dissenters, Quakers, &c.; a Jews' synagogue; a county infirmary, erected in 1756; an hospital for the maintenance of fifty-four poor people, with a chaplain, physician, and surgeon; another hospital and chapel dedicated to St. James, for the maintenance of nineteen poor people; a general workhouse, incorporated by act of parliament, for paupers; two commodious market-houses; an elegant theatre; a custom-house; and a county-gaol, erected after the plan of Mr. Howard, on the site of the ancient castle. A noble shire-hall has lately been erected; an elegant assembly and pump room, &c. The mineral springs here are chalybeate, and are thought scarcely inferior to Cheltenham.

The corporation consists of a recorder, twelve aldermen, one of whom is annually chosen mayor, town clerk, chamberlain, forty common-councilmen, and twelve incorporated companies of trades.

The cathedral is considered a very magnificent specimen of Gothic architecture. It was begun on the foundation of a monastery, about the year 1047, by Aldred, bishop of Worcester, afterwards archbishop of York. Abbot Horton, in 1551, built the north aisle, and the great hall, now used as a library; and succeeding abbots enlarged and beautified the venerable pile, until it was made a cathedral by Henry VIII., when he suppressed the monastery. It is 420 feet in length, and 144 in width. From the centre

resses a majestic tower, 198 feet in height, surmounted by two beautiful perforated pinnacles, twenty-four feet in height. This tower contains a peal of eight bells, the tenor of which weighs 6000 pounds.

The choir presents a fine specimen of pointed architecture, and is terminated at the east end by perhaps the largest window in England; composed entirely of painted glass. The canopies of the stalls exhibit a most beautiful specimen of the florid Gothic, and are the admiration of all who visit them. Among the monuments in this cathedral, those of Robert duke of Normandy, and the unhappy Edward II., are most deserving of attention; the former is of wood, with the effigy of the duke; the latter of alabaster. Gloucester was formerly surrounded with walls, defended by a castle, built in the reign of William the Conqueror, and part of which was standing in Leland's time. The city had also at one time a mint. It has three large suburbs, and its boundaries are nearly three miles in circumference. The air is deemed salubrious. The annual average of burials, as registered for ten years, bearing only a proportion to the population of one in thirty-eight.

This town was made a borough by king John, and a corporation by Henry III. Edward I. held a parliament here in 1272, at which several useful laws were enacted, called the Statutes of Gloucester. Richard II. also held a parliament here; and Richard III., who bore the title of duke of Gloucester, gave the city his sword and cap of maintenance, and made it a county of itself, with jurisdiction over the hundreds of Dudston and King's Barton; but these privileges were taken away by act of parliament, after the Restoration, and the walls razed to the ground, because the inhabitants had shut their gates against Charles I. In the city and neighbourhood are many remains of abbeys of black and white friars, and formerly it had eleven churches. In the suburbs are the remains of Lantony Abbey, founded by the earl of Hereford for the monks who were driven by the Welsh from Monmouth. It is now converted into out-buildings belonging to some farms. Markets, Wednesday and Saturday.

GLOVE, *n. s. & v. a.* } Sax. *glofe*; Swed.

GLOV'ER, *n. s.* } *glof*; Dan. *kluffiav*, to divide. Old Minshew asks, with more humor than judgment, "q. gift-love?" A cover for the hands: one whose trade is to make and sell gloves.

Hire *glove* he toke, of which he was ful faine;
And, finally, when it was woxen eve,
And al was wel, he rose and toke his leve.

Chaucer. Troilus and Creseide.

My limbs,
Weakened with grief, being now enraged with grief,
Are thrice themselves; hence therefore, thou nice
crutch;

A scaly gauntlet now, with joints of steel,
Must *glove* this hand. *Shakspeare. Henry IV.*

Does he not wear a great round beard like a *glover's*
paring knife? *Shakspeare.*

They flew about like chaff i' the wind;
For haste some left their masks behind,
Some could not stay their *gloves* to find.

Drayton.

The next he prays on is her pain,
That alm'n'er of transpiring balm;
So soft, 'tis air but once removed;
Tender as 'twere a jelly *gloved.* *Cleaveland.*

White *gloves* were on his hands, and on his head
A wreath of laurel. *Dryden.*

They called for tea and chocolate,
And fell into their usual chat,
Discouraging with important face
On ribbons, fans, and *gloves*, and lace. *Swift.*

GLOVER (Richard), the author of *Leonidas* and several other esteemed works, was the son of Richard Glover, a Hamburgh merchant in London, and was born in St. Martin's Lane in 1712. He very early manifested his propensity to poetry; and while at school wrote, amongst other pieces, a poem to the memory of Sir Isaac Newton, prefixed to the view of that author's philosophy, published in 4to. in 1728, by Dr. Pemberton. But, though possessed of talents calculated to excel in literature, he devoted his attention to commerce, and commenced a Hamburgh merchant. One of his earliest friends was Matthew Green, the author of some admirable poems, which in 1737, after his death, were collected and published by Mr. Glover. In 1737 Mr. Glover married Miss Nunn, with whom he received a handsome fortune; and published *Leonidas*, a poem, in 4to., which soon passed through three editions. It was inscribed to Lord Cobham; and on its first appearance was received with great approbation. Lord Lyttleton, in his Common Sense, and in a poem addressed to the author, praised it in the warmest terms; and Dr. Pemberton published *Observations on Poetry*, especially epic, occasioned by the late poem upon *Leonidas*, 1738, 12mo., merely to point out its beauties. In 1739 Mr. Glover published *London, or the Progress of Commerce*, 4to., and a ballad entitled *Hosier's Ghost*. Both these pieces seem to have been written with a view to incite the public to resent the recent conduct of the Spaniards; and the latter had a very considerable effect. The political dissensions at this period raged with great violence, especially in the metropolis; and, at different meetings of the livery, Mr. Glover was called to the chair, and acquitted himself in a very able manner. His talents for public speaking, his knowledge of political affairs, and his information concerning trade and commerce, soon afterwards pointed him out to the merchants of London as a proper person to conduct their application to parliament on the neglect of their trade. He accepted the office; and gave striking proofs of his oratorical powers. In 1744 the duchess of Marlborough died, and by her will left to Mr. Glover and Mr. Mallet £500 each, to write the History of the Duke of Marlborough's Life. It is supposed that Mr. Glover very early renounced his share of it; and Mallet, though he continued to talk of performing the task almost as long as he lived, never made any progress in it. About this period Mr. Glover withdrew a good deal from public notice. He had been honored with the attention of Frederick Prince of Wales, who once presented him with a complete set of the Classics, elegantly bound; and, on his absenting himself on account

of the embarrassment in his circumstances, sent him £500. In 1753 Glover produced at Drury-lane his tragedy of *Boadicea*; which was acted nine nights. Mr. Garrick, Mr. Mossop, Mrs. Cibber, and Mrs. Pritchard, were among the performers; and Dr. Pemberton wrote a pamphlet to recommend it. In 1761 Mr. Glover published *Medea*, a tragedy, written on the Greek model; but it was not acted until 1767, when it appeared at Drury-lane for Mrs. Yates's benefit. At the accession of his late majesty, having surmounted his difficulties, he was chosen M. P. for Weymouth. In 1770 his poem of *Leonidas* was republished in 2 vols. 12mo., corrected, and extended from nine books to twelve: several new characters being added, and the old ones placed in new situations. The calamities arising, in June 1772, from the failure of the bank of Douglas, Heron, and Co. in Scotland, occasioned Mr. Glover to take a very active part in settling those complicated concerns. In February 1774 he called the annuitants of that house together, at the King's Arms tavern, and laid proposals before them for the security of their demands, with which they were fully satisfied. He also undertook to manage the interests of the merchants and traders of London concerned in the trade of Germany and Holland, and of the dealers in foreign linens, in their application to parliament in May 1774. Both his speeches on these occasions were published that year. In 1775 he engaged on behalf of the West India merchants in their application to parliament, examined the witnesses, and summed up the evidence, in his usual masterly manner. This speech was also printed. For his exertions in this service, he was complimented with a service of plate, worth £300. Besides an epic poem of considerable length, he in addition to his writings already named left some tragedies and comedies in MS., and a most estimable character as a man, a citizen, and an author. He died November 25th, 1785.

GLOUT, v. n. A low word, connected probably with **GLOAT**, which see. To pout; to look sullen. It is still used in Scotland.

She lurks in midst of all her den, and streaks
From out a ghastly whirlpool all her necks,
Were, *glouting* round her rock, to fish he falls.

Chapman.

Glouting with sullen spight, the fury shock
Her clotted locks, and blasted with each look.

Garth.

GLOW, v. n., v. a. & n. s. } Saxon *glopan*;
GLOW'WORM, n. s. } Goth. *gloa*; Dut. *gloeyen*; Teut. *glucn*; Wel. *glo*; à Gr. *χλαυω*, to make warm, Minshew. A partial and grateful heat; a warmth which exists in the human frame after exercise; figuratively applied to the ardor of friendship in different degrees; a bright and roseate color; the burning of desire. A small creeping grub with a phosphoric or luminous tail.

The circles of his eye in his hed
They *gloweden* betwixen yelwe and red.

Chaucer. *The Knights Tale*.

But sithence silence lesseneth not my fire,
But told it flames, and hidden it *does glow*,
I will reveal what ye so much desire. Spenser.

On each side her
Stood pretty dimpled boys like smiling Cupids,
With divers coloured fans, whose wind did seem
To glow the delicate cheeks which they did cool. *Shakspeare*.

His goodly eyes,
That o'er the files and musters of the war
Have *glowed* like plated Mars, now bend, now turn
Their office upon a tawny front. *Id.*

The pale complexion of true love,
And the red *glow* of scorn and proud disdain. *Id.*

The *glowworm* shews the matten to be near,
And 'gins to pale his ineffectual fire. *Id.*
A great light drowneth a smaller that it cannot be
seen; as the sun that of a *glowworm*. *Bacon*.
Kunigund, wife to the emperor Henry II., to show
her innocency; did take seven *glowing* irons, one after
another, in her bare hands, and had thereby no
harm. *Hakewill*.

Nor amidst all these triumphs dost thou scorn
The humble *glow-worms* to adorn,
And with those living spangles gild
(O greatness without pride), the bushes of the field. *Cowley*.

With smile that *glowed*
Celestial rosy red, love's proper hue. *Milton*.
Not all parts alike, but all alike informed
With radiant light, as *glowing* iron with fire. *Id.*
The man, who first upon the ground
A *glow-worm* spied, supposing he had found
A moving diamond, a breathing stone;
For life it had, and like those jewels shone;
He held it dear, 'till by the springing day
Informed, he threw the worthless worm away. *Waller*.

Clad in a gown that *glows* with Tyrian rays. *Dryden*.
A fire which every windy passion blows;
With pride it mounts, and with revenge it *glows*. *Id.*

A malicious joy,
Whose red and fiery beams cast through your visage
A *glowing* pleasure. *Dryden and Lee's Oedipus*.

From the mingled strength of shade and light,
A new creation rises to my sight;
Such heavenly figures from his pencil flow,
So warm with life his blended colours *glow*,
Amidst the soft variety I'm lost. *Addison*.

Did not his temples *glow*
In the same sultry winds and scorching heats? *Id. Cato*.

You strive in vain
To hide your thoughts from him, who knew too well
The inward *glowings* of a heart in love. *Id.*
Nor would you find it easy to compose
The mettled steeds, when from their nostrils flows
The scorching fire that in their entrails *glows*. *Id. Ovid*.

Forced compliments and formal bows
Will shew thee just above neglect;
The fire with which thy lover *glows*,
Will settle into cold respect. *Prior*.
Did Shadrach's zeal my *glowing* breast inspire
To weary tortures, and rejoice in fire. *Id.*
The cord slides swiftly through his *glowing* hands. *Gay*.

Here on a couch extend the Cyprian dame,
Let her eye sparkle with the *glowing* flame. *Id.*
A waving *glow* his bloomy beds display,
Blushing in bright diversities of day. *Pope*.
So perish all, whose breast ne'er learned to *glow*
For others' good, or melt at others' woe. *Id.*
Fair ideas flow
Strike in the sketch, or in the picture *glow*. *Id.*

Not the fair fruit that on yon branches *glows*,
 With that ripe red th' autumnal sun bestows,
 Can move the god. *Id.*
 Each pleasing Blount shall endless smiles bestow,
 And fair Belinda's blush for ever *glow*. *Id.*
 Here clearer stars *glow* round the frozen pole. *Id.*

To praise is always hard,
 When real virtue fires the *glowing* bard. *Lewis.*
 When crept into aged veins,
 Love slowly burns, and long remains;
 It *glows*, and with a sullen heat,
 Like fire in logs, it warms us long.

Such as suppose that the great stile might happily
 be blended with the ornamental, that the simple,
 grave, and majestic dignity of Raffaele could unite
 with the *glow* and bustle of a Paulo, or Tintoret, are
 totally mistaken. *Reynolds.*
 Like th' ethereal *glowed* the green expanse. *Savage.*

How beautiful she looked! her conscious heart
Glowed in her cheek, and yet she felt no wrong. *Byron.*

An emerald aigrette with Haidee's hair in't
 Surmounted as its clasp a *glowing* crescent,
 Whose rays shone ever trembling but incessant.

Id. Don Juan.
 GLOW-WORM, in zoology. See LAMPYRIS.
 GLOZE, *v. n.* & *n. s.* } Sax. glepan; Goth.
 GLOZEN, *n. s.* } *glosa*; specious; in-
 sinuating flattery. To pretend or wheedle.

For ye wol faren well at festes,
 And be worm clothed for the cold,
 Therefore ye *glosen* goodes hestes,
 And begile peple yong and old.

Chaucer. The Plowman's Tale.
 For he could well his *glozing* speaches frame,
 To such vaine uses, that him best became.

Spenser. Faerie Queene.
 Now to plain dealing; lay these *glazes* by.

Shakspeare.
 Which Salique land the French unjustly *glaze*
 To be the realm of France. *Id.*
 So *glazed* the tempter, and his poem tuned,
 Into the heart of Eve his words made way. *Milton.*

Man will hearken to his *glazing* lies,
 And easily transgress. *Id. Paradise Lost.*
 Precious couches full oft are shaken with a fever;
 If then a bodily evil in a bodily *glaze* be not hidden,
 Shall such morning dews be an ease to the heat of a
 lover's fire? *Sidney.*

Nor for a *glazing* speech,
 Fair protestations, specious marks of friendship.

Philips.
 A false *glazing* parasite would call his foolhardiness
 valour, and then he may go on boldly, because blindly,
 and, by mistaking himself for a lion, come to perish
 like an ass. *South.*

GLUCHOV, a town of European Russia, in
 the southern government of Czernigov, and the
 chief place of a circle. Clay of a particular
 quality is found in the neighbourhood, and sent
 to the porcelain manufactories of Moscow and
 St. Petersburg. It contains about 7000 in-
 habitants, and is sixty miles E. S. E. of Novgorod
 Sieverskoï.

GLUCINA, from *γλυκαινω*, to sweeten; a
 peculiar earth discovered by Vauquelin in the
 beryl and emerald, and so named from its char-
 acteristic property of forming salts of a saccha-
 rine taste. Its general properties are, 1. It is

white; 2. Insipid; 3. Adhesive to the tongue;
 4. Insoluble in water; and, 5. In ammoniac;
 but, 6. Soluble in the fixed alkalies; 7. In the
 carbonate of ammoniac; and, 8. In almost all
 the acids, except the carbonic and phosphoric,
 and forming salts of a saccharine taste; 9. Intu-
 sible; but, 10. Fusible with borax into a trans-
 parent glass; 11. It absorbs one-fourth of its
 carbonic acid; 12. Decomposes the aluminous
 salts; and, 13. It is not precipitable by well
 saturated hydro-sulphurets.

Its specific characters, which are not found
 united in any of the other known earths, are
 these:—1. Its salts are saccharine, and slightly
 astringent; 2. It is soluble in the carbonate of
 ammoniac; 3. It is very soluble in the sulphuric
 acid by excess; 4. It decomposes the aluminous
 salts; 5. It is completely precipitated from its
 solutions by ammoniac; and, 6. Its affinity for
 the acids is intermediate between magnesia and
 alumine. 100 parts of beryl contain sixteen of
 glucina. M. Vanquelin justly remarks that 'in
 the sciences, a body, a principle, or a property,
 formerly unknown, though it may often have
 been used, or even held in the hands, and referred
 to other simple species, may, when once dis-
 covered, be afterwards found in a great variety
 of situations, and be applied to many useful
 purposes. Chemistry affords many recent exam-
 ples of this truth.' Sir H. Davy's researches
 have rendered it more than probable that glucina
 is a compound of oxygen, and a peculiar metal-
 lic substance, which may be called glucinum.
 By heating it along with potassium, the latter
 was converted for the most part into potassa;
 and dark colored particles, having a metallic
 appearance, were found diffused through the
 mass, which regained the earthy character by
 being heated in the air, and by the action of
 water. In this last case, hydrogen was slowly
 disengaged. According to Sir H. Davy, the
 prime equivalent of glucina would be 3.6 on the
 oxygen scale, and that of glucinum 2.6. These
 are very nearly the equivalents of lime and cal-
 cium. From the composition of the sulphate,
 Berzelius infers the equivalent to be 3.2, and
 that of its basis 2.2.

GLUCK (Christopher), a celebrated musician
 and composer, was born in Bohemia in 1716.
 After visiting Italy he came to England in 1745,
 and published three operas, with little success.
 He then returned to the continent; and in 1764
 produced his Orfeo, which became very popular.
 This was followed by other pieces of equal
 celebrity and excellence; and, on going to Paris,
 he had the honor of introducing a new style of
 music in that capital. He died possessed of a
 large fortune, at Vienna, in 1787. He wrote,
 besides his operas, some able letters on music.

GLUCKSTADT, a well-built town of Den-
 mark, on the Elbe, in the duchy of Holstein. It
 is near the mouth of that river, at the point of
 its junction with the Rhu, and has a harbour,
 which, though incumbered with sand-banks, is
 much frequented by the Greenland fishery crews.
 The town is intersected by canals, but fresh wa-
 ter is scarce. It is the seat of the provincial and
 chief magistracy of Holstein; it has also a maga-
 zine, arsenal, house of correction, workhouse,

and navigation school. The Jews have a synagogue, and the Roman Catholics a chapel. The town was founded by Christian II. in 1617, who made it the entrepot of the commerce with Iceland. It stands so low that the centre outworks can be laid under water. Population 5200. Twenty-eight miles north-west of Hamburg.

GLUE, *n.s. & v.a.*

Fr. *glu*; Lat.

GLUE-BOILER, *n.s.*

} *gluten*; Wel. *gloed*.

GLUE, *n.s.*

} A viscous body com-

GLUTINOUS, *adj.*

} monly made by

GLUTINOUSNESS, *n.s.*

} boiling the skins of

GLUE, *n.s.*

} animals to a jelly;

any viscous or tenacious matter by which bodies are held on to another; a cement: to join, unite, or cement together: a person whose trade is to make glue, or use it.

Whoso teacheth a fool is as one that *glueth* a potsherd together. *Ecclesi. xxii. 7.*

But, sickerly, withouten any fable,

The hors of bras, that may not be remued;

It stant as it were to the ground *glued*.

Chaucer. The Squires Tale.

I fear thy overthrow

More than my body's parting with my soul:

My love and fear *glued* many friends to thee.

Shakespeare. Henry VI.

Water, and all liquors, do hastily receive dry and more terrestrial bodies proportionable; and dry bodies, on the other side, drink in waters and liquors; so that, as it was well said by one of the ancients of earthly and watery substances, one is a *glue* to another.

Bacon's Natural History.

The cause of all vivification is a gentle and proportionable heat, working upon a *glutinous* and yielding substance.

Bacon.

It is called balsamick mixture, because it is a *gluy* spumous matter.

Next this marble venomed seat,

Smear'd with gums of *glutinous* heat.

Milton.

Intemperance, sensuality, and fleshly lusts, do debase men's minds and clog their spirits; sink us down into sense, and *glue* us to those low and inferior things.

Tillotson.

She curbed a groan, that else had come;

And pausing, viewed the present in the tomb

Then to the heart adored devoutly *glued*

Her lips, and, raising it, her speech renewed.

Dryden.

With *gluy* wax some new foundation lay

Of virgin combs.

Id.

Those wasps in a honey pot are sensual men plunged in their lusts and pleasures; and, when they are once *glued* to them, 'tis a very hard matter to work themselves out.

L'Estrange.

The driest and most transparent *glue* is the best.

Mozon.

Whatever is the composition of the vapour, let it have but one quality of being very *gluy* or viscous, and it will mechanically solve all the phenomena of the grotto.

Addison.

The parts of all homogeneous hard bodies, which fully touch one another, stick together very strongly; and, for explaining how this may be, some have invented hooked atoms, which is begging the question; and others tell us their bodies are *glued* together by rest; that is, by an occult quality, or rather by nothing.

Newton's Opticks.

To build the earth did chance materials chuse,
And through the parts cementing *glue* diffuse.

Blackmore.

Nourishment too viscid and *glutinous* to be subdued by the vital force.

Arbuthnot on Aliments.

The flowers of grains, mixed with water, will make a sort of *glue*.

Id.

Most wounds, if kept clean, and from the air, the flesh will *glue* together with its own native balm.

Derham.

There is a resistance in fluids, which may arise from their elasticity, *glutinousness*, and the friction of their parts.

Cheyne.

I hear thee, view thee, gaze o'er all thy charms,
And round thy phantom *glue* my clasping arms.

Pope.

Whose loos or ends are *glued* with brother earth.

Fletcher. Purple Island.

English *glue* is universally allowed to be the best in Europe, partly from the excellency of the materials, and partly from the skill of the manufacturers.

Campbell's Pol. Surv.

GLUE is differently denominated, according to its preparation, and the various uses it is designed for; as common glue, glove glue, and parchment glue. But the last two are more properly called size. The common, or strong glue, is chiefly used for this purpose, but only the shavings, parings, or scraps of them, or the feet, sinews, &c. That made of whole skins, however, is undoubtedly the best; as that made of sinews is the very worst.

In making glue of parings, they first steep them two or three days in water: then, washing them well out, they boil them to the consistence of a thick jelly, which they pass, while hot, through ozer baskets, to separate the impurities; and then let it stand some time to purify it further: when all the filth is settled to the bottom of the vessel, they melt and boil it a second time. They next pour it into flat frames or moulds, whence it is taken out pretty hard and solid, and cut into square pieces or cakes. They afterwards dry it in the wind, in a sort of coarse net; and at last string it to finish its drying. The glue made of sinews, feet, &c., is managed after the same manner; only with this difference, that they bone and scour the feet, and do not lay them to steep. Of this commodity there is a very great exportation from England; the English glue being universally allowed to be the best in Europe, partly from the excellency of the materials, and partly from the skill of the manufacturers. Next to this is the Flanders glue. In both countries it is made by the tanners from fragments of good skins dried with much care. In France it is a separate trade; and the glue-makers pick up their materials as they can, from the several dealers in skins, and boiling these with cow-heels, make their glue; which, as they purchase every thing, must render it dear, as well as of an inferior quality. The best glue is that which is made from the skins of the oldest beasts, especially if a bull's hide is used. Glue is considerably improved in quality by keeping after it is made: and the surest way to try its goodness is to lay a piece of it to steep three or four days; and if it swell considerably without melting, and when taken out resume its former dryness, it is excellent. A glue that will hold against fire or water, it is said, may be made thus:—Mix a handful of quick-lime with four ounces of linseed oil; boil them to a good thickness; then spread

it on tin plates in the shade, and it will become exceedingly hard, but may be easily dissolved over a fire as glue, and will effect the business to admiration. Neumann observes, that glue dissolved in a solution of lapis calaminaris, in spirit of nitre, and afterwards inspissated, forms an extremely slippery tenacious mass, which might be of use for entangling flies, caterpillars, and other insects, if it were not too expensive.

In order to prepare glue for use, set a quart of water on the fire; then put in about half a pound of good glue, and boil them gently together till the glue be entirely dissolved, and of a due consistence. When glue is to be used, it must be made thoroughly hot; after which, with a brush dipped in it, besmear the faces of the joints as quickly as possible; then, elapping them together, rub them lengthwise one upon another, two or three times, to settle them close; and let them stand till they are dry and firm. Mr. Boyle gives the following receipt for preparing a fine strong glue from isinglass: steep the isinglass for twenty-four hours in common brandy. When the menstruum has opened and mollified the isinglass, they must be gently boiled together, and kept stirring till they appear well mixed; and till a drop thereof, suffered to cool, turns into a strong jelly. Then strain it, whilst hot, through a clean linen cloth into a vessel to be kept close stopped. A gentle heat suffices to dissolve this glue into a transparent and almost colorless fluid, but very strong; so that pieces of wood glued together with it will break elsewhere, rather than in the place where they are joined. See ISINGLASS.

GLUM, *adj.* A low cant word formed by corrupting gloom. Sullen; stubbornly grave.

Some, when they hear a story, look *glum*, and cry, Well, what then? *Guardian.*

GLUT, *v. a. & n. s.* } French, *engloutir*;
GLUT-TON, *n. s.* } Wel. *glwth*; Lat.
GLUT-TONIZE, *v. n.* } *glutit*; Gr. *γλοῦω*.
GLUT-TONOUS, *adj.* } To swallow; to
GLUT-TONOUSLY, *adv.* } gorge; to eat to satiety.
GLUT-TONY, *n. s.* } One given to excessive and luxurious feeding; voracity of appetite; an obstruction. It appears to comprehend the ideas of desire, greediness, and satiety. It is applied figuratively to inordinate love of any amusement or pursuit.

Glotonie is unmesurable appetite to eat or to drink; or elles to do in ought to the unmesurable appetit.

He that is usant to this sinne of *glotonie*, he ne may no vice withstond he must be in servage of all vices.

Chaucer. The Persones Tale.

When they would smile and fawn upon his debts,
And take down th' interest in their *glutt'nous* maws.

Shakpeare.

The exceeding luxuriousness of this *gluttonous* age, wherein we press nature with cverweighty burdens, and, finding her strength defective, we take the work out of her hands, and commit it to the artificial help of strong waters.

Raleigh.

If you pour a *glut* of water upon a bottle, it receives little of it.

Ben Jonson's Discoveries.

The ambassador, making his oration, did so magnify the king and queen, as was enough to *glut* the hearers.

Bacon.

The Chinese eat horseflesh at this day, and some *gluttons* have used to have catflesh baked. *Id.*

Let him but set the one in balance against the other, and he shall find himself miserable, even in the very *glut* of his delights. *L'Etrange.*

Gluttony is the source of all our infirmities, and the fountain of all our diseases. *Barton.*

The rest bring home in state the happy pair
To that last scene of bliss, and leave them there;
All those free joys insatiably to prove,
With which rich beauty feasts to *glutton* love.

Cowley.

Love breaks friendship, whose delights
Feed, but not glut our appetites. *Denham.*

Disgorged foul
Their devilish *glut*, chained thunderbolts and hail
Of iron globes. *Milton's Paradise Lost.*

So death
Shall be deceived his *glut*; and with us two
Be forced to satisfy his rav'nous maw. *Milton.*
Their sumptuous *gluttonies* and gorgeous feasts,
On citron tables or Atlantick stone. *Id.*

With death's carcass *glut* the grave. *Id.*
Well observe

The rule of not too much, by temperance taught
In what thou cat'st and drink'st; seeking from
thence

Due nourishment, no *gluttonous* delight. *Id.*
The menstruum, being already *glutted*, could not act
powerfully enough to dissolve it. *Boyle.*

Well may they fear some miserable end,
Whom *gluttony* and want at once attend.

Dryden.

His faithful heart, a bloody sacrifice,
Torn from his breast, to *glut* the tyrant's eyes. *Id.*

A sylvan scene, which, rising by degrees,
Leads up the eye below, nor *gluts* the sight
With one full prospect. *Id.*

What way remove
His settled hate, and reconcile his love,
That he may look propitious on our toils,
And hungry graves no more be *glutted* with our spoils. *Id.*

Through Macer's gullet she runs down,
While the vile *glutton* dines alone;
And, void of modesty and thought,
She follows Bibb's endless draught. *Prior.*

I found
The fickle ear soon *glutted* with the sound,
Condemned eternal changes to pursue,
Tired with the last, and eager of the new. *Id.*
He attributes the ill success of either party to their
glutting the market, and retailing too much of a bad
commodity at once. *Arbuthnot.*

The inhabitants of cold moist countries are generally more fat than those of warm and dry; but the most common cause is too great a quantity of food, and too small a quantity of motion; in plain English, *gluttony* and laziness. *Id.*

The water some suppose to pass from the bottom of the sea to the heads of springs, through certain subterranean conduits or channels, until they are by some *glut*, stopped, or, by other means, arretd in their passage. *Woodward.*

Gluttons in murder, wanton to destroy,
Their fatal hearts so impiously employ. *Grenville.*

A *glut* of study and retirement in the first part of my life, cast me into this; and this will throw me again into study and retirement. *Pope to Swift.*

If a *glutton* was to say, in excuse of his *gluttony*, that he only eats such things as it is lawful to eat, he would make as good an excuse for himself as the

greedy, covetous, ambitious tradesmen, that should say, he only deals in lawful business. *Lavo.*

That when he now was gorged with crammed down store,

And porter wanting room had shut the door,

The *glutton* sighed, that he could gormandize no more.
Fletcher's Purple Island.

There is a morbid sort of GLUTTONY, called *fames canina*, i. e. dog-like appetite, which sometimes occurs, and renders the person seized with it an object of pity and of cure as in other diseases. See BULLMA. King James I., when a man was presented to him who could eat a whole sheep at one meal, asked, 'What could he do more than another man?' and being answered 'He could not do so much,' said 'Hang him then; for it is unfit a man should live that eats as much as twenty men, and cannot do so much as one.' The emperor Clodius Albinus devoured more than a bushel of apples at once. He eat 500 figs to his breakfast, 100 peaches, ten melons, twenty pounds of grapes, 100 gnat-snappers, and 400 oysters. Hardi Canute, the last of the Danish kings in England, was so great a glutton, that a historian calls him *Bocca di Porco*, 'Swine's-mouth.' His tables were covered four times a day with the most costly viands that either the air, sea, or land, could furnish; and as he lived he died; for, revelling at a banquet at Lambeth, he fell down dead. One Phagon, in the reign of Aurelianus, eat at one meal, it is said, a whole boar, 100 loaves of bread, a sheep, and a pig, and drank above three gallons of wine. Fuller says, that Nicholas Wood, of Harrison, in Kent, eat a whole sheep at one meal, raw; at another, three dozen of pigeons. At Sir William Sidley's he eat as much victuals as would have sufficed thirty men. At lord Wotton's he devoured at one dinner eighty-four rabbits. Mallet, a counsellor at law, in the reign of Charles I., eat at one time a dinner provided in Westminster for thirty men. He lived to near sixty years of age, but, during the seven last years of his life, eat as moderately as other men. Happily in modern times these heroes of the belly are only considered as fit companions for the heroes of the whip, and of pugilism.

GLYCAS. See GLICAS.

GLYCINE, knobbed-rooted liquorice-vetch, a genus of the decandria order, and diadelphia class of plants; natural order thirty-second, papilionaceæ: CAL. bilabiate: COR. carina turning back the vexillum with its point.

1. *G. abrus*, is a native of Egypt and the Indies. The stalks and roots are very sweet to the taste. Herman affirms, that the juice obtained from them by decoction is little inferior to liquorice, whence its name of wild liquorice in those parts of America where it is native.

2. *G. frutescens*, the Carolina kidney-bean tree. It has shrubby climbing stalks, twining round any support, fifteen or twenty feet high, adorned with pinnated leaves of three pairs of foliicles, terminated by an odd one, and from the axillas clusters of large bluish-purple flowers, succeeded by long pods like those of the climbing kidney-bean. It flowers in June and July, but the seeds do not ripen in this country. It is cultivated in our gardens, however, and easily propagated,

either by seeds imported from America, or by layers.

GLYCIRRHIZA, liquorice, a genus of the decandria order, and diadelphia class of plants; natural order thirty-second, papilionaceæ: CAL. bilabiate; the upper lip tripartite, and the under one entire; the legume ovate and compressed. There are six species. The chief are,

1. *G. echinata*, the prickly-podded liquorice, resembling the common sort, only the pods are prickly: and

2. *G. glabra*, the common liquorice, with long, thick, creeping roots, striking several feet deep into the ground; upright, firm, annual herbaceous stalks, three or four feet high, garnished with winged leaves of four or five pairs of oval lobes, terminated by an odd one; and from the axillas erect spikes of pale blue flowers in July, succeeded by short smooth pods. The root is the useful part, which is replete with a sweet balsamic, pectoral juice, much used in all compositions for coughs, and disorders of the stomach. Both these species are very hardy perennials; but this last is the sort commonly cultivated for use, its roots being fuller of juice, and sweeter than the other. The roots are perennial: but the stalks rise in spring, and decay in autumn. They are propagated by cuttings of the small roots issuing from the sides of the main ones near the earth, divided into lengths of six or eight inches, each having one or more good buds. The proper season for procuring the sets for planting is in open weather, from October to March; but from the middle of February till the middle of March is rather the best season for planting. An open situation is to be preferred. The soil ought to be a light loose temperature, and three or four feet deep: for the roots of liquorice will arrive at that depth and more, and the longer the roots the more valuable they are. The ground should be trenched three spades deep; then proceed to plant the sets, by line and dibble, a foot distant in each row: putting them perpendicular into the ground, with the tops about an inch under the surface; let the rows be a foot or a foot and a half asunder. The London gardeners sow a crop of onions on the same ground the first year; which might be done without detriment to the liquorice or the onions; as the liquorice does not rise above ten or twelve inches the first summer; keep the ground clean from weeds by hoeing. If there be a crop of onions, use the small hoe, cutting out the onions to four or five inches distant, clearing away such as grow immediately close to the liquorice plants; and, when the onions are gathered, give the ground a thorough hoeing with a large hoe, to loosen the surface, and destroy all weeds; and, in autumn, cut down the decayed stalks of the liquorice, and nothing more is necessary to be done till February or March, when it is proper to give a slight digging between the rows. During spring and summer keep down all weeds by broad hoeing; and, in autumn, when the stalks are in a decaying state, cut them down to the surface of the earth. In three years after planting, the roots of the liquorice will be fit to take up. The proper season for this is from the beginning of November till February; for they should neither be

taken up before the stalks are fully decayed, nor deferred till late in spring, otherwise the roots will be apt to shrivel and diminish in weight. In taking them up, the small side roots are trimmed off, the best divided into lengths for fresh sets, and the main roots tied in bundles for sale. Sell them as soon as possible after they are taken up, before they lose much of their weight. They are sold to the druggists from about 20s. to 40s. per cwt.; and an acre of ground has produced 3000 and upwards, which have been sold for above £60; but the price is commonly in proportion to the goodness of the roots. This plant is cultivated in most countries of Europe, for the sake of its root. British liquorice is preferable to foreign; this last being generally mouldy, which this root is very apt to become, unless kept in a dry place. The powder of liquorice usually sold is often mingled with flour, and probably too often with substances not quite so wholesome; the best sort is of a brownish-yellow color (the fine pale yellow being generally sophisticated), and of a very rich sweet taste, much more agreeable than that of the fresh root. Liquorice is almost the only sweet that quenches thirst; whence it was called by the Greeks *αἰψον*. Galen says, that it was employed in this intention in hydropic cases, to prevent the necessity of drinking. Fuller, in his *Medicina Gymnastica*, recommends it as a very useful pectoral; and says it softens acrimonious humors, and is gently detergent. An extract is directed to be made from it in the shops. It is chiefly brought from abroad, though the foreign extract is not equal to such as is made with proper care in Britain.

GLYN, *n. s.* Irish *gleann*, *glyn*, plural; Erse. *ghm*, Scott. A hollow between two mountains.

Though he could not beat out the Irish, yet he did shut them up within those narrow corners and *glyn*s under the mountain's foot. *Spenser.*

GMELIN (John George), a celebrated German botanist and traveller, was born at Tubingen in 1709, and took the degree of M. D. at the university there in 1727. He then went to Petersburg, and was made a member of the Imperial Academy; and in 1731 professor of chemistry and natural history. He was employed in 1733 in an expedition to explore the boundaries of Siberia, and in 1747 visited his native country. He died of a fever at Petersburg in May, 1755, leaving a valuable *Flora Siberica*, seu *Historia Plantarum Siberiæ*, 1747, 1749, 2 vols. 4to., to which two parts were added by his nephew; and *Travels through Siberia*, written in German, 4 vols. 8vo.

GMELIN (Samuel Theophilus), nephew of the above, was born at Tubingen in 1743, where he took the degree of M. D. in 1763. He also was distinguished for his acquaintance with natural history, and made professor in the Imperial Academy at Petersburg. The Russian government further employed him with professor Guldenstadt, on an expedition of discovery to the provinces on the Caspian, where Gmelin was made a prisoner by a Tartar chief; who treated him with so much harshness, that he died in confinement, July, 1774. He published *Historia*

ria Fucorum, Petrop. 1763, 4to.; and an account of his travels appeared in 4 vols. 4to., 1771, 1774, and 1786, the last volume being edited by M. Pallas.

GMELIN (John Frederick), a third eminent natural philosopher of the same family, was also a native of Tubingen, and studied at that university, and at Gottingen, where he obtained the professorship of chemistry and natural history. He wrote *Onomatologia Botanica*, 9 vols. 8vo.; *Apparatus Medicaminum*, 2 vols. 8vo.; and other works on chemistry, mineralogy, and natural history; but he is best known as the editor of the *Systema Naturæ*, of Linnaeus, 9 vols. 8vo., Leipsic, 1788. He died at Gottingen in May, 1805. He made some useful discoveries of vegetable and mineral dyeing substances.

GMELENA, in botany, a genus of the angiospermia order, and didynamia class of plants; natural order fortieth, personatæ: CAL. nearly quadridentate: cor. campanulate, or bell-shaped; there are two bipartite, and two simple anthers; the fruit is a plum, with a bilocular kernel.

GNA, or AGNO, a river of Italy, in maritime Austria, which rises in the Vicentine Mountains, runs through the ci-devant Venetian district of Cologne, dividing it into two nearly equal parts, and, after joining the Bachiglione, falls into the Po.

GNADENHUETTEN, the name of three settlements of the Moravians or United Brethren in North America. One is in Pennsylvania, on the south-west coast of Lehighon; another on Muskingum River; and another on the Huron, twenty-two miles from lake St. Clair, and twenty-eight north-west of Detroit.

GNAPHALIUM, cudweed, goldylocks, eternal or everlasting flower, &c., a genus of the polygamia superflua order, and syngenesia class of plants, natural order forty-ninth, composite: receptacle naked; the pappus feathered: CAL. imbricated, with the marginal scales roundish, parched, and colored. There are 146 species; the most remarkable of which are,

1. *G. arboreum*, or tree gnaphalium, with a woody stem, branching four or five feet high, narrow sessile leaves, with revolute borders, smooth on their upper side, and roundish bunches of pale yellow flowers.

2. *G. margaritaceum*, the pearly-white eternal flower, has creeping, very spreading roots, crowned with broad, spear-shaped, white, hoary leaves; herbaceous, thick, woolly stalks, a foot and a half high, branching outward, garnished with long, acute-pointed, white, woolly leaves, and terminated by a corymbose cluster of yellowish flowers, which appear in June and July, and are very ornamental.

3. *G. odoratissimum*, the sweet-scented eternal flower, has shrubby winged stalks, branching irregularly a yard high, with corymbose clusters of bright yellow flowers, changing to a dark yellow.

4. *G. orientale*, the oriental goldylocks, has three varieties, with yellow, gold-colored, and white silvery flowers. They have shrubby stalks, rising two or three feet high.

5. *G. plantaginifolium*, has large woolly radi-

cal leaves, decumbent running roots, and herbaceous simple stalks, rising six or eight inches, terminated by a corymbus of white flowers in June, July, &c.

6. *G. stœchas*, has a shrubby stalk, dividing into slender branches, three feet long, terminated by corymbous clusters of yellow flowers, appearing in May and June.

The second, fifth, and sixth sorts are hardy, and will thrive in any soil or situation. The second and fifth increase exceedingly by their roots; and the sixth is easily propagated by slips. The first, third, and fourth species are somewhat tender; and therefore should be kept in pots, to be sheltered in a green-house or garden-frame in winter. Others may be planted in the full ground, in a dry and warm situation, especially the orientale and its varieties, and likewise the odoratissimum; for these two species will struggle tolerably through an ordinary winter, and make a pretty appearance during summer. All these are propagated by slips or cuttings of their shoots. The flowers of all these species will retain their beauty for years, if carefully gathered in a dry day, soon after they are blown.

GNAR, *v. n.* } Sax. gnýppan; Belg.

GNARI, *v. n.* } gnarren. To growl; to

GNARLED, *adj.* } murmur or snarl; gnar, nar, or nurr, is a Staffordshire word for knots of wood.

He was short shouldered, brode a thikke gnarre,

Ther was no dore that wolde heve of barre.

Chaucer. *Prologue to Cant. Tales.*

When he 'gan to rear his bristles strong,

And felle gnarr, until day's enemy

Did him appease.

Spenser.

Thus is the shepherd beaten from thy side,

And wolves are gnarling who shall gnaw thee first.

Shakspeare

Gnarling sorrow hath less power to bite

The man that mocks at it, and sets it light.

Id. *Richard II.*

Merciful heav'n!

Thou rather with thy sharp and sulphurous bolt

Split'st the unwedgable and gnarled oak,

Than the soft myrtle. Id. *Measure for Measure.*

The gnarring porter durst not whine for doubt;
Still were the furies while their sovereign spoke.

Fairfax.

GNASH, *v. a. & v. n.* Dutch, *knaschen*. To grind the teeth, or strike them violently together; figuratively descriptive of rage and passion.

He shall gnash with his teeth, and melt away.

Psal. cxii. 10.

They gnashed upon me with their teeth.

Id. xxxv. 16.

There shall be weeping and gnashing of teeth.

Matt. viii.

Shewe forth thy doctrine; be not ought agaste;

I will the supporte; loke thou doe no spare

Maugre age, although that he frette or gnaste.

Chaucer. *The Prologue to the Remedie of Love.*

His great iron teeth he still did grind

And grimly gnash, threatening revenge in vain.

Spenser.

They him laid

Gnashing for anguish, and despite and shame,
To find himself not matchless.

Milton.

The seer, who could not yet his wrath asswage,
Rowled his green eyes, that sparkled with his rage,

And gnashed his teeth.

Dryden's *Virgil*.

With boiling rage Atrides burned
And foam betwixt his gnashing grinders churned.

Dryden.

He now, with pleasure, views the gasping prize,
Gnash his sharp teeth, and roll his blood-shot eyes.

Gay's *Rural Sports*.

GNAT, *n. s.*

GNATFLOWER, *n. s.* } Saxon, gnætt, from

GNATSNAPPER, *n. s.* } gnaw. A small stinging insect: used proverbially for any thing very small. A flower, otherwise called the bee-flower. A bird so called because he lives by catching gnats.

Ye blind guides, which strain at a gnat and swallow a camel.

Matt. xxiii. 24.

Not worth, to thee as in comparison

The mountance of a gnat.

Chaucer. *The Manciples Tale.*

Whom, thus at point prepared, to prevent,

A little nousrling of the humid ayre,

A gnat unto the sleepe shepherd went.

Spenser. *Virgils Gnat.*

Her whip of cricket's bone, the lash of film;

Her waggoner, a small grey-coated gnat.

Shakspeare.

They deny that any bird is to be eaten whole, but only the gnatsnapper.

Hakewill on Providence.

GNAT, in zoology. See CULEX.

GNAT FLOWER. See OPHRYS.

GNAW, *v. a. & v. n.* } Sax. gnagan; Teut.

GNAWER, *n. s.* } knaghen; Goth. gnata

(see GNAT). Dan. gnawe. To eat by degrees; to corrode; to bite in agony, or rage; to wear away.

They gnawed their tongues for pain. Rev. xvi. 10.

The fomy stedes on the golden bridle

Gnawing. Chaucer. *The Knights Tale.*

His children wenden, that for hunger it was

That he is armes gnaue, and not for wo.

Id. *The Monkes Tale.*

Like rotten fruit I fall, worn like a cloth,

Gnawen into rags by the devouring moth.

Sandys

See the hell of having a false woman: my bed shall be abused, my coffers ransacked, my reputation gnawen at.

Shakspeare.

I thought I saw a thousand fearful wrecks,

A thousand men that fishes gnawed upon.

Id. *Richard III.*

Gnawing with my teeth my bonds asunder,

I gained my freedom. Id. *Comedy of Errors.*

A knowing fellow, that his would gnaw a man

Like to a vermine, with his hellish braine,

And many an honest soule, even quick had slain.

Chapman.

I might well, like the spaniel, gnaw upon the chain that ties me; but I should sooner mar my teeth than procure liberty.

Sidney.

He comely fell, and dying gnawed the ground.

Dryden.

His bones clean picked; his very bones they gnaw.

Id.

To you such scabbed harsh fruit is given, as raw

Young soldiers at their exercising gnaw.

Id. *Juvenal*.

A lion, hampered in a net, called to a mouse to help him out of the snare: the mouse gnawed the threads to pieces, and set the lion at liberty.

L'Estrange.

Critics must excuse me, if I compare them to certain animals called asses, who by gnawing vines originally taught the great advantage of pruning them.

Shenstone.

GNESNA, GNESNO, or GNIENNO, a large old town of Russian Poland, once the capital of

Great Poland, and the see of an archbishop, who was primate of Poland. It is said to have been the first town built in the kingdom, and was formerly very considerable. Here are still eleven churches, and four religious houses and seminaries. It is, however, very thinly inhabited, and remarkable for nothing but its annual horse and cattle fair. Inhabitants 3500, including 1000 Jews. It is 150 miles west of Warsaw, and thirty east by north of Posen.

GNETUM, in botany, a genus of the monadelphia order, and monœcia class of plants. The omentum of the male is a single scale: cor. none, and but one filament with a pair of antheræ: cal. of the female of the same form: cor. none; the style with the stigma is trifid; the fruit is a monospermous plum. Species one only; an East Indian herb.

GNIDIA, in botany, a genus of the monogynia order, and octandria class of plants: cal. funnel-shaped and quadrifid, with four petals inserted into it: there is one seed somewhat resembling a berry. Species sixteen; all Cape plants.

GNOMES, *ΓΝΟΜΙ*, imaginary beings who, according to the cabbalists, inhabit the inner parts of the earth. They are supposed to be small in stature, and guardians of quarries, mines, &c.

GNOMON, *n. s.* Gr. *γνώμων*. The hand or pin of a dial.

There were from great antiquity sun-dials, by the shadow of a style or *gnomon*, denoting the hours of the day. *Broune.*

The *gnomon* of every dial is supposed to represent the axis of the world, and therefore the two ends or extremities thereof must answer directly to the North and South pole. *Harris.*

GNOMON. See **DIAL** and **DIALLING**. The word *γνώμων* literally implies something that makes a thing known; as the stile of a dial makes the hour known.

GNOMONICS, *n. s.* Gr. *γνομονική*. A science which makes part of the mathematics: it teaches to find a just proportion of shadows for the construction of all kinds of sun and moon dials, and for knowing what o'clock it is by means thereof; as also of a *gnomon* or stile, that throws off the shadow for this purpose.—*Trevoux.*

GNOSTICS, from *γνῶσις*, knowledge, ancient heretics, famous from the first rise of Christianity, principally in the east. It appears, from several passages of Scripture, particularly 1 John ii. 18; 1 Tim. vi. 20; and Col. ii. 8; that many persons were infected with the Gnostic heresy in the first century; though the sect did not render itself conspicuous either for numbers or reputation before the time of Adrian, when some writers erroneously date its rise. The name was adopted by this sect, on the presumption that they were the only persons who had the true knowledge of Christianity. Accordingly they looked on all other Christians as simple, ignorant, and barbarous persons, who explained and interpreted the sacred writings in a low, literal, and unedifying signification. Gnostics afterwards became a general name, comprehending divers sects and parties of heretics who rose in the first centuries,

and who, though they differed among themselves as to circumstances, yet all agreed in some common principles. They corrupted the doctrine of the gospel by a profane mixture of the tenets of the original philosophy, concerning the origin of evil and the creation of the world. Such were the Valentinians, Simonians, Carpocratians, Nicolaitans, &c.

GNOSTICS sometimes also occurs in a good sense in the ancient ecclesiastical writers, particularly Clemens Alexandrinus, who, in the person of his Gnostic, describes the characters and qualities of a perfect Christian. This point he labors in the seventh book of his *Stromata*, where he shows that none but the Gnostic, or learned person, has any true religion. In this sense the father uses Gnostics, in opposition to the heretics of the same name; affirming that the true Gnostic is grown old in the study of the Holy Scripture; and that he preserves the orthodox doctrine of the apostles and of the church; whereas the false Gnostic abandons all the apostolical traditions, as imagining himself wiser than the apostles.

GNOSTICS was sometimes also more particularly used for the successors of the Nicolaitans and Carpocratians, in the second century, upon their laying aside the names of the first authors. Such as would be thoroughly acquainted with all their doctrines, reveries, and visions, may consult Irenæus, Tertullian, Clemens Alexandrinus, Origen, and St. Epiphanius; particularly the first of these writers, who relates their sentiments at large, and confutes them. Indeed he dwells more on the Valentinians than any other sect of Gnostics; but he shows the general principles on which all their mistaken opinions were founded, and the method they followed in explaining Scripture. He accuses them of introducing into religion certain vain and ridiculous genealogies, i. e. a kind of divine processions or emanations, which had no other foundation but in their own wild imagination. The Gnostics confessed that these æons, or emanations, were nowhere expressly delivered in the sacred writings; but insisted that Jesus Christ had intimated them in parables to such as could understand them. They built their theology, not only on the gospels and the epistles of St. Paul, but also on the law of Moses and the prophets. Their persuasion that evil resided in matter, as its centre and source, made them treat the body with contempt, discourage marriage, and reject the doctrine of the resurrection of the body and its re-union with the immortal spirit. Their notion, that malevolent genii presided in nature, and occasioned diseases and calamities, wars and desolations, induced them to apply themselves to the study of magic, in order to weaken the powers or suspend the influence of their malignant agents. The Gnostics considered Jesus Christ as the Son of God, and inferior to the Father, who came into the world for the rescue and happiness of miserable mortals, oppressed by matter and evil beings; but they rejected our Lord's humanity, on the principle that every thing corporeal is essentially and intrinsically evil; and therefore the greatest part of them denied the reality of his sufferings. They set a great value on the beginning of the gospel of St.

John, where they fancied they saw a great deal of their æons or emanations, under the terms the Word, the Life, the Light, &c. They divided all nature into three kinds of beings, viz. hylic, or material; psychic, or animal; and pneumatic, or spiritual. On the like principle they also distinguished three sorts of men: material, animal, and spiritual. The first, who were material and incapable of knowledge, inevitably perished, both soul and body; the third, such as the Gnostics themselves pretended to be, were all certainly saved; the psychic or animal, who were the middle between the other two, were capable either of being saved or damned, according to their good or evil actions. With regard to their moral doctrines and conduct they were much divided. The greatest part of this sect adopted very austere rules of life, recommended rigorous abstinence, and prescribed severe bodily mortifications, with a view of purifying and exalting the mind. However, some maintained that there was no moral difference in human actions; and thus, confounding right with wrong, they gave a loose rein to all the passions, and asserted the innocence of following blindly all their motions, and of living by their tumultuous dictates. They supported their opinions and practice by various authorities; some referred to fictitious and apocryphal writings of Adam, Abraham, Zoroaster, Christ, and his apostles; others boasted that they had deduced their sentiments from secret doctrines of Christ, concealed from the vulgar; others affirmed that they arrived at superior degrees of wisdom by an innate vigor of mind; and others asserted that they were instructed in these mysterious parts of theological science by Theudas a disciple of St. Paul, and by Matthias one of the friends of our Lord. The tenets of the ancient Gnostics were revived in Spain in the fourth century, by a sect called the Priscillianists. At length the name Gnostic, which originally was glorious, became infamous, by the idle opinions and dissolute lives of the persons who bore it.

GNU, or GNU, in zoology. See CAPRA.

GO, *v. n.* pret. *I went*; *I have gone*. Sax. *gan*; Goth. and Swed. *ga*. This was probably changed to *gone*, or *gang*, then contracted to *go*. *Went* is the preterite of the old word *wend*. The primary idea is progression, or advancement, whether from place to place, or from one degree to another. It is opposed to *come*.

To walk; to move step by step.

You know that love
Will creep in service where it cannot go.

Shakspeare.

After some months those muscles became callous; and, having yielded to the extension, the patient makes shift to go upon it though lamely.

Wiseman's Surgery.

To move; not stand still.

Rise, let us be going. *Matt. xxvi. 46.*

But now I wol again to Custance go.
Chaucer. The Man of Lawes Tale.

When all sins are old in us,

And go upon crutches, covetousness
Does but then lie in her cradle. *Decker.*

When they asked for their own

He was broke and was gone,
And his creditors all left to sorrow. *Marvell.*

Go, then, well worthy of the praise ye seek,
And shew the shame ye might conceal at home.
Cowper.

To walk solemnly.

If there be cause for the church to go forth in solemn procession, his whole family have such business come upon them that no one can be spared.

Hooker.

To walk leisurely; not run.

And must I go to him?

—Thou must run to him; for thou hast staid so long, that going will scarce serve the turn. *Shakspeare.*

To march or walk a-foot.

I will only go through on my feet. *Num. xx. 19.*

To travel; to journey.

From them I go

This uncouth errand sole. *Milton.*

To proceed; to make a progress.

Thus others we with defamation wound,
While they stab us; and so the jest goes round.

Dryden.

To remove from place to place.

I am in blood

Stept in so far, that, should I wade no more,
Returning were as tedious as go o'er. *Shakspeare.*

To depart from a place; to remove from a place: the opposite of to come.

I will let you go, that ye may sacrifice, only you shall not go very far away. *Ex. viii. 28.*

And when she had so said she went her way.

John xi. 28.

I hope it be not gone to tell my lord

That I kiss aught but him. *Shakspeare.*

At once, good-night:

Stand not upon the order of your going,
But go at once. *Shakspeare. Macbeth.*

Colchester oysters are put into pits, where the sea goeth and cometh. *Bacon's Natural History.*

A young tall squire

Did from the camp at first before him go. *Cowley.*

Then I concur to let him go for Greece,

And wish our Egypt fairly rid of him. *Dryden.*

Go first the master of thy herds to find,

True to his charge, a loyal swain and kind.

Pope.

To move or pass in any manner, or to any end.

Put every man his sword by his side, and go in and out from gate to gate throughout the camp.

Ex. xxxii. 27.

The mourners go about the streets. *Eccles. xii. 5.*

The sun shall go down over the prophets, and the day shall be dark over them. *Mac. iii. 6.*

Though the vicar be bad, or the parson be evil,
Go not for thy tything thyself to the devil. *Tasser.*

She may go to bed when she list; all is as she will.

Shakspeare.

You did wish that I would make her turn;
Sir, she can turn and turn and still go on. *Id.*

I am glad to see your lordship abroad: I heard say your lordship was sick: I hope your lordship gone abroad by advice. *Id.*

The sun, which once did shine alone,

Hung down his head, and wished for night,

When he beheld twelve suns for one

Going about the world, and giving light.

Herbert.

This seen the rest at awful distance stood,
As if they had been there as servants set,

To stay, or to go on, as he thought good,

And not pursue, but wait on his retreat. *Dryden.*

Turn not children going, till you have given them all the satisfaction they are capable of. *Locke.*

History only acquaints us that his fleet *went* up the Elbe, he having carried his arms as far as that river.

Arbathnot.

The last advice I give you relates to your behaviour when you are going to be hanged, which, either for robbing your master, for house-breaking, or *going* upon the highway, may very probably be your lot.

Swift's Directions to the Footman.

Those who come for gold will *go* off with pewter and brass, rather than return empty.

Swift.

Careless what others of my choice may deem, I long, where Love and Fancy lead, to *go*

And meditate on heaven—enough of earth I know.

Beattie.

To pass in company with others.

Thou shalt again be adorned with thy tabrets, and shalt *go* forth in the dances of them that make merry.

Jer. xxxi. 4.

He *goeth* in company with the workers of iniquity, and walketh with wicked men.

Job.

Away, and with thee *go* the worst of woes, That seekest my friendship, and the gods my foes,

Chapman.

Whatever remains in story of Atlas, or his kingdom of old, is so obscured with age or fables, that it may *go* along with those of the Atlantick islands.

Temple.

To proceed in any course of life, good or bad. And the Levites that are *gone* away far from me, when Israel *went* astray, which *went* astray away from me after their idols, they shall even hear their iniquity.

Ezek. xlv. 10.

To proceed in mental operations.

If I had unwarily too far engaged myself for the present publishing it, truly I should have kept it by me till I had once again *gone* over it.

Digby on the Soul. Dedication.

Thus I have *gone* through the speculative consideration of the Divine Providence.

Hide.

If we *go* over the laws of Christianity, we shall find that, excepting a few particulars, they enjoin the same things, only they have made our duty more clear and certain.

Tillotson.

In their primary qualities we can *go* but a very little way.

Locke.

I *go* over some parts of this argument again, and enlarge a little more upon them.

Id.

They are not able all their life-time to reckon, or regularly *go* over any moderate series of numbers.

Id.

I hope, by *going* over all these particulars, you may receive some tolerable satisfaction about this great subject.

South.

To take any road.

I will *go* along by the highway; I will neither turn to the right hand, nor to the left.

Deut. ii. 27.

Who shall beseech thee? Or who shall *go* aside to ask how thou doest?

Jer. xv. 5.

His horses *go* about

Almost a mile.

Shakspeare. Macbeth.

I have endeavoured to escape into the ease and freedom of a private scene, where a man may *go* his own way and his own pace.

Temple.

To march in a hostile or warlike manner.

We be not able to *go* up against the people; for they are stronger than we.

Numb. xiii. 31.

Let us *go* down after the Philistines by night, and spoil them until the morning light.

1 Sam. xiv. 36.

Thou art not able to *go* against this Philistine to fight with him.

Id. xvii. 33.

The remnant of Jacob shall be among the Gentiles as a lion among the beasts of the forest; who, if he *go* through, both treadeth down and teareth in pieces, and none can deliver.

Mic. v. 8.

You were advised his flesh was capable Of wounds and scars, and that his forward spirit Would lift where most trade of danger ranged; Yet did you say *go* forth.

Shakspeare. Henry IV.

To change state or opinion for better or worse.

We will not hearken to the king's words to *go* from our religion.

1 Mac. ii. 22.

The regard of the publick state, in so great a danger, made all those goodly things, which *went* so to wreck, to be lightly accounted of in comparison of their lives and liberty.

Knolles.

They look upon men and matters with an evil eye; and are best pleased when things *go* backward, which is the worst property of a servant of a prince or state.

Bacon.

All *goes* to ruin, they themselves contrive

To rob the honey, and subvert the hive.

Dryden.

Landed men, by their providence and good husbandry, accommodating their expences to their income, keep themselves from *going* backwards in the world.

Locke.

Cato, we will all *go* into your opinion.

Addison.

To apply one's self.

Seeing himself confronted by so many, like a resolute orator, he *went* not to denial, but to justify his cruel falsehood.

Sidney.

Because this atheist *goes* mechanically to work, he will not offer to affirm that all the parts of the embryon could, according to his explication, be formed at a time.

Bentley.

To have recourse to.

Dare any of you, having a matter against another, *go* to law before the unjust, and not before the saints?

1 Cor.

To be about to do.

So extraordinary an example, in so degenerating an age, deserves for the rarity, and, I was *going* to say, for the incredibility of it, the attestation of all that knew him, and considered his worth.

Locke.

To shift; to pass life not quite well.

Every goldsmith, eager to engross to himself as much as he could, was content to pay high for it, rather than *go* without.

Locke.

Cloaths they must have; but if they speak for this stuff, or that color, they should be sure to *go* without it.

Id.

To decline; to tend towards death or ruin. This sense is only in the participles *going* and *gone*.

The fourthe partie of this day is *gon*.

Chaucer. The Man of Lawes Tale.

He is far *gone*, and, truly, in my youth,

I suffered much extremity for love,

Very near this.

Shakspeare. Hamlet.

Ancient of days! august Athena! where,

Where are thy men of might? thy grand in soul?

Gone, glimmering through the dream of things that were,

First in the race, that led to glory's goal;

They won and passed away.

Byron. Childe Harold.

To be in party or design

They with the vanquished prince and party *go*,

And leave their temples empty to the foe.

Dryden

To escape.

Timotheus himself fell into the hands of Dositheus and Sosipater, whom he besought with much craft to let him *go* with his life.

2 Mac. xii. 24.

To tend to any act.

There be some women, Silvius, had they marked him

In parcels as I did, would have *gone* near

To fall in love with him.

Shakspeare. As you like it.

To be uttered.

His disciples personally appeared among them and ascertained the report which had *gone* abroad concerning a life so full of miracles. *Addison.*

To be talked of; to be known.

It has the greatest town in the island that *goes* under the name of Ano-Caprea, and is in several places covered with a very fruitful soil. *Addison.*

To pass; to be received.

Because a fellow of my acquaintance set forth her praises in verse, I will only repeat them, and spare my own tongue, since she *goes* for a woman. *Sidney.*

And the man *went* among men for an old man in the days of Saul. *1 Sam. xvii. 12.*

A kind imagination makes a bold man have vigour and enterprise in his air and motion : it stamps value upon his face, and tells the people he is to *go* for so much. *Collier.*

Clipping should be finally stopped, and the money which remains should *go* according to its true value. *Locke.*

To move by mechanism.

This pope is decrepid, and the bell *goeth* for him. *Bacon.*

Clocks will *go* as they are set ; but man, Irregular man's never constant, never certain. *Otway.*

'Tis with our judgments as our watches, none *Go* just alike, yet each believes his own. *Pope.*

To be in motion from whatever cause.

The wayward sisters, hand in hand,

Posters of the sea, and land,

Thus do *go* about, about. *Shakespeare. Macbeth.*

Clit and wasled money *goes* about, when the entire and weighty lies hoarded up. *Waller.*

To move in any direction.

Shall the shadow *go* forward ten degrees, or *go* back ten degrees ? *2 Kings xx. 9.*

Doctor, he is a curer of souls, and you a curer of bodies : if you should fight, you *go* against the hair of your professions. *Shakespeare.*

To flow ; to pass ; to have a course.

The god I am, whose yellow water flows

Around these fields, and fattens as it *goes*, Tyber by name. *Dryden's Ælucid.*

To have any tendency.

Athenians, know

Against right reason all your counsels *go*,

This is not fair, nor profitable that,

Nor t'other question proper for debate. *Dryden.*

To be in a state of compact or partnership.

As a lion was bestriding an ox that he had newly plucked down, a robber passing by cried out to him, half shares ; you should *go* your snip, says the lion, if you were not so forward to be your own carver. *L'Estrange.*

There was a hunting match agreed upon betwixt a lion, an ass, and a fox, and they were to *go* equal shares in the booty. *Id.*

To be regulated by any method ; to proceed upon principles.

Where the multitude beareth sway, laws that shall tend to the preservation of that state must make common smaller offices to *go* by lot, for fear of strife and divisions likely to arise. *Hooker.*

The principles I there *went* on, I see no reason to alter. *Locke.*

We are to *go* by another measure. *Sprat.*

The reasons that they *went* upon were very specious and probable. *Bentley.*

To be pregnant.

Great bellied women,

That had not half a week to *go*. *Shakespeare.*

The fruit she *goes* with,

I pray that it good time and life may find. *Id. Henry VIII.*

Of living creatures some are a longer time in the womb, and some shorter : women *go* commonly nine months, the cow and ewe about six months. *Bacon.*

And now with second hopes she *goes*,

And calls Lucina to her throes. *Milton.*

Some do *go* with their young the sixth part of a year, or two over or under, that is, about six or nine weeks : and the whelps of these see not till twelve days. *Browne.*

To pass ; not to remain.

She began to afflict him, and his strength *went* from him. *Judges xvi. 19.*

When our merchants have brought them, if our commodities will not be enough, our money must *go* to pay for them. *Locke.*

To pass, or be loosed, not to be retained.

Then he lets me *go*,

And, with head over his shoulder turned, He seemed to find his way without his eyes. *Shakespeare. Id.*

Let *go* the hand of that arch heretick.

To be expended.

Scholars are close and frugal of their words, and not willing to let any *go* for ornament if they will not serve for use. *Felton.*

To be in order of time or place.

We must enquire farther what is the connexion of that sentence with those that *go* before it, and those which follow it. *Watts.*

To reach or be extended to any degree.

Can another man perceive that I am conscious of any thing, when I perceive it not myself ? No man's knowledge here can *go* beyond his experience. *Locke.*

To extend to consequences.

It is not one master that either directs or takes notice of these : it *goes* a great way barely to permit them. *L'Estrange.*

To reach by effects.

Considering the cheapness, so much money might *go* farther than a sum ten times greater could do now. *Wilkins.*

To extend in meaning.

His amorous expressions *go* no further than virtue may allow. *Dryden's Ovid, Preface.*

To spread ; to be dispersed ; to reach.

Whose flesh, torn off by lumps, the ravenous foe In morsels cut, to make it farther *go*. *Tate.*

To have influence ; to be of weight ; to be of value.

I had another reason to decline it, that ever uses to *go* far with me upon all new inventions or experiments : which is, that the best trial of them is by time, and observing whether they live or not. *Temple.*

'Tis a rule that *goes* a great way in the government of a sober man's life, not to put any thing to hazard that may be secured by industry, consideration, or circumspection. *L'Estrange.*

Whatever appears against their prevailing vice *goes* for nothing, being either not applied, or passing for lital and slander. *Swift.*

To be rated one with another ; to be considered with regard to greater or less work.

I think, as the world *goes*, he was a good sort of man enough. *Arbutnot.*

To contribute; to conduce; to concur; to be an ingredient.

The medicines which *go* to the ointments are so strong, that, if they were used inwards, they would kill those that use them. *Bacon.*

More parts of the greater wheels *go* to the making one part of their lines. *Glanville's Scepis.*

I give the sex their revenge, by laying together the many vicious characters that prevail in the male world, and shewing the different ingredients that *go* to the making up of such different humours and constitutions. *Addison.*

There *goes* a great many qualifications to the completing this relation: there is no small share of honour and conscience and sufficiency required. *Collier of Friendship.*

Something better and greater than high birth and quality must *go* toward acquiring those demonstrations of publick esteem and love. *Swift to Pope.*

To fall out, or terminate; to succeed.

I will send to thy father, and they shall declare unto him how things *go* with thee. *Tob. x. 8.*

Your strong possession much more than your right, Or else it must *go* wrong with you and me. *Shakspeare.*

Howe'er the business *goes*, you have made fault I' the holdness of your speech. *Id.*

In many armies, if the matter should be tried by duel between two champions, the victory shall *go* on the one side; and yet, if it be tried by the gross, it would *go* on the other side. *Bacon.*

It has been the constant observation of all, that if a minister had a cause depending in the court, it was ten to one but it *went* against him. *South.*

At the time of the prince's landing, the father, easily foreseeing how things would *go*, went over, like many others, to the prince. *Swift.*

Whether the cause *goes* for me or against me, you must pay me the reward. *Watts's Logick.*

To be in any state. This sense is impersonal. He called his name Beriah, because it *went* evil with his house. *I Chron. vii. 23.*

It shall *go* ill with him that is left in his tabernacle. *Job xx.*

To proceed in train or consequence.

How *goes* the night, boy?

—The moon is down: I have not heard the clock; And she *goes* down at twelve. *Shakspeare.*

I had hope,

When violence was ceased, and war on earth,

All would have then *gone* well. *Milton.*

Duration in itself is to be considered as *going* on in one constant, equal, uniform course. *Locke.*

To *go about*. To attempt; to endeavour; to set one's self to any business.

O dear father,

It is thy business that I *go about*. *Shakspeare.*

Which answer exceedingly united the vulgar minds to them, who concurred only with them as they saw them like to prevail in what they *went about*. *Clarendon.*

I lost him; but so found, as well I saw

He could not lose himself, but *went about* His father's business. *Milton.*

Some men, from a false persuasion that they cannot reform their lives, and root out their old vicious habits, never so much as attempt, endeavour, or *go about* it. *South.*

Either my book is plainly enough written to be rightly understood by those who peruse it with attention and indifferency, or else I have writ mine so obscurely that it is in vain to *go about* to mend it. *Locke.*

They never *go about*, as in former times, to hide or palliate their vices; but expose them freely to view. *Swift.*

To *go aside*. To err; to deviate from the right.

If any man's wife *go aside*, and commit a trespass against him. *Numb. v. 12.*

To *go between*. To interpose; to moderate between two.

I did *go between* them, as I said; but more than that he loved her; for, indeed, he was mad for her. *Shakspeare.*

To *go by*. To pass away unnoticed.

Do not you come my tardiness to chide, That lapsed in time and passion, lets *go by* The important acting of your dread command? *Id. Hamlet.*

So much the more our carver's excellent, Which lets *go by* some sixteen years, and makes her As she lived now. *Id. Winter's Tale.*

What's that to us? The time *goes by*; away. *Shakspeare.*

To *go by*. To find or get in the conclusion.

In argument with men a woman ever *Goes by* the worse, whatever be her cause. *L'Estrange.*

He's sure to *go by* the worst that contends with an adversary that is too mighty for him. *L'Estrange.*

To *go by*. To observe as a rule.

'Tis not to be supposed, that by searching one can positively judge of the size and form of a stone; and indeed the frequency of the fits, and violence of the symptoms, are a better rule to *go by*. *Sharp's Surgery.*

To *go down*. To be swallowed; to be received; not rejected.

Folly will not easily *go down* in its own natural form with discerning judges. *Dryden.*

Nothing so ridiculous, nothing so impossible, but it *goes down* whole with him for truth and earnest. *L'Estrange.*

If he be hungry, bread will *go down*. *Locke.*

Ministers are so wise to leave their proceedings to be accounted for by reasoners at a distance, who often mould them into the systems that do not only *go down* very well in the coffee house, but are supplies for pamphlets in the present age. *Swift.*

To *go in and out*. To do the business of life.

The lord shall preserve thy *going out* and thy coming in. *Psalms.*

To *go in and out*. To be at liberty.

He shall *go in and out*, and find pasture. *John.*

To *go off*. To die; to go out of life; to de-cease.

I would the friends we miss were safe arrived: Some must *go off*; and yet, by these I see So great a day as this is cheaply bought. *Shakspeare.*

In this manner he *went off*, not like a man that departed out of life, but one that returned to his abode. *Tuttler.*

To *go off*. To depart from a post.

The leaders having charge from you to stand, Will not *go off* until they hear you speak. *Shakspeare. Henry IV.*

To *go on*. To make attack.

Bold Cethegus, Whose valour I have turned into his poison, And praised so to daring, as he would *Go on* upon the gods. *Ben Jonson.*

To go on. To proceed.

He found it a great war to keep that peace, but was fain to go on in his story. *Sidney.*

I have escaped many threats of ill fits by these notions; if they go on, the only pollice I have dealt with is wool from the belly of a fat sheep. *Temple.*

He that desires only that the work of God and religion shall go on, is pleased with it, whoever is the instrument. *Taylor.*

To look upon the soul as going on from strength to strength, to consider that she is to shine for ever with new accessions of glory, and brighten to all eternity, is agreeable. *Addison.*

Go on cheerfully in the glorious cause you have undertaken. *Id.*

Copious bleeding is the most effectual remedy in the beginning of the disease: but, when the expectoration goes on successfully, not so proper, because it sometimes suppresseth it. *Arbuthnot on Diet.*

I have already handled some abuses during the late management, and in convenient time shall go on with the rest. *Swift.*

When we had found that design impracticable, we should not have gone on in so expensive a management of it. *Id.*

Many clergymen write in so diminutive a manner, with such frequent blots and interlineations, that they are hardly able to go on without perpetual hesitations, or extraordinary expletives. *Id.*

I wish you health to go on with that noble work. *Berkley.*

To go over. To revolt; to betake himself to another party.

In the change of religion, men of ordinary understandings don't so much consider the principles as the practice of those to whom they go over. *Addison.*

Power, which, according to the old maxim, was used to follow, is now gone over to money. *Swift.*

To go out. To go upon any expedition.

You need not have pricked me: there are other men fitter to go out than I. *Shakspeare. Henry IV.*

To go out. To be extinguished.

Thinkst thou the fiery fever will go out,

With titles blown from adulation. *Id. Henry V.*

Spirit of wine burned till it go out of itself, will burn no more. *Bacon's Natural History.*

The care of a state, or an army, ought to be as constant as the chymist's fire, to make any great production; and if it goes out for an hour, perhaps the whole operation fails. *Temple.*

The morning, as mistaken, turns about;

And all her early fires again go out. *Dryden's Aureng.*

Let the acquaintance be decently buried, and the flame rather go out than be smothered. *Collier.*

My blood runs cold, my heart forgets to heave, And life itself goes out at thy displeasure. *Addison's Cato.*

And at her felt approach and secret might,

Art after art goes out, and all is night. *Pope's Dunciad.*

To go through. To perform thoroughly; to execute.

If you can as well go through with the statute laws of that land, I will think you have not lost all your time there. *Spenser.*

Kings ought not to suffer their counsel to go through with resolution and direction, as if it depended on them, but take the matter back into their own hands. *Bacon.*

He much feared the earl of Antrim had not steadiness of mind enough to go through with such an undertaking. *Clarendon.*

Finding Pyrocles every way able to go through with that kind of life, he was as desirous for his sake as for his own to enter into it. *Sidney.*

The amazing difficulty and greatness of his account will rather terrify than inform him, and keep him from setting heartily about such a task, as he despairs ever to go through with it. *South's Sermon.*

The powers in Germany are borrowing money, in order to go through their part of the expence. *Addison on the War.*

To go through. To suffer; to undergo.

I tell thee that it is absolutely necessary for the common good that thou shouldst go through this operation. *Arbuthnot.*

To go upon. To take as a principle.

This supposition I have gone upon through those papers. *Addison.*

The senses of this word are very indistinct: its general notion is motion or progression. It commonly expresses passage from a place, in opposition to come. This is often observable even in figurative expressions. We say, the words that go before and that come after: to day goes away and to-morrow comes.

Go to, *interj.* Come, come, take the right course. A scornful exhortation.

Go to, then, O thou far renowned son Of great Apollo, shew thy famous might In medicine. *Spenser.*

Go to, go to, thou art a foolish fellow; Let me be clear of thee. *Shakspeare. Twelfth Night.*

My favour is not bought with words like these: Go to; you'll teach your tongue another tale. *Rowe.*

GOA, a city of India, in the province of Bejapoor, the capital of the Portuguese possessions. It at the present time consists of two distinct towns; the Old City about eight miles up the river, now almost deserted from its unhealthy air; and the New Town on the mouth of the river. The former, however, contains the inquisition (as well as many magnificent churches), and the clergy connected with it reside there: exhibiting on the whole specimens of European architecture superior to any other part of India, particularly the cathedral, and the church and convent of the Augustines.

At New Goa, which is protected by the forts of the harbour, the viceroy resides. It formerly carried on a considerable trade in arrack, but this has been of late transferred to BATAVIA, which see. There is still a small trade carried on in betel nuts, cowries, and toys with Africa; and Goa imports piece goods, sugar, ivory, raw silk, glass and woollens: but its expenses are said far to exceed its revenue. In 1808 there were 200 churches and chapels in the district, and above 2000 priests. The whole Portuguese territory in the neighbourhood of Goa, including the islands, is about forty miles in length by twenty in breadth.

Goa was taken by the Bhamenee sovereigns of the Deccan from the Hindoo rajahs of Bijanagur, in the middle of the fifteenth century; in 1510 it was besieged and taken by the Portuguese general Albuquerque, when he made it the capital of the Portuguese possessions in the east, adding to its fortifications. The inhabitants now amount to about 20,000, of whom few are

genuine Portuguese. It is now altogether a very neglected and inferior place. Travelling distance from Poonah 245 miles, from Bombay 292.

GOAD, *n. s. & v. a.* Sax. *gao*; Goth. *gud*; Wel. *got*. A pointed instrument, with which oxen are driven forward. To incite; stimulate, or urge on.

Most dangerous
Is that temptation, that doth *goad* us on
To sin in loving virtue.

Shakspeare. Measure for Measure.

Goaded with most sharp occasions,
Which lay nice manners by, I put you to
The use of your own virtues. *Shakspeare.*

Of all that breathes the various progeny,
Stung with delight, is *goaded* on by thee. *Dryden.*
Oft in his hardened hand a *goad* he bears. *Pope.*

Goaded by ambition's sting,

The hero sunk into the king!

Then he fell—so perish all

Who would men by man enthral.

Byron.

GOAL, *n. s.* Fr. *gaule*. A landmark; starting-post; hence, figuratively, the end to which any design tends.

Let a post-angel start with thee
And thou the *goal* of earth shall reach as soon as he.
Cowley.

And the slope sun his upward beam
Shoots against the dusky pole,
Pacing toward the other *goal*. *Milton.*
Hast thou beheld, when from the *goal* they start,
The youthful charioteers with heaving heart
Rush to the race? *Dryden's Virgil.*

So man, who here seems principal alone,
Perhaps acts second to some sphere unknown;
Touches some wheel, or verges to some *goal*;
'Tis but a part we see, and not a whole. *Pope.*

Onward he flies, nor fixed as yet the *goal*
Where he shall rest him on his pilgrimage.
Byron. Childe Harold.

GOALPARAH, a town in the district of Rangamutty, Bengal, situated near the frontiers of Assam, on the south bank of the Brahmapootra. The Assamese bring gold, ivory, lac, wax, and tar hither, for which they receive, salt, silks, and fine muslins. No European is allowed to proceed beyond this place without a pass. There is a custom-house on the opposite side of the river, at a place called Kangrar. It is 170 miles north by east from Decca.

GOAND, an independent mountainous district of Hindostan, in the province of Gundwana, intersected by the Mahanuddy River. It is in fact tributary to Nagpore, but the inhabitants are very uncivilised, and the country not worth entire conquest.

GOAR, *n. s.* Welsh, *gorer*. Any edging sewed upon cloth to strengthen it, or to widen it.

A saint she wered, barred all of silk;
A barme-cloth, eke, as white as morwe milk
Upon her lendes ful of many a *gor*.

Chaucer. The Miller's Tale.

GOAT, *n. s.* Sax. and Scot. *gao*. A
GOATHERD, }
GOATISH, *adj.* } ruminant animal, that
GOAT'S-SKIN, *n. s.* } seems a middle species
GOAT'S-MILK, } between deer and sheep.
GOAT'S-RUE, } The adjective is used figuratively for ruminance or
GOAT'S-THORN. } lust. Goatherd, Sax. *gao*
and *hyrto*, one who herds goats: goats'-rue and

goats'-thorn are herbs: the other compounds are plain.

A vois lie hadde as smale as hath a *gote*.

Chaucer. Prologue to the Canterbury Tales.

Up to the rocke he ran, and thereon flew
Like a wyld *gote*, leaping from hill to hill,
And dauncing on the craggy cliffes at will.

Spenser. Faerie Queene.

Is not thilk same *goatherd* proud,
That sits on yonder bank,

Whose straying herd themselves doth shroud
Among the bushes rank? *Spenser's Pastorals.*

An admirable evasion of a whoremaster, man, to
lay his *goatish* disposition on the change of a star.

Shakspeare. King Lear.

Gall of *goat*, and slips of yew.

Id. Macbeth.

The first gave the *goatherd* good contentment,
and the marquis and his servant chased the kid about the
stack. *Wotton.*

We Cyclops care not for your *goat-fed* Jove,

Nor other blest ones; we are better farre.

Chapman.

You may draw naked boys riding and playing with
their paper-mills upon *goats*, eagles, or dolphins.

Peacham.

The little bear that rocked the mighty Jove,
The swan whose borrowed shape concealed his love,
Are graced with light; the nursing *goat's* repaid
With heaven and duty raised the pious maid.

Creech.

The last is notorious for its *goatish* smell, and tufts
not unlike the beard of that lecherous animal.

More against Atheism.

After the fever and such like accidents are diminished, asses and *goat's* milk may be necessary.

Wiseman's Surgery.

Then filled two *goatskins* with her hands divine;
With water one, and one with sable wine. *Pope.*

Goat's rue has the reputation of being a great alexipharmick and suitorific: the Italians eat it raw and boiled; with us it is of no esteem. *Hill.*

GOAT. See CAPRA.

GOAT ISLAND, a flat island of the Eastern Seas, the southernmost of the Bashees. It was so called from the number of goats found on it. Long. 121° 0' E., lat. 20° 6' N. Also, a small island among the Philippines, in long. 120° 13' E., lat. 13° 52' N.

GOAT ISLAND, GREAT, a small island on the south coast of Jamaica, in long. 76° 51' E., lat. 17° 53' N.

GOAT ISLAND, LITTLE, an island about a mile north-west from Great Goat Island.

GOATS'-BEARD, in botany. See TRAGOPOGON.

GOAVE, PETIT, a sea-port town of Hispaniola, with a capacious and safe harbour: the environs contain sugar, coffee, indigo, and cotton plantations. Hither the inhabitants of Grand Goave and the neighbourhood send their commodities. It is twenty miles W. S. W. of Leogane.

GOB, *n. s.*

GOBBET, *n. s. & v. a.* } Fr. *gobé, gober*. A
GOBBLE, *v. a.* } small quantity; a
GOBBLE, *n. s.* } mouthful: one that
gourmand: to eat greedily.

He said he hadde a *gobbet* of the seyl

Thatte Peter had whan that he went

Upon the see till Jesus Crist him hente.

Chaucer. Prologue to Canterbury Tales.

The cooks, slicing it into little *gobbets*, prick it on a prong of iron, and hang it in a furnace.

Sandy's Travels.

Therewith she spewed, out of her filthy maw,
A flood of poison, horrible and black,
Full of great lumps of flesh and *goblets* raw.
Spenser.
By devilish policy art thou grown great,
And, like ambitious Sylla, overgorged
With *goblets* of thy mother's bleeding heart.
Shakspeare.

Do'st think I have so little wit as to part with such
a *gob* of money.
L'Estrange.

The sheep were so keen upon the acorns, that they
gobbled up now and then a piece of the coat along
with them.
Id.

Down comes a kite powdering upon them, and *gob-*
bets up both together.
Id.

The giant gorged with flesh, and wine, and blood,
Lay stretched at length, and snoring in his den,
Belching raw *goblets* from his maw, o'ercharged
With purple wine and cruddled gore confused.
Addison.

Of last year's corn in barn great store;
Fat turkeys *gobbling* at the door.
Prior.

The time too precious now to waste,
And supper *gobbled* up in haste,
Again afresh to cards they run.
Swift.

GOBBI, a district of Western Africa, to the
south of Cape Lopez Gonsalvo, extending along
the coast to Camma. The chief trade is in ele-
phants' teeth.

GOBBO CORTONESE (Peter Paul), a cele-
brated painter of fruit and landscapes, born at
Cortona in 1580. He learned the principles of
design from his father; was afterwards the dis-
ciple of Crescentio at Rome, and perfected him-
self in his profession by copying after nature,
with judgment and accuracy. By his skill in
the chiaro-scuro he gave an exact and expressive
roundness to his fruits, &c.; but he chiefly ex-
celled in coloring. He died in 1640.

GO-BETWEEN, *n. s.* Go and between. One
that transacts business by running between two
parties. Commonly in an ill sense.

Even as you came in to me her assistant, or *go-*
between, parted from me: I say I shall be with her
between ten and eleven.
Shakspeare.

GOBIN, a town of France, in the department
of the Aisne, in the midst of a forest. Inhabitants
1750. Here is one of the most celebrated ma-
nufactures of mirrors in Europe. Some of the
plates cast are eleven feet in length, and from
three to four in breadth. Eleven miles west of
Laon, and twenty-five east of Chauny.

GOBIUS, in ichthyology, a genus of fishes be-
longing to the order thoracici. They have two
holes between the eyes, seven rays in the mem-
brane of the gills, and the belly fins are united
in an oval form. There are twenty-five species,
principally distinguished by the number of rays
in their fins. See *ICHTHYOLOGY*.

GO'BLET, *n. s.* Fr. *gobelet*. A bowl; or cup,
that holds a large draught.

My figured *goblets* for a dish of wood. *Shakspeare.*
We love not loaded boards, and *goblets* crowned;
But free from surfeits our repose is found. *Denham.*
Crown high the *goblets* with a cheerful draught;
Enjoy the present hour, adjourn the future thought.
Dryden.

If not, the *goblet* pass unquaffed;
It is not drained to banish care:

The cup must hold a deadlier draught
That brings a Lethe for despair. *Byron.*

GO'BLIN, *n. s.* Fr. *gobeline*; which Spenser
has once retained; writing it in three syllables.
'This word some derive from the Gibellines, a
faction in Italy; so that elfe and goblin is
Guelph and Gibelline, because the children of
either party were terrified by their nurses with
the name of the other: but it appears that elfe is
Welsh, and much older than those factions.
Elifff Uishon are phantoms of the night, and the
Germans likewise have long had spirits among
them named *Goboldi*, from which *gobeline*
might be derived.'—Dr. Johnson. An evil spirit;
a walking spirit; a frightful phantom. A fairy;
an elf.

His son was Elfinel, who overcame
The wicked *gobbelines* in bloody field;
But Elfant was of most renowned fame,
Who of all crystal did Panthea build. *Spenser.*
Go, charge my *goblins* that they grind their joints
With dry convulsions; shorten up their sinews
With aged cramps. *Shakspeare. Tempest*

Angels and ministers of grace defend us!
Be thou a spirit of health, or *goblin* damned,
Bring with thee airs from heaven, or blasts from hell?
Shakspeare.

To whom the *goblin*, full of wrath, replied,
Art thou that traitor angel? *Milton's Paradise Lost.*

Always, whilst he is young, be sure to preserve his
ender mind from all impressions and notions of spirits
and *goblins*, or any fearful apprehensions in the dark.
Locke.

Mean time the village rouses up the fire,
While well attested, and as well believed,
Heard solemn goes the *goblin* story round.
Thomson.

And *gob'ins* all
To the damp dungeon shrink, or hoary halt,
Or westward with impetuous flight
Shoot to the desert realms of their congenial night.
Beattie.

GO-BY, *n. s.* Delusion; artifice; circum-
vention; over-reach.

Except an apprentice is instructed how to adulterate
and varnish, and give you the *go by* upon occasion,
his master may be charged with neglect.
Collier on Pride.

GO-CART, *n. s.* Go and cart. A machine in
which children are enclosed to teach them to
walk, and which they push forward without
danger of falling.

Young children, who are tried in
Go-carts, to keep their steps from sliding,
When members knit, and legs grow stonger,
Make use of such machine no longer. *Prior.*

GOCAUK, a large town of Hindostan, in the
province of Bejapoor, situated on the acclivity
of a hill, and defended on three sides by a brick
wall and wet ditch. On the other, the south
side, it has the Gutpurba River. The manufac-
ture of cotton and silk goods here is extensive.
About two miles from this town is a very fine
cataract 174 feet high; the breadth of it in the
rainy season is 160 yards. This was the chief
town of a district when taken by Mu'azim, the
son of Aurungzebe, in 1685; but it has now no
buildings of importance.

GOD, *n. s. & v. a.* } Sax. *gob*, which like-
 GOD'LESS, *n. s.* } wise signifies good. The
 GOD'LIKE, *adj.* } same word passes in
 GOD'LINESS, *n. s.* } both senses with only
 GOD'LY, *adj. & adv.* } accidental variations
 GODLING, *n. s.* } through all the Teuto-
 GODHEAD, *n. s.* } nic dialects. The Su-
 GODWARD, *adj.* } preme Being. An idol;
 GODLYHEAD, *n. s.* } a false god; a little divi-
 nity: a human being canonised; religious or
 irreligious persons and aets: goodness and piety:
 some of these words are obsolete. Figuratively
 undue attention paid to any subordinate things
 or beings.

He that sacrificeth unto any *god*, save unto the
 Lord only, he shall be utterly destroyed.

Erodus xxii.

Help, Lord, for the *godly* man ceaseth, for the
 faithful fail among the children of men.

Psaln xii. 1.

And such trust have we through Christ to *Godward*.

2 Cor.

Whose end is destruction, whose *god* is their belly.

Phil. iii.

Grant that we may hereafter live a *godly*, righteous,
 and sober life.

Common Prayer.

In the morrow tide, is most convenient to a man to
 say his prayers, and for to think on *God*, and to
 honour *God*, and to geve almesse to the poure.

Chaucer. The Persones Tale.

For this, and many more such outrage,

I crave your *godlyhead* to asswage

The rancorous vigour of his might. *Spenser.*

Virtue and *godliness* of life are required at the
 hands of the minister of God.

Hooker.

The apostle St. Paul teacheth, that every one that
 will live *godly* in Christ Jesus must suffer persecution.

Id.

Of these two sorts of men, both *godless*, the one
 has utterly no knowledge of God, and the other studies
 how to persuade themselves that there is no such
 thing to be known. *Id.*

I am not Licio,

But one that scorns to live in this disguise,

For such a one as leaves a gentleman,

And makes a *god* of such a cullion. *Shakspeare.*

Be content

Your low-laid son our *godhead* will uplift. *Id.*

Were your *godheads* to borrow of men, men would
 forsake the *gods*. *Id. Timon.*

As flies to wanton boys are we to the *gods*,

They kill us for their sport. *Id. King Lear.*

This last old man

Loved me above the measure of a father;

Nay, *godded* me, indeed. *Id. Coriolanus.*

These marriages did not beget men, so much as
 wickedness; from hence religious husbands both lost
 their piety, and gained a rebellious and *godless* gen-
 eration. *Bishop Hall.*

For nought more *god-like* in this world is found,
 Then so resolved a man, that nothing may

His resolution alter or confound,

When any taske of worth, he doth assay.

George Withers.

That *godless* crew

Rebellious. *Milton.*

Thus Adam his illustrious guest besought,

And thus the *godlike* angel answered mild. *Id.*

At the holy mount

Of heaven's high-seated top, the imperial throne

Of *godhead*, fixed for ever firm and sure,

The filial power arrived. *Id. Paradise Lost.*

The same church is really holy in this world, in
 relation to all *godly* persons contained in it, by a real
 infused sanctity. *Pearson.*

All the churches of *God* are united into one by the
 unity of discipline and government, by virtue whereof
 the same Christ ruleth in them all. *Id.*

Strong *god* of arms, whose iron sceptre sways

The freezing North, and Hyperborean seas,

And Seythian colds, and Thracia's Winter Coast,

Where stand thy steeds, and thou art honoured
 most. *Dryden.*

Thy puny *godlings* of inferior race,

Whose humble statues are content with brass.

Id.

For faults not his, for guilt and crimes

Of *godless* men, and of rebellious times,

Him his ungrateful country sent,

Their best Camillus, into banishment. *Id.*

Adoring first the genius of the place,

The nymphs and native *godheads* yet unknown.

Id. Aeneid.

That prince shall be so wise and *godlike*, as, by
 established laws of liberty, to secure protection and
 encouragement to the honest industry of mankind.

Locke.

The Supreme Being, whom we call *God*, is neces-
 sary, self-existent, eternal, immense, omnipotent,
 omniscient, and best being; and therefore also a
 being who is and ought to be esteemed most sacred
 or holy. *Grew's Cosmologia.*

So may thy *godhead* be confest,

So the returning year be blest. *Prior.*

Ere wit oblique had broke that steady light,

Man like his maker, saw that all was night;

To virtue in the paths of pleasure trod,

And owned a father when he owned a *God*.

Pope.

There fixed the dreadful, here the blest abodes;
 Fear made her devils, and weak hope her *gods*.

Id.

Blest be the day I' scaped the wrangling crew,
 From Pyrrho's maze, and Epicurus' sty,
 And held high converse with the *god-like* few;
 Who to the enraptured heart, and ear, and eye,
 Teach beauty, virtue, truth, and love, and melody.

Beattie.

God. See THEOLOGY.

GOD'S HOUSE, LEAGUE OF, one of the three
 chief divisions of the Swiss Canton of the Gri-
 sons. It has eleven jurisdictions, a territorial
 extent of 1280 square miles, and a population of
 about 23,000. See GRISONS.

GODALMING, a town on the Wye, at a
 place where it divides into several streams. It
 is a corporation; and by its charter the chief ma-
 gistrate is a warden chosen yearly, with eight
 assistants. It carries on manufactures of kerseys
 and stockings; and is famous for liquoreice. It
 has a market on Wednesday. Its name is sup-
 posed to have been derived from Goda, a pious
 lady among the Saxons, who founded a religious
 house here. The town consists of one principal
 street, running east and west, and several smaller
 ones. The church is a neat building, with a
 high and handsome spire; besides which here
 are a Quakers' meeting-house, two chapels for
 other dissenters, a good charity school, and, on
 the common, an hospital endowed for ten old
 men. It is four miles south-west from Guild-
 ford, and thirty-three from London.

GODAVERY, GANGA GODAVERY, a fine river
 of India, rising on the eastern side of the Bala

Ghaut, about seventy miles to the north-east of Bombay. It traverses nearly the whole of the breadth of the peninsula in a circuitous south-east direction, and is computed to be 800 miles in length. During the rainy season it is often more than a mile and a half in breadth. On reaching Rajamundry, in the Northern Circars, it divides into two main branches, one of which falls into the bay of Bengal, a few miles south of the town of Coringa, and the other a little below Narsipore, forming between them the fertile island of Nagur. There are several forests of saul and teak timber near the banks of this river, only a small portion of which passes through the British territories. This river, from its source, is held sacred by the Hindoo inhabitants of the peninsula. Its Delta contains three small harbours, viz. Yanam, Bunder Malacca, and Narsipore. The harbours of Ingeram and Coringa are also connected with this river; but none of its branches are navigable for ships of burden.

GODAVERY POINT, a head-land on the south side of the entrance of the northern branch of the above river; it is also called Point Gordeware. Long, 82° 32' E., lat. 16° 43' N.

GOD-CHILD, *n. s.* God and child. A term of spiritual relation; one whose sponsor at baptism promised to see him or her educated as a Christian.

GODDARD (Jonathan), M. D., an eminent physician and chemist, and one of the first promoters of the Royal Society. He was born about 1617; educated and graduated at Oxford; was elected a fellow of the College of Physicians in 1646, and appointed reader of the anatomical lecture in 1647. Oliver Cromwell appointed him first physician to the army, a member of the council of state, and warden of Merton College; but he lost this office on the Restoration. He was elected professor of physic in Gresham College, in 1655. He prepared all his own medicines; and, in 1668, published a treatise, recommending that practice to all physicians. He was the inventor of the *Gutta Anglicana*. He died of an apoplectic fit in 1674. Bishop Seth Ward says, he was the first Englishman who constructed a telescope.

GOD-DAUGHTER, *n. s.* God and daughter. A girl who has had a sponsor in baptism. A term of spiritual relation.

GODDESS, *n. s.* From god. A female divinity.

Hear, nature, hear! dear goddess, hear a father!
Shakspeare.

A woman I forswore? but I will prove,
Thou being a goddess, I forswore not thee:
My vow was earthly, thou a heav'nly love. *Id.*

I long have waited in the temple nigh,
Built to the gracious goddess Clemency;
But reverence thou the power.

Dryden's Fables.

From his seat the goddess born arose,
And thus undaunted spoke. *Id.*

When the daughter of Jupiter presented herself among the crowd of goddesses, she was distinguished by her graceful stature and superior beauty.

Addison.

Modesty withheld the goddess' train.
Pope's Odyssey.

GODDESS-LIKE, *adj.* Goddess and like. Resembling a goddess.

Then female voices from the shore I heard;
A maid amidst them goddess-like appeared. *Pope.*

GOD-FATHER, *n. s.* God and father. The sponsor at the font.

He had a son by her, and the king did him the honour as to stand god-father to his child. *Bacon.*

Confirmation, a profitable usage of the church, transcribed from the apostles, consists in the child's undertaking in his own name the baptismal vow; and, that he may more solemnly enter this obligation, bringing some god-father with him, not now, as in baptism, as his procurator. *Hammond.*

Jack Thomson and Bill Thomson;—all the rest Had been called 'Jemmy' after the great bard
I don't know whether they had arms or crest.
But such a god-father's as good a card. *Byron.*

GODFREY of Bouillon, or Boulogne, prince of Lorraine, was chosen general of the expedition which the Christians undertook for the recovery of the Holy Land, and sold his dukedom to prepare for the war. He took Jerusalem from the Turks in 1099; and was made king of it; but he never would submit to be crowned, alleging that it would be impious to wear a crown of gold in the city where his Saviour had been crowned with thorns. The sultan of Egypt afterwards sent a terrible army against him; which he defeated, with the slaughter of about 100,000 of the enemy. He died in 1160.

GOD-MOTHER, *n. s.* God and mother. A woman who has undertaken sponsorship in baptism. A term of spiritual relation.

GODOLPHIN (John), an eminent English civilian, born in the island of Sicily in 1617, and educated at Oxford. In 1642-3, he was created LL. D.; in 1653 he was appointed one of the judges of the admiralty; and at the Restoration he was made one of the king's advocates. He was esteemed as great a master of divinity as of law; and published, 1. *The Holy Limbeck.* 2. *The Holy Arbor.* 3. *A View of the Admiral's Jurisdiction.* 4. *The Orphan's Legacy.* 5. *Repertorium Canonicum, &c.* He died in 1678.

GODOLPHIN (Sidney), earl of Godolphin, was of the above family, and educated at the same University. He was one of those who voted under Charles II. for the exclusion of the duke of York from the throne, notwithstanding which he was employed by James II., and on the flight of that monarch Godolphin voted for a regency. Under William and Mary he was made a commissioner of the treasury. During the reign of queen Anne he was at the head of this department; and in 1704 became a knight companion of the garter. In 1706 he was created earl of Godolphin; but four years afterwards was obliged to retire from office. His death took place in 1712.

GOD-SHIP, *n. s.* From god. The rank or character of a god; deity; divinity.

Discoursing largely on this theme,
O'er hills and dales their god-ships came. *Prior.*

GOD-SON, *n. s.* God and son. One who has had a sponsor at the font.

What, did my father's godson seek your life?
He whom my father named? your Edgar? *Shakspeare.*

GODWIN (Mary), also known by her maiden name of Woolstonecraft, was born near London in 1759. After keeping a boarding school, and being a companion to a lady on a journey to Lishon, she had recourse to her pen, and produced some translations from the French; and an Essay on Female Education. Her principal performance was a Vindication of the Rights of Women, a book whose principal tendency is to unsex the sex. She now fell in love with Mr. Fuseli, the painter, a married man; and, not meeting with a return to her passion, went to France, and formed a connexion with one Imlay, an American, who soon abandoned her. She next became attached to Mr. Godwin, whom she afterwards married, and who wrote her life. She died in 1797.

GOD-WIT, *n. s.* Sax. *god*, good, and *wit*, an animal. A bird of peculiar delicacy.

Nor ortelans nor god-wits crown his board. Cowley.

GODWYN (Thomas), a learned English author, born in 1517, master of the free-school at Abington in Berkshire; where he educated many youths, who became eminent in church and state. He was a man of great learning: he wrote *Historiæ Romanæ anthologia*, *Synopsis antiquitatum Hebraicarum*, *Moses et Aaron*, *Florilegium Phrasicon*, &c. He died in 1642.

GOELWARAH, a district of the province of Gujerat, Hindostan, situated between 21° and 22° of N. lat. It is bounded on the east by the gulf of Cambay, and is famous for a breed of large cattle. It was ceded by the Maharrattas to the British in 1805, in part payment of a subsidiary force, and is subject to the jurisdiction of Kaira. The chief town is Gogo.

GODYELD, *adv.* } Corrupted from god shield
Go'dyeld, *adv.* } or protect. A term of thanks. Now not used.

Herein I teach you,
How you should bid *godyield* us for your pains,
And thank us for your trouble. *Shakspeare's Macbeth.*

GOEL, *adj.* Sax. *golep*; yellow. An old word.

In March at the furthest, dry season or wet,
Hop roots so well chosen let skilful go set;
The *goeler* and younger, the better I love;
Well gutted and pared, the better they prove.
Tusser.

GOEN, a large town of Asiatic Turkey, on the right bank of the Tigris, and 150 miles S. S. E. of Mosul.

GO'ER, *n. s.* From go.

One that goes; a runner.

I would they were in Africk both together,
Myself by with a needle, that I might prick
The *goer* back. *Shakspeare. Cymbeline.*

Such a man

Might be a copy to these younger times;
Which, followed well, would now demonstrate them
But *goers* backward. *Id. All's well.*

Nothing could hurt either of us so much as the intervening officious impertinence of those *goers* between us, who in England pretend to intimacies with you, and in Ireland to intimacies with me.

Pope to Swift.

A walker: one that has a gait or manner of walking good or bad.

The earl was so far from being a good dancer, that he was no graceful *goer*. *Wotton.*

The foot. Obsolete.

A double mantle, cast

A'thwart his shoulder, his faire *goers* graced

With fitted shoes.

Chapman.

GOES or **TER GOES**, an old town of the Netherlands, in South Beveland, at the east mouth of the Scheldt. It has an ancient and curious monastery; and manufactures of salt, and a good trade in corn and hops. When it was besieged by the insurgents, in the reign of Philip II. of Spain, the Spaniards marched a body of troops seven miles through the water from Bergen-op-Zoom, across a ford which was never before deemed practicable, and has never since, it is said, been attempted. It is ten miles east of Flushing. Population 3700.

GOG and **MAGOG**, two names generally joined together in Scripture (Ezek. xxxviii. 2, 3, &c.; xxxix. 1, 2, &c.; Rev. xx. 8). Moses speaks of Magog the son of Japhet, but says nothing of Gog (Gen. x. 2; Chron. i. 5). Gog was prince of Magog, according to Ezekiel; Magog being the name of the country or people. The generality of the ancients made Magog the father of the Scythians and Tartars; and several interpreters discovered many traces of their name in the provinces of Great Tartary. Others supposed that the Persians were the descendants of Magog. Some have imagined that the Goths were descended from Gog and Magog; and that the wars described by Ezekiel, and undertaken by Gog against the saints, are those which the Goths carried on against the Roman empire, in the fifth century. Bochart has placed Gog in the neighbourhood of Caucasus. He derives the name of this celebrated mountain from the Hebrew Goghasan, 'the fortress of Gog.' He maintains that Prometheus, said to be chained to Caucasus by Jupiter, is Gog, and no other.

GOGGLE, *v. n.* } Saxon *reegl egen*;
GOGGLE-EYED, *adj.* } squint-eyed; not looking straight.

They are deformed, unnatural, or lame; and very unseemly to look upon, except to men that be *goggle-eyed* themselves. *Ascham.*

Inflamed all over with disgrace,
To be seen by her in such a place,
Which made him hang his head, and scowl,
And wink and *goggle* like an owl. *Hudibras*
Nor sighs, nor groans, nor *goggling* eyes did want.

Dryden.

GOGGLES, in surgery, instruments used for curing squinting, or that distortion of the eyes which occasions this disorder. They are short conical tubes, composed of ivory stained black with a thin plate of the same ivory fixed in the tubes near their anterior extremities. Through the centre of each of these plates is a small circular hole, about the size of the pupil of the eye, for the transmission of the rays of light. These goggles must be continually worn in the day-time, till the muscles of the eye are brought to act regularly and uniformly, so as to direct the pupil straight forwards; and by these means the cure will probably be sooner or later effected.

GOGGRAH, a river, called also the Sarfew and Deva in different parts of its course, supposed by Major Rennell to be the Agoramis of Arrian. It has its source in the mountains of

Thibet, and flows through the provinces of Kemaon, Oude, and part of Bahar, till at Maniee it joins the Ganges. It is navigable for boats to the foot of the hills, and is held sacred by the Hindoos. On its banks are several large towns.

GOGO, a sea-port of Hindostan, in the province of Gujerat, and the capital of the district of Goelwarah. Here is a safe roadstead and good refreshing place during the south-west monsoon. Vessels from fifty to 300 tons burden are built; and a considerable trade is carried on with Bombay. The sailors are very able and adroit. It is an ancient town, which came into possession of the British, with the district, in 1805, and is gradually increasing. Lat. $21^{\circ} 41' N.$, long. $72^{\circ} 21' E.$

GOIHU, an extensive and mountainous district of the province of Agra, Hindostan, on the south side of the river Chumbul, and between the twenty-sixth and twenty-seventh degrees of north latitude. It is comparatively fertile; and abounds with strong positions; we may instance the celebrated fortress of Gualior. It is governed by a Hindoo prince, but has suffered much from the inroads of the Mahrattas.

GOHUR, the capital, a fortified town, was formerly a village dependent upon Gualior. The present rannah's ancestors were zemindars of this village, and by caste Jauts, of the Bamrowly tribe. Prior to the battle of Paniput, in 1762, they had acquired Gualior, but were compelled to yield it to the Mahrattas. The rannah of Gohud now attempted to shake off the Mahratta yoke, but was subdued by Ragoonauth Row in 1766. On a subsequent rupture Gohud was taken by Madhjee Sindia in 1784.

In 1804 a treaty was entered into by the British government with the rannah of Gohud, Kirrut Singh Luckindra, by which he was to be established in the sovereignty of this and a considerable number of adjacent districts; in consideration of which he was to maintain a subsidiary force of three battalions, and make over the city and fortress of Gualior to the British. Afterwards he agreed to relinquish the country and fort of Gohud, and the other districts guaranteed to him by the former treaty, in consequence of which the British government granted him the districts of Dhelepoor, Baree, and Rajekerali, in perpetual sovereignty.

GOJAM, a populous province of south-eastern Abyssinia, about eighty miles in length, and forty in breadth. It is flat and full of rich pastures, enclosed by a range of very high mountains stretching in a semicircle along the course of the Abyssinian Nile. The cattle are very numerous and rather large.

GOLANA, a city of Brasil, in the province of Itamarca, on the shore of the river of the same name, three leagues from its mouth. Long. $35^{\circ} 16' W.$, lat. $7^{\circ} 39' S.$

GOTANA, a river of Brasil, running east, in the province of Rio Grande, and falling into the Atlantic Ocean.

GOLIAZ, a province of Brasil, bounded chiefly by Minas Geraes on the east, Matto Grosso on the west, and Para on the north. Its greatest length is from lat. 6° to $21^{\circ} S.$ It possesses several gold mines, and diamonds are found in

some parts, but they are not in general of a pure water, though of good size. Cattle, which are bred on the frontiers, and some cotton, are the other objects of trade. The mules, on their return from Rio de Janeiro, are loaded with iron, salt, prints, baizes, fire-arms, powder and shot, hats, and a variety of artificers' tools. The inhabitants personally take away valuable articles to Rio de Janeiro, and lay out the proceeds in negroes (the first object of commerce), iron, salt, &c. The population of this district is small in comparison to its extent. According to Mr. Mawe it is a productive country, having numerous rivers well stored with fish, and woods abounding with fine birds. The principal town, Villa Boa, is situated in lat. $16^{\circ} S.$, about eighty leagues to the west of Paracatu.

GOING, *n. s.* From go.

The act of walking.

When nobles are their taylor's tutors,
No heretics burnt, but wenches suitors,
Then comes the time, who lives to see't,
That *going* shall be used with feet.

Shakspeare.

Pregnancy.

The time of death has a far greater latitude than that of our birth; most women coming, according to their reckoning, within the compass of a fortnight; that is, the twentieth part of their *going*.

Grew's Cosmologia Sacra.

Departure.

Thy *going* is not lonely; with thee goes
Thy husband; him to follow thou art bound.

Milton.

GO'LA, *n. s.* The same with cymatium.

In a cornice the *gola*, or cymatium of the corona, the coping, the modillions or dentelli, make a noble show.

Spectator.

GOLCONDA, a province of Hindostan, now called Hyderabad. It was once the capital of an extensive kingdom under native Hindoo princes, and afterwards a principal division of the Bhamenee sovereignty, upon the fall of which it became the seat of a monarchy under the Cuttub Shahee dynasty. In 1690 it was surrendered, after a siege of seven months, to the Mogul army of Aurengzebe. The deposed sovereign, Abou Houssun, died in confinement here in 1704.

GOLD, *n. s.*

GOLD'-BEATER, *n. s.*

GOLD'-BOUND, *adj.*

GOLD'EN, *adj.*

GOLD'ENLY, *adv.*

GOLD'-FINDER, *n. s.*

GOLD'-SIZE, *n. s.*

GOLD'-HAMMER, *n. s.*

GOLD'ING, *n. s.*

GOLD'NEY, *n. s.*

GOLD'-PLEASURE, *n. s.*

GOLD'Y-LOCKS, *n. s.*

GOLD'SMITH, *n. s.*

GOLD'-FINCH, *n. s.*

Sax. *golds*; Wel.

golud, riches. Either of gold, as Scaliger says, which is in Dut. to shine; 'or of another Dutch word, which is *gellen*, and signifies in Latin *valere*, in English to be of price or value: hence cometh their ordinary word *gel*, for money.'—Pea-

cham. Used figuratively to express value; applied to different things from their color resembling gold; thus gold of pleasure, golden saxifrage, gold-hammer, gold-finch, goldney, goldy-locks, are names of herbs, birds, and fishes; gold-size is a yellow size; gold-smith, one who manufactures gold, &c.; gold-beater, one who beats or foliates

gold to gild other matter; a golden age is a happy and prosperous age.

And forth we went,
Devoutly, soft, and esie pace to se,
Venus the goddess' image all of *golde*.

Chaucer. The Court of Love.

And, as I me advise
The *golden-love*, and leden-love they hight,
The tone was sad, the toder glad and light.

Id.

Ther maist thou see devising of hameis
So uncouth and so riche, and wrought so welle
Of *goldsmithry*, of bronding and of stele.

Id. The Knightes Tale.

And as I stode and cast aside mine eye,
Twas ware of the fairest medlar tree,
That ever yet, in all my life I se
As full of blossomes as it might be;
Therein a *gold-finch* leping pretily,
From bough to bough, and as him list, he ete
Here and there of buddes and floures swete.

Id. The Florie and the Leafe.

Upon her head she wore a crown of *gold*;
To shew that she had powre in things divine.

Spenser's Faerie Queene.

My brother Jacques he keeps at school, and report
speaks *goldenly* of his profit.

Shakspeare. As You Like It.

Thou that so stoutly had resisted me,
Give me thy *gold*, if thou hast any *gold*;
For I have bought it with an hundred blows.

Shakspeare.

Neither chain nor *gold-smith* came to me. *Id.*

So sweet a kiss the *golden* sun gives not
To those fresh morning drops upon the rose;
Nor shines the silver moon one half so bright
Through the transparent bosom of the deep. *Id.*
Many young gentlemen flock to him every day,
and fleet the time carelessly, as they did in the *golden*
world. *Id.*

The king's a baw-cock, and a heart of *gold*,
A lad of life, an imp of fame. *Id. Henry V.*

Thy air,

Thou other *gold-bound* brow is like the first.

Shakspeare.

Gold hath these natures; greatness of weight,
closeness of parts, fixation, plianthness or softness,
immunity from rust, and the colour or tincture of
yellow. *Bacon's Natural History.*

Of singing birds they have linnets, *goldfinches*, rud-
docks, Canary-birds, blackbirds, thrushes, and divers
others. *Carew.*

The gum of ivy is good to put into your *goldsize* and
other colours. *Peacham on Drawing.*

Heaven's *golden* winged herald late he saw

To a poor Galilean virgin sent. *Crashaw.*

The good yeoman wears russet clothes, but makes
golden payment, having time in his buttons, but silver
in his pocket. *Fuller.*

Gold begets in brethren hate,

Gold in families debate;

Gold does friendship separate;

Gold does civil war create.

These the smallest harms of it!

Gold alas! does love beget. *Cowley.*

Corrupt with *gold* thy wives and daughters bring
To the black idol for an offering. *Marvell.*

Our *goldbeaters*, though, for their own profit sake,
they are wont to use the finest *gold* they can get, yet
they scruple not to employ coined *gold*; and that the
mint-masters are wont to alloy with copper or silver,
to make the coin more stiff, and less subject to be
wasted by attrition. *Boyle.*

Nine royal knights in equal rank succeed,
Each warrior mounted on a fiery steed
In *golden* armour glorious to behold;
The rivets of their arms were nailed with *gold*.
Dryden.

That verse which they commonly call *golden*, has
two substantives and two adjectives, with a verb be-
twixt them to keep the peace. *Id.*

A *goldfinch* there I saw, with gaudy pride
Of painted plumes that hopped from side to side.

Id.

We readily say this is *gold*, and that a silver goblet,
only by the different figures and colours represented
to the eye by the pencil. *Locke.*

Golden russeting hath a gold coloured coat under
a russet hair, and its flesh of a yellow colour.

Mortimer.

And see the guardian angels of the good,
Reclining soft on many a *golden* cloud. *Rowe.*

O cursed lust of *gold*, when for thy sake
The fool throws up his interest in both worlds,
First starved in this, then damned in that to come.

Blair's Grave.

His empty paunch that he might fill,

He sucked his vittels through a quill;

Untouched it passed between his grinders,

Or't had been happy for *goldfinders*. *Swift.*

The *goldsmith* or scrivener, who takes all your for-
tune to dispose of, when he has beforehand resolved
to break the following day, does surely deserve the
gallows. *Id.*

Thence arises that *golden* rule of dealing with others,
as we would have others deal with us. *Watts.*

The lust of *gold* succeeds the lust of conquest:

The lust of *gold* unfeeling and remorseless!

The last corruption of degenerate man.

Dr. Johnson's Irene.

And forth an host of little warriors march
Grasping the diamond lance, and targe of *gold*.

Beattie. Minstrel.

Who is this?

Who truly looketh like a demigod,
Blooming and bright, with *golden* hair, and stature,
If not more high than mortal, yet immortal
In all that nameless bearing of his limbs,
Which he wears as the sun his rays.

Byron. Deformed Transformed.

GOLD, in chemistry and metallurgy, is a yellow
metal of specific gravity 19.3. It is found in na-
ture only in a metallic state, and most commonly
in grains, ramifications, leaves or crystals, rhom-
boidal octahedral, or pyramidal. Its matrix is ge-
nerally quartz, sandstone, siliceous schistus, &c.
It is found also in the sands of many rivers,
particularly in Africa, Hungary, and France, in
minute irregular grains, called gold dust. Na-
tive gold is never completely pure; it is alloyed
with silver or copper, and sometimes with iron
and tellurium. The largest piece of native gold,
that has been hitherto discovered in Europe, was
found in the county of Wicklow, in Ireland. Its
weight was said to be twenty-two ounces, and
the quantity of alloy it contained was very small.
Several other pieces, exceeding one ounce, have
also been discovered at the same place, in sand,
covered with turf, and adjacent to a rivelet. The
following is Kirwan's arrangement of the ores of
gold.

Species 1.—Native gold. Its color yellow,
more or less dilute, or brownish-red, like Spanish

snuff, malleable and flexible. Found either in compact masses; or in spangles, inlaying, or disseminated; or capillary, arborescent, ramified, interwoven, or dentiform; or crystallised in cubic, pyramidal, prismatic, or tabular forms; or in grains visibly or invisibly mixed with various other substances. External lustre, 3. Internal 2. Metallic. Fracture, hackly. Hardness 5. Specific gravity exceeds 12, more or less in proportion to the quantity of silver or copper with which it is commonly alloyed, and the cavities it may contain.

The substances in or on which it is found are either stony, sandy, earthy, or inflammable, or ores of other metallic substances. Of the first, the most common is quartz, siliceous schistus, hornstone, sandstone, spar, gypsum, &c., in Hungary, Transylvania, Bohemia, &c.; or trap, or jasper, felspar, or in clays, as in Bohemia; or in the sand of various rivers, in different countries, as Hungary, France, Africa, &c.: particularly in the yellowish-red, and violet sands. It is so generally interspersed through earths of various kinds, that Bergman thinks it more extensively diffused, though in exceedingly small quantities, than any other metal, except iron.

If 100 lbs. of sand contain 24 grs. of gold, it is said the separation is worth attention. In Africa 5 lbs. of sand often contain 62 grs. of gold. The heaviest, which is often black or red, yields most. Gold interspersed through sand, is often separated by mere mechanical means, amply described in the Paris Memoirs for 1718 and 1786; in Born's Letters from Hungary, and in Diedric's Description des Gites des Minerals. Native gold is sometimes invisibly dispersed and disguised, sometimes visibly contained in the form of a brownish-red powder in martial pyrites, as in that in Adelfors in Sweden, and also in Norway, Bohemia, and Siberia. It seems now agreed that it is not really mineralised in these ores. For it is often extracted from them by the mere mechanical means of pounding and washing, or at least from the residuum left after solution in the nitrous acid; its quantity is generally very small, scarcely above 8 grs. in 10,000 of the ore, or 1 oz., or $1\frac{1}{2}$ oz. in 1 cwt. of the ore. That of Facebay, in Transylvania, however, contains 12·5 per cent. of gold.

Gold is also extracted from a particular sort of argentiferous copper pyrites, called, in Hungary, gelf. This is found either massive, or crystallised in rhomboids, or other irregular quadrangular or polygon masses. Its contents in gold and silver are rich, but very unequal: much of the gold may be separated by pounding and washing. Muller concludes that gold exists in it in a state of dispersion, and not combined nor consequently mineralised.

It often also exists in a greenish-yellow copper pyrites, somewhat duller than the common, and containing besides iron, also manganese.

It is found mixed with arsenical pyrites in the valley of Zillar, near Saltzburgh. The quintal affords only twenty-five grains. It is separated by washing, and affords a profit of about £400 or £500 per annum.

It is sometimes found in the sulphurated silver ores of Hungary and Saxony, and is sepa-

rated, after the expulsion of the sulphur, by nitrous acid, as the gold falls to the bottom in the form of black powder.

The most remarkable ores in Europe affording gold, are those of Nagaya, in Transylvania; they, properly speaking, are compounds of several sulphurated ores, among which native gold occurs either in the state of a metallic alloy, or more or less plentifully disseminated, though invisible by the help of microscopes.

Of these ores there are five sorts, the antimonia, the arsenical, the blendose, the manganese, and the sylvanitic. The first and principal is the antimonia. Blatter erze of some, or gold ore of Nagaya. Its color is bluish-gray, or intermediate between that and the iron gray. It is found in plates of various thickness, adhering to, but separable from each other, or intersecting each other in various directions, and somewhat flexible. These, some say, are crystallised in hexangular forms, but Ruprecht denies it; between them the white ore presently to be mentioned is often found. Lustre 3. Metallic. Transparency 0. Their fracture foliaceous, inclining sometimes to the granular.

The hardness of the plates is 6. Their specific gravity 8·919. They scrape into flakes like plumbago, and like it stain the fingers. Soluble in acids with effervescence. When pulverised three per cent. of these plates are attracted by the magnet, and twenty-one per cent. soluble in nitrous acid. The solution is greenish, the residuum purplish: 100 parts of this ore contain about twelve of silver and gold, the remainder consists of iron, lead, and antimony, all sulphurated, and silex; the proportions are not accurately stated in the incomplete and unsatisfactory analyses that have as yet appeared.

The color of the arsenical ore is, according to Ruprecht, tin white, according to Muller, yellowish white, according to Born, yellowish gray. Its fracture granular or foliated, often striated or fibrous. Its specific gravity, 10·678. It is so fusible as not to bear roasting. When pulverised the magnet attracts nearly five per cent. of it, and nitrous acid dissolves 72, 5 per cent. of it. The color of the solution is light green, and of the residuum blackish-brown. Mild fixed alkalis afford, both with the solutions of this, and of the former ore, a light yellow precipitate. By Muller's account, it contains about twenty-five per cent. of auriferous silver.

Hence Werner calls it the silver ore of Nagaya. Born tells us it contains antimony, iron, and gold. The matrix of both these ores is a grayish quartz, or hornstone and silex mixed with white calx of manganese.

Of the blendose ores, Muller mentions two varieties, the black and the red, or the reddish-brown (this last phosphoresces, when scraped in the dark; the black does not), whose external appearances do not probably differ from those of the common blendose ores, besides zinc, iron and sulphur; most of them contain antimony also, and some manganese.

The specific gravity of the black, according to Muller, is 5·398; which exceeds the specific gravity of mere blend. The nitrous acid dissolves ninety-seven per cent. of it with an hepatic

smell, which common blends yield only when treated with marine or vitriolic acids. It contains .062 per cent. of auriferous silver. The reddish-brown is still poorer, and seems a mixture of blend, manganese, lead, and arsenic, with a small proportion of auriferous silver. The red exposed to the blow-pipe gives a purple tinge to borax if nitre be added. The black does the same, even without that addition, a sign that they contain manganese.

The manganesian ore consists of thin laminae, of a gray color, somewhat withered, inserted in a matrix of whitish manganese. According to Haecquet it is very poor in gold, but baron Born tells us it contains twenty-five per cent. of this metal, and is the richest of all the ores found in that country. Yet it is so light, that it is called cotton ore.

The sylvanitic ore; Weisses golderz of the Germans; Aurum Graphicum, of some; is according to baron Born of a whitish color, intermediate betwixt that of antimony and bismuth. Lustre, 3. It consists of amorphous plates, whose fracture is granular, like that of steel.

Its fragments prismatic. Its hardness from 4 to 5. Brittle. Its specific gravity, 5.723; its matrix an aggregate of lithomarga and quartz, with pyrites interspersed. Before the blow-pipe it decrepitates and melts like lead. It burns with a lively brownish flame and disagreeable smell, and at last vanishes in a white smoke, leaving only a whitish earth.

According to Wallerius, native gold is found, 1. In solid masses. In Hungary, Transylvania, and Peru. 2. In grains. In the Spanish West Indies. 3. In a vegetable form, like the branches or twigs of plants. 4. In a drusic figure, as if composed of groups or clusters of small particles united together, found in Hungary. 5. Composed of thin plates, on thin pellicles covering other bodies, found in Siberia. 6. In a crystalline form in Hungary. Gold is also found in the form of thick solid pieces. It is in general more frequently imbedded in quartz, and mixed with it than with any other stone; and the quartz in which the gold is found in the Hungarian mines, Mr. Magellan tells us, is of a peculiarly mild appearance. Sometimes, however, it is found in limestone, hornblende, &c. Europe is principally supplied with gold from Chili and Peru in South America. A small quantity is likewise imported from China and the coast of Africa. The principal gold mines of Europe are those of Hungary, Salzburg, and Adelfors in Smaland. Some gold is also extracted from the silver mines of Östersilvarberget, in the province of Dalarna. Native gold has been found in Lapland, above Tornea, and in Westmanland. In Peru it is found mixed with a stony matter not well known, from which it is extracted by amalgamation. Sometimes kernels or lumps of a spongy texture, and very light, are met with, which contain a good quantity of gold dust. Gold is also found separate from any matrix, in lumps of visible grains mixed with sand in the beds of rivers.

Perfectly pure gold may be obtained, by dissolving the gold of commerce in nitro-muriatic acid, and precipitating the metal, by adding a

weak solution of sulphate of iron. The precipitate, after being well washed and dried, is pure gold. For the methods of analysing the ore or metal, see ASSAYING, CUPELL, METALLURGY, &c.

Pure gold is very soft, tough, ductile, and malleable, unaltered by the most powerful furnaces, but volatilised by the intense heat of powerful burning mirrors; and it has been driven up in fumes by a stream of oxygen urged upon it when red hot. The electric shock converts it into a purple oxide, as may be seen by transmitting that commotion through gold leaf, between two plates of glass; or by causing the explosive spark of three or more square feet of coated glass to fall upon a gilded surface. A heat of 32° W., or perhaps 1300° F. is required to melt it, which does not happen till after ignition. Its color, when melted, is of a bluish-green; and the same color is exhibited by light transmitted through gold leaf. But silver, copper, and all the rest of the metals which can be formed into leaves, are perfectly opaque.

No acid acts readily upon gold but aqua regia and aqueous chlorine. Chromic acid, added to muriatic, enables it to dissolve gold.

When gold is immersed in aqua regia, an effervescence takes place, and the solution tinges animal matters of a deep purple, and corrodes them. By careful evaporation, fine crystals of a topaz color may be obtained. The gold is precipitated from its solvent by a great number of substances. Lime and magnesia precipitate it in the form of a yellowish powder. Alkalies exhibit the same appearance; but an excess of alkali redissolves the precipitate. The precipitate of gold, obtained from aqua regia by the addition of a fixed alkali, appears to be a true oxide, and is soluble in the sulphuric, nitric, and muriatic acids; from which, however, it separates by standing, or by evaporation of the acids. Gallic acid precipitates gold of a reddish color, very soluble in the nitric acid, to which it communicates a fine blue color.

Ammonia precipitates the solution of gold much more readily than fixed alkalies. This precipitate, which is of a brown, yellow, or orange color, possesses the property of detonating with a considerable noise when gently heated. It is known by the name of fulminating gold. See POWDER, FULMINATING. When precipitated from this solution by tin, it forms the purple precipitate of Cassius, so much used in enamelling. This consists of an oxide of gold, mixed with an oxide of tin. Sulphurets precipitate gold from its solvent, the alkali uniting with the acid, and the gold falling down combined with the sulphur; of which, however, it may be deprived by moderate heat.

The solution of gold in sulphuric ether appears to crystallise after a considerable time. Mr. Sivright having allowed a solution of gold in sulphuric ether to stand four days in a vessel, with a cork and a piece of leather tied over it, found that a great part of the liquid had evaporated, leaving the gold in the form of a thin plate, which has the usual brightness of pure gold, and resembles the flat pieces of native copper found in Cornwall. There were distinct crystals in one or two parts of the plate.

The peroxide of gold thrown down by potash, from a solution of the neutral muriate, consists, according to Berzelius, of 100 gold and twelve oxygen. It is probably a tri-oxide. The protoxide of a greenish color is procured by treating with potash water muriate of gold, after heat has expelled the chlorine. It seems to consist of 100 metal + 4 oxygen. The prime equivalent of gold comes out apparently 25.

Most metals unite with gold by fusion. With silver it forms a compound, which is paler in proportion to the quantity of silver added. It is remarkable, that a certain proportion, for example a fifth part, renders it greenish, but occasions hardly any perceptible alteration of ductility, hardness, or mean specific gravity.

A strong heat is necessary to combine platina with gold: it greatly alters the color of the gold, if its weight exceed the forty-seventh part of the mass.

Mercury is strongly disposed to unite with gold, in all proportions, with which it forms an amalgam: this, like other amalgams, is softer the larger the proportion of mercury. It softens and liquifies by heat, and crystallises by cooling. Lead unites with gold, and considerably impairs its ductility, one-fourth of a grain to an ounce rendering it completely brittle. It gives an alloy externally resembling fine pale gold, but which is as brittle as glass, is wholly destitute of metallic lustre, and has a fine-grained porcellaneous appearance: its specific gravity a little less than the mean. The very fumes of this metal are nearly as prejudicial to the ductility of gold as those of bismuth.

Copper renders gold less ductile, harder, more fusible, and of a deeper color. This is the usual addition in coin, and other articles used in society. Tin renders it brittle in proportion to its quantity; but it is a common error of chemical writers to say, that the slightest addition is sufficient for this purpose. When alloyed with tin, however, it will not bear a red heat. With iron it forms a gray mixture, which obeys the magnet. This metal is very hard, and is said to be much superior to steel for the fabrication of cutting instruments.

With bismuth, in the proportion of thirty-eight grains to the ounce, it yields an alloy of a pale greenish yellow, excessively brittle, and exhibiting a fine-grained earthy fracture: its specific gravity somewhat greater than the mean. If standard gold be alloyed with even a quarter of a grain of bismuth in the ounce, the mixture, although in color and texture resembling gold, is yet perfectly brittle.

Arsenic, on account of its volatility, can be combined with gold only in small proportions.

The alloy, or mixed metal hence produced, is of a gray color, coarse granular fracture, and very brittle.

Antimony, mixed by fusion with either fine or standard gold in the proportion of not more than $\frac{1}{4}$ gr. to the ounce (being not more than $\frac{1}{700}$ of the whole mass), will give a brittle compound of a close granular fracture, with little metallic lustre: while, with a change quite as extraordinary as in nickel, mixed in the proportion of thirty-eight grains to the ounce, produces an alloy of the

color of fine brass, with a coarse-grained earthy fracture, and very brittle: its specific gravity being somewhat less than the mean. With manganese, in its black oxide, gold will combine, and produce an alloy of a reddish gray, capable of receiving a brilliant lustre like steel: the mixed metal is exceedingly hard, and so far possessed of ductility as to be in some measure flattened by the hammer before it breaks.

Zinc greatly injures the ductility of gold, and, when equal in weight, a metal of a fine grain is produced, which is said to be well adapted to form the mirrors of reflecting telescopes, on account of the fine polish it is susceptible of, and its not being subject to tarnish. The alloys of gold with molybdena are not known. It could not be mixed with tungsten, on account of the infusibility of this last substance.

Mr. Hatchett gives the following order of different metals, arranged as they diminish the ductility of gold: bismuth, lead, antimony, arsenic, zinc, cobalt, manganese, nickel, tin, iron, platina, copper, silver. The first three were nearly equal in effect; and the platina was not quite pure.

For the purposes of coin, Mr. Hatchett considers an alloy of equal parts of silver and copper as to be preferred, and copper alone as preferable to silver alone.

The limits of the ductility and malleability of gold are not known. According to Cronstedt, one grain of it may be stretched out so as to cover ninety-eight Swedish ells, equal to 63.66 English yards of silver wire; but Wallerius asserts, that a grain of gold may be stretched in such a manner as to cover 500 ells of wire. At any rate, the extension is prodigious; for, according to the least of these calculations, the 1,000,000th part of a grain of gold may be made visible to the naked eye. Nor is its malleability inferior to its ductility. Poyle, quoted by Apligny in his Treatise of Colors, says, that one grain and a half of gold may be beaten into fifty leaves of one inch square, which, if intersected by parallel lines drawn at right angles to each other, and distant only the 100th part of an inch from each other, will produce 25,000,000 of little squares, each very easily discernible to the naked eye.

By the weight and measure of the best wrought gold leaf, it is found that one grain is made to cover $56\frac{1}{2}$ square inches; and from the specific gravity of the metal together with this admeasurement, it follows that the leaf itself is $\frac{1}{320000}$ part of an inch thick. This, however, is not the limit of the malleability of gold; for the gold-beaters find it necessary to add three grains of copper in the ounce to harden the gold, which otherwise would pass round the irregularities of the newest skins, and not over them; and in using the old skins, which are not so perfect and smooth, they proceed so far as to add twelve grains. From further calculation it appears that sixteen ounces of gold, which would form a cube of about one inch and a quarter, would be sufficient to gild a silver wire equal in length to the circumference of the globe. See CHEMISTRY.

GOLDBEATER'S SKIN, *n.s.* The intestine rectum of an ox, which goldbeaters lay between the leaves of their metal while they beat it, where-

by the membrane is reduced thin, and made fit to apply to cuts or small fresh wounds, as is now the common practice.

When your gillyflowers blow, if they break the pod, open it with a penknife at each division, as low as the flower has burst it, and bind it about with a narrow slip of *goldbeater's skin*, which moisten with your tongue, and it will stick together. *Mortimer.*

GOLDEN FLEECE, in the ancient mythology, was the skin and fleece of the ram upon which Phryxus and Helle are said to have swum over the sea to Colchis; and which, being sacrificed to Jupiter, was hung upon a tree in the grove of Mars, guarded by two brazen-hoofed bulls, and a monstrous dragon that never slept; but was taken and carried off by Jason and the Argonauts. Some authors have endeavored to show that this fable is an allegorical representation of some real history, particularly of the philosopher's stone. Others have explained it by the profit of the wool-trade to Colchis, or the gold which they commonly gathered there with fleeces in the rivers. See ARGONAUTS.

GOLDEN FLEECE, ORDER OF THE, a military order instituted by Philip the Good, duke of Burgundy, 1427; thus named from a representation of the golden fleece, borne by the knights on their collars, which consisted of flints and steels. The king of Spain, as duke of Burgundy is grand master of the order; the number of knights is fixed to thirty-one. It is said to have been instituted on occasion of an immense profit which that prince made by wool; though others will have a chemical mystery couched under it, as that famous one of the ancients, which the adepts pretend to be the secret of the *elixir vitæ*, written on the skin of a sheep.

GOLD THREAD, or spun gold, is a gilt wire, wrapped or flatted over a thread of yellow silk, by twisting it with a wheel and iron bobbins. By means of a curious machinery, a number of threads is thus twisted at once by the turning of a wheel. The principal art consists in so regulating the motion, that the several circumvolutions of the wire, on each thread, may just touch one another, and form, as it were, one continued covering. At Milan, it is said, they make a sort of flatted wire, gilt only on one side, which is wound upon the thread, so that only the gilt side appears. There is also a gilt copper wire, made in the same manner as the gilt silver, chiefly at Nuremberg. The Chinese, instead of flatted gilt wire, use slips of gilt paper, which they interweave in their stuffs, and twist upon silk threads.

GOLDONI, a celebrated dramatic author, born at Venice in 1707. Having shown an early attachment to dramatic performances his father, Dr. Goldoni, had a small theatre erected in his own house, in which, while a mere child, he and his companions amused themselves by acting comedies. Having finished his grammatical and rhetorical studies at Venice and Prague, he went to Rimini to study philosophy; but, preferring the theatre to Aristotle, he went off with a company of comedians to Chiozzo. After attempting to study the law at Venice, he became secretary to the resident of that state at Milan. In this city he wrote his Venetian Gondolier, the first of his comedies that was acted and printed; and soon after composed several other

pieces for a Venetian company then at Milan, and whom he accompanied to Genoa, where he married. After visiting Tuscany, Florence, and Pisa, he returned to Venice, and wrote comedies for the theatre of St. Angelo. These cost him so little trouble, that it is said he wrote sixteen new comedies, besides forty-two other pieces for that theatre, within a year; and many of these, though so rapidly executed, are considered as his best productions. The first edition of his works was published in 10 vols. 8vo, 1753. He wrote afterwards a great number of pieces for the theatre at St. Luke, which were published under the title of *The New Comic Theatre*. He composed fifty-nine other pieces between 1753 and 1761; and, on the invitation of duke Philip, visited Parma, from whence he went to Rome. He next went to Paris on the invitation of M. Zenuzzi, the chief actor on the Italian theatre there, with whom he engaged for two years. After this, he was employed as an Italian teacher to the princesses, aunts to the unfortunate Louis XVI.; for which he received 4000 livres a-year, and a present of 100 louis d'ors in a gold box. In his sixty-second year he wrote a French comedy, entitled *Bourru Bienfaisant*, which was acted at Louis XVI.'s marriage; and for which he received 150 louis from the king, besides considerable sums from the performers and book-sellers. He died at Paris in 1792, aged eighty-five. As a dramatic author, he is reckoned equal to the best comic poets of modern times; and in fertility of invention superior to them all. His whole works were printed at Leghorn, in 1788—91, in 31 vols. 8vo. He has been styled the *Moliere of Italy*; and Voltaire, in a letter to the *marquis Albergati*, called him the *Painter of Nature*. His favorite work, generally reckoned his master-piece, was his *Terence*. His last piece was his *Volponi*.

A GOLDSMITH, or Silversmith, is an artist who makes vessels, utensils, and ornaments, in gold and silver. There is a vast variety in the works made, and tools used, by goldsmiths, which we cannot here particularise. Works that have raised figures are cast in a mould, and afterwards carved, or polished and finished; plates or vessels of silver or gold are beat out from thin flat plates; table and tea-spoons, &c., are beat out from solid ingots, and their mouths struck up with a punch; tankards, and other vessels of that kind, are formed of plates soldered together, and their mouldings are beat, not cast. The business of the goldsmiths formerly required more labor than it does at present; for they were obliged to hammer the metal from the ingot to the thinness they wanted; but, since the invention of flattening-mills, the metals are reduced to the thinness required at a small expense. As the goldsmith often has to make his own moulds, he ought to be a good designer, and have a taste in sculpture: he also ought to know enough of metallurgy to be able to assay and refine gold and silver, and to mix the exact quantity of alloy. The goldsmiths in London employ different hands under them for the various branches of their trade; such as jewellers, box-makers, toy-makers, turners, gilders, burnishers, chasers, refiners, founders, &c. Their wares must be assayed by the wardens of

their own company in London, and marked; and the gold and silver must be of the standard fineness, under a penalty of £10. Any false metal may be seized and forfeited to the king. The cities of Edinburgh, York, Exeter, Bristol, &c., have also places appointed for assaying gold and silver plate. Plate sent to the assay-office, when discovered to be coarser than the standard, is broken and defaced; and the fees for assaying are limited.

GOLDSMITH (Oliver), was born at Roscommon, in Ireland, in 1729. His father, who possessed a small estate in that county, had nine sons, of whom Oliver was the third. After being instructed in the classics, he was, with his brother the Rev. Henry Goldsmith, placed in Trinity College, Dublin, about the end of 1749. In this seminary he took the degree of B. D.; but, his brother not being able to obtain preferment, Oliver turned to the study of physic; and, after attending some courses of anatomy in Dublin, proceeded to Edinburgh in 1751, where he studied medicine under the professors of that university. His benevolent disposition soon involved him in difficulties; and he was obliged precipitately to leave Scotland, in consequence of an engagement to pay a considerable sum for a fellow-student. A few days after, about the beginning of 1754, he arrived in Sunderland, near Newcastle, where he was arrested at the suit of a tailor in Edinburgh, to whom he had given security for his friend. By the good offices of Lachlan Maclane, esq. and Dr. Sleigh, then in college, he was delivered out of the hands of the bailiff; and took his passage on board a Dutch ship to Rotterdam, where, after a short stay, he proceeded to Brussels. He then visited great part of Flanders; and after passing some time at Strasburg and Louvain, where he took the degree of M. B., he accompanied an English gentleman to Berne and Geneva. He travelled on foot during the greatest part of his tour, having left England with very little money. Being capable of sustaining fatigue, and not easily terrified at danger, he became enthusiastically fond of visiting different countries. He had some knowledge of French and of music; and played tolerably well on the German flute; which, from an amusement, became at times the means of subsistence. His learning procured him an hospitable reception at most of the religious houses; and his music made him welcome to the peasants of Flanders and other parts of Germany. 'Whenever I approached,' he used to say, 'a peasant's house towards night-fall, I played one of my most merry tunes; and that procured me not only a lodging, but subsistence for the next day: but in truth, I must own, whenever I attempted to entertain persons of a higher rank, they always thought my performance odious, and never made me any return for my endeavours to please them.' On his arrival at Geneva, he was recommended as a travelling tutor to a young man who had been left a considerable sum of money by his uncle, a pawnbroker, near Holborn. During Goldsmith's continuance in Switzerland, he assiduously cultivated his poetical talents, of which he gave some proofs while at the college of Edinburgh.

It was here he sent the first sketch of his delightful poem called *The Traveller*, to his brother the clergyman in Ireland, who lived with an amiable wife on an income of only £40 a-year. From Geneva Mr. Goldsmith and his pupil visited the south of France; where the young man, upon some disagreement with his preceptor, paid him the small part of his salary which was due, and embarked at Marseilles for England. Our wanderer was left once more upon the world at large, and passed through various difficulties in traversing the greatest part of France. At length, his curiosity being satisfied, he bent his course towards England, and arrived at Dover the beginning of the winter of 1758. When he came to London, his cash did not amount to two livres. Being an entire stranger, his mind was filled with the most gloomy reflections. With difficulty he discovered that part of the town in which his old acquaintance Dr. Sleigh resided. This gentleman received him with the warmest affection, and liberally invited him to share his purse till some establishment could be procured for him. Goldsmith, unwilling to be a burden to his friend, eagerly embraced an offer which was made him soon after to assist the late Rev. Dr. Milner in an academy at Peckham; and acquitted himself greatly to the doctor's satisfaction; but having obtained some reputation, by the criticisms he had written in the *Monthly Review*, Mr. Griffith, the proprietor, engaged him in the compilation of it; and, resolving to pursue the profession of an author, he returned to London, as the mart where abilities of every kind meet distinction and reward. As his finances were not in a good state, he adopted a plan of the strictest economy; and took lodgings in an obscure court in the Old Bailey, where he wrote several ingenious pieces. The late Mr. Newberry, who gave great encouragement to men of literary abilities, became a patron to him, and introduced him as one of the writers in the *Public Ledger*, in which his *Citizen of the World* originally appeared, under the title of *Chinese Letters*. His fortune now began to improve. The simplicity of his character, the integrity of his heart, and the merit of his productions, made his company very acceptable to a number of respectable families; and he emerged from his shabby apartments in the Old Bailey to the politer air of the Temple, where he took handsome chambers, and lived in a genteel style. The publication of his *Traveller*, and his *Vicar of Wakefield*, was followed by the performance of his comedy of the *Good-natured Man* at Covent-Garden theatre, and placed him in the first rank of the poets of the eighteenth century. Among many other persons of distinction who were desirous to know him, was the duke of Northumberland: and a circumstance that attended his introduction to that nobleman shows a striking trait of his character. 'I was invited,' said the Doctor, 'by my friend Mr. Percy, to wait upon the duke, in consequence of the satisfaction he had received from the perusal of some of my productions. I dressed myself in the best manner I could; and, after studying some compliments I thought necessary on such an occasion, proceeded to Northumberland-house, and ac-

quainted the servants that I had particular business with his Grace. They showed me into an antichamber; where, after waiting some time, a gentleman, very genteely dressed, made his appearance. Taking him for the duke, I delivered all the fine things I had composed in order to compliment him on the honor he had done me; when, to my great astonishment, he told me I had mistaken him for his master, who would see me immediately. At this instant the duke came into the apartment; and I was so confused on the occasion, that I wanted words barely sufficient to express the sense I entertained of the duke's politeness, and went away extremely chagrined at the blunder I had committed. Another anecdote exhibits the strict integrity of his character. Previous to the publication of his *Deserted Village*, the bookseller had given him a note for 100 guineas for the copy, which the Doctor mentioned a few hours after to one of his friends: who observed, it was a very great sum for so short a performance: 'In truth,' replied Goldsmith, 'I think so too; I have not been easy since I received it; therefore I will go back and return him his note:' which he absolutely did; and left it entirely to the bookseller to pay him according to the profits produced by the sale of the piece; which, however, turned out very considerable. During the last rehearsal of his comedy, entitled, *She stoops to Conquer*, which Mr. Coleman had no opinion would succeed, on the Doctor's objecting to the repetition of one of Tony Lumpkin's speeches, being apprehensive it might injure the play, the manager with great keenness replied, 'Psha, my dear Dr. do not be fearful of squibs, when we have been sitting almost these two hours upon a barrel of gunpowder.' The piece, however, was received with uncommon applause by the audience; and the severity of Coleman's observation put an end to the Doctor's friendship for him. Notwithstanding the great success of his pieces, by some of which he cleared £1800 in one year, his circumstances were not in a prosperous situation; partly owing to the liberality of his disposition, and partly to a habit of gaming, of the arts of which he knew very little, and thus became the prey of those who took advantage of his simplicity. Before his death he published the prospectus of a *Universal Dictionary of Arts and Sciences*; and, as his literary friends, Sir Joshua Reynolds, Dr. Johnson, Mr. Beauclerc, Mr. Garrick, and others, had undertaken to furnish him with articles upon different subjects, he entertained the most sanguine expectations from it. The undertaking, however, did not meet with that encouragement from the booksellers, which he had imagined it would receive; and he lamented this circumstance almost to the last hour of his life. He had been for some years afflicted, at different times, with a violent stranguy, which contributed to embitter the latter part of his life; and which, united with the vexations which he suffered upon other occasions, brought on a kind of habitual despondency. In this unhappy condition he was attacked by a nervous fever, which terminated in his death, on the 4th of April, 1774. His character is justly expressed by Pope:—

In wit a man, simplicity a child.

The learned leisure he loved to enjoy was often interrupted by distresses which arose from the liberality of his temper, and which sometimes threw him into loud fits of passion; but this impetuosity was corrected upon reflection; and his servants have been known upon these occasions, purposely to throw themselves in his way, that they might profit by it immediately after; for he who had the good fortune to be reproved, was certain of being rewarded for it. The universal esteem in which his poems were held, and the repeated pleasure they gave in the perusal, is a striking test of their merit. He was a studious and correct observer of nature; happy in the selection of his images, in the choice of his subjects, and in the harmony of his versification; and, though his embarrassed situation prevented him from finally revising many of his productions, his *Hermit*, his *Traveller*, and his *Deserted Village*, claim a place among the most finished pieces in the English language. Besides the works above mentioned, he wrote, 1. *History of the Earth and Animated Nature*, 6 vols. 8vo. 2. *History of England*, 4 vols. 8vo. 3. *History of Rome*, 2 vols. 4. *Abridgements of the two last for the use of schools*. 5. *A view of Experimental Philosophy*, 3 vols. 8vo. A posthumous work. 6. *Miscellanies, &c.*

GOLETTA, or GOULETTA, the port of Tunis, being a channel of communication between the lake and sea. It was formerly deep and extensive, but is reduced now to a depth nowhere exceeding six feet. It is defended on each side by a well-built castle.

GOLF, a game much practised in Scotland, and said to be peculiar to this country. It has been very ancient; for there are statutes prohibiting it as early as 1457, lest it should interfere with the sport of archery. Some derive the name from a Dutch game, called *Kolf*, in some respects similar, being played with clubs, though in others very different. Golf is commonly played on rugged broken ground, covered with short grass, near the sea-shore. A field of this sort is in Scotland called *links*. The game is generally played in parties of one or two on each side. Each party has an exceedingly hard ball, somewhat larger than a hen's egg. This they strike with a slender and elastic club, about four feet long, crooked in the head, and having lead run into it to make it heavy. The ball, being struck with this club, will fly to the distance of 200 yards, and the game is gained by the party who puts his ball into the hole with the fewest strokes. But the game does not depend solely upon the striking of the longest ball, but also upon measuring the strength of the stroke, and applying it in such directions as to lay the ball in smooth ground, whence it may be easily moved at the next stroke. To encourage this amusement, the city of Edinburgh, A. D. 1744, gave to the company of golfers a silver club, to be played for annually by the members, the victor to append a gold or silver piece to the prize. For their better accommodation, twenty-two of the members subscribed £30 each in 1768 for building a house for their meetings. The spot chosen for this purpose was the south west corner of *Leith links*,

where an area was feued from the magistrates of Edinburgh, and a commodious house and tavern built upon it.

GOLIUS (James), a celebrated professor of Arabic and the mathematics at Leyden, descended from a very honorable family, and born at the Hague in 1596. He studied at Leyden, under Erpenius; and, having acquired the learned languages, travelled into Asia and Africa. He was esteemed and honored by Muley Zidan, emperor of Morocco and the grand signior. He brought home many MSS. to Leyden; and in 1624 succeeded Erpenius. As he had been an eye-witness of the wretched state of Christianity in the Mahomedan countries, he endeavoured to procure a new edition of the New Testament, in the original language, with a translation into the vulgar Greek, by an Archimandrite; and, as some of these Christians use the Arabic tongue in divine service, he also dispersed among them an Arabic translation of the Confession of the Protestants, with the Catechism and Liturgy. He was likewise appointed interpreter to the states for the Arabic, Turkish, Persian, and other eastern languages. He published, 1. The life of Tamerlane, in Arabic. 2. The history of the Saracens, written by Elmacin. 3. Alferganus's elements of Astronomy, with a new version, and learned commentaries. 4. An excellent Arabic lexicon. 5. A Persian Dictionary. He died in 1667.

GOLL, *n. s.* Corrupted, as Skinner thinks, from Sax. *þal* or *pól*, whence *pealsan*, to handle or manage. Hands; paws; claws. Used in contempt, and obsolete.

They set hands, and Mopsa put her golden *golls* among them; and blind fortune, that saw not the colour of them, gave her the pre-eminence. *Sidney*.

GOLLEN, or **GELLA**, a strait of the Baltic, between Stralsund and Rugen. On the north it is gradually filling up with sand, but is extending eastward.

GOLNITZ, a town in the palatinate of Zyps, Upper Hungary, where iron abounds. It is fourteen miles south-east of Kapsdorf. Population 5000.

GOLTZIUS (Henry), a famous engraver and painter, born in 1558, at Mulbreck, in the duchy of Juliers. He was taught engraving by Theodore Van Cuerehert. He travelled through Germany into Italy; visited Bologna, Florence, Naples, Venice, and Rome. In this journey he adopted a singular disguise, making his servant pass for his master, while he himself appeared as a servant, kept by the other merely for his skill in painting. Under this disguise he enjoyed life in all its variety. On his return he settled at Haerlem, where he died in 1617, aged fifty-nine. No man ever surpassed, and few have equalled, him in the command of the graver and freedom of execution. He copied the style of Albert Durer, Lucas of Leyden, and other old masters, with astonishing exactness. He engraved several of his own designs on wood, in *chiaro-scuro*. Of his prints, which are very numerous, the following are the most celebrated: 1. Six large upright plates, styled his master-pieces. These he engraved, to show that he was perfectly capable of imitating the styles of Durer, Lucas, and others,

whose works were then held in higher estimation than his own: for he had adopted a new manner, which he pursued because he thought it superior. It is said that, with one of them, the Circumcision, which he smoked to give it the more plausible air of antiquity, he actually deceived some of the first connoisseurs of that age; by one of whom it was bought for an original engraving of Albert Durer. The subjects of these plates are, The Annunciation of the Virgin; Her meeting with Elizabeth; the Nativity; the Circumcision; the Adoration of the Wise Men; the Holy Family. 2. The Judgment of Midas; and, 3. The Venetian Ball (both large plates lengthwise), from Theodore Bernard. 4. The Boy and Dog, a middling sized upright plate, from a design of his own; an admirable print. 5. The Necromancer, a middling sized upright oval print, in *chiaro-scuro*. 6. Night in her Chariot, the same.

GOLTZIUS (Hubert), a learned German, born in Venlo, in Gueldres, in 1526. He travelled through Germany, France, and Italy, to make collections of medals, &c. He was the author of several excellent works, in which he was so accurate, that he had them printed at his own house, under his own correction, and even engraved the plates with his own hand. Among these his *Imperatorum fere omnium vivæ imagines*, a *J. Cæsare ad Carolum V. ex veteribus numismatibus*, is an admirable work. He died at Bruges, in 1583, aged fifty-seven.

GOMBROON, or **BUNDER ABBAS**, a celebrated sea-port of Laristan, in Persia, on a bay of the gulf of Ormus. Its trade was formerly extensive, being the principal port of all the south of Persia. The customs now do not amount to more than 20,000 rupees annually. It is fortified with double walls, and is subject to the imaum of Mascat.

GOMER, in Scripture history, the son of Japheth (Gen. x. 2), and, according to Josephus, father to the people of Galatia. The ancient inhabitants of that country were called Gomares before the Galatians seized possession of it. The Chaldee places Gomer in Africa; Bochart in Phrygia, because Phrygia, in Greek, has the same signification (a coal) as Gomer in Hebrew and Syriac. Others are of opinion that the ancient Cimbri, or Cimmerians, sprung from Gomer, and probably from them the Welsh, called Cymri. It is not improbable that Gomer, or the Gomerites, his descendants, peopled likewise Germany and Gaul; the name German not differing much from Gomeian. Cluvier conjecturing that the ancient Celtica comprehended Illyria, Germany, Gaul, Spain, and the British Isles, as all these people anciently spoke the same language, farther supposes that Gomer, or his family, peopled the countries in Asia, between the Paropamisus and mount Imaus, and between the confluence of the Oxus and Oby; whence these people are called Gomares by Ptolemy and Mela.

GOMER, a county of Hungary, between those of Liptau and Borsod, and extending along the rivers Rima and Sajó. The county of Kis-Hont was annexed to it in 1802; the two together containing an area of 1610 square miles, and 144,000 inhabitants. Its most remarkable mountains are

the Oehsenberg and Szinetz, connected with the Carpathians. Here are found the best iron, and at Theissholtz the only natural magnets in Hungary. The bread is also celebrated. At Agtelek there is also a curious cavern. The town has about 2000 inhabitants, and is ninety-two miles N. N. E. of Budah.

GOMERA, one of the most fertile of the Canary Isles, consists properly of a lofty mountain, the upper part of which is in winter covered with snow. It is about twenty miles long, and ten wide, but cultivation is confined to the coast; the centre being a great forest. The capital, of this name, is situated on the east coast, and has a good harbour. Population about 7000. Eighteen miles south-west of Teneriffe. Long. 17° 8' W., lat. 28° 6' N.

GOMPHOSIS, *n. s.* Gr. *γομφος*, a nail. A particular form of articulation.

Gomphosis is the connexion of a tooth to its socket.

Wiseman.

GOMPIRENA, globe amaranth, eternal or everlasting flower, in botany, a genus of the digynia order, and pentandria class of plants; natural order fifty-fourth, miscellanæ. *CAL.* colored; the exterior one triphyllous, or diphyllous, with two carinated connivent leaflets; the nectarium cylindrical, with ten teeth: *CARS.* monospermous. There are ten species; only one of which is commonly cultivated in our gardens, viz. the

G. globosa. It has an upright stalk branching all around, two or three feet high, garnished with oval, lanceolate, opposite leaves; and every branch and side-shoot terminated by a close globular head of flowers, composed of numerous, very small starry florets, closely covered with dry scaly calices placed imbricatum, persistent and beautifully colored purple, white, red, or striped and variegated. The flowers themselves are so small and closely covered with scaly calices, that they scarcely appear. The numerous closely placed scaly coverings, being of a dry firm consistence, colored and glittering, collected into a compact round head, about the size of an ordinary cherry, make a fine appearance. They are annual plants, natives of India; and require artificial heat to raise and forward them to a proper growth, so that they may flower in perfection, and produce ripe seed. They flower from June to November; and if the flowers are gathered when at full growth, and placed out of the sun they will retain their beauty several months.

GOMUT, a navigable river of Bengal, which traverses the district of Tippera from east to west, and falls into the Megna, some miles to the north of Chandpoor. It is navigable at all seasons.

GONAVE, an island and town in the bay of Leogane, on the western side of St. Domingo. It is forty miles long, and about nine broad. Petite Gonave is a smaller isle, about two miles each way, separated from the south-east corner of this by a channel three miles wide. Forty miles west by north-west of Port au Prince.

GONDAR, the capital of Abyssinia, seated on the top of a hill of considerable height, and surrounded by a valley of that name. It contains about 10,000 families in times of peace.

Vol. X.

At the west end of the town is the king's palace; formerly a structure of considerable consequence. See ABYSSINIA. The hill on which the town is built rises in the middle of the valley, through which run two rivers: one, the Kakha, coming from the mountain of the Sun, flanks all the south of the town; while the other called the Angrab, falling from the mountain Waggora, encompasses it on the north and north-east: both unite at the bottom of the hill about a quarter of a mile south of the town. Upon the bank opposite to Gondar, on the other side of the river, is a town of the Mahomedans. These places with the province around are now in the hands of the Galla.

GONDI (John Francis Paul), cardinal de Retz, was the son of Philip Emanuel de Gondi, count de Joigny, lieutenant-general, &c., and was born in 1613. From a doctor of the Sorbonne, he first became coadjutor to his uncle John Francis de Gondi, whom he succeeded in 1654 as archbishop of Paris; and was finally made a cardinal. He has drawn his own character in his memoirs with impartiality. From the greatest degree of debauchery, and still languishing under its consequences, he made himself admired as a popular preacher. At the age of twenty-three he was at the head of a conspiracy against the life of cardinal Richelieu; he precipitated the parliament into cabals, and the people into sedition: and was, says M. Voltaire, the first bishop who carried on a civil war without the mask of religion. However, he was at last obliged to quit France; and he lived the life of a vagrant exile for five or six years, till the death of his great enemy cardinal Mazarin, when he returned. After assisting in the conclave at Rome, which chose Clement IX., he retired from the world. Voltaire says, that in his youth he lived like Catiline, and in his old age like Atticus. He died in 1679. He wrote his memoirs in his retirement; the best edition of which is that of Amsterdam, 4 vols. 12mo., 1710.

GO'NDOLA, *n. s.* } Fr. *gondole*. A boat
Go'NDOLIER. } much used in Venice; a
small boat: the gondolier is the boatman.

He saw did swim

Along the shore, as swift as glance of eye,

A little *gondelay*, bedecked trim

With boughs and harbours woven cunningly.

Spenser.

In a *gondola* were seen together Lorenzo and his
amorous Jessica. *Shakspeare. Merchant of Venice.*

Your fair daughter,

Transported with no worse nor better guard,

But with a knave of hire, a *gondolier*,

To the gross clasps of a lascivious Moor.

Shakspeare.

As with *gondolas* and men, his

Good excellence the duke of Venice

Sails out, and gives the gulph a ring. *Prior.*

Nor shall the muse through narrow Venice stray,
Where *gondolas* their painted oars display. *Gay.*

'Tis sweet to hear

At midnight on the blue and moonlight deep,

The song of oar of Adria's *gondolier*,

By distance mellowed, o'er the waters sweep.

Byron.

GONE, *part. preter.* From *go*. See *To Go*.

Advanced; forward in progress.

I have known sheep cured of the rot, when they have not been far *gone* with it, only by being put into broomlands. *Mortimer.*

The Observer is much the brisker of the two, and, I think, farther *gone* of late in lyes and impudence than his Presbyterian brother. *Swift.*

Ruined; undone.

He must know 'tis none of your daughter nor my sister; we are *gone* else.

Shakespeare. Winter's Tale.

I'll tell the story of my life,
And the particular accidents *gone* by,
Since I came to this isle. *Id. Tempest.*

Lost; departed.

When her masters saw that the hope of their gains were *gone*, they caught Paul and Silas.

Acts xvi. 19.

Speech is confined to the living, and imparted to only those that are in presence, and is transient and *gone*. *Holder.*

Dead; departed from life.

I mourn Adonis dead and *gone*. *Oldham.*

A dog, that has his nose held in the vapour loses all signs of life; but carried into the air, or thrown into a lake, recovers, if not quite *gone*.

Addison on Italy.

GO'NFALON, *n. s.* } *Ital. gonfalon*; French
GO'NFANON. } *gonfanon*; Islandic,
gunfana from *gunn*, a battle, and *fani*, a flag
(*Lyc.*) An ensign; a standard.

Ten thousand thousand ensigns high advanced,
Standards and *gonfalons*, 'twixt van and rear,
Stream in the air. *Milton.*

GOXONG API, one of the Banda islands at the north-east end of the harbour of Beema, in the island of Sumbawa, and forming the west side of the entrance of Sapy Straits. It is a volcanic mountain, about 1500 feet in height, terminating in two high peaks; the soil being astonishingly fertile. It is only separated from Neira by a narrow strait, and has the appearance of an immense heap of cinders.

GOXONG TELLO, or Tominie Bay, a large bay of the island of Celebes, nearly 180 miles long from east to west, and from fifty to ninety broad. It deeply indents the north-east coast, and abounds in small rocky islands and shoals, particularly towards the south coast. Longitude of the entrance 124° E., lat. 0° 12' S.

GOXONG TELLO, or GCOXONG TELLO, a town of Celebes, situated on a river of the same name, on the south side of the above bay. The Dutch had formerly a settlement here, which in 1797 was taken by the English. The inhabitants are Malays, who carry on a considerable trade in the exportation of gold, tortoise-shell, &c. Long. 123° E., lat. 0° 28' N.

GONORRHOEA, *n. s.* Gr. *γορρος* and *ρρω*. A morbid running of venereal hurts.

Rauty mummy or stone mummy grows on the tops of high rocks; they powder and boil it in milk, and then give it to stop *gonorrhoeas*. *Woodward.*

GONORRHOEA, from *γορρ*, the semen, and *ρρω*, to flow; from a supposition of the ancients, that it was a seminal flux. A genus of disease in the class locales, and order apoceneses of Dr. Cullen's arrangement, who defines it a preter-

natural flux of fluid from the urethra in males, with or without libidinous desires. Females, however, are subject to the same complaint in some forms. He makes four species, viz.:

1. Gonorrhœa pura, or benigna; a puriform discharge from the urethra, without dysuria, or lascivious inclination, and not following an impure connexion.

2. Gonorrhœa impura, maligna, syphilitica, virulenta; a discharge resembling pus, from the urethra, with heat of urine, &c., after impure coition, to which often succeeds a discharge of mucus from the urethra, with little or no dysuria, called a gleet. This disease is also called fluor albus malignus. Blennorrhagia by Swediaur. In English, a clap, from the old French word clapises, which were public shops, kept and inhabited by single prostitutes, and generally confined to a particular quarter of the town, as is even now the case in several of the great towns in Italy. In Germany the disorder is named tripper, from dripping; and in French, chaudpisse, from the heat and scalding in making water.

GONTAULT (Armand de), lord of Biron, marshal of France, a celebrated general in the sixteenth century, who signalised himself by his valor and conduct in several sieges and battles. He was made grand master of the artillery in 1569. He was the first who declared for Henry IV. He brought a part of Normandy under his subjection, and dissuaded him from retiring to England, or Rochelle. He was killed by a cannon-ball at the siege of Epemay, on the 26th of July, 1592. He used to carry a pocket-book, in which he wrote down every thing remarkable, which gave rise to a proverb at court; when a person happened to say any thing remarkable, 'You have found that in Biron's pocket-book.'

GOOCHLAND, a county in Virginia, surrounded by Louisa, Fluvanna, Henrico, Hanover, and Powhatan counties. It is forty miles long, and fourteen broad.

GOOD, <i>adj.</i> , <i>n. s.</i> , <i>adv.</i> & <i>interj.</i>	} Sax. <i>gōð</i> , Goth. Swed. and Belgic, <i>god</i> ; Teut. <i>got</i> . The ad- jective of god, deity: supposed also by some to be derived from Latin
GOOD-CONDITIONED.	
GOOD-NOW, <i>interj.</i>	
GOOD-LINESS, <i>n. s.</i>	
GOOD'LY, <i>adj.</i> & <i>adv.</i>	
GOOD'LYHOOD, <i>n. s.</i>	
GOOD'MAN, <i>n. s.</i>	
GOOD'NESS, <i>n. s.</i>	
GOODS,	
GOOD'Y, <i>n. s.</i>	
GOOD'Y-SHIP, <i>n. s.</i>	

gaudeo; Gr. *γαῖαν*; Heb. *chada*. The adjective good, which is the radix whence all the others are derived, stands opposite to evil of every kind, whether physical or moral; it is indiscriminately applied with or without other words as expressive of whatever, in person, condition, or prospect, appears to be fit, beneficial, pure, wholesome, entire, true, desirable, or gratifying: the modifications are consequently very numerous, but all include the primary meaning; this is applicable to the dispositions of moral agents or the qualities of inanimate objects. Goody and goodman are familiar appellations of civility, generally ironical.

Having, either generally, or for any particular end, such physical qualities as are expected or desired. Not bad; not ill.

God saw every thing that he had made, and beheld it was very *good*. *Gen. i. 31.*

An universe of death! which God by curse Created evil; for evil only *good*. *Milton.*

Resolved
From an ill cause to draw a *good* effect. *Dryden.*
Notwithstanding this criticism the verses were *good*. *Spectator.*

A man is no more to be praised upon this account, than because he has a regular pulse, and a *good* digestion. *Addison.*

Ah! ne'er so dire a thirst of glory boast,
Nor in the critick let the man be lost!
Good nature and *good* sense must ever join;
To err is human, to forgive, divine. *Pope.*

Proper; fit; convenient; right; not wrong.
Amongst a man's peers a man shall be sure of familiarity, and therefore it is *good* a little to keep state; amongst a man's inferiors one shall be sure of reverence, and therefore it is *good* a little to be familiar. *Bacon.*

If you think *good*, give Martius leave. *Id.*
It was a *good* time to comply with the importunity of the gentlemen of Sussex. *Clarendon.*

For brevity is very *good*
When w' are, or are not understood. *Butler.*
Conducive to happiness.

It is not *good* that the man should be alone. *Gen. ii. 18.*

We may as well pretend to obtain the good which we want without God's assistance, as to know what is *good* for us without his direction. *Snalbridge.*

Uncorrupted; undamaged.
He also bartered away plums, that would have rotted in a week, for nuts that would last *good* for his eating a whole year. *Locke.*

Wholesome; salubrious.
A man first builds a country seat,
Then finds the walls not *good* to eat. *Prior.*

Medicinal; salutary.
The water of Nilus is sweeter than other waters in taste, and it is excellent *good* for the stone and hypochondriack melancholy. *Bacon's Natural History.*

Pleasant to the taste.
Eat thou honey, because it is *good*; and the honey-comb, which is sweet. *Prov. xxiv. 13.*

Of herbs and plants some are *good* to eat raw; as lettuce, endive, and purslane. *Bacon's Natural History.*

Complete; full.
The Protestant subjects of the abbey make up a *good* third of its people. *Addison on Italy.*

Useful; valuable.
All quality, that is *good* for any thing, is originally founded upon merit. *Collier on Envy.*

We discipline betimes those other creatures we would make useful and *good* for somewhat. *Locke.*
Sound; not false; not fallacious.

He is resolved now to shew how slight the propositions were which Luther let go for *good*. *Atterbury.*

Legal; valid; rightly claimed or held.
According to military custom the place was *good*, and the lieutenant of the colonel's company might well pretend to the next vacant captainship in the same regiment. *Wotton.*

Confirmed; attested; valid.
Ha! am I sure she's wronged? Perhaps 'tis malice!

Slave, make it clear, make *good* your accusation. *Smith.*

With *as* preceding. It has a kind of negative or inverted sense; *as good as*, no better than.

Therefore sprang there even of one, and him *as good as* dead, so many as the stars of the sky in multitude. *Heb. xi.*

With *as* preceding. No worse.
He sharply reproved them as men of no courage, which, being many times *as good as* in possession of the victory, had most cowardly turned their backs upon their enemies. *Knolles.*

The master will be *as good as* his word, for his own business. *L'Estrange.*

Well qualified; not deficient.
If they had held their royalties by that title, either there must have been but one sovereign over them all, or else every father of a family had been *as good as* a prince, and had *as good as* a claim to royalty as these. *Locke.*

Skilful; ready; dextrous.
I make my way where-e'er I see my foe;
But you, my lord, are *good* at a retreat. *Dryden.*
Happy; prosperous.
Behold how *good* and how pleasant it is for brethren to dwell together in unity. *Psalms cxxxiii. 1.*
Many *good* morrows to my noble lord!
— *Good* morrow, Catesby, you are early stirring. *Shakspeare.*

Good e'en, neighbours;
Good e'en to you all, *good* e'en to you all. *Id.*
At my window bid *good* morrow. *Milton.*
Good morrow, Portius! let us once embrace. *Addison.*

And so *good* night to them—or if you will
Good morrow—for the cock had crown, and light
Began to clothe each Asiatic hill,
And the mosque crescents struggled into sight. *Byron.*

Honorable.
They cast to get themselves a name,
Regardless whether *good* or evil fame. *Milton.*

Silence, the knave's repute, the whore's *good* name,
The only honour of the wistling dame. *Pope.*
A young unmarried man with a *good* name
And fortune has an awkward part to play;
For *good* society is but a game. *Byron.*

Cheerful; gay. Joined with any words expressing temper of mind.
They may be of *good* comfort, and ever go cheerfully about their own affairs. *2 Mac. xi. 26.*

Quietness improves into cheerfulness, enough to make me just so *good* humoured as to wish that world well. *Pope.*

Considerable; not small, though not very great.

A *good* while ago God made choice that the Gentiles by my mouth should hear the word. *Acts xv. 7.*
The plant, having a great stalk and top, doth prey upon the grass a *good* way about, by drawing the juice of the earth from it. *Bacon.*

Myrtle and pomegranate, if they be planted though a *good* space one from the other, will meet. *Peacham on Drawing.*

The king had provided a *good* fleet, and a body of three thousand foot to be embarked. *Clarendon.*

We may suppose a great many degrees of lightness and lightness in these earthy particles, so as many of them might float in the air a *good* while, like exhalations, before they fell down. *Burnet.*

They held a *good* share of civil and military employments during the whole time of the usurpation. *Swift.*

Elegant; decent; delicate: with *breeding*.

If the critic has published nothing but rules and observations in criticism, I then consider whether there be a propriety and elegance in his thoughts and words, clearness and delicacy in his remarks, wit and *good-breeding* in his railery. *Addison's Guardian*.

Mankind have been forced to invent a kind of artificial humanity, which is what we express by the word *good-breeding*. *Addison*.

Those among them, who return into their several countries, are sure to be followed and imitated as the greatest patterns of wit and *good-breeding*. *Swift*.

A moderate knowledge in the little rules of *good-breeding*, gives a man some assurance, and makes him easy in all companies. *Budgell*.

Real; serious; not feigned.

Love not in *good* earnest, nor no farther in sport neither, than with safety of a pure blush thou mayest in honour come off again. *Shakspeare*.

Rich; of credit; able to fulfil engagements.

Antonio is a *good* man: my meaning, in saying that he is a *good* man, is to have you understand me that he is sufficient. *Shakspeare*.

Having moral qualities, such as are wished; virtuous; pious; religious; applied both to persons and actions. Not bad; not evil.

The woman hath wrought a *good* work upon me. *Matthew*.

All man's works are on me,
Good or not *good*, ingraft my merit, those
Shall perfect, and for these my death shall pay. *Milton*.

What reward

Awaits the *good*, the rest what punishment. *Id*.

The only son of light

In a dark age, against example *good*,
Against allurements. *Id*.

Such follow him, as shall be registered
Part *good*, part bad, of bad the larger scroll. *Id*.

Grant the bad what happiness they would,
One they must want, which is to pass for *good*. *Pope*.

Why drew Marseilles' *good* bishop purer breath,
When Nature sickened, and each gale was death? *Id*.

Such was Roscommon, not more learned than *good*,
With manners generous as his noble blood. *Id*.

No farther intercourse with heaven had he,
But left *good* works to men of low degree. *Harte*.
Kind; soft; benevolent.

Glory to God in the highest, and on earth peace
and *good* will towards men. *Luke ii. 14*.

For a *good* man some would even dare to die.

Rom. v. 7.

Without *good* nature man is but a better kind of
vermin. *Bacon*.

Here we are loved and there we love,

Good nature now and passion strive

Which of the two should be above,

And laws unto the other give. *Suckling*.

'Tis no wonder if that which affords so little glory
to God, hath no more *good* will for men.

Decay of Piety.

When you shall see him, sir, to die for pity,
'Twere such a thing, 'twould so deceive the world,
'Twould make the people think you were *good* natured. *Denham*.

Matters being so turned in her, that where at first
liking her manners did breed *good* will, now *good* will
became the chief cause of liking her manners. *Sidney*.

Good sense and *good* nature are never separated,
though the ignorant world has thought otherwise. *Dryden*.

Affability, mildness, tenderness, and a word which
I would fain bring back to its original signification of
virtue, I mean *good* nature, are of daily use. *Id*.

To teach him betimes to love and be *good* natured
to others, is to lay early the true foundation of an
honest man. *Locke*.

This doctrine of God's *good* will towards men, this
command of men's proportionable *good* will to one
another, is not this the very body and substance, this
the very spirit and life of our Saviour's whole insti-
tution? *Sprut*.

How could you chide the young *good* natured prince,
And drive him from you with so stern an air. *Addison*.

It was his greatest pleasure to spread his healing
wings over every place, and to make every one sensi-
ble of his *good* will to mankind. *Calamy*.

'Tis no wonder if that which affords so little glory
to God, hath no more *good* will for men.

Decay of Piety.

Favorable; loving.

But the men were very *good* unto us, and we were
not hurt. *1 Samuel xxv. 15*.

Truly God is *good* to Israel, even to such as are of
a clean heart. *Psalms lxxiii. 1*.

You have *good* remembrance of us always, desiring
greatly to see us, as we also to see you. *1 Thessalonians iii. 6*.

This idea must necessarily be adequate, being
referred to nothing else but itself, nor made by any
other original but the *good* liking and will of him that
first made this combination. *Locke*.

Companionable; sociable; merry. Often
used ironically.

Though he did not draw the *good* fellows to him by
drinking, yet he eat well. *Clarendon*.

Not being permitted to eat without drinking, will
prevent the custom of having the cup often at his
nose; a dangerous beginning and preparation to *good*
fellowship. *Locke*.

It was well known, that Sir Roger had been a *good*
fellow, in his youth. *Arbuthnot*.

It is sometimes used as an epithet of slight
contempt, implying a kind of negative virtue, or
bare freedom from ill.

My *good* man, as far from jealousy as I am from
giving him cause. *Shakspeare. Merry Wives of Windsor*.

She had left the *good* man at home, and brought
away her gallant. *Addison's Spectator*.

In a ludicrous sense.

As for all other *good* women that love to do but
little work, how handsome it is to louse themselves in
the sunshine, they that have been but a while in Ire-
land can well witness. *Spenser*.

Hearty; earnest; not dubious.

He, that saw the time fit for the delivery he in-
tended, called unto us to follow him, which we both,
bound by oath, and willing by *good* will, obeyed. *Sidney*.

The *good* will of the nation to the present war has
been since but too much experienced by the successes
that have attended it. *Temple*.

Good will, she said, my want of strength supplies;
And diligence shall give what age denies. *Dryden*.

In *good* time. Not too fast.

In *good* time, replies another, you have heard them
dispute against a vacuum in the schools. *Collier*.

In *good* sooth. Really; seriously.

What, must I hold a candle to my shames?
They in themselves, *good* sooth, are too too light. *Shakspeare*.

Good (to make). To keep; to maintain; not to give up; not to abandon.

There died upon the place all the chieftains, all making *good* the fight without any ground given.

Bacon's Henry VII.

He forced them to retire in spite of their dragoons, which were placed there to *make good* their retreat.

Clarendon.

He without fear a dangerous war pursues;
As honour made him first the danger chuse,
So still he *makes it good* on virtue's score.

Dryden.

Since we claim a proper interest above others in the pre-eminent rights of the household of faith, then, to *make good* that claim, we are obliged above others to conform to the proper manners and virtues that belong to this household.

Sprat.

Good (to make). To confirm; to establish.

I farther will maintain

Upon his bad life to *make* all this *good*.

Shakespeare.

To *make good* this explication of the article, it will be necessary to prove that the church, which our Saviour founded, and the apostles gathered, was to receive a constant and perpetual accession.

Pearson.

These propositions I shall endeavour to *make good*.

Smatridge.

Good (to make). To perform.

While she so far extends her grace,
She *makes but good* the promise of her face.

Waller.

Good (to make). To supply.

Every distinct being has somewhat peculiar to itself, to *make good* in one circumstance what it wants in another.

L'Estrange.

Good, v. s. That which physically contributes to happiness; benefit; advantage; the contrary to evil or misery.

I fear the emperor means no *good* to us.

Shakespeare.

Let me play the lion too: I will roar, that I will do any man's heart *good* to hear me.

Id.

He waved indifferently 'twixt them, doing neither *good* nor harm.

Id. Coriolanus.

Nature in man's heart her laws doth pen,
Prescribing truth to wit, and *good* to will.

Darwin.

The lessening or escaping of evil is to be reckoned under the notion of *good*: the lessening or loss of *good* is to be reckoned under the notion of evil.

Wilkins.

Love with fear the only God,

Merciful over all his works, with *good*

Still overcoming evil.

Milton.

God is also in sleep, and dreams advise,

Which he hath sent propitious, some great *good* Presaging.

Id.

He when the wheel of empire whirlleth back,
And though the world's disjointed axle crack,
Sings still of ancient rights and better times,
Seeks wretched *good*, arraigns successful times.

Marvell.

This caution will have also this *good* in it, that it will put them upon considering, and teach them the necessity of examining more than they do.

Locke.

Good is what is apt to cause or increase pleasure, or diminish pain in us; or else to procure or preserve us in the possession of any other *good*, in absence of any evil.

Id.

Refuse to leave thy destined charge too soon,

And for the church's *good* defer thy own.

Prior.

A thirst after truth, and a desire of *good*, are principles, which still act with a great and universal force.

Rogers.

Works may have more wit than does them *good*.
As bodies perish through excess of blood.

Pope.

Prosperity; advancement.

If he had employed

Those excellent gifts of fortune and of nature
Unto the *good*, not ruin of the state.

Ben Jonson.

Earnest; not jest.

The *good* woman never died after this, 'till she came to die for *good* and all.

L'Estrange.

Moral qualities, such as are desirable; virtue; righteousness; piety; the contrary to wickedness.

Depart from evil, and do *good*.

Psalm xxxiv. 14.

If a man be *good*, or doth or sayth a thing to *good* entente, the backbiter wol turne all that *goodnesse* up so down to his shrewde entente.

Chaucer. The Persones Tale.

Not only carnal *good* from evil does not justify; but no *good*, no not a purposed *good*, can make evil *good*.

Holyday.

O sons, like one of us is Man become,

To know both *good* and evil, since his taste

Of that defended fruit; but let him boast

His knowledge of *good* lost, and evil got;

Happier had it sufficed him to have known

Good by itself, and evil not at all.

Milton.

Empty of all *good*, wherein consists

Woman's domestick honour, and chief praise.

Id.

By *good*, I question not but *good*, morally so called bonum honestum, ought, chiefly at least, to be understood; and that the *good* of profit or pleasure, the bonum utile, or jucundum, hardly come into any account here.

South.

Nor holds this earth a more deserving knight

For virtue, valour, and for noble blood,

Truth, honour, all that is comprized in *good*.

Dryden.

Good placed after *had*, with *as*, seems a substantive; but the expression is, I think, vicious; and *good* is rather an adjective elliptically used, or it may be considered as adverbial. See *Good, adv.*

Without *good* nature and gratitude, men had *as good* live in a wilderness as in a society.

L'Estrange.

The pilot must intend some port before he steers his course, or he had *as good* leave his vessel to the direction of the winds, and the government of the waves.

South.

Good, adv. Well; not ill; not amiss.

As good. No worse.

Was I to have never parted from thy side,

As good have grown there still a lifeless rib.

Milton.

Says the cuckow to the hawk, Had you not *as good* have been eating worms now as pigeons?

L'Estrange.

Good, interj. Well! right! It is sometimes used ironically.

GOODALL (Walter), a learned Scottish antiquary and philologist, born in 1689. He was many years keeper of the Advocates' Library, which gave him an opportunity of examining the original papers, and authentic documents, preserved among the records of that learned faculty, which he did not fail to improve. Being a zealous friend to the exiled royal house of Stuart, he was anxious to rescue the character of Mary, queen of Scots, from the calumnies that had been thrown upon it for nearly two centuries; and accordingly, after much deep investigation,

published a vindication of that princess, which very much attracted the public attention, and exhibits equal proofs of his learning and industry in literary researches. He wrote several other pieces, and died at Edinburgh in 1751, in the seventy-second year of his age.

GOOD BEHAVIOUR, in law, a proper carriage and behaviour to the king and the people. A justice of the peace may, at the request of another, or where he himself sees cause, demand surety for the good behaviour; and to that end the justice may issue out his warrant against any persons whatsoever, under the degree of nobility; but, when it is a nobleman, complaint is to be made in the court of chancery, or king's bench, where such nobleman may be bound to keep the peace. Infants and females coverts, who ought to find surety by their friends, may be bound over to their good behaviour; also lunatics, who have sometimes lucid intervals, and all others who break the peace, or are suspected to do it, by affrays, assaults, battery, wounding, fighting, quarrelling, threatening, &c. Persons may be likewise bound to good behaviour for a scandalous way of living, keeping bawdy-houses, gaming-houses, &c.; and so may common drunkards, whores, cheats, libellers, &c. He who demands surety for the peace, on any violence offered, must take an oath before the justice, that he goes in fear of his life, or some bodily harm, &c., and that it is not out of malice, but from a regard to his own safety.

GOOD-CONDITIONED, *adj.* Without ill qualities or symptoms. Used both of things and persons, but not elegantly.

No surgeon dilates an abscess of any kind by incisions, when the pus is *good-conditioned*. *Sharp.*

GOODLINESS, *n. s.* From goodly. Beauty; grace; elegance.

The stateliness of houses, the *goodliness* of trees, when we behold them, delighteth the eye. *Hooker.*

She sung this song with a voice no less beautiful to his ears, than her *goodliness* was full of harmony to his eyes. *Sidney.*

GOODLY, *adj.* From good. Beautiful; graceful; fine; splendid. Now little in use.

Rebecca took *goodly* raiment of her eldest son Esau, and put them upon Jacob. *Genesis xxvii. 15.*

There was not among the children of Israel a *goodlier* person than he. *1 Sam. ix. 2.*

That castle was most *goodly* edified
And plaste for pleasure nigh that forrest syde.

Spenser. Faerie Queene.

He had not made them any recompence for their *goodly* houses and olive gardens, destroyed in the former wars. *Knolles.*

A *goodly* city is this Antium. *Shakspeare. Coriolanus.*

Patience and sorrow strove

Which should express her *goodliest*: you have seen
Sunshine and rain at once. Her smiles and tears
Were like a wetter May. *Id. King Lear.*

Here from gracious England have I offer
Of *goodly* thousands. *Id. Macbeth.*

Both younger then they were; of stature more;
And all their formes, much *goodlier* than before.

Chapman.

The *goodliest* man of men since born

His sons, the fairest of her daughters Eve. *Milton.*

A prince of a *goodly* aspect, and the more *goodly* by a grave majesty, wherewith his mind did deck his outward graces. *Sidney.*

Of the fourth Edward was his noble song;
Fierce, *goodly*, valiant, beautiful and young. *Waller.*

Not long since walking in the field,
My nurse and I we there beheld
A *goodly* fruit, which, tempting me,
I would have plucked. *Id.*

How full of ornament is all I view
In all its parts! and seems as beautiful as new:
O *goodly* ordered work! O power divine!
Of thee I am, and what I am is thine! *Dryden.*

His eldest born, a *goodly* youth to view,
Excelled the rest in shape and outward shew;
Fair, tall, his limbs, with due proportion joined,
But of a heavy, dull, degenerate mind. *Id.*

Bulky; swelling; affectedly turgid.
Round as a globe, and liquored every chink,
Goodly and great he sails behind his link. *Dryden.*
Happy; desirable; gay.

England was a peaceable kingdom, and but lately
inured to the mild and *goodly* government of the
Confessor. *Spenser.*

We have many *goodly* days to see. *Shakspeare.*
What fruits of fragrance blush on every tree,
What *goodly* prospects o'er the hills expand. *Byron.*

GOODLY, *adv.* Excellently. Obsolete.
There Alma, like a virgin queen most bright,
Doth flourish in all beauty excellent;
And to her guests doth bounteous banquet dight,
Attempted *goodly* well for health and for delight. *Spenser.*

GOODLYHOOD, *n. s.* From goodly. Grace; goodness. Obsolete.

I praise Love of his *godlihed*
To Bialacoil doe gentleness
For whom I live in soche distresse.
Chaucer. Romaunt of the Rose.
But mete thy *goodlihood* forgive it me,
To meet which of the gods I shall thee name. *Spenser.*

GOODMAN, *n. s.* From good and man. A slight appellation of civility; generally ironical.

How now, what's the matter? part—

—With you, *goodman* boy, if you please.

Come, I'll flesh ye. *Shakspeare. King Lear.*

A rustic term of compliment; gaffer.

Nay, hear you, *goodman* deliver.

Shakspeare. Hamlet.

But see the sun-beams bright to labour warn,
And gild the thatch of *goodman* Hodge's barn. *Gay.*

Old *goodman* Dobson of the green,
Remembers he the trees has seen. *Swift.*

GOODNESS, *n. s.* From good. Desirable qualities either moral or physical; kindness; favor.

Than cometh magnificence, that is to say,
When a man doth and performeth gret werkes
Of *goodnesse*, that he hath begonne, and that
Is the end why that men shuld do good werkes:
For in the accomplishing of good werkes
Lieth the gret guerdon.

Chaucer. The Persones Tale.

There is in all things an appetite or desire, whereby
they incline to something which they may be; all
which perfections are contained under the general
name of *goodness*. *Hooker.*

There is a general, or natural *goodness* in creatures,
and a more special or moral *goodness*. *Perkins.*

All *goodness*

Is poison to thy stomach,

—Yes, that *goodness*

Of gleaming all the land's wealth into one,
Into your own hands, cardinal, by extortion:

The goodness of your intercepted packets
You writ to the pope against the king; your goodness,
Since you provoke me, shall be most notorious.

Shakspeare.

There's no goodness in thy face.

Id.

All made very particular relations of the strength of the Scots army, the excellent discipline that was observed in it, and the goodness of the men.

Clarendon.

If for any thing he loved greatness, it was because therein he might exercise his goodness.

Sidney.

The goodness of every thing is measured by its end and use, and that's the best thing which serves the best end and purpose.

Tillotson.

Nobody can say, that tobacco of the same goodness is risen in respect of itself: one pound of the same goodness will never exchange for a pound and a quarter of the same goodness.

Locke.

Good-now. Interjection.

In good time; a la bonne heure. A gentle exclamation of intreaty. It is now a low word.

Good-now, sit down, and tell me, he that knows, Why this same watch?

Shakspeare. Hamlet.

A soft exclamation of wonder.

Good-now, Good-now, how your devotions jump with mine!

Dryden.

Goods, *n. s.* From good. Moveables in a house. Chaucer seems to use the singular in this sense.

————— I in fewe yeres

Have spended upon divers maner freires
Ful many a pound, yet fare I never the bet;
Certain my good have I almost beset:
Farewel my good, for it is al ago.

Chaucer. The Sompnoures Tale.

That giv'st to such a guest

As my poor selfe, of all thy goods the best.

Chapman.

Personal or moveable estate.

This hinders nothing the procedures of the civil courts, which respect the temporal punishment upon body and goods.

Lesley.

That a writ be sued against you,

To forfeit all your goods, lands, tenements,
Castles and whatsoever. Shakspeare. Henry VIII.
Wares; freight; merchandise.

Her majesty, when the goods of our English merchants were attached by the duke of Alva, arrested likewise the goods of the low Dutch here in England.

Raleigh's Essays.

Salce, that scorned all power and laws of men,
Goods with their owners hurrying to their den.

Waller.

GOODWIN SANDS, or GODWIN SANDS, famous sand-banks off the coast of Kent, lying between the North and South Foreland. As they run parallel with the coast for three leagues together, at about two leagues and a half distant from it, they add to the security of that capacious road, the Downs: for, while the land shelters ships with the wind from south-west to north-west only, these sands break all the force of the sea when the wind is at E. S. E. The most dangerous wind, when blowing hard on the Downs, is the S. S. W. These sands occupy the space that was formerly a large tract of low ground, belonging to Godwyn, earl of Kent, father of king Harold II.; and which being afterwards given to the monastery of St. Augustin, at Canterbury, the abbot neglecting to keep in repair the wall

that defended it from the sea, the whole tract was drowned, A. D. 1100, leaving these sands, upon which so many ships have since been wrecked. These sands lie east of the Downs four miles and a half from South Foreland.

GOODY, *n. s.* Corrupted from good wife. A low term of civility used to mean persons.

Soft, goody sheep, then said the fox, not so;
Unto the king so rash you may not go.

Hubbert.

Swarmed on a rotten stick the bees I spied,
Which erst I saw when goody Dobson died.

Gay.

Plain goody would no longer down;

'Twas madam in her program gown.

Swift.

GOODYSHIP, *n. s.* From goody. The quality of goody. Ludicrous.

The more shame for her goodyship,

To give so near a friend the slip.

Hudibras.

GOOLGUNGE, a town of the district of Bundelcund, Hindostan, near which is a pass in the mountains called Goomaghaut. Long. 85° 38' E., lat. 24° 26' N.

GOOLPUSSERA, a town of the province of Nepal, Hindostan, on the road between the cities of Patna and Nepal. Near it is an extensive forest of fine saul timber, next in value to the teak. Long. 85° 10' E., lat. 27° 1' N.

GOOMAH, a town of Hindostan, in Bahar, situated at the junction of three roads. It formerly had a fort, which commanded a pass through the mountains leading into Bengal. Long. 85° 20' E., lat. 24° 24' N.

GOOMSUR, a town and small district of Hindostan, at the north-west extremity of the Northern Circars, surrounded by a forest of bamboos, through which it is excessively difficult to pass. Long. 84° 55' E., lat. 19° 53' N.

GOOMTY, a river of Hindostan, which rises in the mountains of Kemaon, whence it flows in a south-east direction through Oude, and after passing the cities of Lucknow, Sultanpore, and Joanpore, falls into the Ganges, about fourteen miles below Benares. It is navigable at all times for boats as high as Lucknow.

GOONDUL, a southern district of the province of Mysore, India. It possesses the strong fort called Hengul.

GOONEE, a river of Hindostan, province of Sind, which, rising in the hills of Poollejar, unites with the Loonce, or salt river, and the Indus, and forms a large island called Majur. During the rainy season it is navigable for boats from Mondavie to Hyderabad.

GOOR, a range of lofty mountains in Persia, dividing Khorassan from Cabul.

GOORACKPOOR, a district in the province of Oude, Hindostan, situated to the north of the Goggrah, or Dewah River, between the twenty-sixth and twenty-eighth degrees of northern latitude. It was ceded in 1801 by the nabob of Oude to the British; and abounds with fine timber. Marquis Hastings assigned a portion of it to the Pindarie chiefs. It is situated to the north of Bengal, and well watered by various streams.

GOORACKPOOR, the capital of the above district, is situated on the eastern bank of the Boora Rapti, which is navigable for boats at all seasons. It formerly had a brick citadel, is the residence of the civil establishment of the district, and has

a cantonment for a battalion of native infantry,
&c. Long. 83° 22' E., lat. 26° 45' N.

GOOSE, *n. s.* } Sax. *gor*; Belg. *goes*;
GOOSEBERRY, *n. s.* } Erse. *gawe*, sing, *geury*,
GOOSECAP, *n. s.* } plural; Welch, *guyz*. A
GOOSEFOOT, *n. s.* } large water fowl prover-
GOOSEGRASS, *n. s.* } bially noted, we know not
why, for foolishness: a foolish person: wild orach,
an herb so called: a tailor's smoothing iron.
Gooseberry, goose and berry, because eaten
with young geese as sauce. A berry and tree.

This miller to the toun his daughter send
For ale and bred; and roasted hem a *goos*;
And bond hir hors he should no more go loos.

Chaucer. The Reves Tale.

Thou cream-faced lown,
Where got'st thou that *goose* look?

Shakespeare. Macbeth.

Since I pluckt *geese*, played truant, and whipt top,
I knew not what 'twas to be beaten till lately.

Shakespeare.

Come in, tailor: here you may roast your *goose*.

Id.

August has upon his arm a basket of all manner of
ripe fruits; as pears, plums, apples, *gooseberries*.

Peachum.

Birds most easy to be drawn are water-fowl; as the
goose and swan. *Peachum on Drawing.*

Rather than fail they will deery
That which they love most tenderly;
Quarrel with minced-pies, and disparage
Their best and dearest friend plum-porridge:
Fat pig and *goose* itself oppose,
And blasphemic custard through the nose.

Hudibras.

Nor watchful dogs, nor the more wakeful *geese*,
Disturb with nightly noise the sacred peace. *Dryden.*
Goosegrass, or wild tansy, is a weed that strong clays
are very subject to. *Mortimer.*

Upon a *gooseberry* bush a snail I found;
For always snails near sweetest fruit abound. *Gay.*
While man exclaims, 'See all things for my use',
'See man for mine!' replies a pampered *goose*. *Pope.*

'The royal game of *goose*,' as I may say,
Where every body has some separate aim,
An end to answer, or a plan to lay. *Byron.*

GOOSEBERRY, in botany. See RIBES.

GOOSEFOOT. See CHENOPodium.

GOOSEGRASS. See GALIUM.

GOOSE ISLAND, an island of the river St. Lawrence,
about twelve miles below Orleans. It is
connected with Crane Island by a marsh, and
they together about twelve miles long; and in-
habited by about forty families. They produce
wheat, and have fine pasturage.

GOOSE ISLAND, an island in Christmas Sound,
on the south coast of the island of Terra del
Fuego, so named by captain Cook.

GOOSE ISLAND, another small island lying off
the south of New Holland.

GORBELLY, *n. s.* } From Sax. *gor*, dung,
GORBELLED, *adj.* } and belly, according to
Skinner and Junius. It may perhaps come from
Welsh, *gor*, beyond; too much; or, as seems
to me more likely, may be contracted from gorm-
and, or gorman's belly, the belly of a glutton.

—Dr. Johnson. A big paunch; a swelling
belly. A term of reproach for a fat man.
Hang ye, *gorbelled* knaves, are you undone?
No, ye fat chuffs, I would your store were here.

Shakespeare.

GORCAH, GHURKA. A town and district of
northern Hindostan, the original country of the
present Nepaul sovereigns, situated between the
twenty-eighth and twenty-ninth degrees of north
latitude. The Trisoolgunga once separated the
territories of the Ghoorkali and Newar (or Ne-
paul) princes, the western limit of the Ghoorka
district, being marked by the Mursiangdi. This
territory, besides a numerous peasantry, contains
several Rajpoot families, and some Newars, but,
according to Mr. Hamilton, it is principally oc-
cupied by the Brahminical and Khetri tribes;
and as these constituted the principal strength
of Purthi Narrain's government, and continue to
form the main support of the present one, they
possess considerable authority. Their chiefs are
known by the name of thurgurs, from whom are
selected the leading conductors of affairs. Their
numbers are thirty-six, the title properly de-
scending only to the heads of families, and these
thirty-six are subdivided into three other grada-
tions. 'The Ghoorkhali reigning family pretend
to derive their descent from the Rajpoot princes
of Odeypoor, in the same manner as the Sevajee
family claimed a similar origin. For a conside-
rable period they have existed in the mountai-
nous country bordering on the river Gunduck,
during which time they have gradually risen into
power by successive encroachments on their
neighbours. After the conquest of Nepaul by
the Ghoorkhals, in 1768, the seat of govern-
ment was transferred to Catmandoo, and the city
of Gorcah, having since been much neglected,
is greatly decayed.'

Near Gorcah is said to be a very considerable
mass of rock crystal.

GORD, *n. s.* An instrument of gaming, as
appears from Beaumont and Fletcher.—War-
burton.

Thy dry bones can reach at nothing now, but *gord*
and ninepins. *Beaumont and Fletcher.*

Let vultures gripe thy guts; for *gords* and Fulham
holds. *Shakespeare.*

GORDIAN Knot, in antiquity, a knot made
by K. Gordius, in one of the cords of his yoke,
or, as some have it, in the leathers of his chariot
harness; which was so very intricately twisted,
that it was impossible to discover where it began
or ended. The oracle of Apollo having declared,
that whoever should untie this knot should be
master of all Asia, many attempted it, but with-
out success; till at last Alexander the Great,
after likewise attempting in vain to untie it, cut
it asunder with his sword, and thus either eluded
or fulfilled the prediction. See GORDIUS.

GORDIANUS I. (Mæcius Antonius), a Ro-
man general, for his virtues chosen emperor by
the army in the reign of Maximinus, A. D. 236.
He was descended on the father's side from the
Gracchi, and on the mother's from Trajan. He
had been twice consul, and was proconsul of
Africa when chosen emperor; but his son being
slain by Capellian, the governor of Mauritania, he
killed himself in his eightieth year. See ROME.
He had collected into his library 62,000 books.

GORDIANUS II. (Mæcius Antonius), surnamed
Africanus, the son of the preceding, by Annia
Orestille, the grand-daughter of the emperor
Marcus Antoninus, was made consul by the em-

peror Alexander, and afterwards associated with his father in the empire, but slain in fighting against the partisans of Maximinus, A. D. 237.

GORDIUM, a city of Phrygia Major, where Alexander the Great cut the Gordian knot.

GORDIUS, in fabulous history, a poor husbandman who had two yokes of oxen, wherewith he ploughed his land and drew his wain. An eagle sitting a long while upon one of his oxen, he consulted the soothsayers; a virgin bad him sacrifice to Jupiter in the capacity of king. He married the virgin, who bore to him Midas. The Phrygians, instructed by the oracle to set the first person they met in a wain upon the throne, met Gordius, and made him king. Midas, for this good fortune, dedicated to Jupiter his father's cart; and Gordius hung up the knot of the yoke in the temple. See **GORDIAN KNOT**.

GORDIUS, in zoology, the hair worm, a genus of animals belonging to the class of vermes and order of intestina. There are several species:

G. aquaticus, the water hair-worm, is ten or twelve inches in length, and of about the thickness of a horse hair; its skin is smooth and glossy; its color pale yellowish-white all over, except the head and tail, which are black. The body is rounded, and very slender in proportion to its length: the mouth is small, and placed horizontally; the jaws are of equal length, and obtuse at their extremities. This species is common in our fresh waters, especially in clay, through which it passes as a fish does through the water.

G. argillaceus, or clay hair-worm, only differs from the preceding in color, being yellowish at the extremities, and in being chiefly found in clay.

G. marinus, the sea hair-worm, is filiform, twisted spirally, and lying flat, about half an inch in length; of a whitish color, smooth, and scarcely diminishing at the head. It infests herrings, bleaks, and various other fish.

G. medinensis, the muscular hair-worm, is all over of a pale yellowish color.

GORDON (Alexander), M. A., an eminent Scottish antiquary, was secretary to the Society for Encouragement of Learning. He succeeded Dr. Stukely as secretary to the Antiquarian Society, which office he resigned in 1741 to Mr. Joseph Ames. He went to Carolina with governor Glen, where, besides a grant of land, he held several offices, and died a justice of the peace, leaving a handsome estate to his family. He published, 1. *Itinerarium Septentrionale*, or a Journey through most of the Counties of Scotland, in two parts, with sixty-six copper-plates, 1726, folio. 2. *Supplement to the Itinerarium*, 1732, folio. 3. *The Lives of Pope Alexander VI. and his son Caesar Borgia*. 4. *A complete History of the Ancient Amphitheatres*, 1730, 8vo. afterwards enlarged in a second edition. 5. *An Essay towards Explaining the Hieroglyphical figures on the Coffin of the ancient Mummy belonging to captain William Lethieuller*, 1737, folio, with cuts. 6. *Twenty-five plates of all the Egyptian Mummies and other Egyptian Antiquities in England*, 1739, folio.

GORDON (hon. George), or lord George Gordon, was born in London, in 1750. He early

entered into the navy, but quitted it during the American war, in consequence of an altercation with earl Sandwich. He was elected M. P. for Ludgershall, Wilts, in 1774; and during several sessions animadverted, with great freedom and humor, on the speeches and proceedings of both ministry and opposition. An alarm having been excited by the repeal of certain penal statutes against the Roman Catholics, in 1779, lord George was chosen president of the Protestant association at London; and, on the 2d of June 1780, went to the house of commons, to present their petition against that rescissory act, attended by 60,000 of the petitioners. The dreadful consequences of this imprudent measure are related under the article **GREAT BRITAIN**. Lord George was imprisoned in the Tower, on the 9th June 1780; and tried for high treason, but acquitted on the 4th February, 1781; on which occasion there was a very general illumination in Scotland, and £485 were subscribed to reimburse him for the expenses of his trial. On the 4th of May, 1786, he was excommunicated by the archbishop of Canterbury, for not appearing in court as a witness in a cause. In February and June, 1787, he was tried before the court of King's Bench, for publishing libels on the queen of France, the French ambassador, and the empress of Russia; and also for a seditious pamphlet entitled, *A petition to Lord G. Gordon from the Prisoners in Newgate*, praying that he would secure their liberties, by preventing them from being sent to Botany Bay; which petition, upon trial, was proved to have been written by himself. Being convicted of these charges, he, on the 25th June, went over to Holland, where he turned Jew, and was circumcised; but, returning to England in August, he was apprehended on the 7th December, at Birmingham; and on the 28th January, 1788, was sentenced to imprisonment for five years, and to continue in jail till he should find bail for his good behaviour, in £10,000. Not being able to find bail at the end of that period to the extent required, this operated as a sentence of imprisonment for life. In July, 1789, he presented a petition to the National Assembly of France, and was visited by several eminent revolutionists. He died 1st November, 1793, of a fever, attended with delirium, in the forty-third year of his age. As an author, his publications, political and miscellaneous, abounded with humor, and were not destitute of argument; as a public speaker, his language was animated, and his diction classical. Of his eccentricities we shall say nothing; but his conversion from Christianity—from one of the strictest sects of Presbyterian seceders, to Judaism, was so very strange a measure, that (if indeed it was real), it can be accounted for only upon one supposition.

GORDON (Thomas), a Scotch author, born at Kirkcudbright, famous for his translations and political writings. He came young to London; where he supported himself by teaching languages, until he procured employment under the earl of Oxford in queen Anne's time. He first distinguished himself in the defence of Dr. Hoadley in the Bangorian controversy; which recommended him to Mr. Trenchard, in conjunction with whom he wrote the well known

Cato's Letters, upon a variety of important public subjects. These were followed by a periodical paper, under the title of the Independent Whig; which was continued some years after Mr. Trenchard's death, by Gordon alone, against the hierarchy of the church: but with more acrimony than was shown in Cato's Letters. At length Sir Robert Walpole retained him to defend his administration, to which end he wrote several pamphlets. At the time of his death, in 1750, he was first commissioner of the wine licenses, an office which he had enjoyed many years. He published English translations of Sallust and Tacitus, with additional discourses to each author, which contain much useful matter. Two of his tracts, entitled 1. A Cordial for Low-spirits, in 3 vols; and, 2, The Pillars of Priestcraft and Orthodoxy shaken; in 2 vols. 8vo., were published after his death.

GORDONIA, in botany, a genus of the polyandria order, and monadelphia class of plants: *CAL.* simple style, five cornered, stigma quinquefid: *CAPS.* quinquelocular: *SEEDS* two-fold with a leafy wing. Species four, the principal is *G. lasianthus*. A tall and very straight tree, with a regular pyramidal head. Its leaves are shaped like those of the common bay, but serrated. It blossoms in May, June, and July. The flowers grow on foot-stalks about five inches long, are monopetalous, and are succeeded by conic capsules with a divided calyx. The stamina are headed with yellow apices. This tree retains its leaves all the year, and grows only in wet places, and usually in water.

GORE, *n. s. & v. a.* } *Sax.* gone; Welsh, *GORY*, *adj.* } *gor.* Effused and congealed blood. The verb signifies to stab, or pierce, especially, as cattle, with a horn. The adjective, used figuratively also as bloody, murderous, fatal, is now obsolete.

That all the ground with purple blood was spent;
And all their armours stayed with bloudie *gore*.

Spenser. Faerie Queene.

A griesly wound,
From which forth gushed a stream of *gore* blood thick,

That all her goodly garment stained around,
And into a deep sanguine dyed the grassy ground.

Spenser.

When two boars with rankling malice met,
Their *gory* sides the fresh wounds fiercely fret. *Id.*

Oh, let no noble eye prophane a tear
For me, if I be *gored* with Mowbray's spear.

Shakspeare.

His horrid beard and knotted tresses stood
Stiff with his *gore*, and all his wounds ran blood.

Denham.

The bloody fact
Will be avenged; though here thou see him die,
Rolling in dust and *gore*. *Milton's Paradise Lost.*
Some tossed, some *gored*, some trampling down he killed.

Dryden.

Another's crimes the youth unhappy bore,
Glutting his father's eyes with guiltless *gore*. *Id.*

He idly butting, feigns
His rival *gored* in every knotty trunk.

Thomson. Spring.

The first born man still in his mind he bore,
Foully arrayed in guiltless brother's *gore*,
Which for revenge to Heaven, from Earth did loudly roar.

Fletcher. Purple Island.

Then plunged; the rock below received like glass,
His body crashed into one *gory* mass,
With scarce a shred to tell of human form,
Or fragment for the sea-bird or the worm. *Byron.*

GORE (Thomas), a writer on heraldry, was born at Alderton in Wiltshire, and educated at Magdalen College, Oxford. He first entered at Lincoln's Inn, but soon after retired to his patrimony at Alderton. He was appointed, in 1680, high sheriff of Wiltshire, and wrote Loyalty displayed, and Falsehood unmasked, as a defence of his character in that office. He was the author of A Table showing how to blazon a Coat ten several ways, 1655; Series Alphabetica Latino-Anglica, Nomina Gentilitiorum, sive cognominum plurimarum familiarum, quæ multos per annos in Anglia floruerunt, 1667; Catalogus in certa capita, seu classes, alphabetico ordine concinnatus; plerumque omnium Authorum tam antiquorum quam recentiorum qui de re Heraldica, Latine, Gallice, Ital. Hisp. scripserunt, Nomenclator Geographicus. He died at Alderton in 1684.

GORE'S ISLAND, an island of the North Pacific, so named by captain Cook in 1778. It is about thirty miles in length, consisting of two hills connected by a low neck of land, in Long. 172° 30' W., lat. 60° 40' N.

GOREE, an island and town of South Holland, being the first land usually made by vessels bound to Rotterdam. The island is ten miles in circumference, and was once called West Voorn.

GOREE, a small island, off the coast of Africa, about a mile from the southern shore of Cape Verd. Its importance is solely derived from its inaccessible situation. The first European power which occupied it was the Dutch, who, in 1617, concluded a treaty of cession with Birar, king of Cape Verd. It was taken in 1663 by the English admiral Holmes, but retaken two years after by De Ruyter. In 1677 a French squadron, commanded by the count d'Estrées forced it to surrender: and by the treaty of Nimeguen it was ceded to France.

Goree is divided into three parts. One consists of the rock which forms a naked mass of black basalt, rising on all sides to the height of 300 feet. On the summit is a plain 150 fathoms in length and seventy in breadth. The western side is perpendicular from top to bottom, and physically inaccessible; the eastern and southern sides are very steep, but it cannot be considered quite impossible to scale them. The northern side is the most accessible; and here a mound has been formed, fifteen feet in width, and with a proper slope for conveying heavy artillery up to the plain. On the top is fort St. Michael, originally built by the Dutch, and considered by Colheny as having no strength except what it derives from its situation. On a sandy plain, at the foot of the rock, is the town of Goree, supposed to contain about 5000 inhabitants. It is the entrepôt for the French trade with the opposite coast of Africa. The third part of the island is the north point, which forms a kind of natural mole 120 fathoms long by thirty broad; it is commanded by a fort called St. François. Such is the French account of this place.

GORGE, *n. s. & v. n.* } Fr. *gorge, gorger* ;
 GOR'GED, *adj.* } Ital. *gorger*, of Lat.
 GOR'GET, *n. s.* } *gurgulio*. The throat ;
 the food swallowed : to swallow, or fill up the
 throat : figuratively to satiate. Gorget is a piece
 of armour used to defend the throat.

And all the way, most like a brutish beast,
 He spewed up his *gorge*, that all did him detest.

Spenser.

There were birds also made so finely, that they did
 not only deceive the sight with their figures, but the
 hearing with their songs, which the watery instru-
 ments did make their *gorge* deliver.

Sidney.

And now how abhorred in my imagination it is ! my
gorge rises at it.

Shakspeare. Hamlet.

Her delicate tenderness will find itself abused, be-
 gin to heave the *gorge*, disrelish and abhor the Moor.

Id. Othello.

He that makes his generation messes,

To *gorge* his appetite.

Id. King Lear.

He with a palsy fumbling on his *gorget*,
 Shakes in and out the rivet.

Id. Troilus and Cressida.

Being with his presence glutted, *gorged*, and full.

Shakspeare.

Look up a height, the shrill *gorged* lark so far
 Cannot be seen or heard.

Id.

See how his *gorget* peers above his gown,

To tell the people in what danger he was.

Ben Jonson.

About his neck a threefold *gorget*,

As rough as treble leathern target.

Hudibras.

Gorge with my blood, thy barbarous appetite.

Dryden.

He did oftentimes spend the night in the church
 loone praying, his headpiece, *gorget*, and gauntlets
 lying by him.

Knolles.

I desire that they will not *gorge* the lion either with
 nonsense or obscenity.

Addison.

GORGE, in architecture, the narrowest part of
 the Tuscan and Doric capitals, lying between
 the astragal, above the shaft of the pillar, and
 the annulets.

GORGE, in fortification, the entrance of the
 platform of any work. See FORTIFICATION.

GOR'GEOUS, *adj.* } Old Fr. *gorgias* ; Ital.

GOR'GEOUSLY, *adv.* } *gioire*, of Lat. *gaudere*.

GOR'GEOUSNESS, *n. s.* } Fine ; splendid ; showy ;
 glittering in various colors ; applied generally to
 attire or dress.

The cloud-capped towers, the *gorgeous* palaces,

The solemn temples, the great globe itself ;

Yea, all which it inherits, shall dissolve ;

And like this insubstantial pageant faded,

Leave not a wreck behind.

Shakspeare.

O, that deceit should dwell

In such a *gorgeous* palace !

Id. Romeo and Juliet.

As full of spirits as the month of May,

And *gorgeous* as the sun at Midsummer.

Shakspeare.

He bad them look upon themselves, and upon their
 enemies, themselves dreadful, their enemies *gorgeous*
 and brave.

Hayward.

The duke, one solemn day, *gorgeously* clad in a suit
 all over spread with diamonds, lost one of them of good
 value.

Wotton.

The *gorgeous* East, with richest hand,

Pours on her kings barbaric pearl and gold.

Milton.

With *gorgeous* wings, the marks of sovereign sway,
 The two contending princes make their way

Dryden

On's shield a tomb, where death had dressed his
 bed,

With curious art, and crowned his loathsome head

With gold, and gems :—his word, more *gorgeous* when
 dead.

Fletcher's Purple Island.

GORGET, is a kind of breast-plate like a half
 moon, with the arms of the prince thereon ;
 worn by the officers of foot. They are either gilt
 or silver, according to the color of the buttons on
 the uniforms.

GORGET, or GORGERET, in surgery, the con-
 cave or cannulated conductor, used in lithotomy.
 See SURGERY and LITHOTOMY.

GORGAS, a celebrated orator of Sicily,
 born at Leontium, about A. A. C. 417. Ac-
 cording to Quintilian, he was the first extem-
 poraneous speaker. But this is not credible ;
 men must have spoken extempore, before they
 studied speeches. A statue of gold was erected
 to him at Delphi.

GORGON, *n. s.* Gr. γοργων. A monster
 with snaky hairs, of which the sight turned the
 beholders to stone ; any thing ugly or horrid.

Gorgons and hydras, and chymeras dire.

Milton.

Why did'st thou not encounter man for man,

And try the virtue of that *gorgon* face

To stare me into stature ?

Dryden.

The GORGONS, in antiquity and mythology,
 were three sisters, whose names were Stheno,
 Euryale, and Medusa ; the latter of whom was
 mortal, but the two former were subject neither
 to age nor death. They are described with wings
 on their shoulders, with serpents round their
 heads, their hands were of brass, and their teeth
 of a prodigious size, so that they were objects of
 terror to mankind. Pausanias says, the GORGONS
 were the daughters of Phorbus, or Phorcys ;
 after whose death Medusa, his daughter, reigned
 over the Libyans dwelling near the lake Trito-
 nidis. The queen, being fond of hunting and
 war, laid the neighbouring countries quite waste.
 At last Perseus, having made war on them, and
 killed the queen, when he came to take a view
 of the field of battle, he found the queen's corpse
 so extremely beautiful, that he ordered her head
 to be cut off, and carried it with him to show the
 Greeks, who could not behold it without asto-
 nishment. Others represent them as a kind of
 monstrous women, covered with hair, who lived
 in woods and forests. Others, again, make them
 animals, resembling wild sheep, whose eyes had
 a poisonous and fatal influence.

GORGONIA, in natural history, a genus of
 zoophytes, formerly called ceratophyta, and in
 English named sea-fans, sea-feathers, and sea-
 whips. Linnæus and Pallas consider them as
 of a mixed nature in their growth, between ani-
 mals and vegetables ; but, Ellis shows them to
 be true animals of the polype kind, growing up
 in a branched form resembling a shrub, and in
 no part vegetable. They differ from the fresh
 water polype in many of their qualities, and
 particularly in producing from their own sub-
 stance a hard and solid support, serving many
 of the purposes of the bone in other animals.

The surface of the gorgonia is composed of a kind of scales, so well adapted to each other as to serve for defence from external injuries: and the flesh, or, as some have called it, the bark or cortex, consists of proper muscles and tendons for extending the openings of their cells; for sending forth thence their polype suckers in search of food; and for drawing them in suddenly, and contracting the sphincter muscles of their starry cells, in order to secure these tender parts from danger; and also of proper secretory ducts, to furnish and deposit the osseous matter that forms the stem and branches as well as the base of the bone. Mr. Ellis affirms, that there are ovaries in these animals, and thinks it very probable that many of them are viviparous. See ZOOPLYTES.

GORITZ, or GORZ, a province of the Austrian empire between Germany and Italy, bounded on the north-east and south by the duchy of Carniola, and on the west by the Venetian States. In 1817 it was constituted a circle of the new kingdom of Illyria, and contains 974 square miles, with 116,000 inhabitants. On the north side it extends among the Alps, and is bleak, but around the town of Goritz and throughout the south-west it is very warm, and produces vines and the fruits of Italy. This province came into the possession of Austria, so far back as the year 1500, on the decease of the last of the counts. The county of Gradiska was afterwards annexed to it, and the whole considered a part of Friuli. It was retained by Austria during the different changes of Buonaparte's reign, and received very considerable additions on Illyria being constituted a kingdom in 1817. It is divided into the three districts of Canale, Gradiska, and Goritz.

GORITZ, or GORIZIA, a town of the Austrian empire, the capital of the above province, stands on the Isonzo, and is divided into the upper and lower town. The former, situated on a mountain and defended by a castle, is an ancient place: the latter stands on a plain adjacent to the river. Its chief manufactures are of leather and silk. In 1751 an archbishop's see was erected here, but it was suppressed in 1782. In the beginning of 1797, Goritz was taken by the French. The castle and the adjoining eminences command beautiful prospects. Twenty miles N. N. W. of Trieste.

GORI, EUS (Abraham), an eminent antiquary, born at Antwerp, in 1540. He collected the rings and seals of the ancients, and published an account of a prodigious number of them, in 1601; under this title, *Dactylis theca*; sive *Anaulorum Sigillarium*, quorum apud priscos tam Græcos quam Romanos usus ex ferro, ære, argento, et auro, *Promptuarium*. This was the first part of the work; the second was entitled, *Variarum Gemmarum, quibus antiquitas in signando uti solita, sculpturæ*. In 1608 he published his collection of medals: which, however, if we may believe the Scaligerana, it is not safe always to trust. He resided at Delft, and died there in 1609.

GORLITZ, a town of the Prussian states, in Upper Lusatia. It is a well-built town, standing on the Neisse, and has long been noted for its

woollen and linen manufactures. Here is a great provincial school, and a library containing the archives of the local history. It has likewise a literary society, and a cabinet of natural history. Gorlitz contains six churches, the chief of which has an excellent organ; a spire of great height, and a chapel cut out of the rock. The town has been frequently injured by fires, and has also suffered from sieges. The battle of Bautzen, 21st of May 1813, ended in the neighbourhood. Population 8500. Fifty miles east of Dresden, and sixty-eight north of Prague.

GOR'MAND, *n. s.* } Fr. *gormand*; per-
GOR'MANDISE, *v. n.* } haps of Lat. *voro* (*goro*,
GOR'MANDISER, *n. s.* } as the Gauls would
pronounce it), and *mando*, to wish to eat. But
Minshew says *q. gulose mandere* (to eat gluttonously). A ravenous or luxurious eater: to eat voraciously or greedily.

GOROPIUS (John), M. D., a native of Brabant; author of a work entitled *Origines Antuerpianæ*, wherein, among other legendary stories, he attempts to prove that the Flemish was the original language spoken by Adam and Eve.

GORREUS (John), M. D., a physician of Paris, in the sixteenth century, who published a translation of Nicander. He was born in 1500. Being a protestant, he suffered much from religious persecution; and, his coach being one day suddenly seized by a party of soldiers, he was attacked with a delirium, and died, in 1572.

GORSE, *n. s.* Sax. *gorr*. Furze; a thick prickly shrub that bears yellow flowers in Winter.

GORSERIA, in botany, a genus of the polygamia frustanea order, and syngenesia class of plants; natural order forty-ninth, compositæ. The receptacle is naked; the pappus woolly; the florets of the radius ligulated or plane: CAL. imbricated with spinous scales.

GOSHAWK, *n. s.* Sax. *gor*, goose, and *þafco* a hawk. A hawk of a large kind.

Like as a *goshawk*, that in foote doth beare
A trembling culver having spide on hight
An eagle, that with plummy wings doth sheare
The subtil ayre, stooping with all his might
The quarry throwes with fell despight
And to the batteil doth herselfe prepare
So ran the geauntesse unto the fight.

Spenser. *Fæerie Queene.*

Such dread his awful visage on them cast;
So seem poor doves at *goshawks* sight aglast.

Fairfax.

GOSHAWK. See FALCO.

GOSHEN, in ancient geography, a district of Egypt, which Joseph procured for his father and brethren. It was the most fruitful part of the country; and its name seems to be derived from the Hebrew *Geshem*; which signifies 'rain.' Calmet thinks that Goshen, which Joshua x. 41, xi. 16, xv. 51, makes part of the tribe of Judah, is the same land of Goshen which was given to Jacob and his sons by Pharaoh. Gen. xlv. 26.

GOSHEN, a post town of Orange county, New York, twenty miles west of West Point, sixty-three north of New York, 112 south by west of Albany.

It is pleasant and flourishing, and contains a court house, a gaol, a bank, and an academy, and has considerable trade. It is an excellent agricultural town, situated in a fertile tract of country, and includes a part of the Drowned Lands. The courts for the county are held alternately at Gosshen and Newburgh. Three weekly newspapers are published here.

GOSLAR, an old town of Hanover, in Hildesheim, on the Gosse, and at the foot of the Ramelsberg Mountain famous for its mines. Its houses are mean and crowded; but a great fire destroyed about 500 in 1780, and their areas have since been laid out in gardens. The most curious building in the town is the Kaiserhaus, where the emperors in former times used to hold their courts, and call the diet together. It is now used as a magazine. The cathedral contains an altar of Crothos, one of the deities of the ancient Saxons; it is a brass chest with openings on every side to allow the flames to issue upwards and consume the infants laid on it. The inhabitants are chiefly Lutherans, and their chief employment is mining and brewing. Goslar was in former times a free imperial town, but given to Prussia in 1802, and ceded to Hanover in 1814. Here gunpowder is supposed to have been invented by a monk of the name of Berthold Schwartz. It is twenty-eight miles south of Brunswick, and twenty-five south of Wolfenbittel.

GOSLING, *n. s.* From goose. A young goose; a goose not yet full grown.

A fool sent forth to fetch the *goslings* home,
When they unto a river's brink were come
(Through which their passage lay) conceived a feare
His dames best brood might have been drowned there.

George Withers.

Why do you go nodding and wagging so like a fool,
as if you were hipshot? says the goose to her *gosling*.

L'Estrange.

Nature hath instructed even a brood of *goslings* to stick together, while the kite is hovering over their heads.

Swift.

GOSPEL, *n. s. & v. n.* } Sax. *godes þel*,
GOSPELLER, *n. s.* } or God's good
tidings; Gr. *εὐαγγέλιον*; Erse. *soskel, skcal, sunch*, happy tidings. The Sax. spellian (whence our word **SPELL**), also signifies to detail. Divinity or theology. To gospel is to fill with sentiments of religion, used in Shakspeare with some degree of irony. Gospeller is a name of the followers of Wickliffe, who first attempted a reformation from popery, given them by the Papists in reproach, from their professing to follow and preach only the gospel. The histories given by the four evangelists are called the gospel, and it is a term applied to the Christian revelation, generally.

Matheu that was of iudee as he is set first in order of *gospellers*, so he wroot first the gospel in iudee, and fro the office of a tolgaderer he was clepid to God.

Wiclif. Prologue on Matheu.

This maiden, bright Cecile, as hire lif saith,
Was come of Romaines, and of noble kind;

And from hire cradle, fostred in the faith
Of Crist; and bare his *gospel* in hire mind.

Chaucer. The Second Nomes Tale.

And for to make you hem perceiven
That usen folke thus to cleiven,

I wol you saine, withouten drede,
What men maie in the *Gospel* rede
Of saint Mathewe the *gospellere*,
That saith as I shall you saie here.

Chaucer. Romanat of the Rose.

Are you so *gospelled*

To pray for this good man, and for his issue,
Whose heavy hand hath bowed you to the grave?

Shakspeare.

These *gospellers* have had their golden days,
Have trodden down our holy Roman faith.

Rowe.

Thus may the *gospel* to the rising sun,
Be spread, and flourish where it first begun. *Wall.*
How is a good Christian animated and cheered by
a stedfast belief of the promises of the *gospel*!

Bentley.

All the decrees whereof Scripture treateth are
conditionate, receiving Christ as the *gospel* offers him,
as Lord and Saviour; the former, as well as the latter,
being the condition of scripture-election, and the
rejecting or not receiving him thus, the condition of
the scripture reprobation.

Hammond.

The **GOSPEL** comprehends the history of the life, actions, death, resurrection, ascension, and doctrine of Jesus Christ, recorded in the writings of St. Matthew, St. Mark, St. Luke, and St. John; who are thence called Evangelists. The Christian church never acknowledged any more than these four gospels as canonical. See **BIBLE**.

GOSPORT, a town of Hampshire, seventy-nine miles from London. It has a ferry over the mouth of the harbour to Portsmouth, and great trade, especially in time of war. Travellers prefer lodging here, as cheaper and more commodious than at Portsmouth. The mouth of the harbour is secured by four forts, and a platform of above twenty cannon level with the water. Gosport has an hospital for sick and wounded sailors, and a free school.

GOSSAMER, *n. s.* Low Lat. *gossipium*. The down of plants; the long white cobwebs which fly in the air in calm sunny weather, especially about the time of autumn.

As sore wondren som on cause of thunder,
On ehbe, and floud, on *gossomere* and on mist,
And on all things, til that the cause is wist.

Chaucer. The Squieres Tale.

A lover may bestride the *gassamoure*,
That idles in the wanton Summer air,
And yet not fall, so light is vanity. *Shakspeare.*

Four nimble gnats the horses were,
Their harnesses of *gossomere*.

Drayton's Nymphia.

The filmy *gossamer* now flits no more,
Nor balcyons bask on the short sunny shore.

Dryden.

GOSSAMER is the name of a fine filmy substance, like cobwebs, which is seen to float in the air in clear days in autumn, and is more observable in stubble fields, and upon furze and other low bushes. This is probably formed by the flying spider, which, in traversing the air for food, shoots out these threads from its arms which are borne down by the dew, &c.

GOSSELIN (Anthony), regius professor of history and rhetoric in the university of Caen in Normandy, and principal of the College of Du Bois, was author of a Latin history of the ancient Greeks.

GOSSIELINI (Julian), an Italian author, born in 1525. At seventeen he was made secretary to Ferdinand de Gonzaga, viceroy of Sicily, and retained that office forty years. He wrote several works in prose and verse; and died at Milan in 1587.

GOSSIP, *n. s.* & *v. n.* } Sax. *gōþ*, and *gýþ*;
GOSSIPRED, *n. s.* } Goth. *godsp.* Relation; affinity. The primary idea being relation or affinity, the words are variously applied: as to sponsors in baptism; to tripping companions; to merry chattering persons, as women at a lying-in.

And if I have a gossip or a friend,
Withouten gilt,—thou chidest as a fend
If that I walke or play unto his hous.

Chaucer. *Prologue to the Wif of Bathes Tale.*

And sometimes lurk I in a gossip's bowl,
In very likeness of a roasted crab,
And when she drinks, against her lips I bob.

Shakespeare.

Nor met with fortune, other than at feast,
Full warm of blood, of mirth, of gossiping. *Id.*
Go to a gossip's feast and gaud with me.

With all my heart I'll gossip at this feast. *Id.*

Gossipred or compaternity, by the common law, is a spiritual affinity; and the juror, that was gossip to either of the parties, might, in former times, have been challenged as not indifferent. *Davies.*

At the christening of George duke of Clarence, who was born in the castle of Dublin, he made bot the earl of Kildare and the earl of Ormond his gossips. *Id. On Ireland.*

To do the office of a neighbour,
And be a gossip at his labour. *Hudibras.*
'Tis sung in every street, ;

The common chat of gossips when they meet.

Dryden.

The market and exchange must be left to their own ways of talking; and gossipings not be robbed of their ancient privilege. *Locke.*

He gives himself up to an idle gossiping conversation. *Law.*

He died when last from pilgrimage I came
With other gossips from Jerusalem. *Pope.*

There are a set of malicious, prating, prudent gossips, both male and female, who murder characters to kill time; and will rob a young fellow of his good name before he has years to know the value of it.

Sheridan.

GOSSLAR, a large and ancient town of Lower Saxony, in the territory of Brunswick. It is a free imperial city, and it was here that gun-powder was first invented. It is a large place, but the buildings are in the ancient taste. In 1728 St. Stephen's fine church and 280 houses were burnt. It is seated on a mountain near the Gose, and near it are rich mines of iron. The inhabitants are famous for brewing excellent beer. Long. 5° 37' E., lat. 51° 55' N.

GOSSYPUM, cotton, a genus of the polyandria order, and monadelphia class of plants; natural order thirty-seven, columniferae: cal. double, the exterior trifold: caps. quadrilocular: seeds enclosed in cotton wool. There are ten species, all natives of warm climates.

G. arboreum, the cotton tree, has an upright woody perennial stalk, branching six or eight feet high; palmated, four or five-lobed smooth leaves, and yellow flowers succeeded by large pods filled with seeds and cotton.

G. Barbadense, the Barbadoes shrubby cotton, has a shrubby stalk, branching four or five feet high, three-lobed smooth leaves, glandulous underneath, and yellow flowers succeeded by oval pods containing seeds and cotton.

G. herbaceum, the common herbaceous cotton, has an herbaceous smooth stalk two feet high, branching upwards; five-lobed smooth leaves, and yellow flowers from the end of the branches succeeded by roundish capsules full of seeds and cotton.

G. hirsutum, the hairy American cotton, has hairy stalks branching laterally two or three feet high; palmated, three and five-lobed hairy leaves, and yellow flowers succeeded by large oval pods furnished with seeds and cotton.

The last three species are annual, but the first is perennial both in root and stalk. In warm countries these plants are reared in great quantities in fields for the sake of the cotton; but the herbaceum species is most generally cultivated. The pods are sometimes as large as middling sized apples, closely filled with the cotton surrounding the seed. When these plants are raised in this country, they must be continually kept in a warm stove, where they will produce seeds and cotton. The American islands produce cotton shrubs of various sizes, which rise and grow up without any culture; especially in low and marshy grounds. Their produce is of a pale red; some paler than others; but so short that it cannot be spun. None of this is brought to Europe, though it might be usefully employed in making hats. The little that is picked up, serves to make mattresses and pillows. The cotton shrubs, that supply our manufactures, require a dry and stony soil, and thrive best in ground that has been tilled. The plant appears more flourishing in fresh lands than in those which are exhausted; but, while it produces more wood, it bears less fruit. A western exposure is fittest for it. The culture begins in March and April, and continues during the first spring rains. Holes are made at seven or eight feet distance, and a few seeds thrown in. When they are five or six inches high, all the stems are pulled up, except two or three of the strongest. These are cropped twice before the end of August. This precaution is necessary, as the wood bears no fruit till after the second pruning; and, if the shrub was suffered to grow more than four feet high, the crop would not be greater, nor the fruit so easily gathered. The same method is pursued for three years; for so long the shrub may continue, if it cannot conveniently be renewed oftener with the prospect of an advantage that will compensate the trouble. This useful plant will not thrive if great attention is not paid to pluck up the weeds that grow about it. Frequent rains promote its growth; but they must not be incessant. Dry weather is particularly necessary in March and April, which is the time of gathering the cotton, to prevent it from being discolored and spotted. When gathered in, the seeds must be picked out from the wool with which they are naturally mixed. This is done by a cotton mill; composed of two rods of hard wood, about eighteen feet long, eighteen lines

in circumference, and fluted two lines deep. They are confined at both ends, so as to leave no more distance between them than is necessary for the seed to slip through. At one end is a little millstone, which, being put in motion by the foot, turns the rods in contrary directions. They separate the cotton, and throw out the seed contained in it. See **COTTON**.

GOT, participle of **get**. See **GET**.

GOTHA-ELF, a considerable river in the south-west of Sweden, formed by the junction of a number of torrents flowing from the Norwegian Alps. Before falling into the lake Wener, it bears the name of Clara-Elf: after flowing out of that lake, near Wenersborg, and about fifty miles from Gottenburg, it forms the famous cataracts of Trolhata. It is now navigable, and in its course divides into two branches, both of which fall into the Cattegat, the one passing through Gottenburg, the other a few miles to the north. A great obstacle to the navigation of this river being the cataracts of Trolhata. An association was formed, in 1793, to conduct a canal parallel to its course at the place of the cataracts. They completed this undertaking in 1800: and it is said to be the intention of the Swedish government to prolong the line of navigation by the Wetter and other lakes, so as to unite the German Ocean and the Baltic, through the centre of that kingdom.

GOTHA, SAXE, DUCHY OF, is a small state of Germany, which comprises a great part of the southern regions of Thuringia, and a portion of the principality of Altenburg. The whole surface is about 1170 square miles. It is bounded by Saxe-Weimar, Prussia, and Schwartzburg. South-west it is hilly and covered with forests; but the other parts are fertile, and grain is raised in considerable quantities. Flax and wool are also grown. The rivers are the Leine and the Neisse. Among its mineral products are iron, coal, manganese, and cobalt. Many of the inhabitants are also engaged in manufacturing ticken and woollen cloth.

Saxe-Gotha is altogether independent. The executive power is possessed by the duke and his privy council, but there is a diet composed of the land-holders and deputies from the towns, who meet every fourth year. The religion is Lutheranism, but all persuasions are tolerated. The duke maintains a small armed force; his contingent to the general army of the confederation of Germany is 1875 men, and the annual revenue of the state about £150,000. Gotha and Altenburg are the chief towns.

GOTHA, the capital of the foregoing duchy, is, according to a recent traveller, 'a beautiful object.' It is built round a hill of considerable elevation, and towers above the surrounding country, presenting fine prospects in every direction. The suburbs, which are extensive, contain a number of houses in the midst of elegant gardens, and give a cheerful aspect to the environs. The streets within the city, though some of them are steep, are handsome: many of the houses are very large, and the whole has the appearance of opulence and comfort. The most

prominent object is the Schloss, or ducal palace, in which the reigning duke resides. Here is a large and valuable library, with a good collection of curiosities. Among the MSS. are more than 3000 charters and other official documents, with a number of scarce works on coins. Gotha is partly surrounded by rows of stately trees, and the suburbs are ornamented with fountains. Its manufactures are porcelain, woollen, and cotton, and it partakes in the trade between Leipsic and the south-west of Germany. Population 12,000.

GOTHARD (St.), one of the highest mountains west of Switzerland. From the top, where there is an hospital for travellers and a monastery for monks, is one of the most pleasing prospects in the world. It is eight miles from Altorf, and is situated in the canton of Uri, on the confines of the Vallais, the Grisons, and Italy. Its ancient name, according to Ptolemy and Strabo, was Adula. The Rhine, the Reuss, the Rhone, and the Aar rise in it. Considered in its utmost extent, it comprehends, besides St. Gothard, properly so called, the mountains of Crispian, Fourche, Grimsel, and Vogelsburg. Its top is covered with eternal snow, varying in height from 8000 to 12,000 feet. It has some mines of fine crystals. No fewer than thirty lakes are situated in this range. The Reuss particularly fixes the attention of the traveller, as it runs parallel with the road a great part of the way, and over it is erected that singular arch called the Devil's Bridge, the abutments of which rest on each side on peaks of rock at an immense elevation.

The road across these mountains into Italy is from ten to fifteen feet broad, and not so steep and difficult as might be expected. It is well paved with granite, but in winter the passage is rendered inconvenient by the snow which lies to the depth of twenty or thirty feet, and the winter lasts long. But the carrying trade is still prosecuted actively, and takes place chiefly on sledges, drawn by a couple of oxen. Other carriages have not as yet been used here. There is a subterraneous passage cut through a mass of rock, which was too high to be climbed, and too vast to be removed; the opening is about twelve feet in height, and as much in width; in length about 200; it is almost dark, the light being admitted only at the ends and at a small crevice. Nothing can exceed the contrast exhibited to the traveller coming from the north, who, after seeing nature in her most frigid form, and passing this dreary cavern, opens all at once on the vale of Urseren. This gallery is called the Uernerloch or Rochepercée. This tremendous mountain was passed on the 25th and 26th of May, 1800, by a division of the French army under general Monecy, consisting of 25,000 men.

GOTHLAND, the southern and most fertile division of Sweden, or all the country to the southward of the lake Wener, has the Cattegat, the Sound, and the Baltic, for its maritime boundaries. It is mentioned in history both under the general name of Gothland, or by the divisions of East, West, and South Gothland; but none of these are recognised in the recent dis-

tribution of Sweden into provinces, which are much smaller, and consist, in the case of Gothland, of the provinces of Smaland, Halland, Christianstadt, Culmar, Gottenburg, Skaraborg, Cronoberg, Blekingen, Ionkoping, Linkoping, and Malmohms. It contains 40,000 square miles and 1,500,000 inhabitants. See SWEDEN.

GOTHLAND, or **GOTTILAND** (i. e. Swed. good-land), an island eighteen leagues distant from the nearest point of Sweden, and from Windau the nearest point of Courland. It is twenty leagues long and seven at its greatest breadth, forming an elevated plain from 150 to 200 feet above the level of the sea. In some places the shore ascends gradually, but in others it resembles a wall. It has two hills, Torsberg on the east, and Hoberg on the south. The first is a steep and naked rock, on the summit of which is a hollow plain, 1200 feet in circumference, and always covered with water. The Hoberg is also a steep rock, remarkable for its caverns, one of which, called the bedchamber of the old man of the mountain, resembles a well-proportioned apartment, and is the subject of many popular tales.

This island is composed of calcareous substances, such as marble, breaches, calcareous spath, and earth, distributed in strata, and often mixed with free-stone containing mica. Besides the extensive beds of madreporas, &c., found round it, entroques, anomias, and mytilus, are also met with petrified, as well as fragments of carneolas, agates, and granite. The soil towards the north is a compact clay producing forests of pines; on the south it is a mixture of sand, clay, and earth. The interior has several lakes and rivers; of the latter the principal is the Lummeland, which issues from lake Mor-teba, sinks into the earth, and after having made itself a subterraneous passage twelve feet wide and six high, re-appears as a rapid torrent.

The climate is more temperate than that of the neighbouring coast of Sweden, the walnut-tree producing fruit. The grains are, wheat, barley, rye, and oats, cultivated in farms spread all over the island. Cattle are reared in considerable numbers, particularly sheep, of which the breed has been lately improved by a cross of the Merino. The forests in the north part furnish plank, tar, and potash for exportation, and the quarries, marble, building, and limestone. Population about 35,000.

There is but one town here and two or three villages. Wisby, the former, is built on a rock on the west coast, and contains 3000 to 4000 inhabitants. It was once a depôt of the Hanse league; and the ruins of several large churches, and other buildings, prove it to have been of more consequence than at present. Its port can only receive a few small vessels. The havens of Capelshamn on the north and Slitehamn on the east, are more capacious; particularly the latter, which is one of the best ports of the Baltic, and defended by the fort of Carlsbelt.

Until the thirteenth century, the Gottlanders enjoyed a degree of independence under the protection of Sweden, but their internal disputes at last caused their entire submission to that power. The island for a short time, in the

middle of the fourteenth century, fell under the dominion of Denmark, and, towards the end of that century, a horde of pirates occupied its coasts. The Teutonic knights at last attacked and destroyed them, and the island acknowledged the sovereignty of the grand master of the order, who sold it to Sweden for 9000 gold nobles. It was ceded to Sweden from Denmark by the peace of Bræmesbro in 1644.

Gothland forms a government, and has a bishop of its own, together with a small militia for its defence; it also furnishes a considerable number of seamen to the Swedish fleet. A considerable number of runic stones have been found on this island, but none more ancient than the introduction of Christianity.

GOTHIC LANGUAGE. Our principal connexion with the fragments that remain of this language is in the etymology of our own. This we shall be found to remember in our Lexicon; and for some original remarks on the subject generally, see GRAMMAR, part I. sect. 2.

GOTILOFRED, or **GODFREY** (Dionysius, or Denis), an eminent lawyer, born of an illustrious family at Paris, in 1549. France being involved in confusion by the leaguers, he accepted of a professor's chair at Geneva, until he was employed by Henry IV.; but, being afterwards stripped of his employments as a Huguenot, he retired to Heidelberg, whence no offers could detach him. The disturbances in the Palatinate obliged him, in 1621, to take refuge in Strasburg, where he died in 1622. He wrote a great number of books; his principal work is the *Corpus Juris Civilis, cum notis*.

GOTILOFRED (Theodore, or Theodosius), son of Denis, was born at Geneva in 1580. As soon as he had finished his studies he went to Paris; where he conformed to the Romish religion, and applied with indefatigable industry to the study of history, (that of France particularly), wherein he became very eminent. In 1632, Louis XIII. made him one of his historiographers, with a stipend of 3000 livres; and, in 1636, he was sent to Cologne, to assist at the treaty of peace negotiating there, on the part of France, by the cardinal of Lyons. This treaty being removed to Munster, Gothofred was sent thither, where he drew up memoirs on the subject; and continued in that city, in the king's service, to his death in 1649. His principal work is his *Account of the Ceremonial of the Kings of France*.

GOTILOFRED (James), brother of Theodore, was born at Geneva in 1587. Applying himself to the study of the law, he obtained the professor's chair there, and was made counsellor of the city, and was several times in France, Germany, Piedmont, and Switzerland, to negotiate the affairs of the republic. He died in 1562; and his chief work is his *Codex Theodosianus, cum perpetuis commentariis, &c.*

GOTILOFRED (Denis), son of Theodore, was born at Paris in 1615. He studied history after his father's example; became as eminent in that department of knowledge; and obtained the reversion of his father's place of historiographer royal, from Louis XIII., when he was but twenty-

five years of age. He published his father's *Ceremonial of France*; finished his *Memoirs of Philip de Commynes*; and was preparing a *History of Charles VIII.*, when he died in 1681.

GOTHS, a warlike nation, famous in the Roman history, who came originally out of Scandinavia, the name given by the ancients to Sweden, Norway, Lapland, and Finmark. According to the most probable accounts, they were the first inhabitants of those countries; and thence sent colonies into the islands of the Baltic, the Cimbrian Chersonesus, and the adjacent places. The time of their first settling in Scandinavia, and of their first peopling the above-mentioned islands and Chersonesus, are equally uncertain; though the Gothic annals state the latter to have happened in the time of Serug the great-grandfather of Abraham. The first migration of the Goths is said to have been conducted by their king Eric; in which all the ancient Gothic chronicles, as well as the Danish and Swedish ones, agree. Their second migration is said to have happened many ages after; when, being overstocked with people, Berig, then king of the Goths, went out with a fleet in quest of new settlements. He landed in the country of the Ulmerugians, now Pomerania, drove out the ancient inhabitants, and divided their lands among his followers. He fell next upon the Vandals, whose country bordered on that of the Ulmerugians, and overcame them; but, instead of forcing them to abandon their country, he only made them share their possessions with the Goths. The Goths, who settled in Pomerania and the adjacent parts of Germany, being greatly increased, undertook a third migration in great numbers under Filimer the Great, their fifth prince after leaving Scandinavia; and, taking their route eastward, entered Scythia, advanced to the Cimmerian Bosphorus, and, driving out the Cimmerians, settled near the Palus Mæotis. Thence, in process of time, being greatly increased in Scythia, they resolved to seek new settlements; and accordingly, taking their route eastward, they traversed several countries, and at length returned into Germany. Their leader in this expedition was the celebrated Woden. See ODRX and WODEN.

At what time Woden reigned in this country, is quite uncertain; but all historians agree, that he went in quest of new settlements with incredible numbers of people following him. He first entered Roxolania, comprehending the countries of Prussia, Livonia, and a great part of Moscow; thence he went by sea into the north parts of Germany; and, having reduced Saxony and Jutland, he at last settled in Sweden, where he reigned till his death, and became so famous that his name reached all countries, and he was by the northern nations worshipped as a god. He is said to have brought the Runic characters out of Asia, and to have taught the northern nations the art of poetry; whence he is styled the father of the Scaldi or Sealdri, their poets, who described in verse the exploits of the great men of their nation, as the bards did among the Gauls and Britons. The Romans distinguished the Goths into two classes; the Ostrogoths and

Visigoths. These names they received before they left Scandinavia; the Visigoths being softened by the Latins from Westergoths, or those who inhabit the western part of Scandinavia, as the Ostrogoths were those who inhabited the eastern part of that country. Their history affords nothing of importance till the time of their quarrelling with the Romans; which happened in the reign of Caracalla. After that period it becomes so closely interwoven with that of the Romans that, for the most remarkable particulars of it, we must refer to the article *ROME*. After the destruction of the Roman empire, by the Heruli, the Ostrogoths, under Theodoric, became masters of the greatest part of Italy, having overcome and put to death Odoacer king of the Heruli in 494. They retained their dominion in this country till A. D. 553; when they were finally conquered by Narses, Justinian's general: see *ITALY*. The Visigoths settled in Spain, in the time of Honorius, where they founded a kingdom which continued till the country was subdued by the Saracens. See *SPAIN*. The Goths were famous for their hospitality and kindness to strangers, even before they embraced Christianity. Nay, it is said, that from their being eminently good, they were called Goths, by the neighbouring nations; that name, according to Grotius and most other writers, being derived from the German word *guten*, which signifies good. They encouraged, says Dio, the study of philosophy above all other barbarous or foreign nations, and often chose kings from among their philosophers. Polygamy was not only allowed but countenanced among them; every one being valued or respected according to the number of his wives. By so many wives they had an incredible number of children, of whom they kept but one at home, sending out the rest in quest of new settlements; and hence those swarms of people which over-ran so many countries. With them adultery was a capital crime, and irremissibly punished with death. Polygamy prevailed among them when they were known to the Romans only by the name of Gètes (their most ancient name); as appears from the poet Menander, who was himself of that nation; and from Horace who greatly commends the chastity of their women. Their laws fell little short of those of the ancient Romans. Their government was monarchical; their religion was much the same with that of the ancient Germans or Celtes; and their dress is described by Appollinaris Sidonius in the following words: They are shod, says he, with high shoes made of hair, and reaching up to their ankles; their knees, thighs, and legs, are without any covering; their garments of various colors scarcely reaching to the knee; their sleeves only cover the top of their arms; they wear green cassocks with a red border; their belts hang on their shoulder; their ears are covered with twisted locks; they use hooked lances and missile weapons.

GOTTENBURG, or GOTHENBURG, is an important town of Sweden, standing on a marsh interspersed with ridges of rock rising from 100 to 300 feet in height. The town occupies the plain, and one of the ridges on the west side;

by which it is divided into upper and lower. The houses are built upon piles. Great harbour runs from east to west, and divides the town into two nearly equal parts; it consists of well-built houses of three stories high, and is crossed at right angles by two other principal streets. Several of the streets of Gottenburg are traversed by canals, bordered with trees. The Upper Town, has an imposing appearance, the houses rising one above another in the form of an amphitheatre; and the streets being wide and clean, but without any side pavement. The houses are generally built of stone or brick, and are large, having pillars in front, and flat concealed roofs. The circumference, exclusive of the suburbs of Haga, is about three miles. The public edifices of Gottenburg are the exchange, the extensive buildings belonging to the East India Company, an hospital, and a magnificent church built since 1812, with stones from Scotland. The only curiosities are a few private collections of paintings.

The harbour is the best situated for foreign trade of any in Sweden, and is formed by two long chains of rocks. It is about a quarter of a mile in breadth, commodious for vessels of moderate size; and has a fort on a small rocky island at the entrance. Gottenburg ranks next to Stockholm, as a trading town; the principal manufactures are coarse linen, and woollen stuffs, sail-cloth, ropes, some silk and cotton goods, soap, tobacco, and sugar refining. Its mercantile transactions extend to America and the Indies: but a very large connexion is kept up with Scotland. Iron and steel, furnished by the mines of Warmeland, are the principal articles of export; and after these, linen, timber, tar, train oil, alum, and herrings.

Gottenburg is the seat of the Swedish East India Company; and a Greenland whale fishery was set on foot in 1775. The number of vessels belonging to the port is upwards of 250; that of vessels of all nations that enter it annually, about 1000. This port flourished greatly during the exclusion of the English from the continental ports, when it was a depôt of British as well as Baltic goods. It has a large provincial school, a mercantile academy, and an academy of sciences and literature, and the English language is pretty generally spoken. It is the see of a bishop, the seat of a chamber of manufactures, and of various courts of justice.

Charles IX., when duke of Gothland, in 1607 founded a town of this name on the island of Hisingen; it was, however, destroyed by the Danes in 1611, and was rebuilt by Gustavus Adolphus in its present position. Few places have suffered more from fire; two calamities of this kind took place in December 1802 and November 1804; by the former, 179 houses and the cathedral were burned down, and the latter consumed upwards of 200 houses, the barracks and several granaries. The fortifications have been lately demolished. The province comprises the adjacent country, (part of West Gothland) to the extent of 760 square miles. The town contains about 25,000 inhabitants. Forty miles south of Uddevalla.

GOTTINGEN, a province of the south of

Hanover, bounded by Brunswick, Hildesheim, the Prussian states, and Hesse-Cassel. It includes several distinct tracts of country, viz. the quarter of Gottingen, the principality of Grubenhagen, Elbingeroda, Hohenstein, the bailiwick of Plesse, and Gleichen, with a small portion of the Eichsfeld, lately ceded by Prussia. Its superficial extent is 1225 square miles, and its population (chiefly Lutherans) 176,000. The eastern side includes the Hartz and the adjoining mountains, and is cold. The Weser forms its boundary on one side, and it is also watered by the Leine and the Rhume. This province abounds in flax, tobacco, and fruit, and grows some little corn: it has extensive pasturages and forest lands, and contains all the mines of silver, copper, lead, and iron in the kingdom. The country is now divided into bailiwicks and jurisdictions, like the rest of Hanover.

GOTTINGEN, the capital of the above province, stands in a valley on a canal branching from the Leine, at the foot of the Haimberg Mountain. The streets are wide and well paved, and lighted at night; and its situation is healthy. It was formerly fortified; but the walls are demolished, or laid out in walks, which command a pleasant prospect. Gottingen was, some centuries ago, included in the list of Hanse towns; but its chief title to notice arises from its university founded by George II. in 1734. It is on a nobly comprehensive plan, embracing divinity, philosophy, law, and medicine. The number of professors is unlimited, and generally exceeds forty.

A lively modern traveller gives the following picture of this university and some of its most distinguished literati:—

‘Gottingen, though not yet 100 years old, has already exhibited more celebrated men, and done more for the progress of knowledge in Germany, than any other similar institution in the country. Meyer, Mosheim, Michaelis, and Heyne, are names not easily eclipsed; and, in the present day, Blumenbach, Gauss, whom many esteem second only to La Place, Hugo, Hieren, and Sartorius, fully support the pre-eminence of the Georgia Augusta. Europe has placed Blumenbach at the head of her physiologists; but, with all his profound learning, he is in every thing the reverse of the dull, plodding, cumbersome, solidity, which we have learned to consider as inseparable from a German savant—a most ignorant and unfounded prejudice. Göthe is the greatest poet, Wolff the greatest philologist, and Blumenbach the greatest natural historian of Germany; yet it would be difficult to find three more jocular and entertaining men. Blumenbach has not an atom of academical pedantry or learned obscurity about him; his conversation is a series of shrewd and mirthful remarks on any thing that comes uppermost, and such likewise I have heard it said, is sometimes his lecture. Were it not for the chaos of skulls, skeletons, mummies, and other materials of his art, with which he is surrounded, you would not easily discover, unless you brought him purposely on the subject, that he had studied natural history. He sits among all sorts of odd things, which an ordinary person would call lumber,

and which even many of those who drive his own science could not make much of; for it is one of Blumenbach's excellencies, that he contrives to make use of every thing, and to find proofs and illustrations where no other person would think of looking for them. By the side of a drawing which represented some Botocuda Indians, with faces like baboons, cudgelling each other, hung a portrait of the beautiful Agnes of Mansfeld. A South American skull, the lowest degree of human confirmation, grinned at a Grecian skull, which the professor reckons the perfection of crania. Here stood a whole mummy from the Canary Islands, there half a one from the Brasils, with long strings through its nose, and covered with gaudy feathers, like Papageno, in the magic flute. Here is stuck a negro's head, there lies a Venus, and yonder reclines, in a corner, a contemplative skeleton, with folded hands. Yet it is only necessary to hear the most passing remarks of the professor, as you stumble after him through this apparent confusion, to observe how clearly all that may be learned from it is arranged in his head, in his own scientific combinations. The only thing that presented external order, was a very complete collection of skulls, showing the fact, by no means a new one, that there is a gradual progression in the form of the skull, from apes up to the most generally received model of human beauty. 'Do you see these horns?' said he, searching among a heap of oddities, and drawing forth three horns, 'they were once worn by a woman. She happened to fall and break her head; from the wound sprouted this long horn; it continued to grow for thirty years, and then she cast it; it dropped off; in its place came a second one; but it did not grow so long, and dropped off too. Then this third one all on the same spot; but the poor woman died while the third was growing, and I had it cut off from the corpse.' They were literally three genuine horns. The last two are short, thick, and nearly straight; but the first is about ten inches long, and completely twisted, like the horn of a ram. It is round and rough, of a brownish color, and fully half an inch in diameter towards the root. All three are hollow, at least at the base. The termination is blunt and rounded. Other instances of the same thing have been known, but always in women; and Blumenbach says it has been ascertained, by chemical analyses, that such horns have a greater affinity, in their composition, with the horns of the rhinoceros, than with those of any other animal.

'The pre-eminence of Gottingen is equally founded in the teachers and the taught. A Gottingen chair is the highest reward to which a German savant aspires, and to study at Gottingen is the great wish of a German youth. There are good reasons for this both with the one and the other. The professor is more comfortable, in a pecuniary point of view, and possesses greater facilities for pushing on his science, than in the other universities; the student finds a more gentlemanly tone of manners than elsewhere, and has within his reach better opportunities of studying to good purpose. This arises from the exertions of their government to render

the different helps to study—the library, the observatory, the collections of physical instruments, and the hospitals—not as costly, but as useful as possible. It has never adopted the principle of bribing great men by great salaries, a principle naturally acted on in those universities which possess no other recommendation than the fame of the teachers. It has chosen rather to form and organise those means of study which, in the hands of a man of average talent (and such are always to be had) are much more generally and effectively useful, than the predilections of a person of more distinguished genius when deprived of this indispensable assistance. The professors themselves do not ascribe the rapidly increasing prosperity of the university so much to the reputation of distinguished individuals who have filled so many of its chairs, as to the pains which have been taken to render these means of improvement more perfect than they are to be found united in any sister seminary. 'Better show-collections,' said professor Hieron very sensibly, 'may be found elsewhere; but the great recommendation of ours is, that they have been made for use, not for show; that the student finds in them every thing he would wish to see and handle in his science. This is the true reason why the really studious prefer Gottingen, and this will always secure our pre-eminence, independent of the fame of particular teachers; the latter is a passing and changeable thing, the former is permanent.' Above all, the library is a great attraction, both to the teacher and the learner. It is not only the most complete among the universities, but there are very few royal or public collections in Germany which can rival it in real utility. It is not rich in manuscripts, and many other libraries surpass it in typographical rarities, and specimens of typographical luxury; but none contains so great a number of really useful books in any given branch of knowledge. The principle on which they proceed is, to collect the solid learning and literature of the world, not the curiosities and splendors of the printing art. If they have twenty pounds to spend, instead of buying some very costly edition of one book, they very wisely buy ordinary editions of four or five. When Heyne undertook the charge of the library, in 1763, it contained 60,000 volumes. He established the prudent plan of increase, which has been followed out with so much success, and the number is now nearly 200,000. They complain much of the expense of English books. No compulsory measures are taken to fill the shelves, except that the booksellers of Gottingen itself must deliver a copy of every work which they publish.' *Russell's Tour in Germany.*

A new observatory at Gottingen, which was some years since begun under the direction of the celebrated M. Gauss, is now provided with fixed instruments of high perfection, viz. a meridian circle by Repsold; and another meridian circle and transit instrument by Reichenbach. These instruments are so perfect, that the two last show, under favorable circumstances, at noon, stars of the fourth or even of the fifth magnitude. A regular course of observations is carried on at the observatory

There are in Gottingen four Lutheran and two Calvinist churches; a Catholic chapel, and some manufactures of linen and woollen. The town has twice been in the possession of the French, viz. from 1757 to 1762, and from 1803 to 1813. A serious difference took place between the students and the inhabitants of the town in October 1818; the government took part with the latter, and, though some diminution took place in the number of students, it was considered as only temporary. Inhabitants, exclusive of students and military, 8500. Twenty-one miles north-east of Cassel, and fifty-one E. S. E. of Paderborn.

GOTTO, a country of Central Africa, to the south of the Niger, between Bambarro and Tombuctoo. It was formerly divided into a number of small states dependent upon Bambarra; but a chief of the name of Mossee succeeded in uniting these, and forming them into a general confederacy, with which he carried on a successful war against Bambarra, and Gotto has since been an independent state. The capital is called Moosseedoo, from the name of the above-mentioned chief.

GOUANIA, in botany, a genus of the monœcia order, polygamia class of plants: *cal.* of the hermaphrodite quinquefid: *cor.* none; there are five antheræ covered with an elastic calyptra or hood: the style trifid; the fruit inferior to the receptacle of the flower, divisible into three seeds. The make is like the hermaphrodite, but wanting stigma and germen. Species one only; a native of St. Domingo.

GOUDA, or **TER GOUV**, a town of South Holland, on the Issel, where that river receives the Gouw. It has large manufactures of porcelain and tobacco-pipes, and a commodious port on the Issel, its situation being central for the communication between Holland, Zealand, and Belgium. Gouda is surrounded with ditches of great depth and width, and can, by means of its sluices, lay the whole surrounding country under water. The most accessible point is on the side of the Issel; but this is defended by a strong battery. The church of St. John the Baptist is handsome, and is particularly celebrated for its painted glass windows. The market place is of a triangular form, with a handsome town-house, built in 1449. Population 12,000. Nine miles north-east of Rotterdam, and twenty-two south of Amsterdam.

GOUDT (Henry), usually called count Goudt, was born of a noble family at Utrecht, in 1570: and was knight of the Palatinate. Being fond of painting and engraving, he applied himself diligently to drawing, and made a great proficiency therein. He then went to Rome, where he contracted an intimacy with Adam Elsheimer, studied his style, and made his works models for imitation. Those pictures which Goudt himself painted were delicately touched, in color and pencil resembling Elsheimer. On his return to Utrecht, a young woman who was in love with him, and desirous of fixing his affection upon herself, gave him a philter, which terminated in a very melancholy manner, by depriving him of his senses; and in this dreadful state he dragged on a miserable life to the age of sixty-nine, his

death happening in 1639. It is remarkable that, though lost to every other subject, when painting was spoken of he would discourse upon it in a very rational manner. He engraved seven beautiful prints after the pictures of Elsheimer, which are well known to the curious, and are to be met with in most choice collections. He worked with the graver only, in a very neat style; and produced a most powerful effect, not by strengthening the strokes, according to the usual method, but by crossing them with additional strokes, equally neat, five or six times, one over another, in the deep shadows. The weeds and other parts of the fore ground, in his admirable print of Ceres, are very finely expressed. The seven prints mentioned above, are 1. Ceres drinking from a pitcher. An old woman appears holding a candle at the door of the cottage, and a boy naked standing by her laughing and pointing at the goddess; for which contempt he was metamorphosed by her into a frog. The powerful and striking effect of this engraving cannot be properly described. This print is also called the sorcery. 2. The flight into Egypt; a night scene, in which the moon and stars are introduced with great success. 3. The angel with Tobit, who is drawing a fish by his side. The back ground is a landscape; the weeds in the fore ground, and the branches of the trees in front, as well as the foliage and weeds hanging from them, are beautifully expressed. 4. The angel with Tobit, crossing a stream of water: the back ground a landscape. 5. Baucis and Philemon entertaining Jupiter and Mercury. 6. A landscape called the Aurora, representing the dawn of day. 7. The beheading of St. John in prison, a very small upright oval print, which is by far the most scarce.

To GOVE, to mow; to put in a gove, goff, or mow. An old word.

Load safe, carry home, follow time being fair, *Gove* just in the barn, it is out of despair. *Tusser.*

GOVEA (Antony), a Latin poet and critic of the sixteenth century; author of Latin Epigrams, which have been admired. His editions of Virgil and Terence display great judgment and critical accuracy. He died in 1613.

GOVERN , <i>v. a. & v. n.</i>	} Fr. <i>gouverner</i> , <i>gouvernante</i> ; Lat. <i>gubernare</i> ; all of Gr. <i>κυβερνᾶω</i> , à <i>κυβη</i> , the head; Belgic <i>governuren</i> ; Span. and Port. <i>governan</i> . Our words are principally formed from the French <i>gouverner</i> with different terminations. The primary idea is superiority either in position or agency, and this is the key to each word, whether referring to communities or individuals. It also implies self-management as to body or mind; influence of words on each other with regard to construction; a pilot, regulator, or manager of ships, &c.; a lady who has the care and superintendence of young ladies of quality.
GOVERNABLE , <i>adj.</i>	
GOVERNANCE , <i>n. s.</i>	
GOVERNAN'TE , <i>n. s.</i>	
GOVERNESS , <i>n. s.</i>	
GOVERNMENT , <i>n. s.</i>	
GOVERNOR , <i>n. s.</i>	
GOVERNAIL , <i>n. s.</i>	

For the kingdom is the Lord's, and he is the *governor* among the nations. *Ps. xxii. 28.*

Behold all the ships, which though they be so great, and are driven of fierce winds, yet they are turned

about with a very small helm, whithersoever the governor listeth. *Jas. iii. 4.*

Jonathan took the *governance* upon him at that time, and rose up instead of his brother Judas. *1 Mac. ix. 31.*

Ye han well and convenably taught me, as in general how I shal *govern* me in he chesing and in the witholding of my counsellours.

Chaucer. The Tale of Melibeus.

Aurelian when that the *governance*
Of Rome came into his hondes tway,
He shope upon this queene to do vengeance,
And with his legions he toke his way
Toward Zenobie. *Id. The Monkes Tale.*

Beth not bedaffed for your innocence,
But taketh on you the *governaille*.

Id. The Merchant's Tale.

Great affliction that severe *governess* of the life of man brings upon the soul she seizes on.

More against Atheism.

No *government* can do any act to limit itself: the supreme legislative power cannot make itself not to be absolute. *Lesley.*

During the minority of kings, the election of bishops, and other affairs of the church, must be left in the hands of their *governours* and courtiers. *Id.*

He likest is to fall into mischance

That is regardless of his *governance*. *Spenser.*

Their god

Shot many a dart at me with fierce intent ;

But I them warded all with wary *government*. *Id.*

This inconvenience is more hard to be redressed in the *governor* than the *governed* ; as a malady in a vital part is more incurable than in an external.

Spenser on Ireland.

It must be confessed, that of Christ, working as a creator and a *governour* of the world by providence, all are partakers. *Hooker.*

Thy eyes windows fall,

Like death, when he shuts up the day of life ;

Each part deprived of supple *government*,

Shall stiff and stark, and cold appear, like death. *Shakspeare.*

What ! shall king Henry be a pupil still,

Under the surly Gloster's *governance* ? *Id.*

You needs must learn lord, to amend this fault ;
Though sometimes it shows greatness, courage, blood,
Yet oftentimes it doth present harsh rage,
Defect of manners. want of *government*,
Pride, haughtiness, opinion, and disdain. *Id.*

To you, lord *governour*,

Remains the censure of this hellish villain. *Id.*

To Eltam will I, where the young king is,

cing ordained his special *governour* ;

And for his safety there I'll best devise. *Id.*

The moon, the *governess* of floods,

Pale in her anger, washes all the air,

That rheumatick diseases do abound. *Id.*

Go after her, she's desperate ; *govern* her. *Id.*

They that *govern* most make least noise. You see when they row in a barge, they that do drudgery work, slash, and puff, and sweat ; but he that *governs* sits quietly at the stern, and scarce is seen to stir. *Selden.*

There they shall found

Their *government*, and their great senate chuse

Through the twelve tribes, to rule by laws ordained. *Milton.*

With Boynton or with Middleton twere sweet,

But with a parliament abhors to meet.

And thinks 'twill ne'er be well within this nation

Till it be *governed* by a convocation. *Marvell.*

Whipping, that's *Virtue's governess*,

Tut'ress of arts and sciences. *Hudibras.*

He presented himself unto her, falling down upon both his knees, and holding up his hands, as the old *governor* of Danae is painted, when she suddenly saw the golden shower. *Sidney.*

Safety and equal *government* are things

Which subjects make as happy as their kings. *Waller.*

Slaves to our passions we become, and then

It grows impossible to *govern* men. *Id.*

There seem to be but two general kinds of *government* in the world : the one exercised according to the arbitrary commands and will of some single person ; and the other according to certain orders or laws introduced by agreement or custom, and not to be changed without the consent of many. *Temple.*

By that rule

Your wicked atoms may be working now

To give bad counsel, that you still may *govern*. *Dryden.*

While he survives, in concord and content

The commons live, by no division rent ;

But the great monarch's death dissolves the *government*. *Id.*

The great work of a *governour* is to fashion the carriage, and form the mind ; to settle in his pupil good habits, and the principles of virtue and wisdom. *Locke.*

The flexibleness of the former part of a man's age, not yet grown up to be headstrong, makes it more *governable* and safe. *Id.*

I am at present against war, though it puts the power into my hands, and though such turbulent and naughty spirits as you are, *govern* all things in times of peace. *Davenant.*

The magistrate cannot urge obedience upon such potent grounds as the minister, if so disposed, can urge disobedience : as, for instance, if my *governour* should command me to do a thing, or I must die, or forfeit my estate ; and the minister steps in and tells me, that I offend God, and ruin my soul, if I obey that command, 'tis easy to see a greater force in this persuasion. *South.*

Every one knows, who has considered the nature of *government*, that there must be in each particular form of it an absolute unlimited power. *Addison.*

Listen, children, unto me,

And let this your lesson be,

In our language evermore

Words that *govern* go before. *Mauger's French Grammar.*

The chief point, which he is to carry always in his eye, and by which he is to *govern* all his counsels, designs, and actions. *Atterbury.*

They beget in us a great idea and veneration of the mighty author and *governour* of such stupenduous bodies, and excite and elevate our minds to his adoration and praise. *Bentley.*

Where any one person or body of men seize into their hands the power in the last resort, there is properly no longer a *government*, but what Aristotle and his followers call the abuse or corruption of one. *Sieft.*

Those *governments* which curb not evils, cause ;
And a rich knave's a libel on our laws. *Young.*

Another very important branch of self-knowledge is, the knowledge of those *governing* passions or dispositions of the mind, which generally form what we call a man's natural temper. *Mason.*

GOVERNMENT is also used for a post or office, which gives a person the power or right to rule over a city, or a province, either supremely or by deputation.

GOVERNMENT is likewise used for the city, country, or place to which the power of government is extended.

GOVERNMENT, CIVIL, was instituted for the preservation and advancement of men's civil interests, and for the better security of their lives, liberties, and properties. The use and necessity of government is such, that there never was an age or country without some sort of civil authority: but, as men are seldom unanimous in the means of attaining their ends, so their difference in opinion as to government has produced various forms of it. According to Montesquieu, and most other writers, they may in general be reduced to three kinds: 1. The republican; 2. The monarchical; 3. The despotic. The first is that in which the people in a body, or only a part of the people, have the sovereign power; the second, where one alone governs, but by fixed established laws; but third, in the despotic government, one person alone, without law and without rule, directs every thing by his own will and caprice. See LAW. On the subject of government at large, see Montesquieu's *Spirit of Laws*, l. 2, c. 1; Locke, ii. 129, &c. 4to. edit. 1768: Sidney on Government; Sir Thomas Smith de Repub. Ang. and Acherly's *Britannic Constitution*. As to the Gothic government, its original and faults, &c., see Montesquieu's *L'Esprit des Loix*, l. 11, c. 8. With respect to the feudal policy, how it limited government, see FEUDAL SYSTEM.

GOUGE, *n.s.* Fr. A chisel having a round edge, for the cutting of such wood as is to be rounded or hollowed.

GOUGH (Richard), topographer and antiquary, was the son of an East India director, and born in Austin Friars, London, in 1735. Educated at home, his mother had printed a translation from the French of a history of the Bible, made by him when he was only eleven years old. At the age of fifteen Gough translated Fleury's works on the Manners of the Israelites. In 1752 he entered at Benet College, Cambridge, and during the time he remained at the university he laid the plan of his *Anecdotes of British Topography*, it was published in one volume 4to. in 1768, and reprinted with improvements in 2 vols. 1780. He left Cambridge without taking a degree, and engaged in no profession. He was a fellow of the Society of Antiquaries, and in the *Archæologia*, or *Transactions of that Society*, as well as in the *Bibliotheca Topographica Britannica*, and the *Gentleman's Magazine*, he published many communications. He also produced *Sepulchral Monuments of Great Britain*, 1786, 2 vols. folio; an enlarged edition of Camden's *Britannia*, 1789, 3 vols. folio; and one still more augmented in 4 vols. 1806; an *Account of the Bedford Missal*; and the *History of Pleshey in Essex*. He died at Enfield, February 20 1809, and bequeathed to the Bodleian library at Oxford his collection of books and manuscripts, relative to Saxon and Northern literature and to British topography.

GOUJET (Claude Peter), a French writer of some note, was the son of a tailor, and born at Paris in 1697. He was educated by the Jesuits; and on taking orders became a canon of the church of St. Jacques de l'Hôpital. His

works are numerous, and display considerable erudition; the principal are—*L'Histoire du Collège Royal de France*, 12mo.; *Hist. du Pontificat de Paul V.*, in which he is by no means favorable to the Jesuits; *Les Vies des Saints*, 2 vols. 4to.; *Supplement to Moreri's Dictionary*, displaying much industry but little judgment; *De l'Etat des Sciences en France*, 12mo.; *Bibliothèque des Auteurs Ecclesiastiques du XVIII Siècle*, 3 vols. 8vo.

GOULART (Simon), a minister of Geneva, born at Senlis in 1543, and one of the most indefatigable writers of his time. He made considerable additions to the 'Catalogue of Witnesses of the Truth' composed by Illyrius; and acquired a great reputation by his works: the principal of which are, 1. A translation of Seneca. 2. A collection of memorable histories. 3. A translation of St. Cyprian de Lapsis. 4. Several devotional and moral treatises. He died at Geneva in 1628.

GOUNVILLE (John Herauld), a French author, born in 1625, originally only a valet to the duke of Rochefoucault, who advanced him to several high offices. He wrote *Memoirs*, containing important anecdotes of the French ministers, from Mazarinet to Colbert. He died in 1705, aged eighty.

GOUR, or GAUR, the ancient capital of Bengal, is situated in the district of Rajemal, a few miles south of the town of Maulda.

The ruins extend fifteen miles along the old banks of the Ganges, and are from two to three miles in breadth. Several villages stand on a part of its site; the remainder is covered with thick forests—the resort of tigers, and beasts of prey, or it has become arable land, the soil of which is largely mixed with brick-dust. The principal buildings are a mosque lined with black marble, elaborately wrought, and two gates of the citadel, which are grand and lofty. The bricks, which are of a most solid texture, are often carried away to Moorshedabad, Maulda, and other places.

No part of this site of Gour is nearer to the present bank of the Ganges than four miles and a half, and some parts, which were originally washed by that river, are, according to Mr. Hamilton, now twelve miles from it. A stream that runs past it communicates with its west side, and is navigable during the rainy season. On the east, and in some places within two miles, it has the Mahanuddy River which communicates with the Ganges, and is always navigable.

'Gaura, or, as it is commonly called, Bengali, is the language spoken in the provinces of which the ancient city of Gour was the capital. It still prevails in all the provinces of Bengal, excepting some frontier districts, but is spoken with the greatest purity in the eastern parts only. Although Gaura be the name of Bengal, yet the Brahmins, who bear that appellation, are not inhabitants of Bengal, but of Hindostan Proper. They reside chiefly in the province of Delhi, while the Brahmins of Bengal are avowed colonists from Kanoge. When Mahommed Bukhtyar Khilligee conquered Bengal, A. D. 1204, he established the then ancient city of Gour as the capital of his dominions. Rajah Lackmanyah, the last Hindoo sovereign whom he expelled,

held his court at Nuddea. In 1535 the emperor Hamayoon, when in pursuit of Shere Khan, the Patan (who afterwards expelled him from Hindostan), took Gour, then the capital of Bengal. Ferishta says, that the seat of government was afterwards removed to Taunda, or Taura, a few miles higher up, on account of the unhealthiness of the climate. *Hamilton's East India Gazetteer.*

GOURD, *n. s.* } Fr. *gourhorde*. A plant.
GOURDINESS, *n. s.* } The fruit of some species are long, of others round, or bottle-shaped. A bottle, from old Fr. *gourt*.—Skinner. The large fruit so called is often scooped hollow, for the purpose of containing and carrying wine, and other liquors: from thence any leathern bottle grew to be called by the same name, and so the word is used by Chaucer. Gourdiness, a swelling in a horse's leg after a journey.

And wete ye—what? I have here in my *gourd*
A draught of win, ye of a ripe grape

* * * * *

To the Manciple he toke the *gourd* again,
And of that drinke the coke was wonder fain,
And thouked him in swiche wise as he conde.

Chaucer. The Manciple's Tale.

But I will haste, and from each bough and brake,
Each plant and juiciest *gourd*, will pluck such choice
To entertain our angel guest.

Milton's Paradise Lost.

Gourd seeds abound so much in oil, that a sweet and pleasant one may be drawn from thence by expression; they are of the four greater cold seeds, and are used in emulsions. *Hill.*

GOURD, in botany. See CUCURBITA.

GOURD, BITTER. See CUCUMIS.

GOURD, ETHIOPIAN SOUR. See ADANSONIA.

GOURD TREE. See CRESCENTIA.

GOURNAY (Mary le Jars de) a celebrated French lady, was born at Paris in 1566. Losing her father, she was adopted by Montaigne while very young, who called her his daughter of alliance. She was well versed in the languages; and has been styled the 'French syren.' Her style however was stiff, and deformed by ancient phraseology. Her temper also was somewhat acrid; and she made herself many enemies. She published an edition of the Essays of her foster father, dedicated to cardinal Richelieu. Her own works were published in a quarto volume, under the title of *Les Aïrs, ou les Presens de la Demoiselle de Gournai*. She had a small pension from the French court, and died in 1645.

GOUSSET, a French protestant minister, born at Blois, in 1635. He left France on the revocation of the edict of Nantz, and went to Holland, where he became professor of Greek and theology at Groningen. He died there, in 1704. He wrote *Commentarii Linguae Hebraicae*, and several other works.

GOUT, *n. s.* } Fr. *goute*; Ital., Span.,
GOUT'WORT, *n. s.* } and Port. *gota*, *gota*, from
GOUT'Y, *adj.* } Lat. *gutta*, a drop, from its being supposed to originate in humors of the joints. A periodical disease, attended with severe pain; an old word signifying drops, still used in Scotland; an affected word (for gout), implying taste; a herb, so named; the state of parts, or a constitution predisposed to the disease.

One that's sick o' the *gout*, had rather
Groan so in perplexity, than be cured
By the sure physician death.

Shakspeare. Cymbeline.

I see thee still,
And on the blade o' the dudgeon *gouts* of blood,
Which was not so before. *Id. Macbeth.*
There dies not above one of a thousand of the *gout*,
although I believe that more die *gouty*. *Graunt.*

Knots upon his *gouty* joints appear,
And chalk is in his crippled fingers found.

Dryden.

This very reverend lecher, quite wora out
With rheumatism, and crippled with his *gout*,
Forgets what he in youthful times has done,
And swings his own vices in his son. *Id.*
Catalogues serve for a direction to any one that has
a *gout* for the like studies. *Woodward on Fossils.*

There are likewise other causes of blood-spitting; one is the settlement of a *gouty* matter in the substance of the lungs. *Blackmore.*

The *gout* is a disease which may affect any membranous part, but commonly those which are at the greatest distance from the heart or the brain, where the motion of the fluids is the lowest, the resistance, friction, and stricture of the solid parts the greatest, and the sensation of pain, by the dilaceration of the nervous fibres, extreme. *Arbuthnot on Diet.*

Most commonly a *gouty* constitution is attended with great acuteness of parts, the nervous fibres, both in the brain and the other extremities, being delicate. *Id.*

Business would have carried my wife to Bath by this time, had she not been seized with a fit of the *gout* when she was ready to set out; but I hope this will not retard her many days. *Warburton.*

GOUT. See MEDICINE.

GOWER (John), one of the most ancient English poets, was contemporary with Chaucer, and his intimate friend. He studied the law, and was some time a member of the society of Lincoln's Inn. Some have asserted that he was a judge. In the first year of Henry IV. he became blind, which he laments in one of his Latin poems. He died in 1402; and was buried in St. Mary Overy's, which church he had rebuilt chiefly at his own expense, so that he must have lived in affluent circumstances. His tomb was magnificent, and curiously ornamented. It still remains, but has been repaired in later times. From the collar of SS round the neck of his effigies, which lies upon the tomb, it is supposed that he had been knighted. He wrote, 1. *Speculum Meditantis*, in French, in ten books. There were two copies of this in the Bodleian library. 2. *Vox Clamantis*, in Latin verse, in seven books. Preserved also in the Bodleian library, and in that of All-souls. It is a chronicle of the insurrection of the commons in the reign of Richard II. 3. *Confessio Amantis*; printed at Westminster by Caxton, in 1493, London 1532, 1545. It is a sort of poetical system of morality, interspersed with a variety of moral tales. 4. *De rege Henrico IV.*; printed in Chaucer's works. There are likewise several historical tracts, in MS. written by our author, which are to be found in different libraries; also some short poems printed in Chaucer's works.

GOWER'S HARBOUR, a bay on the south-west coast of New Ireland, five miles north of Cape St. George. It is by Bougainville called Praslin

Bay (Baie de Praslin), and by Dampier St. George's Bay. Long. $150^{\circ} 40' E.$, lat. $4^{\circ} 56' S.$

GOWER'S ISLAND, so called by captain Carteret, an island in the eastern seas, called, by Monsieur Surville, Inattendue. It is of a figure resembling an arrow, and is low and covered with wood. Carteret could discover no anchorage. Long. $158^{\circ} 56' E.$, lat. $7^{\circ} 56' S.$

GOWGATCHY, the name of two towns in Bengal.

GOWHATTY, the capital of Lower Assam, Hindostan. The surrounding district occupies an extent of hilly country on both banks of the Brahmapootra; and the hills on each side form a spacious amphitheatre, well fortified both by nature and by art. In the seventeenth century this place was the western frontier of Assam, all the country on this side being included in Kamroop. Gowhatty was taken by Aurungzebe in the year 1663. Long. $91^{\circ} 46' E.$, lat. $26^{\circ} 10' N.$

GOWN, *n. s.* } Tent. *gowne*; Welsh
GOWN'ED, *adj.* } *gwen*; Ital. *gonna*; Fr.
GOWN'SMAN, or } *gonnelle*: all probably
GOWN'S-MAN, *n. s.* } from Gr. *govu*, genu, the
knee: because originally a garment only reaching to the knees. An upper or loose garment of male or female; used in a particular sense for the ordinary outward garment of females and the professional dress of students and the different faculties: a dress of peace as distinct from war.

The benefices themselves are so mean in Irish counties, that they will not yield any competent maintenance for any honest minister, scarcely to buy him a gown. *Spenser on Ireland.*

A noble crew about them waited round
Of sage and sober peers, all gravely gown'd.

If ever I said a loosebodied gown, sew me up in the skirts of it, and beat me to death with a bottom of brown thread; I said a gown. *Shakspeare.*

They make garments either short, as cloaks, or, as gowns, long to the ground. *Abbot.*

Girt in his Gabin gown the hero sat. *Dryden.*

In length of train descends her sweeping gown,
And by her graceful walk the queen of love is known. *Id.*

He Mars deposed, and arms to gowns made yield;
Successful councils did him soon approve
As fit for close intrigues as open field. *Id.*

In velvet white as snow the troop was gown'd, *Id.*
The seams with sparkling emeralds set around. *Id.*

Let him with pedants
Pore out his life amongst the lazy gownmen. *Rowe.*

I despise your new gown, 'till I see you dressed in it. *Pope.*

Thus will that whole bench, in an age or two, be composed of mean, fawning gownmen, dependants upon the court for a morsel of bread. *Swift.*

Yet not superior to her sex's cares,
The mode she fixes by the gown she wears;
Of silks and china she's the last appeal;
In these great points she loads the common wheel. *Young.*

If Mr. Onslow will lay aside his privilege, I will lay aside my gown. *Horne Tooke.*

The Gown is an ample sort of garment, worn over the ordinary clothes, hanging down to the feet. It is fashioned differently for ecclesiastics and for laymen. At Rome they gave the name

togavirillis, i. e. the virile gown, to a plain kind of gown which their youth assumed when arrived at puberty. This they particularly denominated *prætexta*. See *TOGA*, *PRÆTEXTA*, &c. In some universities, physicians wear a scarlet gown. In the Sorbonne, the doctors always are in gowns and caps.

Gown is also taken in the general for civil magistracy, or the profession opposite to that of arms. In this sense it was that Cicero said, *Cedant arma togæ*.

GOWRAN, a borough and post town of Ireland, in the county of Kilkenny, three miles from Ballinabola castle, eight east of Kilkenny, and fifty-two from Dublin. It is governed by a portreeve, recorder, and town clerk. Here are the ruins of an old church, and the handsome seat of the late lord Clifden. Long. $7^{\circ} 0' W.$, lat. $52^{\circ} 34' N.$

GOYEN (John Van), painter of landscapes, cattle, and sea pieces, was born at Leyden in 1596; and was instructed by Isaac Nicholai, and afterwards by Esaias Vandervelde, the most celebrated landscape painter of his time. Van Goyen soon rose into general esteem; and his works are more general throughout Europe than the works of any other master, as he possessed an uncommon readiness of hand and freedom of pencil. It was his practice to sketch the views of villages and towns on the banks of rivers or canals; of the sea-ports in the low countries; and sometimes of inland villages, where the scenes around them appeared picturesque. Those he afterwards used as subjects for his landscapes; enriching them with cattle, boats, and figures in character. He understood perspective, and the chiaro-scuro, which enabled him to give his pictures a strong and agreeable effect. He died in 1656, aged sixty.—His best pieces are generally marked with his name and the year; and his finished pictures will be for ever estimable. His pictures frequently have a grayish cast, occasioned by his using a color called Haerlem blue, then much approved but now disused, as it is apt to fade into that grayish tint. His best works are valued so highly in most parts of Europe, that they afford large prices, being ranked with the pictures of Teniers. They are not now easily procured, if undamaged, though his slighter performances are sufficiently common.

GOZZO, a rocky but fertile island of the Mediterranean, to the north-west of Malta, to which it is attached. It is extremely populous; its superficial extent being only thirty-seven square miles, while the inhabitants amount to above 13,000. It contains the town of St. Borgo, the fort of Gozzo, and six villages. The fort is said to occupy the site of an ancient town built by the Phœnicians or Greeks; there, are two smaller ones on the coast. This island was taken by the Turks in 1551, and attacked by them in vain in 1613, and 1709. The channel between it and Malta will admit with safety the largest men of war. The Fungus Melitæus, well known in the medical world, grows on a rock here. It is also asserted, that veins of gold and silver are to be found; as are cotton, corn, and all kinds of vegetables.

GOZZO or GARDA, an island near Candia, the

ancient Claudia, which St. Paul past on his way to Rome. To the west is Pulo Gozzo, or little Gozzo, a very small island. Long, $23^{\circ} 46' E.$, lat. $34^{\circ} 48' N.$

GRAAF REYNET, the most eastern district in the territory of the Cape of Good Hope, extending from Stellenbosch and Drakenstein to Kaffre Land, about 250 miles in length and 160 in breadth, and containing a surface of 40,000 square miles. The occupation here is entirely grazing, and the inhabitants have frequent skirmishes with the neighbouring Kaffers and Bosjesmans. In the centre of the district is the drotsky orchief town, about 500 miles E. S. E. of Cape Town. See CAPE OF GOOD HOPE.

GRAAF (Regnier de), a celebrated physician, born at Schoonhaven, in Holland, in 1641. He studied physic in Prussia, and was educated at Leyden, where he acquired great honor by publishing a treatise *De Succo Pancreatico*. He also published three pieces upon the Organs of Generation, on which subject he had a controversy with Swammerdam. He died in 1673, aged thirty-two; and his works with his life prefixed were published at Leyden in 1677, in 8vo.

GRABE (John Ernest), a very learned writer in the beginning of the eighteenth century, born at Konigsberg in Prussia. He was educated in the Lutheran religion; but the reading of the fathers led him into doubts. He presented to the electoral consistory at Sambia in Prussia a memorial containing his doubts. The elector ordered three eminent divines to answer them. Their answers shook him in his resolution of embracing the Roman Catholic religion; and one of them, Spener, advised him to go England. He went; and king William III. gave him a pension, which was continued by queen Anne. He was ordained a priest of the church of England, and honored with the degree of D. D. by the university of Oxford; upon which occasion Dr. George Smaclridge pronounced two Latin orations, which were afterwards printed. He wrote, 1. *Specilegium S. S. Patrum, ut et Hereticorum, sæculi post Christum natum*, 8vo. 2. An edition of the Septuagint, from the Alexandrian MS. in St. James's library. 3. Notes on Justin, &c.; and other works, which are much and justly esteemed.

GRAB'BLE, *v.n. & v.a.* Belg. *grabblen*. See GRAPPLE. To grope, feel eagerly with the hands: Dr. Johnson says after Ainsworth 'to lie prostrate on the ground,' but supplies no instance of the use of the word.

My blood chills about my heart at the thought of these rogues, with their bloody hands *grabbling* in my guts, and pulling out my very entrails.

Arbutnot's John Bull.

GRACCHUS (Sempronius), the father of Tiberius and Caius. He was proconsul in Spain, subdued the Celtiberians, and rebuilt or repaired Gracchuris.

GRACCHUS (Tiberius and Caius). Tiberius, being tribune of the Roman people, demanded in their name the execution of the Agrarian law; by which all persons possessing above 200 acres of land were to be deprived of the surplus, for the benefit of the poor citizens, amongst whom an equal distribution of them was to be made.

Having carried his plan into execution by violent measures, he fell a victim to his zeal, being assassinated, A. A. C. 133. Caius his brother, pursuing the same steps, was killed by the consul Opimius, A. A. C. 121. See ROME.

GRACIAS A DIOS, a city of Honduras, situated on a river which communicates with the bay of that name. It has two convents; and is 140 miles east of Guatemala. Long, $90^{\circ} 6' W.$, lat. $14^{\circ} 30' N.$ It is also the name of a point of land on the coast of Costa Rica.

GRACE, *n.s. & v.a.*

GRACED, *adj.*

GRACE'FUL, *n.s.*

GRACE'FUL, *adj.*

GRACE'FULNESS, *n.s.*

GRACE'LESS, *adj.*

GRACE'S, *n.s.*

GRACE'FUL, *adj.*

GRACE'FULLY, *adv.*

GRACE'FULNESS, *n.s.*

various expressions or effects of favor or goodness, as mercy, pardon, privilege: and used emphatically, in a theological sense, for the unmerited favor of God and its consequences. To grace is to favor, adorn, or dignify: the graces were female goddesses supposed to bestow beauty: gracious is favorable, benignant, merciful. The meaning of the other compounds appears plain.

For what *grace* is it if ye synnen and ben buffeted and suffer? but if ye doon well and suffres patientli, this is *grace* anentis god, for to this thing ye ben clepid. *Wiclif. 1 Peter 2.*

My hosbond had a legend of his wif
Eriphile, that for an ouche of gold
Hath prively unto the Greeks told
Whir that hire hosbond hidde him in a place,
For which he had at Thebes sory *grace*.

Chaucer. Cant. Tales.

Where justice grows, there grows the greater *grace*,
The which doth quench the brand of hellish smart.

Spenser.

Doctrine is much more profitable and *gracious* by example than by rule. *Id.*

This *graceless* man, for furtherance of his guile,
Did court the handmaid of my lady dear. *Id.*

This they study, this they practise, this they *grace*
with a wanton superfluity of wit. *Hooker.*

It doth grieve me, that things of principal excellency should be thus bitten at by men whom God hath endued with *graces* both of wit and learning, for better purposes. *Id.*

The grievous abuse which hath been of councils, should rather cause men to study how so *gracious* a thing may again be reduced to that first perfection. *Id.*

He might at his pleasure *grace* or disgrace whom he would in court. *Knolles.*

To some kind of men,
Their *graces* serve them but as enemies.

Shakspeare.

In his own *grace* he doth exalt himself
More than in your advancement. *Id.*

I do not think a braver gentleman,
More daring, or more bold is now alive,
To *grace* this latter age with noble deeds. *Id.*

Here come I from our princely general
To know your griefs; to tell you from his *grace*,
That he will give you audience. *Id. Henry IV.*

Your soldiers use him as the *grace* 'fore meat,
Their talk at table, and their thanks at end.

Shakspeare.

O, mickle is the powerful *grace* that lies
In plants, herbs, stones, and their true qualities.

Id.

The king-becoming *graces*,
As justice, verity, temperance, stableness,
Devotion, patience, courage, fortitude,
I have no relish of them. *Id. Macbeth.*
Kings are no less unhappy, their issue not being
gracious, than they are in losing them when they have
approved their virtues. *Id. Winter's Tale.*

Whose hap shall be to have her,
Will not so *graceless* be, to be ingrate.

Shakspeare.

By their hands this *grace* of kings must die,
If hell and treason hold their promises. *Id.*

He writes

How happily he lives, how well beloved,
And daily *graced* by the emperor. *Id.*
Our women's names are more *gracious* than their
Rutilia, that is, red head. *Camden.*

High and mighty king, your *grace*, and those your
nobles here present, may be pleased to bow your ears.
Bacon's Henry VII.

There is due from the judge to the advocate some
commendation and *gracing*, where causes are well
handled. *Bacon.*

Unblamed Ulysses' house,
In which I find receipt so *gracious*.

Chapman.

Who would have looked for tears from Esau? Or
dare trust tears, when he sees them fall from so *grace*
less eyes? *Bp. Hall.*

The desire of more and more rises by a natural *gra-*
dation to most, and after that to all. *L'Estrange.*

He received all the *graces* and degrees, the proctor-
ship and the doctorship could be obtained there.

Clarendon.

The *graciousness* and temper of this answer made
no impression on them. *Id.*

Goring, who was now general of the horse, was
no more *gracious* to prince Rupert than Wilmot had
been. *Id.*

Yet those removed,
Such *grace* shall one just man find in his sight,
That he relents, not to blot out mankind. *Milton.*
Prevenient *grace* descending had removed
The stony from their hearts, and made new flesh
Regenerate grow instead. *Id.*

If the highest love in no base person may aspire to
grace, then may I hope your beauty will not be with-
out pity. *Sidney.*

He saw this gentleman, one of the properest and
best *graced* men that ever I saw, being of a middle
age and a mean stature. *Id.*

Within the church, in the publick profession and
external communion thereof, are contained persons
truly good and sanctified, and hereafter saved; and
together with them other persons void of all saving
grace, and hereafter to be damned. *Pearson.*

Noble pity held
His hand a while, and to their choice gave space
Which they would prove, his valour or his *grace*.

Waller.

Have I reason or good *grace* in what I do?

Temple.

His neck, his hands, his shoulders, and his breast,
Did next in *gracefulness* and beauty stand
To breathing figures. *Dryden's Ovid.*

Rich crowns were on their royal scutcheons placed,
With sapphires, diamonds, and with rubies *graced*.
Dryden.

Or each, or all, may win a lady's *grace*;
Then either of you knights may well deserve
A princess born. *Id. Fables.*

None of us, who now your *grace* implore,
But held the rank of sovereign queen before.

Dryden.

His testimonies he *graciously* confirmed, that it was
the best of all my tragedies. *Id.*

He heard my vows and *graciously* decreed
My grounds to be restored, my former flocks to feed.
Id.

When the guests withdrew,
Their courteous host saluting all the crew,
Regardless passed her o'er, nor *graced* with kind
adieu. *Id.*

Set all things in their own peculiar place,
And know that order is the greatest *grace*. *Id.*

The flower which lasts for little space,
A short lived good, and an uncertain *grace*. *Id.*

To write and speak correctly gives a *grace*, and gains
a favourable attention to what one has to say.

Locke.

Common sense and reason could not but tell them,
that the good and *gracious* God could not be pleased,
nor consequently worshipped, with any thing barba-
rous or cruel. *South.*

I should therefore esteem it great favour and *grace*,
Would you be so kind as go in my place. *Prior.*

From now reveal

A *gracious* beam of light; from now inspire
My tongue to sing, my hand to touch the lyre.
Id.

The *grace-cup* served, the cloth away,
Jove thought it time to show his play *Id.*

This forehead, where your verse has said

The loves delighted and the *graces* played. *Id.*

The *graces* of his religion prepare him for the
most useful discharge of every relation in life.

Rogers.

With secret joy she sees her little race
Hang on her breast and her small cottage *grace*.

Gay.

Now deep in Taylor and the book of Martyrs,
Now drinking citron with his *grace* and Chartres.

Pope.

To theatres, and to rehearsal throng,
And all our *grace* at table is a song. *Id.*

For modes of faith let *graceless* zealots fight,
His can't be wrong whose life is in the right *Id.*

By both his parents of descent divine;
Great Jove and Phœbus *graced* his nobler line. *Id.*

Though triumphs were to generals only due,
Crowns were reserved to *grace* the soldiers too. *Id.*

While *grace* is saying after meat, do you and your
brethren take the chairs from behind the company.

Swift.

Through nature and through art she ranged,
And *gracefully* her subject changed. *Id.*

If hearers are amazed from whence
Proceeds that fund of wit and sense,
Which, though her modesty would shroud,
Breaks like the sun behind a cloud;
While *gracefulness* its art conceals,
And yet through every motion steals. *Id.*

If her majesty would but *graciously* be pleased to
think a hardship of this nature worthy her royal con-
sideration. *Id.*

Walking is the mode or manner of man, or of a
beast; but walking *gracefully* implies a manner or
mode superadded to that action. *Watts's Logic.*

Graceful to sight, and elegant to thought,
The great are vanquished, and the wise are taught.

Young.

One lilac only, with a statelier *grace*,
Presumed to claim the oaks and cedar's place;

And, looking round him with a monarch's care,
Spread his exalted boughs to wave in air.

Harte.

But now let other themes our care engage,
For lo with modest yet majestic grace,
To curb imagination's lawless rage
And from within the cherished heart to brace,
Philosophy appears.

Beattie.

Such was Zulicka—such around her shone
The nameless charms unmarked by her alone—
The light of love—the purity of grace
The mind, the music breathing from her face;
The heart whose softness harmonised the whole
And oh! that eye was in itself a soul.

Byron. *The Bride of Abydos.*

GRACES, GRATIE, or Charities, in the heathen theology, were fabulous deities, three in number, who attended on Venus. Their names are Aglaia, Thalia, and Euphrosyne; i. e. shining, flourishing, and gay; or, according to some authors, Pasithea, Euphrosyne, and Egiale. They were said by some to be the daughters of Jupiter, by Eurynome the daughter of Oceanus; and by others, of Bacchus and Venus.—Some will have the Graces to have been four; and make them the same with the Hours, Hours, or rather with the four seasons of the year. A marble in the king of Prussia's cabinet represents the three Graces in the usual manner, with a fourth seated and covered with a large veil, with the words underneath, Ad Sorores IIII. But this group we may understand to be the three Graces, and Venus, who was their sister, being daughter of Jupiter by Dione. The Graces are always supposed to have hold of each other's hands, and never parted. They were painted naked, to show that the Graces borrow nothing from art, and that they have no other beauties but those of nature. Yet in the first ages they were not represented naked, as appears from Pausanias (lib. vi. and ix.), who describes their temple and statues. They were of wood, all but their head, feet, and hands, which were white marble. Their robe or gown was gilt; one of them held in her hand a rose, another a dye, and the third a sprig of myrtle.

GRACULA, the grackle, in ornithology, a genus belonging to the order of picæ. The bill is convex, cultrated, and bare at the point; the tongue is not cloven, but is fleshy and sharpish; it has three toes before and one behind. The most remarkable species are the following:—

G. barita, the boat-tailed grackle, is about the size of a cuckoo. The bill is sharp, black, and an inch and a half in length; the general color of the plumage is black, with a gloss of purple, especially on the upper parts; the legs and claws are black, the latter hooked. There is a singularity in the folding up of the tail-feathers, which, instead of forming a plain surface at top, sink into a hollow like a deep gutter. It always carries its tail expanded when on the ground, folding it up in the above singular manner only when perched or flying. It inhabits Jamaica, and feeds on maize, beetles, and other insects, as well as on the fruit of the banana. It is likewise common in North America. They breed in swamps, and migrate in September.

G. cristatella, the Chinese starling, is a little bigger than a blackbird. The bill is yellow or orange: and the general color of the plumage

blackish, with a tinge of blue; the legs are dull yellow. These birds talk and whistle very well, and are common in China, where they are much esteemed; and the figures of them are seen frequently in Chinese paintings. Their food is rice, insects, worms, and such like.

G. quiscalia, the purple jack-daw, or Barba-does blackbird, is about the size of a blackbird, and is black, but most beautifully and richly glossed with purple, especially on the head and neck. The female is wholly brown, but deepest on the wings and tail. This species inhabits Jamaica, Carolina, Mexico, and other parts of North America. These birds generally feed on maize, whence they are named maize thieves; but this is not their only food. In spring, soon after the maize seed is put into the ground, they scratch it up again; and, as soon as the leaf comes out, they take it up with their bills, root and all; but when it is ripe they do still more damage, for at that time they come by thousands, and are so bold, that if disturbed in one part of a field they only go to another. In New Jersey and Pennsylvania 3d. per dozen was once given for the dead birds, and by means of this premium they were nearly extirpated in 1750; when the persecution of them was abated on account of the great increase of worms which had taken place in the meadows, and which in the preceding year had left so little hay in New England as to occasion an importation from other parts. The grackles were therefore again tolerated, as it was observed that they fed on these worms till the maize was ripe. These birds build in trees. They pass the winter in swamps, which are quite overgrown with wood, only appearing in mild weather; and, after the maize is got in, are content to feed on the aquatic tare-grass, and if pressed by hunger, buck-wheat and oats, &c.: they are said also to destroy that pernicious insect the bruchus pisi. Their note is pretty agreeable; but their flesh is not good to eat.

G. religiosa, the smaller grackle, or Indian stare, is about the size of a blackbird, the bill an inch and a half long, and of an orange color. The general color of the plumage is black, glossed with violet, purple, and green, in different reflections of light: on the quills is a bar of white: the feathers and legs are orange yellow, and the claws of a pale brown. This species, which is found in several parts of the East Indies, in the Isle of Hainan, and almost every isle beyond the Ganges, is remarkable for whistling, singing, and talking well, much better and more distinct than any of the parrot genus. Its food is of the vegetable kind. Those kept in this climate are observed to be very fond of cherries and grapes: if cherries are offered to one, and it does not immediately get them, it cries and whines like a child, till it has obtained them. It is very tame and familiar.

GRADE, *n. s.*

GRADATION, *n. s.*

GRADUATORY, *n. s.*

GRADIENT, *adj.*

GRADUAL, *adj. & n. s.*

GRADUALITY, *n. s.*

GRADUALLY, *adv.*

GRADUATE, *v. a. & n. s.*

GRADUATION, *n. s.*

Fr. *graduer*; Lat. *gradus*, a step, from *gradior*. The primary meaning is gentle progression step by step; and figuratively to advance by degrees; to dignify with a

degree in the university; to mark with degrees as a thermometer; to raise higher in the scale of metals; to heighten and improve: an academician who has taken his degree; steps from cloisters into the church are called the graduationary.

Ther nis no thing in *gree* superlatif
(As saith Senec) above an humble wif.

Chaucer. *The Merchantes Tale.*

Concerning columns and their adjuncts, architects make such a noise, as if the terms of architraves, frizes, and cornices, were enough to *graduate* a master of this art.

Wotton.

John Tregonwel, *graduated* a doctor, and dubbed a knight, did good service.

Carew's Survey of Cornwall.

Amongst those *gradient* automata, that iron spider is especially remarkable, which, being but of an ordinary bigness, did creep up and down as if it had been alive.

Wilkins.

Nobler birth

Of creatures animate with *gradual* life,
Of growth, sense, reason, all summed up in man.

Milton.

Of greater repugnancy unto reason is that which he delivers concerning its *graduation*, that heated in fire, and often extinguished in oil of mars or iron, the loadstone acquires an ability to extract a nail fastened in a wall.

Browne.

This some ascribe unto the mixture of the elements, others to the *graduality* of opacity and light.

Id.

Not only vitriol is a cause of blackness, but the salts of natural bodies; and dyes advance and *graduate* their colours with salts.

Id. *Vulgar Errors.*

The tincture was capable to transmute or *graduate* as much silver as equalled in weight that gold.

Boyle.

Before the *gradual* prostrate they adored,
The pavement kissed, and thus the saint implored.

Dryden.

The *graduation* of the parts of the universe is likewise necessary to the perfection of the whole.

Grew.

Men still suppose a *gradual* natural progress of things; as that, from great things and persons should grow greater, 'till at length, by many steps and ascents, they come to be at greatest.

South.

Human creatures are able to bear air of much greater density in diving, and of much less upon the tops of mountains, provided the changes be made *gradually*.

Arbutnot.

The places were marked where the spirits stood at the severest cold and greatest heat, and according to these observations he *graduates* his thermometers.

Derham.

That there is a *gradation* I doubt not, upwards, as our senses inform us that there is one downwards. But such a *gradation*, by which finite approaches nearer and nearer to infinite, is inconceivable.

Bolingbroke.

The author of our being weans us *gradually* from our fondness of life the nearer we approach towards the end of it.

Swift.

The best of men have ever loved repose;
They hate to mingle in the filthy fray

Where the soul sours, and *gradual* rancour grows
Unbittered more from peevish day to day.

Thomson.

All up the craggy cliffs that towered to heaven
Green waved the murmuring pines on every side,
Save where opening to the beam of even

A dale sloped *gradual* to the valley wide.

Beattie.

His manly brow

Consents to death, but conquers agony,
And his drooped head sinks *gradually* low.

Byron. *Child Harold.*

GRÆCIA, MAGNA, in ancient geography,

part of the outermost coast of Italy, originally inhabited by Greeks. See ITALY.

GRÆME (John), a Scottish poet, born at Carnwath in Lanarkshire, in 1748, whose pos-
thumous poems have been much admired. His father was a farmer, and he was taught grammar at Lanark, under Mr. R. Thomson, brother-in-law of the celebrated poet of that name, and his progress was rapid. In 1766 he went to the university of Edinburgh, where he soon surpassed the most industrious. He also acquired considerable knowledge in mathematics, natural philosophy, metaphysics, and the belles lettres. In 1769 he gave the first specimens of his poetical genius. In 1770 he was admitted into the theological class; but the fatal disease, which cut him off, now began to appear in the form of a gradual decline, and soon ended in a deep consumption. He died July 26th, 1772. His poems, consisting of fifty elegies and other miscellaneous pieces, were collected and printed at Edinburgh in 1773, in 8vo.

GRÆVIUS (John George), one of the most learned writers in the seventeenth century. In the twentieth-fourth year of his age the elector of Brandenburg made him professor at Duisbourg. In 1658 he was invited to Deventer to succeed his former master Gronovius. In 1661 he was appointed professor of eloquence at Utrecht; and, in 1673, professor of politics and history. He fixed here, and refused several advantageous offers. He had the satisfaction to be sought after by divers princes, and to see several of them come from Germany to study under him. He died in 1703, aged seventy-one. His *Thesaurus Antiquitatum et Historiarum Italiæ, &c.*, and other works are well known.

GRAFF, *n. s.* A ditch; a moat. See GRAVE. Though the fortifications were not regular, yet the walls were good, and the *graff* broad and deep.

Clarendon.

GRAFF, or

GRAFF, *n. s.*, *v. a.* & *v. n.*

GRAFTER, *n. s.*

} Sax. *græft*; Fr. }
} *greffe*, *greffer*. A }
} small branch in- }
} serted into the stock of another tree, and nourished }
} by its sap, but bearing its own fruit; a young }
} cion; to propagate, by insertion into a body, }
} to which it did not originally belong; to practi- }
} se incision: used in a figurative sense with re- }
} spect to the heart, and implying the communi- }
} cation of dispositions which are not natural to it.

And they also, if they bide not still in unbelief, shall be *grafted* in; for God is able to *graft* them in again.

Romans.

Graft in our hearts the love of thy name.

Common Prayer.

In March is good *grafting* the skilful do know,

So long as the wind in the East do not blow:

From moon being changed, 'till past be the prime,

For *grafting* and cropping is very good time.

Tusser.

We've some old crab-trees here at home, that will
not
Be *grafted* to your relish.

Shakspeare. *Coriolanus.*

The noble isle doth want her proper limbs;

Her royal stock *graft* with ignoble plants.

Id.

God gave unto man all kinds of seeds and *graffs* of life: as the vegetative life of plants, the sensual of beasts, the rational of man, and the intellectual of angels.

Raleigh.

To have fruit in greater plenty the way is to *graft*, not only upon young stocks, but upon divers boughs

of an old tree ; for they will bear great numbers of fruit ; whereas if you *graft* but upon one stock, the tree can bear but few. *Bacon.*

It is likely, that as in fruit-trees the *graft* maketh a greater fruit, so in trees that bear no fruit it will make the greater leaves. *Id.*

With his pruning book disjoin
Unbearing branches from their head,
And *graft* more happy in their stead. *Dryden.*

These are the Italian names which fate will join
With ours, and *graft* upon the Trojan line. *Id.*
Now let me *graft* my pears, and prune the vine. *Id.*

His growth is but a wild and fruitless plant ;
I'll cut his barren branches to the stock,
And *graft* you on to bear. *Id. Don Sebastian.*
²Tis usual now an inmate *graft* to see
With insolence invade a foreign tree. *Id. Virgil.*

If you cover the top with clay and horse-dung, in the same manner as you do a *graft*, it will help to heal the sooner. *Mort.*

May one kind grave unite each hapless name,
And *graft* my love immortal on thy fame. *Pope.*
Now the cleft rind inserted *graft*'s receives,
And yields an offspring more than nature gives. *Id.*

This resolution against any peace with Spain is a new incident *grafted* upon the original quarrel, by the intrigues of a faction among us. *Swift.*

GRAFIGNY (Frances), a French lady, authoress of the celebrated Peruvian Letters, which have been translated into all the languages in Europe. She was born in 1693, and married to the duke of Lorrain's chamberlain : after whose death she went to Paris with Mademoiselle De Guise, where her talents were much admired. She died at Paris in 1753, aged sixty-five.

GRAFTING, or ENGRAFTING, in gardening, is the taking a shoot from one tree and inserting it into another, in such a manner, that both may unite close and become one tree. By the ancient writers on husbandry and gardening, this operation is called incision, to distinguish it from inoculation or budding, which they call *inserere oculos*.

The grafts, or cions, with which the grafting is effected, are young shoots of last summer's growth ; for they must not be more than one year, and such as grow on the outside branches, and robust but moderate shooters ; such also as are firm and well-ripened should always be chosen from healthful trees : observing, that the middle part of each shoot is always the best graft, cut at the time of grafting to five or six inches in length, or so as to have four or five good buds ; but should be preserved at full length till grafting time, and then prepared as follows :—They should be cut from the trees in February, in mild weather, before the buds begin to swell, or advance much for shooting : in collecting them choose such as have not made lateral or side shoots : cut them off at full length ; and, if they are not to be used as soon as they are collected, lay their lower ends in some dry earth in a warm border till grafting time ; and, if severe weather should happen, cover them with dry litter.

The season for performing the operation of grafting is February and March. When performed in February, it is generally most success-

ful, especially for cherries, plums, and pears ; but March is best adapted for apples.

There are different methods of grafting practised ; termed whip-grafting, cleft-grafting, crown-grafting, cheek-grafting, side-grafting, root-grafting, and grafting by approach, or inarching : but the first two are most commonly used ; and whip-grafting most of all, as being most expeditious and successful. 1. Cheek-grafting. Cut the head of the stock off horizontally, and pare the top smooth ; then cut one side sloping one and a half or two inches deep, and cut the lower part of the graft sloping the same length, making a sort of shoulder at top of the sloped part. Then place it upon the sloped part of the stock, resting the shoulder upon the crown of it : bind the parts closely together with a string of bass, bringing it in a neat manner several times round the stock and graft ; then clay the whole over nearly an inch thick on every side, from about half an inch or more below the bottom of the graft, to an inch over the top of the stock, finishing the whole coat of clay in a kind of oval globular form, rather longwise, up and down, closing it effectually about the cion, and every part, so as no sun, wind, or wet, may penetrate, to prevent which is the whole intention of claying. Examine it now and then, to see if it any where cracks or falls off, and, if it does, it must be instantly repaired with fresh clay. 2. Cleft-grafting is so called because the stock being large is cleft or slit down the middle for the reception of the graft ; and is performed upon stocks from about one to two inches diameter. First, with a strong knife cut off the head of the stock ; or, if the stock is very large, it may be headed with a saw ; and cut one side sloping upwards about an inch and a half to the top ; then proceed with a strong knife, or chisel, to cleave the stock at top, cross-way the slope, fixing the knife towards the back of the slope, and strike it with a mallet, so as to cleave the stock about two inches, or long enough to admit the graft, keeping it open with the chisel ; this done, prepare the cion, cutting it to such length as to leave four or five eyes, the lower part of which being sloped on each side, like a wedge, one and a half or two inches long, making one side to a thin edge, the other much thicker, leaving the rind thereon, which side must be placed outward in the stock ; the cion being thus formed, and the cleft in the stock being kept open with the chisel, place the graft therein at the back of the stock, the thickest side outward, placing the whole cut part down into the cleft of the stock, making the rind of the stock and graft join exactly ; then, removing the grafting chisel, each side of the cleft will closely squeeze the graft so as to hold it fast ; it is then to be bound with a ligature of bass, and clayed over, as directed above, leaving three or four eyes of the cions uncovered. If it be intended to graft any large stocks or branches by this method, two or more grafts may be inserted in each. In this case the head must be cut off horizontally, making no slope on the side, but smooth the top ; then cleave it quite a-cross, and place a graft on each side, as the stock may be cleft in two places, and insert two grafts in each cleft ; they are thus to be tied and clayed. This method

of grafting may be performed upon the branches of bearing trees, when intended either to renew the wood, or change the sort of fruit. Towards the end of May, or the beginning of June, the junction of the graft and stock in either method will be effectually formed, and the graft begin to shoot, when the clay may be taken off, and, in a fortnight or three weeks after, the bandages likewise.

3. Crown-grafting is commonly practised upon such stocks as are too large to cleave, and is often performed upon the large branches of apple and pear trees, &c., that already bear fruit, when it is intended to change the sorts, or renew the tree with fresh-bearing wood. It is termed crown-grafting, because the stock or branch being headed down, several grafts are inserted at top all around betwixt the wood and bark, so as to give it a crown-like appearance. This kind of grafting should not be performed until March, or early in April; for then the sap being in motion, renders the bark and wood of the stock much easier to be separated for the admission of the graft. The manner of performing it is this: First, cut off the head of the stock or branch, with a saw, horizontally, and pare the top smooth; then having the grafts, cut one side of each flat, and somewhat sloping, an inch and a half, forming a sort of shoulder at top of the slope to rest upon the crown of the stock; and then raising the rind of the stock with a wedge, so as to admit the cion between that and the wood two inches down, place the graft with the flat side next the wood, thrusting it down far enough for the shoulder to rest upon the top of the stock; and in this manner may be put three, four, five, or more grafts, into one large stock or branch. When the grafts are thus inserted, let the whole be tied tight and well clayed: but leave two or three eyes of each graft uncovered, and raise the clay an inch above the top of the stock, so as to throw the wet quickly off, without lodging about the grafted parts, which would ruin the whole. Crown-grafting may also be performed, by making several clefts in the crown of the stock, and inserting the grafts round the top of the clefts. The grafts will be pretty well united with the stock, and exhibit a state of growth, by the end of May or beginning of June, and the clay may then be taken away. The trees grafted by this method succeed extremely well; but, for the first two or three years, have this inconvenience attending them, that they are liable to be blown out of the stock by violent winds; which must be remedied by tying long sticks to the body of the stock or branch, and tying each graft up to one of the sticks.

4. Root-grafting is performed by whip-grafting cions upon pieces of the root of any tree of the same genus, and planting the root where it is to remain. It will take root, draw nourishment, and feed the graft.

5. Side-grafting is by inserting grafts into the sides of the branches without heading them down; and may be practised upon trees to fill up any vacancy, or for the purpose of variety, to have several sorts of apples, pears, plums, &c., upon the same tree. It is performed thus: Fix upon such parts of the branches where wood

is wanted to furnish the head or any part of the tree; there slope off the bark and a little of the wood, and cut the lower end of the grafts to fit the part as nearly as possible; then join them to the branch, and tie them with bass, and clay them over.

6. Whip-grafting is always performed upon small stocks, from about the size of a goose-quill to half an inch, or a little more or less, in diameter; but the nearer the stock and graft approach in size the better. It is called whip-grafting, because the grafts and stocks, being nearly of a size, are sloped on one side, to fit each other, and tied together in the manner of whips. The method is as follows: Cut off the head of the stock at some clear smooth part; then cut one side sloping upward, about an inch and a half or nearly two inches in length, and make a notch or small slit near the upper part of the slope downwards, about half an inch long, to receive the tongue of the cion; then prepare the cion, cutting it to five or six inches in length, forming the lower end also in a sloping manner, so as exactly to fit the sloped part of the stock, as if cut from the same place, that the rinds of both may join evenly in every part; and make a slit so as to form a sort of tongue to fit the slit made in the slope of the stock; then place the graft, inserting the tongue of it into the slit of the stock, applying the parts as evenly and closely as possible; and immediately tie the parts together and cover them with clay, as above directed. This sort of grafting may also be performed, if necessary, upon the young shoots of any bearing tree, if intended to alter the sorts of fruits, or have more than one sort on the same tree. By the middle or end of May the grafts will be well united with the stock, as will be evident by the shooting of the graft; then the clay should be wholly taken away; but suffer the bass bandage to remain some time longer, until the united parts seem to swell and be too much confined by the ligation; then take it wholly off.

7. Grafting by approach, or inarching, is, when the stocks designed to be grafted, and the tree from which you intend to take the graft, either grow so near, or can be placed so near together, that the branch or graft may be made to approach the stock, without separating it from the tree, till after its union or junction with the stock; so that the graft being bent to the stock, they approach and form a sort of arch; whence the names. Being a sure method, it is commonly practised upon such trees as are with difficulty made to succeed by any of the other methods. When intended to propagate any other kind of tree or shrub by this method of grafting, if the tree, &c., is of the hardy kind, and growing in the full ground, a proper quantity of young plants for stocks must be set round it; and, when grown of a proper height, the work of inarching must be performed; or if the branch of the tree designed to be grafted from are too high for the stocks, in that case stocks must be planted in pots, and a slight stage must be erected around the tree, of the due height to reach the branches, and the pots containing the stocks must be placed upon the stage. This method of grafting is sometimes performed with the head of the stock cut

off, and sometimes with the head left on till the graft is united with the stock; though, by previously heading the stock, the work is much easier performed; and, having no top, its whole effort will be directed to the nourishment of the graft. Having the stocks properly placed, either planted in the ground or in pots around the tree to be propagated, then make the most convenient branches approach the stock, and mark on the body of the branches the parts where they will most easily join to the stock, and in those parts of each branch pare away the bark and part of the wood two or three inches in length, and in the same manner pare the stock in the proper place for the junction of the graft; then make a slit upwards in the branch, so as to form a sort of tongue, and make a slit downwards in the stock to admit it; let the parts be then joined, slipping the tongue of the graft into the slit of the stock, making the whole join in an exact manner, and tie them closely together with bass, and afterwards cover the whole with a due quantity of clay, as in the other methods. After this, let a stout stake be fixed for the support of each graft; to which let that part of the stock and graft be fastened which is necessary to prevent their being disjoined by the wind. The operation being performed in spring, let them remain in that position about four months, when they will be united, and the graft may then be separated from the mother tree. In doing this, be careful to perform it with a steady hand, so as not to loosen or break out the graft, sloping it off downwards close to the stock; and if the head of the stock was not cut down at the time of grafting, it must now be done close to the graft, and the old clay and bandage must also be cleared away, and replaced with new, to remain a few weeks longer. If the grafts are not firmly united with the stock, in the period above-mentioned, they must remain another year till autumn, before the grafts are separated from the parent tree. By this kind of grafting may be raised almost any kind of tree or shrub, which is often done by way of curiosity, to ingraft a fruit-bearing branch of a fruit-tree upon any common stock of the same genus, whereby a new tree bearing fruit is raised in a few months. This is sometimes practised upon orange and lemon trees, &c., by grafting bearing branches of a fruit-tree upon any common stocks raised from the kernels of any of the same kind of fruit, or into branches of each other, so as to have oranges, lemons, and citrons, all on the same tree.

Grafting has been practised from the most remote antiquity; but its origin and invention have been differently related by naturalists. Theophrastus tells us, that a bird, having swallowed a fruit whole, cast it forth into a cleft or cavity of a rotten tree; where mixing with some of the putrid parts of the wood, and being washed with the rains, it budded, and produced within this tree another tree of a different kind. Pliny says that a countryman, wishing to make a palisade in his grounds that it might endure the longer, filled up and strengthened the bottom of the palisade by running or wadding it with the trunks of ivy. The effect of this was, that the stakes of the palisades, taking root, became engrafted with the

trunks and produced large trees; which suggested to the husbandman the art of engrafting. The use of grafting is to propagate any curious sorts of fruits; which cannot be done with certainty by any other method: for as all the good fruits have been accidentally obtained from seeds, so the seeds of these, when sown, will many of them degenerate, and produce such fruit as is not worth the cultivating; but, when shoots are taken from such trees as produce good fruit, these will never alter from their kind, whatever be their stock. The reason or philosophy of engrafting is somewhat obscure; but the effect is ordinarily attributed to the diversity of the pores or ducts of the graft from those of the stock, which change the figure of the particles of the juices in passing through them to the rest of the tree. Mr. Bradley, from some observations of Agricola, suggests, that the stock grafted on is only to be considered as a fund of vegetable matter, which is to be filtered through the cion, and digested, and brought to maturity, as the time of growth in the vessels of the cion directs. A cion, therefore, of one kind, grafted on a tree of another, may be rather said to take root in the tree it is grafted in, than to unite itself with it; for it is visible that the cion preserves its natural purity, though it be fed and nourished by a mere crab; which is, without doubt, occasioned by the difference of the vessels in the cion from those of the stock: so that grafting may be justly compared to planting. But the natural juices of the earth, by their secretion and communication in passing through the roots, &c., before they arrive at the cion, must doubtless arrive there half elaborated and concocted; and so disposed for a more easy, plentiful, and perfect assimilation and nutrition; whence the cion must necessarily grow and thrive better and faster than if it were put immediately in the ground.

Many have talked of changing of species, or producing mixed fruits, by engrafting one tree on another of the same class; but, as the graft carries the juices from the stock to the pulp of the fruit, there is little hope of succeeding in such an expectation by ever so many repeated grafts; but if, after changing the graft and stock several times, you set the seed of the fruit produced on the graft in a good mold, it is possible that a change may happen, and a new mixed plant may be produced. Thus the almond and peach may, by many changes in the graftings, and by interations of the stones of the peaches, and of the shells of the almonds, and by teribrations of the stem and the root here and there, alter their nature so much, that the coat or pulp of the almond may approach to the nature of the peach, and the peach may have its kernel enlarged into a kind of almond; and, on the same principle, the curious gardener may produce many such mixed kinds. M. Du Hamel has observed that, in grafting trees, there is always found, at the insertion of the graft, a change in the direction of the fibres, and a sort of twisting or turning about of the vessels, which greatly imitates that in the formation of certain glands in animal bodies; and hence he infers that a new sort of viscus being thus formed, the fruit may be so far influenced by it, as to be meliorated

on the new branch; but that no such sudden and essential changes can be effected by those means, as many writers on agriculture pretend. He observes, however, that this anatomical observation would not have been sufficient to convince him of the falsity of these relations, had not experiment joined to confirm him in this opinion. He tried many grafts on different trees; and, for fear of error, repeated every experiment of consequence several times; but all served only to convince him of the truth of what he at first suspected. He grafted in the common way the peach upon the almond, the plum upon the apricot, and the pear upon the apple, the quince, and the white thorn; one species of plum on other very different species, and upon the peach the apricot, and the almond. All these succeeded alike: the species of the fruit was never altered; and in those which would not come to fruit, the leaves, the wood, and the flowers, were all the same with those of the tree whence the graft was taken. Writers on agriculture have also mentioned a very different sort of grafting, namely, the setting of grafts of one tree upon stocks of a different genus; such as the grafting the pear upon the oak, the elm, the maple, or the plum, &c. M. Du Hamel tried a great number of those experiments carefully, and found every one of them unsuccessful; and the natural conclusion from this was, that there must be some natural alliance between the stocks and their grafts, otherwise the latter will either never grow at all, or very soon perish.

Notwithstanding the facility with which grafts generally take on good stocks, there are many accidents and uncertainties attending them in their different periods. Some perish immediately; some after appearing healthy for many months, and some even for years. Of these last some die without the stock suffering any thing; others perish together with the stocks. It is certain that the greater part of grafted trees do not live so long as they would have done in their natural state; yet this is not an invariable rule: for there are some which evidently live the longer for this practice; nay, there are instances of grafts which, being placed on stocks naturally of short duration, live longer than when placed on those which are more robust and lasting. In order to the succeeding of a graft, it is plain that there must be a conformity in its vessels and juices with those of the stock. The more nearly they agree in this, probably the better they succeed; and the farther they differ, the worse. If there be some difference in the solid parts of trees, there are evidently many more in the juices. The sap in some trees is white as milk, in others it is reddish, and in some as clear and limpid as water. In some it is thin and very fluid; in others thick and viscous. In the taste and smell of these juices there are also no fewer differences: some are sweet, some insipid, some bitter, some acrid, and some fetid; the quality of the sap thus makes a very great difference in the nature of trees; but its quantity, and derivation to the parts, is scarcely less observable. Of this we have familiar instances in the willow and the box; one of which will produce longer shoots in one year than the other in twenty. Another difference

yet more striking, and indeed more essential, in regard to the growth of grafts than all these, is the different season of the year at which trees shoot out their leaves, or ripen their flowers. The almond tree is in flower before other trees in general have opened their earliest buds; and, when other trees are in flower, this is full of leaves, and has its fruit set before the mulberry begins to push out its earliest buttons. The grafts of the almond on the plum, and of the plum on the almond, always grow very vigorously for the first year, and give every appearance of succeeding entirely; yet they always perish in the second or third year. The almond, grafted upon the plum stock, always pushes out very vigorously at first; but the part of the stock immediately under the graft grows smaller and perishes, the graft absorbing too much of the juices, and the graft necessarily perishes with it. The decay of the whole generally happens early in the spring, plainly from the different season of the natural shooting of the two trees; the almond pushing very vigorously, and consequently draining the stock of its juices, at a time when, according to its nature, the juices are but in small quantity in it, and the sap does not begin to ascend. The grafts of the plum on the almond are, from the same cause, furnished with an abundance of sap which they have, at that time, no occasion for; and consequently they as certainly perish of repletion, as the other of inanition. The peach, grafted on the plum, succeeds excellently, and lives longer than it would have done in a natural state; the reason seems to be, that the peach is a tender tree, shoots with great vivacity, and produces more branches than the root is able to maintain. Thus peach trees are usually full of dead wood; and often their large branches perish, and sometimes their whole trunk. On this occasion the plum, being a slow-shooting tree, communicates its virtue to the graft; and the peach consequently sends out shoots which are more robust and strong, and are no more in number than the root is able to supply with nourishment, and consequently the tree is the more lasting.

GRAFTON (Richard), an English historian, born at London in the reign of Henry VIII. He published, 1. An Abridgement of the Chronicles of England; and, 2. A Chronicle and large History of the Affayres of England and Kings of the same, deduced from the Creation of the World. He died in the reign of queen Elizabeth.

GRAFTON, an extensive county of New Hampshire, bounded on the east by Maine District, south by Strafford, Hillsborough, and Cheshire counties, west by Vermont, and north by Canada. It is divided into fifty townships, and seventeen locations.

GRAFTON, or GRAFTON ISLAND, one of the smallest of the Bashee islands in the East Indian Sea. Long. 139° 6' W., lat. 21° 4' N.

GRAHAM (George), clock and watch maker, the most ingenious and accurate artist in his time, was born in 1675 at Kirklington, Cumberland. Besides his universally acknowledged skill in his profession, he was a complete mechanic and astronomer; the great mural arch in the observa-

tory at Greenwich was made for Dr. Halley under his immediate inspection, and divided by his own hand; and, from this incomparable original, the best foreign instruments of the kind are copies. The sector, by which Dr. Bradley first discovered two new motions in the fixed stars, was of his invention and fabric; and, when the French academicians were sent to the north to ascertain the figure of the earth, Mr. Graham was thought the fittest person in Europe to supply them with instruments: those who went to the south were not so well furnished. He was for many years a member of the Royal Society, to which he communicated several ingenious and important discoveries. He died in 1751.

GRAHAM (James), marquis of Montrose. See MONTROSE.

GRAHAM (Sir John), of Abercorn, or Dundaff, one of the patriots who fought along with Wallace, against the English invaders under Edward I. He was killed at the battle of Falkirk, in 1298, where the following inscription repeatedly renewed is to be seen on his monument:—

Mente manaque potens, et Vallæ fidus Achates,
Conditur hic Gramus, bello interfectus ab Anglis.

XXII. Julii, 1298.

GRAHAM (Sir Richard), lord viscount Preston, eldest son of Sir George Graham of Netherby, in Cumberland, Bart. was born in 1648. He was sent ambassador by Charles II. to Louis XIV., and was master of the wardrobe and secretary of state under James II. But, when the Revolution took place, he was tried and condemned, on an accusation of attempting the restoration of that prince; though he obtained a pardon by the queen's intercession. He spent the remainder of his days in retirement, and published an elegant translation of Boethius on the consolations of philosophy. He died in 1695.

GRAHAME (James), a modern Scottish poet, was bred to the bar, but afterwards took orders in a curacy in the neighbourhood of Durham, where he died, in 1811, in the prime of life. His chief pieces are, *The Sabbath*; *The Bards of Scotland*; and *British Georgics*.

GRALE Montes, in ancient geography, the name given by Pliny to that part of the Alps, which lies between France and Italy, and by which they pass out of Italy into the ci-devant province of Provence.

GRAIGEMANACH, a town of Ireland, in Kilkenny, on the Barrow, over which it has a bridge, twenty miles from the sea. The tide flows up to it.

GRAIL, *n. s.* From Fr. *grêle*. Small particles of any kind.

Hereof this gentle knight unweeting was,

And, lying down upon the sandy *grails*,

Drank of the stream as clear as crystal glass.

Spenser.

GRAIN, *n. s.* } Fr. *grain*; Belg. *graen*;
GRAIN'ED, *adj.* } Ital., Span., and Port. *grano*;
GRAINS, *n. s.* } Lat. *granum*. A single
GRAIN'Y, *adj.* } seed; corn; a small weight,
GRAN'ARY, *n. s.* } so called because it is sup-
GRAN'ATE, or } posed of equal weight with
GRAN'ITE, *n. s.* } a grain of corn: the direc-
tion of the fibres of wood; the direction of con-

stituent particles of the human body; a dyed substance: figuratively, temper and disposition. Grains of allowance, something indulged or remitted. Grains, husks of malt. Grains of Paradise, an Indian spice. A storehouse for corn. Granate, or granite, a kind of marble, so called because it is marked with small variations like grains.

For the whole world before thee is as a little *grain* of the balance. *Wis. xi. 22.*

Wherefore I sing; and sing I mote certain,
In honour of that blissful maiden free,

Til for my tongue of taken is the grain,

And, after that thus saide she to me:

My litel childe than: wol I fetchen thee,

Whan that the *grain* is fro the tongue ytake:

Be not agaste I wol thee not fersake.

Chaucer. The Prioresses Tale.

The was eke weying many a spice

As clove, gilofre, and licorise,

Gingiber, and grein de Paris.

Id. Romaunt of the Rose.

And in his barne hath, soth to saine,

An hundred mavis of whete *graine.* *Id.*

Ye, jelousie is love;

And would a bushel of venim excusen,

For that a *grane* of love is on it shove.

Id. Troilus and Creside.

How the red roses flush up in her cheeks,

And the pure snow with goodly vermil stain,

Like crimson dyed in *grain.* *Spenser.*

Your minds, preoccupied with what

You rather must do than with what you should do,

Made you against the *grain* to voice him consul.

Shakespeare.

Though now this *gruined* face of mine be hid

In sap consuming Winter's drizzled snow,

Yet hath my night of life some memory. *Id.*

Knots, by the conflux of meeting sap,

Infect the sound pine, and divert his *grain*

Tortive and errant from his course of growth. *Id.*

Look into the seeds of time,

And say which *grain* will grow, and which will not.

Id.

Let them pronounce the steep Tarpeian death,

Vagabond exile, flaying pent to linger

But with a *grain* a day, I would not buy

Their mercy at the price of one fair word. *Id.*

As it ebbs, the seedsmen

Upon the slime and ooze scatters his *grain*,

And shortly comes to harvest. *Id.*

Thou exist'st on many thousand *grains*

That issue out of dust. *Id. Measure for Measure.*

By intelligence

And proofs as clear as founts in July, when

We see each *grain* of gravel. *Id. Henry VIII.*

His reasons are as two *grains* of wheat hid in two bushels of chaff. *Id. Merchant of Venice.*

It is a sincerely pliable ductile temper, that neglects not to make use of any *grain* of grace. *Hammond.*

The trial being made betwixt lead and lead, weighing severally seven drachms, in the air; the balance in the water weighing only four drachms and forty-one *grains*, and abatement of the weight in the air two drachms and nineteen *grains*: the balance kept the same depth in the water. *Bacon.*

The one being tractable and mild, the other stiff and impatient of a superior, they lived but in cunning concord, as brothers glued together, but not united in *grain.* *Hayward.*

Give them *grains* their fill

Husks, draff, to drink and swill. *Ben Jonson.*

Unity is a precious diamond, whose *grains* as they double, twice double in their value. *Holyday.*

Y

Over his lucid arms
A military vest of purple flow'd,
Livelier than Melibæan, or the *grain*
Of Sarra, worn by kings and heroes old. *Milton.*
Come, pensive nun, devout and pure,
All in a robe of darkest *grain*,
Flewing with majestic train. *Id.*

The third, his feet
Shadowed from either heel with feathered mail,
Sky-tinctured *grain*! *Id. Paradise Lost.*
Quoth Hudibras, it is in vain,
I see, to argue 'gainst the *grain*. *Hudibras.*

His brain
Outweighed his rage but half a *grain*. *Id.*
The tooth of a sea-horse, in the midst of the solidier
parts, contains a curdled *grain* not to be found in
ivory. *Brown.*

They began at a known body, a barley-corn, the
weight thereof is therefore called a *grain*; which
ariseeth, being multiplied, to scruples, drachmas,
ounces, and pounds. *Holder.*

The beech, the swimming alder, and the plane,
Hard box, and linden of a softer *grain*. *Dryden.*

Though much against the *grain*, forced to retire,
Buy roots for supper, and provide a fire. *Id.*

Pales no longer swelled the teeming *grain*,
Nor Phæbus fed his oxen on the plain. *Id.*

Many of the ears, being six inches long, had sixty
grains in them, and none less than forty. *Mortimer.*

The ungrateful person lives to himself, and subsists
by the good nature of others, of which he himself has
not the least *grain*. *South.*

Alabaster, marble of divers colors, both simple and
mixed, the opulites, porphyry, and the *granite*. *Woodward.*

Stones of a constitution so compact, and a *grain* so
fine, that they bear a fine polish. *Id.*

Ants, by their labour and industry, contrive that
corn will keep as dry in their nests as in our *granaries*.
Addison.

He, whose very best actions must be seen with
grains of allowance, cannot be too mild, moderate,
and forgiving. *Id.*

There are still great pillars of *granite* and other
fragments of this ancient temple. *Addison on Italy.*

'Tis a rich soil, I grant you; but oftener covered
with weeds than *grain*. *Collier on Fame.*

The smaller the particles of cutting substances are,
the smaller will be the scratches by which they con-
tinually fret and wear away the glass until it be
polished; but be they never so small, they can wear
away the glass no otherwise than by grating and
scratching it, and breaking the protuberances; and
therefore polish it no otherwise than by breaking its
roughness to a very fine *grain*, so that the scratches
and frettings of the surface become too small to be vi-
sible. *Newton's Opticks.*

I would always give some *grains* of allowance to
the sacred science of theology. *Watts on the Mind.*

The naked nations cloathe,
And be the' exhaustless *granary* of a world.
Thomson's Spring.

And freshness breathing from each silver spring,
Whose scattered streams from *granite* basins burst,
Leap into life, and sparkling woo your thirst. *Byron.*

There *grain*, and flower, and fruit,
Gush from the earth until the land runs o'er.
Id. Don Juan.

GRAIN. See BARLEY, CORN, WHEAT, &c.

GRAIN, OILY. See SESAMUM.

GRAIN, SCARLET. See CACTUS, COCCUS, and
QUEFFERS.

A GRAIN WEIGHT of gold bullion is worth
two-pence, and of silver only half a farthing.

GRAIN COAST. See MALAGUETTA.

GRAIN (John, Baptist le), counsellor and
master of requests to Mary de Medicis queen of
France, was born in 1565, and was much es-
teemed by Henry IV. He wrote a work en-
titled, *Decades*, containing The History of Henry
the Great, and of Louis XIII., from the begin-
ning of his reign to the death of the Marshal
d'Ancre in 1617. He vigorously defends the
edict that had been granted to the reformed. He
died at Paris in 1643.

GRAINGER (James), M. D., a distinguished
poet in the last century, was born at Dunse, in
Berwickshire, in 1724. His father, who had
been reduced by adverse circumstances, still
bestowed on him a classical education, and
placed him with a surgeon at Edinburgh, where
he attended the medical lectures of the university.
Entering the army, as a regimental surgeon, he
served in Germany under the earl of Stair, till
the peace of Aix-la-Chapelle, after which he took
his degree of M. D. and settled in London. He
is said principally to have supported himself by
writing for the press. An Ode to Solitude, pub-
lished in Dodsley's collection, first procured him
reputation; and, among others, the acquaintance
of Shenstone and Dr. Percy. In 1759 he pub-
lished his *Elegies* of Tibullus, which involved him
in a paper war with Dr. Smollet. He then went
to the West Indies as tutor to a young gentle-
man, and, during the voyage, formed an attach-
ment to a lady, whom he married on his arrival
at the island of St. Christopher's, of which her
father was governor. Here he again, and very
successfully, engaged in medical practice; and
produced a West Indian Georgic, or didactic
treatise in blank verse, entitled *The Sugar Cane*,
and Bryan and Pereene, a ballad. The former
he published in England, in 1764. He then re-
turned to Basseterre, St. Christopher's, where he
died of a fever, in 1767.

GRAITNEY. See GREINA.

GRALLE, in ornithology, an order of birds
analogous to the bruta in the class of mammalia,
in the Linnean system. See ZOOLOGY and OR-
NITHOLOGY.

GRAMAYE (John Baptist), a historian and
poet, born at Antwerp, and provost of Arnhem.
He travelled over Germany and Italy, but, in
going to Spain, was carried off by African cor-
sairs to Algiers. He returned to the Nether-
lands, and died at Lubbeck. He published, 1. *Africæ Illustrata*, libri X. in 1622; 4to. 2. *Diarium Algeriense*; 3. *Peregrinatio Belgica*; a curious work; 4. *Antiquitates Flandriæ*, folio; and, 5. *Historia Namurensis*.

GRAMERCY, *interj.* Contracted from *grat*
ne mercy. An obsolete expression of surprise.

O, which a pitous thing it was to see
Hire swooning, and hire humble vois to here!
Grand mercy! Lord! God thank it you, quod she
That ye han saved me my children dere.

Chaucer. The Clerkes Tale.

Truly? *Gramercie* frende of your gode will.

Id. The Court of Love.

Gramercy, sir, said he; but mote I weat
What strange adventure do ye now pursue? *Spenser*

GRAMINA, grasses, one of the seven tribes, or natural families, into which all vegetables are distributed by Linnaeus in his *Philosophia Botanica*. They are defined to be plants which have very simple leaves, a jointed stem, a husky calyx termed gluma, and a single seed. This description includes the several sorts of corn as well as grasses. In Tournefort they constitute a part of the fifteenth class, termed *apetali*; and, in Linnaeus's sexual method, they are mostly contained in the second order of the third class, *triandria digynia*. This numerous and natural family of the grasses has engaged the attention and researches of several eminent botanists; particularly Ray, Monti, Micheli, and Linnaeus. M. Monti, in his *Catalogus stirpium agri Bononiensis*, *gramina ex hujus modi affinita complectens*, printed at Bononia in 1719, divides the grasses from the disposition of their flowers, as Theophrastus and Ray had done before him, into three sections or orders. These are, 1. Grasses having flowers collected in a spike. 2. Grasses having their flowers collected in a panicle or loose spike. 3. Plants that in their habit

and external appearance are allied to the grasses. This class would have been natural if the author had not improperly introduced sweet rush, juncus, and arrow-headed grass, into the third section. Monti enumerates about 306 species of the grasses, which he reduces under Tournefort's genera; to these he added three new genera. Scheuchzer, in his *Aristographia*, published likewise in 1719, divides the grasses, as Monti, from the disposition of their flowers, into the four following sections: 1. Grasses with flowers in a spike, as *phalaris*, *anthoxanthum*, and *frumentum*. 2. Irregular grasses, as *schœnanthus* and *cornucopia*. 3. Grasses with flowers growing in a simple panicle or loose spike, as reed and millet. 4. Grasses with flowers growing in a compound panicle, or diffused spike, as oats and poa. See BOTANY.

GRAMINEOUS, *adj.* Lat. *gramineus*. Grassy. Gramineous plants are such as have a long leaf without a footstalk.

GRAMINIVOROUS, *adj.* Lat. *gramen* and *voros*. Grass-eating; living upon grass.

The ancients were versed chiefly in the dissection of brutes, among which the *graminivorous* kind have a party-coloured choroides. *Sharp's Surgery.*

GRAMMAR, *n. s.* } Fr. *grammaire*,
GRAMMAR-SCHOOL, *n. s.* } *grammaire*; Lat.
GRAMMARIAN, *n. s.* } *grammaticus*; Gr.
GRAMMATICAL, *adj.* } *γραμμα*, a letter. The
GRAMMATICALLY, *adv.* } science of writing or
GRAMMATICASTER, *n. s.* } speaking correctly;
the art or person who teaches the relation of words to each other; the book used for teaching this science; the place in which the learned languages are taught; whatever belongs to the rules of grammar: grammaticaster is a low verbal pedant: this word is obsolete.

I can no more expound in this matere;

I lerne song; I can but smal grammere.

Chaucer. The Prioresse Tale.

Thou hast most traitorously corrupted the youth of the realm in erecting a *grammar-school*.

Shakspeare.

To be accurate in the *grammar* and idioms of the tongues, and then as a rhetorician to make all their graces serve his eloquence. *Fell.*

The beauty of virtue still being set before their eyes, and that taught them with far more diligent care than *grammatical* rules. *Sidney.*

Many disputes the ambiguous nature of letters hath created among the *grammarians*. *Holder.*

I shall take the number of consonants, not from the *grammatical* alphabets of any language, but from the diversity of sounds framed by single articulations with appulse. *Id.*

Varium et mutabile semper femina, is the sharpest satire that ever was made on woman; for the adjectives are neuter, and animal must be understood to make them *grammar*. *Dryden.*

They who have called him the torture of *grammarians*, might also have called him the plague of translators. *Id.*

They seldom know more than the *grammatical* construction, unless born with a poetical genius.

Id. Dufresnoy.

We make a countryman dumb, whom we will not allow to speak but by the rules of *grammar*. *Id.*

The ordinary way of learning Latin in a *grammar-school* I cannot encourage. *Locke.*

Men speaking language, according to the *grammar* rules of that language, do yet speak improperly of things. *Id.*

I have not vexed language with the doubts, the remarks, and eternal triflings of the French *grammaticasters*. *Rymer.*

When a sentence is distinguished into the nouns, the verbs, pronouns, adverbs, and other particles of speech which compose it, then it is said to be analysed *grammatically*. *Watts.*

As *grammar* teacheth us to speak properly, so it is the part of rhetorick to instruct how to do it elegantly, by adding beauty to that language that before was naked and *grammatically* true. *Baker.*

We are naturally led to begin with the consideration of substantive nouns, which are the foundation of all *grammar*, and may be considered as the most ancient part of speech. *Blair's Lectures.*

The first degree of proficiency is, in painting, what *grammar* is in literature, a general preparation for whatever species of the art the student may afterwards choose for his more particular application.

Sir J. Reynolds.

GRAMMAR. It is probable that this word had a very narrow import at first, equivalent perhaps to orthography; but it was gradually extended so as to comprehend many ideas not originally contemplated; and, as authors have never been agreed respecting the number and the nature of those ideas, there is no uniform theory to be found in their writings, nor even a clear and certain definition of the term. In one view Grammar may be considered as a science; in another view it may be considered as

an art; or we may distinguish it into universal or philosophic, and particular or idiomatic. Perhaps the simplest and best distinction would be into rational and customary Grammar. Of the former, reason is to be considered as the authority or standard; of the latter there is no authority or standard but custom, agreeably to the quotation so often adduced from Horace.

Usus

Quem penes arbitrium est, et jus et norma loquendi.

'The first of these,' says Wilkins in his Essay towards a Real Character, 'i. e. philosophical, rational, universal Grammar, hath been treated of but by few; which makes our learned Verulam put it among his Desiderata. I do not know any more that have purposely written of it, but Scotus in his *Grammatica Speculativa*, and Caramuel in his *Grammatica*, and Campanuella in his *Grammatica Philosophica*. (As for Scioppius his Grammar of this title, that doth wholly concern the Latin tongue). Besides which, something hath been occasionally spoken of it by Scaliger, *De Causis Linguae Latinae*; and by Vossius in his *Aristarchus*.' Subsequently to the time of Wilkins, Harris wrote his '*Hermes* or a Philosophical Enquiry concerning Universal Grammar.' This work acquired considerable celebrity. Dr. Lowth in the Preface to his Grammar says: 'Those who would enter more deeply into this subject, will find it fully and accurately handled with the greatest acuteness of investigation, perspicuity of explication, and elegance of method, in a treatise entitled *Hermes*, by James Harris, Esq., the most beautiful and perfect example of Analysis that has been exhibited since the days of Aristotle.'

Lord Momboddo (in *Orig. and Prog. of Language*, vol. i. p. 8) pronounces '*Hermes* a work that will be read and admired as long as there is any taste for philosophy and fine writing in Britain.' Mr. Horne Tooke admits that '*Hermes* has been received with universal approbation both at home and abroad, and has been quoted as undeniable authority on the subject by the learned of all countries. For which, however,' he adds, 'I can easily account, not by supposing that its doctrines gave any more satisfaction to their minds who quoted it than to mine; but because, as judges shelter their knavery by precedents, so do scholars their ignorance by authority: and where they cannot reason, it is safer and less disgraceful to repeat that nonsense at second hand which they would be ashamed to give originally as their own.' 'If others of a more elegant taste for fine writing are able to receive either pleasure or instruction from such philosophical language, as that of *Hermes*, I shall neither dispute with them nor envy them: but can only deplore the dulness of my own apprehension, who, notwithstanding the great authors quoted in Mr. Harris's treatise and the great authors who recommend it, cannot help considering this 'perfect example of analysis,' as an improved compilation of almost all the errors which Grammarians have been accumulating from the time of Aristotle down

to our present days of technical and learned affectation.'

It must be admitted that Mr. Horne Tooke is sufficiently severe, or to use his own expression that he speaks 'too sharply for philosophy.' His apology or justification is: '*Neminem libenter nominem, nisi ut laudem; sed nec peccata reprehenderem, nisi ut aliis prodessem*. At the same time, I confess, I should disdain to handle any useful truth daintily, as if I feared lest it should sting me; and to employ a philosophical enquiry as a vehicle for interested or cowardly adulation. My notions of language were formed before I could account etymologically for any one of the words in question, and before I was in the least acquainted with the opinions of others. I addressed myself to an enquiry into their opinions with all the diffidence of conscious ignorance; and, so far from spurning authority, was disposed to admit half an argument from a great name. So that it is not my fault, if I am forced to carry instead of following the lantern: but at all events it is better than walking in total darkness. And yet, though I believe I differ from all the accounts which have been hitherto given of language, I am not so much without authority as you may imagine. Mr. Harris himself, and all the Grammarians whom he has, and whom (though using their words) he has not quoted, are my authorities. Their own doubts, their difficulties, their dissatisfaction, their contradictions, their obscurity on all these points, are my authorities against them: for their system and their difficulties vanish together.'

The following is the manner in which Mr. Horne Tooke disposes of the once celebrated *Hermes*. 'You mean then by what you have said flatly to contradict Mr. Harris's definition of a conjunction; which he says is a part of speech devoid of signification itself, but so formed as to help signification, by making two or more significant sentences to be one significant sentence.' I have the less scruple to do that, because Mr. Harris makes no scruple to contradict himself. For he afterwards acknowledges that some of them have a kind of obscure signification when taken alone; and appear in grammar, like zoophytes in nature, a kind of middle beings of amphibious character; which, by sharing the attributes of the higher and the lower, conduce to link the whole together.

'Now I suppose it is impossible to convey a nothing in a more ingenious manner. First, he defines a word to be a sound significant: then he defines conjunctions to be words (i. e. sounds significant) 'devoid of signification.' Afterwards he allows that they have 'a kind of signification.' But this kind of signification is 'obscure (i. e. a signification unknown); something I suppose (as Chillingworth couples them) like a secret tradition or a silent thunder: for it amounts to the same thing as a signification which does not signify; an obscure or unknown signification being no signification at all. But not contented with these inconsistencies, which to a less learned man would seem sufficient of all conscience, Mr. Harris goes farther, and adds, they are a 'kind of middle beings (he must

mean between signification and no signification) sharing the attributes of both' (i. e. of signification and no signification) and 'conduce to link them both together.'

It would have helped us a little, if Mr. Harris had here told us what that middle state is, between signification and no signification! what are the attributes of no signification! and how signification and no signification can be linked together! Now all this may, for aught I know, be 'read and admired as long as there is any taste for fine writing in Britain.' But with such unlearned and vulgar philosophers, who seek not taste and elegance but truth and common sense in philosophical subjects, I believe it will never pass as a 'perfect example of analysis;' nor bear away the palm for 'acuteness of investigation and perspicuity of explication.' For separated from the fine writing (which however I can no where find in the book) this is the conjunction explained by Mr. Harris. A sound significant devoid of signification, having at the same time a kind of obscure signification; and yet having neither signification nor no signification; but a middle something between signification and no signification, sharing the attributes of signification and no signification; and linking signification and no signification together.'

It is impossible for logical inconsistency to stand such a cross examination. The only thing felt by the reader is the redundancy and satiety of the confutation. Never was the extinguisher so effectually put upon the reputation of a work as by Horne Tooke on the *Hermes* of Harris. Twenty-two years ago it was a work of great philological celebrity; but since that time there is hardly a grammarian or philologist of any note who has ventured to eulogise it. Mr. Harris was unquestionably an elegant scholar; but on this alone, as the author of *Hermes*, must his claim to admiration now rest.

As the philological reputation of Mr. Horne Tooke has superseded that of Mr. Harris, it will be proper to devote some attention to his celebrated work, entitled, not very happily, *The Diversions of Purley*; which possesses singular interest, displays much learning, acuteness, and reflection; but which is disfigured by considerable blemishes. It is too desultory and miscellaneous—too political, vituperative, sarcastic, assumptive, and dogmatical. The charm of the work would be destroyed by abridgment; but all that is truly ad rem, or available for any philological purpose, might be comprised within a very small compass.

Not a few of Mr. Horne Tooke's positions are specious or imposing rather than sound and satisfactory. As for example the following:—'This method of referring words immediately to God as their framer, is a short cut to escape enquiry and explanation. It saves the philosopher much trouble; but leaves mankind in much ignorance, and leads to great error.' But what ignorance can the supposed Divine origin of language perpetuate among mankind? or how can it lead to great error? Unless we can ascertain the origin of language, we are just where we were as to ignorance or error, whether we assume a Divine or a human origin. All attempts

to ascertain the origin of language have hitherto failed: nor is there the shadow of a probability that future attempts will be more successful. We have the following confession from one who has long made language his study, and who was at one time very sanguine that he could ascertain its origin. 'On this obscure subject the reader is promised nothing but brevity; for, after much toilsome enquiry and anxious reflection, the author has no satisfactory opinion to offer.—Some persons have believed that Hebrew was the first language of man, and that the Hebrew alphabet came down from heaven. This is a short cut (as Horne Tooke terms it) which saves much trouble; for on this hypothesis we have only to believe. Admitting, however, that letters are of human invention,—what is the nature of that invention? Here we possess no certain data on which to reason; for we have no authentic history of this important invention. Being wholly destitute of facts, we have nothing better than conjectures on which to form an opinion.' The author of the *Etymologic Interpreter* might have added, what was no doubt understood, though not expressed, that it is impossible to find out, from examining language itself, the nature of its origin.

Another of Mr. Horne Tooke's specious but unsatisfactory positions is, that it is as 'improper to speak of a complex idea as it would be to call a constellation a complex star; and that they are not ideas, but merely terms which are general and abstract;' and that 'what are called the operations of the mind, are merely the operations of language.' This, which in the view of Mr. Horne Tooke is of great magnitude, he attempts to establish by a very doubtful kind of etymology. He does indeed intimate, 'that it is an easy matter, upon Mr. Locke's own principles, and a physical consideration of the senses and the mind, to prove the impossibility of the composition of ideas.' And accordingly also (as he likewise intimates) of abstraction, complexity, generalisation, relation, &c. of ideas. But, easy as such proof was alleged to be, he did not attempt it: nor has he given any evidence of being capable of a successful attempt of this nature. Indeed his expression betrays inconsistency: for how can any one who knows what he says, or whereof he affirms, speak of 'a physical consideration of the senses and the mind!' It is hardly possible to find any thing more futile than much of what Mr. Horne Tooke says respecting metaphysics. All his etymologies might be as certain as the greater number of them are doubtful, yet every one of his metaphysical deductions or opinions be false. *True* for example, may be the past participle of *traw*; and *truth* the third person singular of the indicative, yet what is called in our language *truth*, be some more certain and less fickle entity than that which any one *traweth* or thinketh. But the fact is, that the very etymology in question is as false as the opinion founded upon it, or attempted to be supported by it. There is not room, however, here to refute the metaphysical theory of Horne Tooke in a full and formal manner; but it can hardly require refutation, for it has little to recommend it but confidence and

assumption. Mr. Horne Tooke's theory of a northern origin to the languages of Europe, and his Gothic etymologies are also very doubtful : but of these more hereafter.

The foregoing may suffice to direct the reader to the great authorities in our language on the subject of Philosophical Grammar. In our present article we divide the consideration of grammar into four parts. I. Treating of the General Principles of Grammar or Philology. II. Of the Parts of Speech, or Grammatic Distinctions of words. III. Of Prefixes and Affixes. IV. Of Rational Grammar of the English Language

PART I.

THE GENERAL PRINCIPLES OF GRAMMAR OR PHILOLOGY.

SECT. I.—OF THE DERIVATION OF THE ENGLISH LANGUAGE.

On this subject, to a certain extent at least, there can be but one opinion among competent judges. A great part of the English language is derived from Latin and Greek. Many words have been received directly from these languages; many have been received through the Italian, the Spanish, the Portuguese, German, Swedish, Danish, and Dutch; but the far greater proportion have come through the medium of the French.

The causes of the direct entrance of learned terms are—the general study of the learned languages; the facility with which such terms are applied to the various purposes of art, science, and philosophy, &c. (not to mention a very general disposition in learned men to show their learning); the application of Latin to law, physic, surgery, anatomy, botany, &c.; add to all which, the consideration that it was long almost the only written language of Europe:—to comprehend all in one sentence, Latin has for many hundreds of years been the learned language of Europe, and the terms of the learned are constantly descending into and becoming part of the common or vernacular language of every people on the face of the earth. It is on this obvious principle that we hope to prove that, if not all, nearly all that very part of our language which is most confidently received as Saxon and Gothic is, in fact, neither more nor less than a corruption of Greek and Latin.

The reason why many Greek and Latin words have been adopted by us, through the medium of the Italian, is sufficiently obvious. Rome, even when her consuls and emperors were no more, was still the seat of empire: an empire of mightier sway over the minds and habits of language of the nations than ever was the power of the Caesars. From other causes, too, Italy was the fountain of influence to all parts of Christendom; for besides the Catholic religion, with its Roman priesthood and Latin tongue, science, the productions of arts, and the arts themselves, were thence derived. It was Italy, too, that took the lead in vernacular literature: and her poets, novelists, historians, and philosophers, were as much in advance of those of other modern nations as she was in advance of the rest of Europe in arts and manufactures.

It has been intimated that the greatest influx

of Greek and Latin words has been through the channel of the French. The causes of this are, evidently, the geographical proximity of France, and her predominant influence in politics, polite literature, and fashion; which influence has operated powerfully in Europe, and especially in Britain, ever since the reign of Charlemagne.

About the commencement of our vernacular literature there was, indeed, an extraordinary importation of French terms; and the reason is obvious; for, as the French borrowed all from the Italian (which is admitted even by Voltaire), we at that period borrowed nearly all from the French. But the grand cause of the fact in question was the conquest. It is well known that William of Normandy attempted to make French the only language of England; that it was the only language spoken at court, taught in schools, employed in statutes, legal forms and pleadings, &c. &c.

It has been intimated above that some of the learned words, of which so much of our language consists, were received through the medium of the Spanish. The reason of this was the political pre-eminence, and consequent predominant influence, which Spain at one time possessed. Thus we have duplicates and triplicates of many words, which we borrowed by turns from the Italians, French, and Spaniards, as they respectively happened to be in the political ascendant. But there was another cause of the influence of the Spanish: it formed a point of contact, or link of connexion, with the arts and sciences of the Saracens: hence the portion of Arabic which is found in the different languages of Europe; for knowledge has the power not only of forcing a passage from more enlightened into less enlightened nations, but also of taking with it the very terms in which it happens to be contained. The fact is, words and thoughts are so mutually adapted that translation is always difficult, and often impossible; so that it is less from choice than necessity that a people, poor in arts and sciences, borrow not only the improvements, but, to a certain extent, the language of their richer, i. e. more intellectual, more literary, and more philosophical neighbours: thus the nations of Europe, during the middle or dark ages, borrowed largely from the Saracens and the Greeks; thus the Celts, the Goths, the Sarmatians, and even the Persians, the Arabians, &c. &c., borrowed largely, for many ages, from the Greeks and Romans. These were the Backwoods-men of Grecian influence and the Roman empire: and, if those stationary and unimprovable animals, the naked savages of Indiana, already speak a corrupt English (or Yankee), it cannot surely be thought incredible that the venerable Gothic (whose origin, Mr. Horne Tooke says, is buried in the deepest antiquity) should prove, after all, with very little if any exception, a corruption of Greek and Latin.

SECT. II.—THE ANGLO-SAXON AND GOTHIC ORIGIN OF THE ENGLISH LANGUAGE CONSIDERED.

It is not without some reluctance that the author approaches this question; because he has to

controvert the opinions of Mr. Horne Tooke, for whose memory he entertains the sincerest respect and for whose labors he feels truly grateful. He will not say that he would rather be in the wrong with Horne Tooke than in the right with Harris; but he considers the errors of the one far more interesting, and even instructive, than the truths of the other. Many had pretended to write philosophically; but it was reserved for the author of *The Diversions of Purley* to be the first, at least in this country, to write sensibly on the subject of language. If his celebrated work be big with promises, which never have been, and which, probably, never can be realised; they have internal evidence of proceeding from sincerity. But, with every disposition to admit the merits of the above work, it certainly does contain a considerable portion of unsound opinion, especially in connexion with the author's favorite theory of a Northern Origin; in support of which, ingenious paradox and bold assertion are more conspicuous than careful enquiry and dispassionate reflection: and the Gothic derivations are, for the most part, not only mere assumptions, but many of them are such as would have disgraced Junius or Skinner.

We had once intended to collect in this place all the unsound and absurd etymologies of Horne Tooke, and confront them with what we deem true derivations; but such a task might seem invidious. It was the unfortunate theory of the Northern Origin that misled the acute judgment of the author of the *Diversions of Purley*; for his Greek and Latin derivations are as remarkably sound and incontrovertible as many of his Gothic derivations are absurd and false. His Gothic partialities and prejudices, connected as they were with a particular theory and a political bias, are easily accounted for; but they are, nevertheless, unworthy of his understanding and inconsistent with the philosophic spirit of free enquiry. He perceived a remarkable similarity, or rather identity, in many Gothic and Anglo-Saxon words with Greek and Latin terms. What is the inference deducible from this fact? That the half civilised and illiterate tribes of the north borrowed such words from the highly civilised, and therefore powerfully influential, Greeks and Romans; or that they both derived them from a common origin? No, indeed, but that the Greeks and Romans, those masters and teachers of the world after the extinction of Babylon and Memphis, borrowed many words (perhaps terms of art and science) from the rude and unlettered tribes of ancient Germany! Or, as is ingeniously (not to say fancifully) supposed, in bold defiance of all history and all probability, that these rude tribes made successful irruptions into Greece and Italy, and grafted their language on that which already existed in these countries!

But the Herculean argument for the Northern Origin is the darkness of its deep antiquity. We can trace (Mr. Horne Tooke avers) the origin of the Latin and the Greek; but that of the Gothic is involved in darkness and buried in the deepest antiquity. But is not the origin of all the languages of all the uncivilised and half-civilised tribes of the earth sufficiently buried in darkness to entitle them to the same honor? Why should

the Anglo-Saxon or Gothic monopolise all this merit? The Celtic has surely some claims; and, as to words without number, every one capable of using a dictionary may soon satisfy himself not only of striking resemblance, but of absolute identity, with both the Greek and the Latin. Have not the Welsh, for example, *Pont* and *Dant*! which are plainly *Pons* and *Dens*, or, as in Italian, *Ponte* and *Dente*. And is it not undeniably certain that the Romans borrowed all such words from the Welsh, the more ancient people?—which word people, as well as *populus*, is, without controversy, a corruption of the Welsh *Pobl*; for the more cultivated and literary language is uniformly derived from one ruder and less literary. It is amusing enough to find other writers advocating the Celtic origin of the Greek and Latin Languages, with as much zeal, if not with the same talent, as Horne Tooke advocated the Gothic origin.

The fact is as well established as any historical fact whatever, that the Goths had not the use of letters before the fourth century; that they borrowed their letters from the Greeks and Romans; that their first attempts at literature were rude translations and imitations of works written in Greek and Latin.

The fair inference seems to be, that as the Gothic, or, say at once, Saxon literature (and the writings of men in the present age who know not how to spell their own name are as worthy of such a dignified appellation), originated in Greek and Latin, so did a great proportion of the words composing it. Such has always been the case; for a rude and illiterate people as naturally borrow words from their civilised and literate neighbours as they borrow their improvements and arts and sciences, or as the poor beg from the rich: and the inverse process supposed is as absurd as the idea of the rich borrowing food and raiment from the poorest paupers that exist in their neighbourhood or live on their bounty.

The only question, indeed, with unprejudiced enquirers, is likely to be concerning not the reality but the amount of Saxon derivation from the learned languages. This may not be easily ascertained with perfect accuracy; but, from the very nature of the operating causes or influencing circumstances, it must have been very considerable: and in reply to all Horne Tooke's witticisms, about the Goths not waiting for others to come and put words in their mouth, it is sufficient to remark, that they would naturally adopt in process of time new foreign terms for many of their old vernacular ideas, (for such is the process with all people similarly circumstanced), and that with the multitude of ideas which literature introduced among them, they would adopt, to a wide extent, the terms in which they were conveyed to them, partly from choice, and partly from necessity. This is the history of all the living languages of the earth; not merely of such as are most rude, unformed, and imperfect (and what can well partake more of these attributes than the scrap of Gothic contained in *Codex Argenteus*, or even the Saxon of the eighth and ninth centuries!) but of those which are most improved, and most firmly fixed by authoritative rules, established principles, and admitted stand-

ards. New terms and modes of speech are constantly displacing the old. Custom, the sovereign arbiter of language, is as capricious as tyrannical; and 'time is the greatest of all innovators.'

The only argument of Mr. Horne Tooke intrinsically deserving refutation, is that which he attempts to erect on the evidence of etymology; and on this he evidently relies with much confidence. He puts the question—When two different languages have the same words, how are we to ascertain which of them borrowed from the other? This is not a very satisfactory mode of putting the question, for two languages might have the same words without either borrowing from the other, as both might have derived them from a common origin. But his manner of replying to the question is still less satisfactory. Etymology is to decide. So far good; but what kind of etymology? Here the advocate of the northern origin (to use his own words) takes a short cut which saves much trouble, but leaves us in much ignorance; for, instead of proofs, he contents himself with assumptions, as if the business were settled by merely asserting that a certain word is a Gothic verb or noun, without even attempting to give us any further information. As to the instances which he gives of Gothic and Saxon words, whence corresponding Latin and Greek words must have been derived, it is difficult to conceive any reason whatever, save that the former are found in Gothic and Saxon letters and spelling.

There are but few Gothic admirers that can deserve the honor of being noticed in connexion with the author of the *Divisions of Purley*; but this seems the proper place for saying a few words about the utility of Saxon literature, especially as there appears some disposition to exalt it into undue importance. A Saxon professor in one of our most renowned seats of learning has employed very laudatory strains on the subject; to one or two of which it will suffice to apply the test of criticism, if, indeed, it be fair thus to try the soundness of panegyrical orations.

'The Anglo-Saxon,' the learned professor affirms, 'is one of those ancient languages to which we may successfully refer in our enquiries how language has been constructed.' This is a most comfortable assurance, pregnant with hope and anticipation as the doctrine of Horne Tooke; but, if equally barren of results, it will only tantalize our fond desires.

The sober truth is, that Anglo-Saxon is available for etymologic purposes in studying the English language, but not half so available as German, Swedish, Danish, Dutch, old English, Scottish, Greek, and Latin. The reason is obvious; such was the illiterateness of even the Saxon literati, that they knew not how to depict to the eye their own barbarous sounds. Hence the caprices of Saxon orthography, as they are leniently termed by the candid and enlightened author of the Anglo-Saxon history. To have a true idea of these caprices, (more properly rude essays at spelling), we have only to compare them with the literary attempts of our most unlettered mechanics or laborers who can barely read and write. Their orthography and composition and that of the Saxons will be found remarkably

similar. This may displease the lovers of Saxon literature, and all lovers are apt to be offended when freedoms are taken with the objects of their affections; but our apology must be, that we have no wish to offend, and the ruling principle of our sentimentality is, *Rien n'est beau que le vrai*.

'The present language of Englishmen,' says the Saxon scholar above alluded to, 'is not that heterogeneous compound which some imagine, compiled from the jarring and corrupted elements of Hebrew, Greek, Latin, French, Spanish, and Italian; but (but what? completely Anglo-Saxon in its whole derivation, having none but pure Gothic words in its whole vocabulary!) completely Anglo-Saxon in its whole idiom and construction.' We may well exclaim *fi* upon *but*; for it brings forth a most irrelevant conclusion. A zealous Frenchman might exclaim,—The present language of Frenchmen is not that corruption of Latin which some imagine, but completely French in its whole idiom and construction: and thus might Spanish and Italian professors reason for the idiomatic antiquity of their language.

Specimens of the present English have been selected for the purpose of showing what a great number of pure Saxon words they contain; but we think it can be proved that most, if not all, of these very Saxon words are as really Greek and Latin, as those which are admitted to be adopted from these languages. The sole difference is, that the words given as Saxon were adopted at a much earlier and ruder period, and, therefore, are more changed, contracted, and disguised. This is an opinion not hastily adopted (for it was reluctantly admitted, being forced upon the understanding of the author in opposition to his faith in the Northern Origin), but slowly and cautiously formed, after much enquiry and long deliberation.

If this opinion can be established, if it can be satisfactorily shown that all, or nearly all, the words of the English language are merely Greek and Latin terms, in learning which so much time is spent in youth; the result will surely be far more important than tracing them up to the darkness of Gothic antiquity, which is as void of pleasing association as of useful instruction.

SECT. III.—VERBAL CONTRACTION, OR ABBREVIATION CONSIDERED.

Here three general rules may be laid down.

1. The more illiterate any people are, the more do they contract their words; and the illiterate part of a community always shorten their words more than the educated portion of society. Thus the language of the Franks abounds with more violent contractions of Latin than does that of the Italians, the modern masters and teachers of Europe. The language of the Saxons is characterised by more verbal contraction than the old English in the time of Chaucer, and the English of his period has more of the same character than when our language first began to be fixed by established rules and uniform polite usage: and thus, also, the language of the vulgar is remarkable for violent contractions. as, *gemman*, for gentleman; *a'nt*, for are not; *fudge*, for fiction; *fib*, for fable: to

which may be added such words as the following, though yet tolerated in familiar or jocular discourse; *cu'nt*, *sha'nt*, *wont*, for cannot, shall not, will not; *rant*, forrodomontade; *rum*, for romantic; *chum*, for comrade, &c. &c. Had these and all such words descended to us from the venerable antiquity of Saxon literature, they would, in all probability, have possessed, if not lignity, at least respectability; but, being vulgar upstarts of recent times, they can never rise to the classic title of good expressions, or to the honor of polite usage.

2. Longer words and syllables contract (whilst language is unfixed) into shorter, and the longer the word, the greater the contraction. Thus polysyllables become monosyllables, and monosyllables frequently shorten into a single letter: as *auditus* contracted into *udito*, It.; *oui*, Fr. Ego contracted into † *eck*, † *ick*, † *ich*, † *ic*, then *I*, *je*, Fr.; *io*, It.; *yo*, Sp. Habeo, contracted into *ho*, It.; *he*, Sp.; *ai*, Fr., &c. &c.

Such is the process of every living language on the face of the earth until checked by grammatic authority, which is late in coming into existence, and not till long after the lawless anarchy of custom has committed strange etymologic outrages in mutilating and disfiguring the monuments of classic antiquity. These disfigurements are the true Gothic origin of the modern languages: and even the Italians, those modern Latins, consider themselves indebted for their language to the Lombards.

The contractions in question are made in every possible manner; sometimes the beginning and sometimes the termination of words is cut off, and sometimes the middle is thrust out and the two extremes compressed into the closest possible contact; especially by the French, who, next to the Anglo-Saxons, have been guilty of the greatest etymologic havoc. The following ancient and modern names of places are presented as instances of the process of verbal contraction above indicated. The oldest form is put first.

Acarnania, now Carnia; Aciris, Acri; Adranum, Aderno; Ænoia, Nona; Ænus, In; Agrigentum, Gergenti; Aletium, Lecci; Alexandria, Scanderia; Alexandrium, Scandalia; Ahuta, Alth; Ambiana, Amiens; Amisia, Emse; Amisus, Amid; Amphipolis, Emboli; Antipolis, Antihe; Aquæ Sextiæ, Aix; Arelatum, Arles; Arsenariaria, Arzen; Ateste, Este; Augusta, Aosta; Augustodunum, Autun; Auximum, Osimo; Barathra, Brata; Borbeto-magus, Worms; Cabillonum, Challon; Cæsar Augusta, Saragossa; Ligeris, Loire; Mæandrus, Madre; Matrona, Marne; Metaurus, Marro; Magantiacum, Mentz; Rhodanus, Rhone; Thessalonica, Salonichi; Garienus, Yar; Eboracum, York; Castellum, Cassel; Conimbrica, Coimbra; Damascus, Damas; Forum Julii, Friuli; Lugdunum, Lyons; Novesium, Neus; Noviodunum, Noyon; Telo Martius, Toulon; Tridentum, Trent, &c. &c.

These instances, besides answering the immediate purpose, serve also to exemplify nearly all the usual alphabetical interchanges and transmutations. It may be observed, that many names of places whose orthography has been fixed, are

much abbreviated in common speech: as Ciren-ester pronounced *sister*, &c. From this, as well as from all the foregoing examples, it plainly appears not only that long words are contracted into shorter forms, but that the longer the name, the greater the contraction; as in all cases the more difficult and unmanageable a word is, the greater is its corruption in process of time. The following instances are taken almost at random.

Eleemosyna, *alms*; episcopos, *bishop* (*abispo*, Sp.; *vescovo*, It.; *cvêque*, Fr.; such are the caprices of etymology!) *presbyter*, *priest*; obli-tero, † *bluther*, *blur*, *blot*; collect, cull; coil (*cueillir*, Fr., &c.); bull (as Irish bull), blunder, contraction of *balena a terra*, It., *balæna ad terram*, a long-established expression; seacalf, seal; despiciatus, despite, spite; succumb, sink; *secure*, sure; semino, sow; sluice from *seclusus*; count, contraction of *computo*; come, *commeo*; chair, *cathedra*; round, *rotundus*; sedate, *sad*, &c.

Such instances might be multiplied indefinitely. We merely subjoin a few examples of proper names.

Benjamin, *Ben*; Robert, *Rob*, *Bob*; Joseph, *Joe*; Juliana, *Jill*; Timothy, *Tim*; Richard, *Rick*, *Dick*; Edward, *Ned*; William, *Will*, *Bill*; Henry, *Harry*, *Hal*; Alexander, *Elick*; Thomas, *Tom*; Margaret, *Meg*, *Peg*; Elizabeth, *Eliza*, *Bet*, *Bess*, *Betty*, &c.; Sarah, *Sally*; Maria, *Mary*, *Molly*, *Moll*, *Poll*, &c. &c. Some of these contracted forms belong to the lower orders of the vocabulary, like all those called flash or cant terms; but others have all the dignity of polite usage. What has thus happened to proper names, also happened in former times to common nouns and to all words; and is still their fate in the language of the vulgar, and in the Saxon-like literature of the uneducated members of society.

SECT. IV.—OF VERBAL CORRUPTIONS.

These are in many respects identical with verbal contraction; but there are many changes of words from their original form which could not be included under that denomination; and, therefore, a few separate remarks may be applied to them here.

1. Words that are new, strange, and unusual (as all foreign terms are when first imported and adapted both to the ear and the mouth) are most liable to be corrupted or changed from their original form. There is an idiom in the sounds and in the pronunciation of every people, as well as in their phraseology; and they naturally bring the sounds and pronunciation and words of other languages (when introduced among them) to their own idiom or manner. The French (as the Greeks did before them) do so professedly and systematically; and all people, however unintentionally, do so to a considerable extent. Hence the reason why words adopted from other languages are often so much disguised, like foreigners in the costume of the country, that their original features can hardly be recognised. Who would suppose, for instance, that our *yes*, *you*, *ay*, are the French *oui*? There is not a single letter the same. The same thing

would happen to words of recent importation, if we did not, by a sort of fashionable pedantry and servility in borrowing almost peculiar to us, put the new patches of French orthography as well as French pronunciation upon the old garment of our language, which was sufficiently motley before; for no confusion of tongues or mixture of all the dialects of Babylon could well equal it in anomalies.

2. Words that are long and hard or difficult are always liable (before language is fixed by grammars and dictionaries) to be much corrupted, or changed from their first form. This has been already indicated.

3. Words much in use, or which frequently pass from mouth to mouth in the hurry of common discourse, are exceedingly liable to be corrupted. Hence, all familiar household words (and that part of our language which has descended from Saxon times consists chiefly of such) are usually much more metamorphosed in process of time than the learned or literary and scientific terms of a people: hence, also, the etymologic difficulty attending the particles of every language.

4. The terminations are the parts of words which are most liable to be corrupted, as is evident from a careful inspection of any given number of terms. The physical reason of this seems to be, that all men, being naturally idle and careless, are usually impatient to get to the end of any thing they have to do or say; and therefore hurry the one out of their hands and the other out of their mouth badly finished. The above fact, as well as that immediately preceding it, has been treated of by Horne Tooke with all the acuteness and dexterity which he applied so successfully to his subject, when his understanding was not biassed by theory.

5. There are many verbal corruptions which originated not in carelessness, hurry, or mere mispronunciation, but in deception occasioned by similitude of sound, in new, strange, or foreign words, to that of some others well known: thus, *Chartreuse*, was corrupted into *Charter-House*; *asparagus*, corrupted into *sparrow-grass*; *reticle*, *ridicule*; *lustrino*, It. a shining silk, corrupted into *lustrestring*; *Benzoin*, *Benjamin*; *lanterna*, corrupted into *lanthorn*, as there happened to be horn in the old lantern, &c. &c. Thus did sheer ignorance produce many strange corruptions, as well as an etymology contemptibly absurd.

6. It is with the ignorant and the uneducated that the grossest verbal corruptions chiefly originate and abound; hence they have, for the most part, a radical meanness and vulgarity about them (unless they have descended from Saxon literature, and possess the dignity of Gothic antiquity); for they never possessed sufficient merit to rise to any office of distinction or station of respectability. Not to adduce such striking instances of gross corruptions, as *bamboozle*, *bother*, *baldrdash*, *rip* or *rip* (i. e. *reprobate*), *demirip*, &c. &c.: even such instances as *hint*, i. e. *intimate*, *gel*, *git*, *gist* (i. e. *gesta*, i. e. *res gesta*), &c., are rather low words: and hence the difficulty of supporting the familiar or middle style with sufficient dignity: a task to which neither

the genius of Swift nor the taste of Addison was fully equal.

SECT. V.—OF ELLIPSIS, OR SYNTACTIC ABBREVIATION.

That which is here indicated has the same relation to composition, i. e. to sentences and members of sentences, as verbal contraction has to single and separate words: the one is the leaving out of letters and syllables; the other is the omitting of whole words. Both are to be accounted for in the same manner; both originate in carelessness, or hurry, or the love of ease, natural to all men; who usually take the shortest cut to the object of their thoughts and affections, and employ elliptic modes of expression, for the same reason that they adopt short-hand and other contractions or abridgments of labor. This is ever their short, direct course, when engaged in good earnest about their wishes and wants, their business and necessities. From various causes, manner, or style, will differ among individuals and among nations: that of one may be exceedingly full and redundant in expression; that of another may be as remarkable for shortness and abbreviation: some from mental taste and habit are lavish of words, as Cicero; others are sparing of them, as Sallust. There are overpowering temptations to verbal redundancy and prolixity; as when attorneys and reviewers, or, perchance, encyclopadists, are paid so much per sheet; and there are temptations to the opposite extreme, as when the writer has to pay for an advertisement; for his words are likely to be few, even if not well ordered. But all such considerations produce no sensible effect on the language of a people, which is always tending to abbreviation in all its modes of expression; for there is this difference between the contraction of words and that of expressions: the former may be checked in process of time, the latter never can be checked; and though there be inconveniences as well as advantages attending this elliptic process, it is amenable to no grammatic law, and, therefore, is always in full operation.

That which is now under consideration was too obvious to escape observation, and therefore it has been frequently noticed by philological and metaphysical writers, as, for instance, by the ingenious Tucker: it was familiar, indeed, to mere grammarians; but Mr. Horne Tooke has treated of ellipsis in such a clear, full, and satisfactory manner, that it is unnecessary to enlarge on the question in this place, and therefore, a few illustrations will suffice.

It is difficult (if, indeed, possible) to select a single sentence or expression which is not elliptic. Take such instances as the following, which happen to occur at the moment: A prince of the blood, i. e. blood royal, or royal blood; a man of color, i. e. dark color; a man of rank, of family, of fortune, &c., i. e. of high rank, of good family, of great fortune, &c. Nor is the ellipsis filled up by thus supplying such omitted terms, for there is hardly a single word, if, indeed, any word, in any single expression, which had not, at one time or other, more words connected with it; which were dropped, because the mean-

ing of the expression having been once well established and effectually associated with some of the leading terms, the other could be omitted, and yet the signification retained. For example, in the expression, man of quality—*man* is a contraction of human, which requires being, or some equivalent word, if the ellipsis be filled up, to be connected with it: then *quality* (a contraction of equality, as *qualis* is of *æqualis*) manifestly requires to be connected with other words; for without their assistance, it could not express the meaning which is now suggested or indicated by it. There is, in reality, ellipsis (i. e. something left out) not only in every expression, but in almost every important word; such as *forma*, (meaning beauty) i. e. *forma venusta*; *libel*, i. e. *libellus famosus*, &c. &c. And to each of such words, the *synecdoche* of the grammarians (that is, a part put for the whole, or, as the word implies, something that is not expressed is implied in or to be taken with that which is expressed) as really belongs, as in those cases where they have applied the term. For example, *famosus* requires *malus*, or some equivalent term; or rather, *fama*, the noun on which the adjective is formed, requires *mala*; for *fama* of itself means merely a saying or report: when, therefore, a *dyslogistic*, i. e. taken in a bad sense, it had originally *mala* or some equivalent word connected with it.

Not to dwell longer on what is so very obvious, that proof and illustration are alike redundant; this seems the proper place to explain a matter connected with it, not quite so evident, and which, therefore, has been very little considered; not only by the common class of writers on philology, and logic, and metaphysics, but even by the acute Horne Tooke, whose antipathy to such writings as those of Harris and Lord Monboddo seems, in some instances, to have obscured his understanding or biased his judgment. That all words have originally a distinct, separate, independent meaning of their own, is a point which he has labored with as much success as acuteness; but there is another consideration which, so far as we remember, he has overlooked, or which he has refused to admit, viz. that there is a syntactic as well as verbal meaning; i. e. there is a meaning effected in composition, which cannot exist without it; for no word or number of words can, by any possibility, convey that signification which is conveyed by a sentence, any more than the figures of arithmetic can indicate separately what they do by every possible mode of combination. The supposition, indeed, would be as absurd as to believe that a thing can be and not be at the same time. Now, though we cannot say that the meaning of words in composition, or when put together to make a sentence, is independent of that meaning which each of them has separately (as may be inversely affirmed), yet we can say, and do affirm, that that the one is wholly distinct from the other. And, if this fact be lost sight of, we are likely to fall into as great errors as in supposing, with Harris, that many words have no meaning at all till they are put together; as if composition had a creative power of producing something out of nothing. This is so absurd as hardly to merit

notice; but, if we do not attend to the distinct meaning produced by the combination of words, we shall be involved in not only etymologic and grammatic, but logical or metaphysical absurdities, such as those which are so plentifully spread over grammars, and dictionaries, and metaphysical disquisitions. For instance: the real attempt (a very unsuccessful one) of almost the whole of the Herculean labor of Dr. Johnson is to give, not, as it professes, verbal, but syntactic meanings; and for the same reason that it assigns ten, twenty, or thirty significations to one word, it might have assigned as many hundreds. It is, indeed, as so often pronounced, a *great* work, but it is not great enough by many thousand degrees for its real though not professed purpose; in reference to which it is truly *little*.

Syntactic, being entirely distinct (though not independent of the verbal as that is of the syntactic) from verbal signification; it follows that the elliptic process can proceed almost, if not altogether, interminably, without absolutely defeating (though it may and often does mar) the purpose of language; so that, in process of time, there is, in every sentence, every member of a sentence, every expression, and almost every word, much more implied than is expressed; much more indicated than is really signified by the sign employed; which acts as a prompter rather than reciter or narrator. Mr. Dugald Stewart is not far from the truth when he says, that the office of language is not so much to convey ideas as to call up trains of thought in the mind. The only thing about the statement to which we demur, is the term *office* (as if such were the original design and use and formation of language), and the subserviency to a particular theory intended by the remark.

SECT. VI.—THE MUTATIONS OF VERBAL SIGNIFICATION CONSIDERED.

That the significations of words, as well as their external form (their spelling and pronunciation), are changed in the course of time, is abundantly manifest. Mr. Horne Tooke, indeed, asserts—‘Every word retains always one and the same meaning. Unnoticed abbreviation in construction and difference of position have caused the appearance of fluctuation, and have misled the grammarians of all languages both ancient and modern.’

That a word generally retains one and the same meaning is certainly true; but that every word always retains one and the same meaning, is a proposition contrary to the most decisive evidence that can be obtained on such a subject. Indeed it would be very unaccountable if all the grammarians of all languages, both ancient and modern, had been misled by mere appearances to believe that words have secondary as well as primary meanings, if no such distinction really exist. But the question admits of being easily settled by obvious and indisputable facts. *Sycophant*, for instance, originally meant an informer (one who gave information against persons exporting fies, the exporting of which was forbidden by law at Athens), now it means a flatterer: heathen originally meant of or belonging to a nation (like Gentile from *Gens*): pagan originally

meant a villager; but both these terms have long meant an idolater or worshipper of false gods: Cæsar, at one time was a proper name (and, perhaps, before that, meant having bushy hair), but it has long meant, as in Germany, Kaiser, and in Russ, Czar, an emperor; which word, emperor, originally meant the commander or general of an army. A hundred such instances might be easily collected. The question here is about a fact; not the manner of accounting for it, or the process by which it was effected; which is, perhaps, after all, what Mr. Tooke intended; so that we may have been all the while contending with a phantom,—which, however, it is worth while to put down.

The reasons of all such shiftings and changes of verbal signification are very obvious after a little enquiry and reflection. Indeed, they have already been virtually explained; and therefore, to avoid repetition, we shall only subjoin a few remarks. As almost every expression (if there be any exception) is elliptical; so, with almost every word (if, here, also any exception exist), there are several ideas associated in the mind of those who employ it, besides the individual idea which it was intended to indicate. The reason of this is too obvious to require any metaphysical abstrusity of theory or of explanation. There is no such entity in either the natural or moral, physical or metaphysical world, as disconnected individuality. There is not any one single entity, be it an object of our senses, a sensation, an idea, a perception, a notion, or whatever we may choose to call it, which can exist alone or in absolute solitude and separation from company. However, much, therefore, it may be intended as the sole or exclusive object of indication by any verbal sign, or by any contrivance whatever, it is after all but one of a flock or group; it may be the first or largest of the flock; it may be the most prominent figure in the group; it may occupy the fore-ground in the representation, but it is always accompanied by a number of other entities. Hence what is called the principle of mental association, or the association of ideas in the mind, so liberally philosophised since the days of the philosopher of Malmshbury.

The fact above indicated, i.e. the complex or gregarious nature of ideas, is the origin of many shiftings or mutations of verbal signification. Here a single illustration is better than a thousand sentences. Take an instance already adduced. *Heathen* primarily means of a nation; or, taken substantively, i.e. elliptically, one of a nation; and, in the plural (ethnicoi, as it occurs in the New Testament), the *nations*; but the *nations of the earth* were all considered, by the Jews, idolaters, or worshippers of false gods: the word for nations was so associated from the first with this idea, as to be, in process of time, identified with and indicative of it only. This Jewish idiom (with many other Jewish notions and idioms) accompanied the Christians (who were, at first, nearly all Jews) from Judea into Europe, where it remains to the present day: and in the use of all such words as *Heathen* and *Gentile*, we, *Christians* and *nations* as we are, speak after the manner of the Jews. Take another instance

of a similar nature and origin: *Pagan* primarily means a villager, a countryman; or, as we have it corrupted through the medium of the French organs of speech, a *peasant*: but the *peasants* continued in the religion of their fathers; and worshipped Pavor and Pallor, and Pan and Priapus, in the old way of their first faith and early associations, long after the inhabitants of Rome and of the large towns had turned from Heathenism to Christianity. Hence, the word for villager or peasant was associated in the minds of the Christians, i.e. the town's people, with the idea of idolater or worshipper of false gods; and, being thus associated, it was soon identified with and exclusively indicative of that idea, like the term *heathen*. A thousand such illustrations might be given of the same process, of a similar changing or shifting of verbal signification; so that Horne Tooke wrote more confidently than advisedly when he asserted, that every word always retains one and the same meaning. It is true, as he supposes, that abbreviation in construction and change of *position* do cause appearances of fluctuations, where no fluctuations really exist; but there are many changes of verbal meaning which cannot thus be accounted for, and which are explicable only on the principle of the association of ideas in the human mind, resulting from and answering to the complex nature of things as existing in the universe, and, therefore, as presented to the human senses.

Metonymy, like synecdoche, as handed down from antiquity, is mingled with error; but it has evidently a basis or substance of truth; and neither Quintilian nor Vossius was wide of the mark of correct definition, when it was defined by the first, 'The putting of one word for another,' and by the last, 'A trope, which changes the name of things that are naturally united, but in such a manner as that one is not the essence of the other.'

SECT. VII.—THE DIFFERENT KINDS OF MUTATION IN VERBAL SIGNIFICATION.

These may be summed up in the following particulars:—1. When the name for a class of beings comes in process of time to indicate a circumstance or peculiarity connected with them: as, *Heathen* or *Pagan*, to denote Idolater; Scythian, Goth, Turk, Tartar, Vandal, &c., to denote barbarity and cruelty, or any person remarkable for these qualities: *Jew*, to indicate any one remarkably false and overreaching, &c. &c. Here a hundred instances might be given, all agreeing as to genus, but differing as to species.

2. When names, originally descriptive of office, agency, &c., come to be merely obscure titles or empty compliments: as, duke, marquis, count, earl, lord, knight, squire, Mr., Sir, madam, lady, Miss, &c. &c. All such words may be compared to the Roman emperors, who were great whilst living, but who acquired deification by death.

3. When old names remain, though that to which they were originally applied, and of which they were descriptive, has ceased, or has been superseded by something else: as, paper,

originally the name of an Egyptian flag or leaf: volume, i. e. something rolled up—a scroll; burg, burgh, burrow, was originally a fortification or fortified place; province originally signified a conquest, or country gained by successful war. Words of this description are very numerous.

4. When words, expressive of action or quality, are appropriated to objects as common or proper names. This is the most prolific origin of verbal multiplication or vocabular augmentation; for thus an indefinite number of nouns are produced by a few verbs and adjectives: thus, *fact, feat, fight, fit, &c.*, are all originally one word; and thus the names of many animals and natural objects, as well as of metaphysical entities, are resolvable into one adjective, or one verb; which one adjective or verb is so exceedingly diversified in spelling and pronunciation, partly by design and partly from accident, as to seem not one and the same word, but a great multitude of separate and independent words: hence, one of the causes of tautology, inanity, obscurity, and absurdity, so often observable in the speeches and writings of men.

5. When a word shifts from a primary to a secondary meaning, or, when it passes over to a concomitant idea, or from the cause to the effect, or vice versa. This is essentially the same as 1, only in a more comprehensive form to prevent mistake.

6. When a word is employed metaphorically; for the very term metaphor, as also trope, imports a changing or turning of the word to another use than that which it originally had. Many words have lost their literal, and retain only their metaphoric import or use; many have passed back from their metaphoric to a literal, or more properly to an unmetaphoric, application.

SECT. VIII.—VERBAL DIVERSITIES AS TO RANK OR RESPECTABILITY.

As the members of a community range in different classes of political rank, so do the words of a language. There are here, also, high and low and middle classes. On these distinctions a few remarks will suffice.

1. A large class of the lower orders of words has been already indicated: for those gross verbal corruptions which have originated with the ignorant and the uneducated (and which have not descended from Gothic antiquity, when ignorance had the honor of being universal) are radically vulgar, and permanently doomed to hopeless degradation.

2. Many words are low or vulgar for the same reason that old-fashioned garbs are so considered; for there is a fashion in language as in other things, and, like that of the world, it is ever passing away. New terms and expressions and modes of speech are constantly displacing the old, which linger among the lower classes long after they have been discarded by those who are at the fountain of influence; and the very circumstance of obsolete words and expressions being found only, or chiefly, among the lower classes in society, stamps their character and seals their fate. Thus the same words, which are

very honorable in one dialect of a language and part of a country, are very dishonorable in another; and this forms one of the most obstinate difficulties which the natives of Scotland have to contend with, in speaking and writing English agreeably to polite usage: for, as the dialect of the North is older by three or four centuries than that of the South, persons accustomed to the old-fashioned dialect are apt to imagine that they are keeping the very best company when guilty of employing most vulgar and disreputable expressions. This fact accounts not only for the Scotticisms, but for the vulgarisms so often detected in the productions of those beyond the Tweed, who have written with freedom and energy; as it accounts also, on the other side, for the artificial stiffness and polished feebleness of those Scottish authors who sacrifice all to taste—who dread nothing so much as the imputation of vulgarity, and who covet nothing so much as the reputation of elegant writing. It would be easy to produce instances; but they might appear invidious.

We have noticed that many words become vulgar in process of time, merely from being old-fashioned; but old fashions are frequently brought up again; and there is a sort of sentimental archaism raging at present among the lovers of the olden literature, who, ever and anon, cite an obsolete phraseology for the very nonce of showing its whilom beauty, too long suffered to wrinkle unadmired in neglected desuetude. If utility could be put in competition with sentimentality, we would address a word of enquiry, or of exhortation, to these admirers of the antique in literature; but the fit will not last long; for the sentimental passion is extremely inconstant: and though some words that had become both vulgar and obsolete, have been thrown up to the very top of fashionable literature, there is some danger of a re-action, and that many of the happiest phrases of Shakspeare will be hackneyed into contemptible vulgarity.

3. Many words become vulgar, in course of time, in consequence of being associated with gross objects, actions, and ideas; and the notion of grossness is every day becoming more fastidious in a state of progressive refinement. This is one of the most operative causes of mutation in living languages: and it is amusing to observe the variety of attempts that are made to clothe gross entities and vulgar ideas in decent and polite phraseology, and the rapid succession of terms that are first degraded and then discarded in the performance of this ungracious duty. Not to present the most obvious, and, therefore, the most disgusting instances, i. e. to our refined notions and sensibilities, take the following: *guts* was, at one time, a very decent term, and fit to appear at the very top of Saxon literature; but it became so very rude, upon long and familiar acquaintance, as to be wholly unbearable in any genteel family, and was turned off for no fault in the world but vulgarity: its place was supplied by *belly*, which was long considered a very well-bred term, and fit to appear in the very best company. But, having become disgustingly vulgar, it has also been turned

out of good society; and, for the present, *stomach* and *abdomen*, two learned foreigners, supply, between them, as well as they can, the place of *belly*; but they are only upon trial, and there is no chance whatever that they will long give satisfaction. It is supposed, indeed, that genteel people, finding so much trouble with such attendants, will contrive, in future, to do without them altogether. The fact is, that pantomime can be successfully substituted for much of the old vulgar drama of real life. It may be urged, that all this results from false refinement and delicacy, and that things ought to be called by their proper names. But this is a Utopian doctrine wherever there is such an entity as refinement; and when the question is about the degree, or the extent, who is to be judge or sovereign arbiter? The calling of gross things by their proper names is one of the privileges of the dead languages. Many instances similar to the above might be presented.

4. There is a set of low words and phrases which originate in wretched metaphor, or in allusions to things of a mean and sordid nature, such as the following: to *cram a subject or person* down any one's throat, or to *saddle* him with a heavy expense, or to *blink* his argument, or to *haul* him over the coals, or to put him in a *cleft-stick*. All such expressions can never be elevated into lasting dignity, however closely they may be associated with the genius of a Swift or a Butler (just as low-life may be associated with the genius of Hogarth); nay, though they may have the high sanction of parliamentary authority; and certainly, though not omnipotent, it can produce very extraordinary effects upon the verbal currency of the kingdom.

It is not necessary to indicate the respectable classes of words, which are of course too numerous to be easily arranged under distinct denominations. In general those terms and expressions, and modes of speech, which have the highest political, intellectual, literary, and scientific origin, possess the greatest dignity; for the general tendency is for words to sink from a higher to a lower—not to rise from a lower to a higher rank. Instances of the latter process are, for the most part, those of extraordinary individual merit. Thus, terms which were at first objected to as Scotticisms (such as the verb *notice*, &c.), and provincialisms, or as too technical and plebeian or classic composition, have, in course of time, risen to respectability in the language. All such words as are evidently useful, peculiarly convenient, distinctive, and descriptive, are sure of adoption, whence soever derived: they are a kind of professional adventurers that are sure to make their way in the world, and to come into general practice.

There is a very large number of words, found in books and dictionaries, which do not properly rank either with the high or the low—the genteel and respectable, or the mean and vulgar order: and which may be designated the *awkward squad*, or pedantic company. They never had any recommendation but their learned bulkiness and strangeness; and therefore they have been unsuccessful candidates for admission into general and established usage.
